So, when Jefferson said that paper money was a cheat, he wasn't hypothesizing about a theoretical construct. He was cheated big time.

²⁴² Sloan, Herbert; *Principle and Interest: Thomas Jefferson and the Problem of Debt*; University of Virginia Press (2001).

And here is the punch line: and so were the other gentry in Virginia including Madison and Washington. Madison, also a large plantation owner, saw the Revolution coming, and he leased his land. The people to whom he leased his land paid him with the worthless legal tender money, and similarly for George Washington.

When the Founders assembled in Philadelphia at the Constitutional Convention (at that time they had gotten Jefferson out of town as our ambassador to France), they were not supposed to write a new constitution. They were to amend the *Articles of Confederation* which were thought to be inadequate because the Articles didn't give the general government the power to tax.

The Framers used the powers granted Congress in the Articles as a template and went down the list transferring what they thought were good provisions to the *Constitution*. When they got to the provision whereby the Articles gave the Congress the power to issue paper money, in those days called "emitting bills of credit," they debated the issue and overwhelmingly voted it down. Madison's notes contain entries to the effect that "we killed paper money," and "we closed the door to paper money."

The principal monetary power of the general government under the *Constitution*, as put forth in Article I Section 8, is "To coin Money, regulate the Value thereof, and of foreign Coin." There is no legal tender power to the general government, and there is no power to issue paper money.²⁴³ That was not an oversight. In addition to the Founders, ordinary people had a miserable experience with legal tender and there was near universal opposition to it. Thomas Paine, sometimes referred to as the Father of the Revolution and the author of "Common Sense," wrote:

"The laws of a country ought to be the standard of equity and calculated to impress on the minds of the people the moral as well as the legal obligations of political justice. But tender laws, of any kind, operate to destroy morality, and to dissolve by the pretense of law what ought to be the principle of law to support, reciprocal justice between man and man; and the punishment of a member [of Congress] who should move for such a law ought to be DEATH."²⁴⁴

What could be clearer than that? Jefferson also confirmed the fact that the general government does not have the power to arbitrarily

²⁴³ The best reference for the constitutional issues dealing with the U.S. monetary system is Dr. Edwin Vieira's magnificent *Pieces of Eight: The Monetary Powers and Disabilities of the United States Constitution*, Sheridan Books (2002), Edition: 2nd

²⁴⁴ Bancroft, George; *A Plea For The Constitution Of The United States, Wounded in the House of Its Guardians*; (1884)

assign value to something that is valueless by making it “legal tender.”

“The federal government — I deny their power to make paper money a legal tender.”²⁴⁵

Even John Marshall, the revered chief justice of the Supreme Court condemned legal tender:

“The inflexible adversary of paper money, detesting it with a hatred almost amounting to a passion, was the chief justice of the United States, John Marshall. While he was on the bench, no case could come before him, in which power was claimed for the United States to issue bills of credit; because at that day he and everybody else well understood and willingly acknowledged that the power to emit bills of credit was withheld from the United States, was forbidden by not being granted. But his opinion of the illegality of the issue of bills of credit by the states gave him the opportunity to declare in terms of universal application that the greatest violation of justice was committed when paper money was made a legal tender in payment of debts. But the opportunity to express his opinion, which was never offered to him as a judge, he found as a historian in his life of Washington. He claimed for himself and those with whom he acted, an “unabated zeal for the exact observance of public and private engagements.” He rightly insisted that the only ways of relief for pecuniary “distresses” were “industry and frugality;” he condemned “all the wild projects of the moment;” he rejected as a delusion every attempt at relief from pecuniary distresses “by the emission of paper money;” or by “a depreciated medium of commerce.” These were his opinions through life. He gave them to the public in 1807, and twenty-four years later in a revised edition of his *Life of Washington* he confirmed his early convictions by the authority of his maturest life.”²⁴⁶

Years later, in 1836, legal tender was still being discussed and condemned:

“Most unquestionably there is no legal tender, and there can be no legal tender, in this country, under the authority of this government or any other, but gold and silver, either the coinage of our own mints, or foreign coins, at rates regulated by congress. This is a constitutional principle, perfectly plain, and of the very highest importance. The states are expressly prohibited from making anything but gold and silver a tender in payment of debts; and

²⁴⁵ Bancroft, George; *A Plea For The Constitution Of The United States, Wounded in the House of Its Guardians*; (1884)

²⁴⁶ *ibid*

although no such express prohibition is applied to congress, yet as congress has no power granted to it, in this respect, but to coin money and to regulate the value of foreign coins, it clearly has no power to substitute paper, or anything else, for coin, as a tender in payment of debts and in discharge of contracts. Congress has exercised this power, fully, in both its branches. It has coined money, and still coins it; it has regulated the value of foreign coins, and still regulates their value. The legal tender, therefore, the constitutional standard of value, is established and cannot be overthrown. To overthrow it, would shake the whole system. The constitutional tender is the thing to be preserved, and it ought to be preserved sacredly, under all circumstances."²⁴⁷

Given the U.S. historical record as well as the universal failure of paper money to protect savings and promises of future payment, how did it happen that gold and silver have been “demonetized?”

As with many ill-advised actions of the general government, the assault on honest money gained traction during wartime. The Civil War was a very unpopular war, and Lincoln had trouble financing it. The Morrill Tariff, which was the government’s principal source of revenue, was raised to 47%. It didn't bring in enough money.

Lincoln instituted an income tax. For the most part, people rejected paying it, and, in any event, it didn't bring in much money either. In this case, the need for funds was so-great, money could not be borrowed except on terms that would have raised interest rates, some said, to as much as 20% or more. Since bank balance sheets consisted mostly of bonds, had interest rates increased so greatly, the banks would have been bankrupted. So, if one cannot tax or borrow, what does one do?

Lincoln’s Secretary of the Treasury, the brilliant lawyer Salmon Chase, who was himself an aspirant to the presidency, agreed to print money, called Greenbacks, because the back of the bills were in green ink. But why would people accept them when they were used to, and were expecting, gold and silver for their goods and services? The answer was that the Greenbacks were made legal tender.

²⁴⁷ *ibid*; Extract from a speech delivered by Daniel Webster in the Senate of the United States, on the 21st of December, 1836, on the subject of the Specie Circular.

Exhibit 23: \$1 legal tender Greenback

As one might imagine, this was very controversial. There ensued a great deal of litigation. At its nadir, Greenbacks depreciated nearly 50% against gold. People who had lent gold or were expecting gold in payment felt they were being cheated. After the Civil War, the legal tender cases litigation percolated up to the Supreme Court. Lincoln had appointed Chase Chief Justice, and it was partially up to him to decide if what he had done during the Civil War was in conformity with the *Constitution*.

The first legal tender case, *Hepburn v. Griswold*, was decided in 1870 at a time when there were two vacancies on the Supreme Court. Chase wrote for the majority that there was no legal tender power in the *Constitution*. He wrote, further, that the government had made the Greenbacks legal tender as a war measure, out of necessity. But since the Civil War was over, so was legal tender.

The two open positions on the Supreme Court were filled (some said that the Court was “packed”) with justices who were known to be sympathetic to legal tender. The Court quickly took a new case, *Knox v. Lee*, and promptly reversed itself and said there was indeed a legal tender power. However, the affirmative decision relied not on the *Constitution per se*, nor on the legislative history, but, ruled the Court, other countries could create legal tender, and therefore, so

could the U.S. In the Court's language, legal tender was a power that accompanied sovereignty.

Chase, now in the minority, wrote in his decision:

"The legal tender quality [of money] is only valuable for the purposes of dishonesty."

In my view, Chase has this right. Further, it seems clear to me that by not giving the legal tender power to the general government, and limiting legal tender by the states to only gold and silver, mindful that the 10th Amendment to the *Constitution* declares "The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people," it means that sovereignty over money is reserved to the people.

In other words, if the people want to increase the money supply, they should mine more gold and silver, and take it to the mint to have it coined. The argument that other countries can impose legal tender and so can we brings to mind when I was a child and was remonstrated for doing something my mother disapproved of. A response from me that "the other kids are doing it" was rejected outright by my mom, and so should have been legal tender.

In defense of this miserable decision, there was an issue of people who had borrowed Greenbacks during the Civil War who would have had to repay their debts in much more valuable gold if legal tender was rejected.

Chief Justice Chase's strong objection to legal tender and very strong language that it was dishonest, did not stop the monetary authorities from putting his image on the \$10,000 legal tender irredeemable paper-ticket-dollar as if he might have endorsed legal tender. This is yet another misrepresentation. It is dishonest.

Exhibit 24: \$10,000 legal tender Federal Reserve Note bearing the likeness of Salmon Chase.

F
Exhibit 25: Blowup of the legal tender wording on the \$10,000 Federal Reserve Note

Notice that this legend is somewhat different from the legend that appears today on Federal Reserve Notes because it includes the words that the note is “redeemable in lawful money.” The reason for this is that, at the time that the Federal Reserve legislation was passed, it was never anticipated that Federal Reserve Notes would be money *per se*.

Today, all of our money is fiat, not redeemable in “lawful money,” and we rely solely on legal tender irredeemable paper-ticket-electronic money, all of which bears the legend:

“This note is legal tender for all debts public and private.”

What this means is that if one owes money to any entity and offers payment in Federal Reserve Note(s), if they are not accepted, then one need not pay. In addition, legal disputes settled in money are payable in the legal tender.

The history of how our money became transformed from constitutionally mandated gold and silver to legal tender irredeemable paper-ticket-electronic money is not well understood. Legal tender and other important monetary concepts have been removed from textbooks and, as far as I know, are taught nowhere. Today, I cannot find a textbook that deals with the history of how our legal tender irredeemable paper-ticket-electronic money became legal tender and the controversies that resulted.

While legal tender was a great benefit to those who issued money, at the end of the 19th century, it was the American Federation of Labor that was most vociferous against legal tender.

“No legal tender law is ever needed to make men take good money; its only use is to make them take bad money. Kick it out!”²⁴⁸

“If money is good and would be preferred by the people, then why are legal tender laws necessary? And, if money is not good and would

²⁴⁸ Byington, Stephen T. *The American Federationist* September 1895. *The American Federationist* was the official monthly magazine published by the American Federation of Labor.

not be preferred by the people, then why in a democracy should they be forced to use it?"²⁴⁹

"We [the American Federation of Labor] believe in a financial policy that will neither depreciate our currency at home nor abroad."

"We believe in an honest dollar."

By repealing legal tender, *The Free Competition in Currency Act of 2011*, will facilitate a transition to an honest monetary system, hopefully avoiding a catastrophic collapse.

The Kind of Money We Use is a Moral Issue

Commodity money is in conformity with the *Eighth Commandment*: "Thou Shall Not Steal," and *Leviticus* 19:35 & 36, which says that one should not falsify weights and measures. Honesty in business dealings is considered consistent with holiness and with moral law.

Fiat money violates the *Eighth Commandment* and the admonition that one should not tamper with weights and measures. Because it is used for future payment, money is said to serve as a store of value. The generation of fiat money, which is produced without work—how much more work is involved in producing a \$100 bill as opposed to a \$1 dollar bill?—dilutes that which has been saved and that which has been promised for future payment. It is the same as stealing.

Property Rights and Money

Commodity money protects property and is protected by the notion of private property. With fiat money, when money is diluted by the creation of additional money out of nothing, the property rights of savers and those who have been promised future payments, such as pensions, are violated.

James Madison, the Father of the *Constitution* condemned paper money, even that which might have promised redemption, on the grounds that it adversely affected property rights. Repeating the passage cited above, he wrote:

"Paper money is unjust; to creditors, if a legal tender; to debtors, if not legal tender, by increasing the difficulty of getting specie. It is unconstitutional, for it affects the rights of property as much as taking away equal value in land." [Emphasis added.]

For example, if one works and saves the money one receives in exchange, arguably one has a property right in the money saved. If the money is fiat, then the purchasing power can be decreased by the

²⁴⁹ Ibid.

issuing authority by creating out of nothing, and without work, any amount of additional money. The result will be that one has lost the value of one's work.

The same logic applies to money that has been promised for future payment, e.g., pensions. Arguably, people who have earned and/or contributed to a pension plan have a property right to what they have earned when the plan vests. If a monetary authority creates additional money out-of-nothing, in effect one loses the value of his property. Where is the justice in that?

Governmental Monetary Integrity

With commodity money such as gold or silver, the general government tends to be completely honest about money and the monetary system, because there is little for the government to do except to coin money. There is very little “wobble room.”

With legal tender irredeemable paper-ticket-electronic money, because it is inherently fraudulent, the government or its agents, e.g., the Federal Reserve, engage in myriad frauds both at home and abroad.

By delegating to the Federal Reserve a power that Congress does not have under the *Constitution*, the power to create money out of nothing, the Congress has empowered the Federal Reserve to act as a *de facto* agent of the general government. While almost all of what the Federal Reserve does is secret and generally not subject to discovery, occasionally evidence of gross malfeasance and fraud appears.

For example, there came a time circa 1982 when the Federal Reserve helped phony up the balance sheet of the Bank of Mexico. Here are the facts.

After Paul Volcker retired as Chairman of the Board of Governors of the Federal Reserve in 1987, he and Toyoo Gyohten, his former counterpart from the Bank of Japan gave a series of lectures at Princeton. Those lectures became a book, *Changing Fortunes*, in which the following passage appears:

“So it was a matter of buying time. In an effort to hold things together psychologically, we agreed with considerable unease to extend overnight swap credits once or twice to the Bank of Mexico to bolster the month-end figures for their dollar reserves. *We would transfer the money each month on the day before the reserves were added up, and take it back the next day.* Our unease did not arise from any fear of financial loss, but because the ‘window dressing’

disguised the full extent of the pressures on Mexico from bank lenders and from the Mexicans themselves.” [Emphasis added.]

This is a *prima facie* fraudulent transaction. The phrase “window dressing” is a euphemism for a misrepresentation, which is the indicium of a fraud. The issue that this raised for me is that if the Federal Reserve is willing to engage in this genre of fraudulent transactions, what might be the limit on what the Federal Reserve might or might not do. I conclude that there is no limit.

Further, what possible legislation passed by Congress authorizes this? Some time ago, I submitted to the Federal Reserve a Freedom of Information request for documents dealing with this transaction. My query turned up nothing.

As a small digression, some time ago as part of a larger presentation I showed this to Mr. Ed Ott, then the Executive Director of the New York City Central Labor Council. Mr. Ott connected a dot that I had not considered. He noted that after the Mexican Peso collapsed, when many ordinary Mexicans lost their savings and jobs, in order to survive, many of them illegally migrated to the U.S. to find work. In this way, fiat money has contributed to the problem of illegal immigration that some in the U.S. have complained about.

The Perils of Money Creation

Prior to August 15, 1971, when President Nixon “temporarily,” he said, defaulted on the U.S.’ sovereign promise to redeem dollars for foreign governments and foreign central banks at the rate of one ounce of gold for \$35 (at the time it was a felony for U.S. citizens to own gold anywhere in the world), the amount of dollars created out of nothing by our banking system was ultimately limited by the amount of gold that could be claimed. After the default, the amount of dollars that could be created out of nothing has no limit. (See *Exhibit 23*)

As Mr. Greenspan confirmed multiple times, the Federal Reserve has the power, on its own authority and without any oversight from Congress, and as recent events have shown, to create money without limit. When money is created out of nothing, it depreciates the purchasing power of money that exists, and more importantly, it depreciates money that has been promised for future payment, e.g., pensions, annuities, etc.

Since 1946, about \$14 trillion (M3) has been added to the economy. Where did all of this money come from? How did it get into the society?

As John Kenneth Galbraith explained:

“The process by which banks create money is so simple that the mind is repelled.”²⁵⁰

Consider, for example, if one were to take a \$300,000 30-year 6% fixed rate mortgage loan from a bank. The interest on the loan will be about \$350,000. Where does the bank get the \$300,000? Papers are passed back and forth and signed. Then a bank employee goes to a computer and types in a book entry to one’s account for \$300,000 and that’s it! In other words, essentially for passing some paper around and keying six keystrokes, the bank will now reap \$350,000 over a 30-year period.

Suppose the loan was for \$3,000,000, yielding the bank about \$3,500,000 in interest. What extra work does the bank need do to realize the additional \$3,150,000? All that need be done is to add an additional zero; one more keystroke. And if the loan was for \$30,000,000, yielding the bank almost \$35 million in interest, all that need be done is to add two more keystrokes!

Is this genre of money creation possibly in conformity with the *Constitution*? In what way is this related to Congress’ power to “coin money?” Is it in conformity with free market principles? Does this kind of “work” justify the lavish salary and bonus compensation paid to bankers? I’ll have more to say about this later.

Exhibit 26: How banks create money

As unbelievable and outrageous as this appears, the process is explained in official Federal Reserve publications. The Board of

²⁵⁰ Galbraith, John Kenneth; *Money: Whence it came, where it went*

Governors and the twelve regional Federal Reserve banks each maintain a Public Information Office. A large number of pamphlets, manuals, reports, videos and other publications purportedly to educate the public on why the Federal Reserve system is so wonderful are available for free or for a nominal sum. This is a great source of reading material if one is having trouble sleeping. The following quote comes from a comic book format directed at children. It explains simply:

“Money exists simply as a bookkeeping entry at a bank.”²⁵¹

Here is a more complete explanation from a more erudite publication:

“If a bank makes a loan, it credits the checking account of the borrower. This creates new money in the form of additional checkable deposits for the borrower.”²⁵²

In effect, the Congress has delegated to the banking system a power that the Congress does not have: the power to create legal tender irredeemable paper-ticket-electronic money out of nothing. What is the response from the financial sector? How can this be justified?

First, they claim that money creation helps the economy and provides jobs by financing factories, real estate, consumer purchases, and so on. While it is true that in some cases money creation is used to build and enhance productive enterprise, mostly it is used for gambling in the capital markets, e.g., proprietary trading. Today, the major money center banks have become *de facto* hedge funds.

Second, they claim that no one coerced another into taking a loan, and presumably the bank is satisfying a customer need while benefiting itself at the same time. In other words, they claim a win-win situation.

But wait, not so fast. The rest of society ultimately pays a huge price for the banking system having the privilege of creating money out of nothing. Consider the effect on the purchasing power of money:

²⁵¹ *The Story of Money*, 8th Printing, 2005, Federal Reserve Bank of New York, page 17

²⁵² *The Federal Reserve Today*, 15th Edition, Federal Reserve Bank of Richmond, page 16

Exhibit 27: Depreciation of the dollar 1949 – 2008; Source: Federal Reserve CPI data.

The reason why I call this “stolen labor” is because if one works, one’s labor is transformed into money, some of which one saves. If one’s savings depreciate, in effect, one has lost his labor. Who benefits? Except for waste, which is unfathomable, the principal beneficiary of legal tender irredeemable paper-ticket-electronic money is the financial sector.

Its members, through a combination of fees and stock options, get to transform the legal tender irredeemable paper-ticket-electronic money into real stuff, e.g. 40,000 foot houses in multiple locations around the globe, 200 foot boats, \$200 million airplanes, now. Later, when savers and those to whom money has been promised, e.g., pensioners, get their rewards, it turns out that their saved money doesn't have the purchasing power they anticipated. In effect, they have been and will be cheated.

Later, I will show empirical data whereby the financial sector public company market capitalization has increased from 5% of total market capitalization in 1980 to more than 20% in 2007. How could the financial sector, which produces no final products that improve the lives of anyone, have quadrupled its share of market

capitalization in one generation? This was just blatant wealth transfer from people who earned it to the financial sector.

These days, the depreciation of the dollar, usually referred to in the press as inflation, as measured by the Consumer Price Index (CPI) is thought to be benign. In my view, and that of anyone who eats food or consumes fuel, the notion that the CPI is benign is false.

John Williams, a Foundation for the Advancement of Monetary Education Foundation Scholar, has had a long career as a professional economist with clients such as Boeing and IBM. Now in retirement, he runs a website service called Shadowstats.com. He claims that the methodology by which the CPI is computed has been modified multiple times since the Clinton years, incorporating “innovations” such as Hedonic Pricing, geometric weighting, substitution, etc. that have had the effect of reducing the CPI from what it would otherwise be had a consistent methodology been used. Here is a plot showing his findings from 1981 through July 2011:

Exhibit 28: Annual Consumer Inflation vs. Shadowstat.com computation using a consistent methodology from the early 1980s.

As can be seen, using a consistent methodology, the CPI has been materially understated for almost 25 years.

Here is a real-life example of how the CPI is understated for ordinary people. This graph shows my monthly healthcare premiums to Oxford for the years 2001 through 2007:

Oxford Monthly Premiums for Larry Parks
(\$ per month)

Exhibit 29: Oxford Health Plan monthly premiums for Larry Parks 2001 – 2007

On the next graph, I show my year-on-year percentage increased cost (which I believe is representative of the experience of most people who have healthcare insurance) and compare it to the percentage increase in the BLS medical component of the CPI:

Exhibit 30: Medical component of the CPI contrasted with increased premiums charged by Oxford Health Plan; Source: BLS and data from Larry Parks' Oxford bills

Thus, the medical component of the CPI is not in conformity with the experience of virtually the entire population, which has experienced double-digit increases for health care for years.

There is overwhelming empirical evidence that prices are increasing greatly for the inputs to consumer items.

Exhibit 31: Year-on-year price increases as at 1/19/2011; Source: Wall Street Journal

Exhibit 32: Year-on-year price increases as at 1/19/2011; Source: Wall Street Journal

It's hard to imagine that these large price increases will not at some point be incorporated into consumer products one way or another. For example, the media has reported on many products whose packaging and content sizes have been reduced, while maintaining the prior price per package when it contained more product. In this way, and many others, the effects of currency depreciation are being obfuscated.

These graphs provide support for Mr. Williams' hypothesis that using a consistent methodology the CPI has been seriously understated for almost 25 years. Since retirement schemes such as Social Security, benefits to disabled veterans, and salary increases to those who have COLA clauses (which used to be common in labor contracts) are keyed to increases in the CPI, these beneficiaries along with Treasury Inflation Protection bond holders are being cheated. Why should our government be part of a cheat?

Boom & Bust in the Economy

With commodity money, such as gold, and without fractional reserve lending (leverage), a.k.a. the creation of "bank money" by banks, economic activity expands without busts. With increasing amounts of fractional reserve lending, there are periodic booms and busts. A bust results when marginal credit that cannot be serviced is liquidated.

Fiat money tends to create huge bubbles, which, when they collapse—and they always collapse—lead to extended depressions and severe hardship, especially for ordinary working people and seniors.

Likelihood, Duration, and Size of Wars

Wars are very expensive. Because the only sources of revenues with commodity money are taxes, which people tend to resist, or borrowing, which drives up interest rates, there tend to be fewer and smaller wars. For example, it is less likely that the U.S. would have fought in Vietnam if President Johnson had to finance the war with taxes.

Fiat currency enables politicians to generate revenues with less accountability. They are then able to act without the consent of the citizenry, which, if consulted, would probably allocate their savings differently. Thus, politicians have a freer hand to engage in military adventurism, and they do.

Military Preparedness and the Ability to Wage War if Need Be

With commodity money such as gold or silver the country will have a stronger industrial base, which makes for a stronger military. Also, lower interest rates, which are a by-product of commodity money, make for a greater capacity to finance a war.

With legal tender irredeemable paper-ticket-electronic money, there will be a weaker military due to a weaker industrial base. Since purchase power of the money is vulnerable to collapse, there is less of a capacity to finance a war. When a collapse arrives, the military can become fatally weakened. This is an important national security issue.

Who Gets the Wealth of Society?

With commodity money such as gold or silver, the wealth of society goes to the people who earn it: workers, entrepreneurs, and the producers of goods and services sold in the market in voluntary transactions.

With legal tender irredeemable paper-ticket-electronic money, an inordinate amount of wealth is transferred from those who produce it to banks and financial intermediaries. Large credit-worthy borrowers benefit. Also, politicians tend to profit along with people who are direct beneficiaries of government largesse.

Social Mobility: the Ability to Improve One's Lot in Society

With commodity money such as gold or silver, social mobility is high. There are innumerable stories of years gone by about people who came to America with nothing but their willingness to work who built major successes. When the U.S. had sound money, it was known worldwide as "The Land of Opportunity." These days, there are innumerable stories about folks going back to their original homelands.

With legal tender irredeemable paper-ticket-electronic money, social mobility is low to none. Because improving one's lot requires the accumulation of wealth, and because it is not economic to save fiat currency, the poor tend to stay poor.

Social Engineering (The Redistribution of Wealth)

With commodity money, such as gold and silver, social engineering is hard to do because it must be done with taxation and people tend to oppose higher taxes. They take a greater interest in where money is spent when it is their own.

With legal tender irredeemable paper-ticket-electronic money, social engineering is easier to attempt by creating money out of nothing and "spending" it, lending it, or guaranteeing loans (where it

is known in advance that such guarantees can be met by creating additional money). Contrary to popular opinion, the empirical evidence confirms that most wealth redistribution is from the poor to the rich.

No less an authority than Mr. Greenspan has confirmed that we have subsidies for the banking system. Mindful that bankers are richer than most, this means that poorer people are transferring wealth to richer people. Where is the justice in that? If we had an honest monetary system, the wealth transfer would be apparent to all and would be objected to.

Unfathomable Waste

There is a loss that can be even greater than the depreciation of the currency if banks make loans for enterprises that are not long-term viable. Consider the recent residential real estate debacle whereby several million homes face foreclosure. More than a million homes are vacant and many millions are “underwater.”

A house isn't like a rock; it requires constant care and maintenance. If a leak develops, water and mold damage can result in a total loss. When a bank finances a home for which insufficient savings have been accumulated to pay for it, the bank gets upfront fees, called “points.” The mortgage broker gets a fee, as does the real estate agent, the appraiser, lawyers . . . a little army of beneficiaries. If the house is a new build, the builder makes a profit as well. My point is that many people get paid.

If the house goes into foreclosure and results in a total loss (there are film clips on the Internet of whole new house divisions being bulldozed), the entire enterprise is for nothing. None of these folks have their compensation clawed back. However, the bank's balance sheet will be replenished one way or another. It is the taxpayer, through additional currency depreciation, who ends up holding the empty bag.

By making a transition to an honest monetary system, when all the facts are on the table without misrepresentations, full disclosure and no coercion, as I will explain further in the section on jobs, prices will again be stable, and savings and promises of future payment will not bear the risk of currency depreciation. *The Free Competition in Currency Act of 2011* will hasten that transition.

Research & Development and Science Education

Because commodity money has a lower interest rate structure and a longer investment-time-horizon, there tends to be more long-term investment. Research and development tend to be long-term

activities. Thus, commodity money results in more scientific activity and the need for more science education.

Because fiat currency results in a higher interest rate structure and a shorter investment-time-horizon, there tends to be less long-term investment. If interest rates are high enough, as in Mexico or Brazil, there may be no long-term investment at all and little research and development, and less demand for science education.

Manufacturing Jobs and Employment

With commodity money such as gold or silver, there is more investment in productive ventures; there are more and higher-paying jobs than otherwise. Because manufacturing is capital intensive, there are also more manufacturing jobs. With fiat, irredeemable paper ticket-token or electronic-checkbook money, there is less investment in long-term productive enterprise; there are fewer and lower-paying jobs.

This is because fiat currencies cause higher interest rates and a shorter investment-time-horizon, causing a decrease in manufacturing activity. Generally, there is an increase in the so-called service sector because it has a much shorter investment-time-horizon. A near zero interest rate today is not a market-driven event. It is blatant market manipulation by the Federal Reserve creating additional money out of nothing to buy bonds.

Exhibit 33: U.S. Manufacturing Employment January 1980 to June 2009; Source: BLS

Exhibit 34: Manufacturing as a percent of the civilian labor force 1949 – 2009; Source: BLS

With commodity money, job security is impacted mostly by increases in productivity, which tends to destroy some jobs and create others. Decreasing prices help offset the negative effects associated with the destruction of jobs resulting from productivity (labor saving) improvements.

With fiat money, job security is impacted by rapidly changing interest and foreign exchange rates, and less of a propensity to save and invest for the long term.

Exhibit 35: Unemployed 16 years and over; Source: BLS

The Free Competition in Currency Act of 2011, by speeding a transition to an honest monetary system, will help to create more and better job opportunities in the U.S.

Except for those workers who do manual work without tools, e.g., picking vegetables or who are professionals working in a knowledge-

based industry, well-paying jobs require tools, or more generally, plant and equipment. The more sophisticated the tool, the more investment in research and development is required over longer periods. The source of investment is always accumulated savings, i.e., that which is not consumed from one's production.

While legal tender irredeemable paper-ticket-electronic money created out of nothing by the banking system may at first blush appear to be an alternate source of funding separate from savings, in fact it dilutes the purchasing power of that which has been saved or has been promised for future payment. The only thing that gives fiat money value is that some people save it. If a country that had no accumulated savings issued paper money, that money would depreciate quickly and would, in effect, be rejected.

Part of the human condition is that people must save (or someone must save on their behalf, e.g., a pension plan) for a time when they can no longer work. Labor songster, the late Joe Glazer wrote a song commemorating this at the time that Walter Reuther was negotiating the Chrysler pension plan circa 1954. The refrain is "Too old to work, too young to die, how am I going to get by?"

Ordinary people are very security conscious and tend to allocate their savings to what they perceive to be the least risky (from the vernacular, not the financial definition) allocation. Most times, they allocate to U.S. Government bonds (in Europe, German bonds are considered safe). Ideally, however, society is best off when savings are allocated to productive enterprise.

Recently, David Malpass, president of Encima Global and former Bear Stearns' chief economist, wrote an insightful op-ed piece in the *Wall Street Journal* in which he observed:

"Treasury bond yields have been at near-record lows and gold prices at record highs, attracting millions of investors into idle assets through coins, exchange-traded funds, and even warehousing facilities." And,

"It means people would rather buy gold than hire workers or start businesses -- that they don't trust the central bank to maintain the value of their money."²⁵³

Thus, if people don't trust the efficacy of currency, they make a "flight-to-safety" rather than invest in productive enterprise. So far, there is substantial residual faith in the fiat dollar, as evidenced by the unsustainably low interest rates on U.S. Government securities.

²⁵³ "Beyond the Gold and Bond Bubbles Shouldn't the Fed Try to Improve Incentives to Invest in Growing Businesses?" by David Malpass, *The Wall Street Journal*, August 31, 2011.

That could change very quickly. The bottom line is that industrialization requires sound money, not money that a central bank can create, in Mr. Greenspan's exact words "without limit."

But there is another and more toxic effect of legal tender irredeemable paper-ticket-electronic money on jobs. As the banking system increases the money supply, as mentioned previously, the purchasing power of money that exists depreciates. This is called inflation as measured by the CPI.

Here is a long-term chart of M3, the so-called broad money supply, from official sources until March 2006, at which time the Federal Reserve stopped publishing this metric. The components of M3 are known, so some have constructed a proxy to continue the series. For our purposes, that proxy is meaningful. Here is a plot showing the M3 money supply from 1946 through 2008.

Exhibit 36: The broad money supply (M3) from 1946 to 2008.

Source: Federal Reserve until March 2006 when the Fed stopped reporting this metric. From April 2006 to December 2008 the data reflects estimates of various observers based on known components of M3.

In 1946, M3 was approximately \$150 billion. By 2008, it had ballooned to \$14 trillion. Contrary to what most people understand, all of our money is created by the banking system. Specifically, when

a bank makes a loan it creates the deposit with a simple book entry. The jargon for money creation is called “fractional reserve lending.”

Notice how the money supply accelerated after the last tie to gold was broken on August 15, 1971. A great deal of the increase in the money supply went into the capital markets, thereby increasing the nominal valuations of equities. Wall Street called this “wealth creation.” In fact, on account of the fees that went to financial sector participants and stock options that went to those who manage publicly-traded companies, it was mostly wealth transfer. I will have more to say about this in the section on Wall Street and the Banks.

Again, creating all of this new money out of nothing increased the price level. The effect on jobs has been an unmitigated disaster and from many points of view.

Consider the price level of the United States from 1800 to 2006:

Exhibit 37: Price Level of the United States 1800 – 2006. Source: Federal Reserve Bank of Dallas.

Notice that the U.S. price level was stable for about 125 years. There were little blips at the time of the War of 1812, the Civil War, WWI and WWII, but at the end of the period prices were nearly what they were in the year 1800. During the period, there were enormous improvements in manufacturing as more and better products were produced. The standard of living at the end of the period was many times greater than that of the year 1800 with innovations such as the

steam engine, railroads, telegraph and many others. Further, the growing industrial strength made the U.S. the envy of the planet. At one point it appeared that a large part of the world's population wanted to migrate to the "Land of Opportunity," also called the "Land of the Free."

It is significant that after FDR seized all of the monetary gold owned by U.S. citizens and made it a felony for U.S. citizens to own monetary gold anywhere in the world, the price level began to increase, especially on account of financing the Vietnam War with legal tender irredeemable paper-ticket-electronic money.

At the time that president Nixon defaulted on the last promise to redeem dollars for gold to foreign countries and foreign central banks, not only did money creation accelerate, but so did the price level.

What does this have to do with jobs? As the price level increased, nominal wages increased, and along with some other effects, especially taxes (which are not part of the CPI calculation), the U.S. became uncompetitive with other locales. I recall up until the last tie to gold was broken the New York City metropolitan area where I live had a large garment center manufacturing presence. Because it was cheaper to manufacture in other countries, e.g., Japan, garment manufacturing, and most labor-intensive manufacturing left the U.S.

Shortly thereafter, whole industries migrated, such as shoe manufacturing. I have been told that there is only one large shoe manufacturer left in the U.S., Allen and Edmonds. As time went on the television industry, microwave ovens and myriad other industries took their jobs overseas.

The spin from Wall Street was that we would be doing the creative work (we would think, and the Asians would sweat) and everyone would benefit. Forgetting the effect of legal tender irredeemable paper-ticket-electronic money in financing "trade," so-called globalization was the new mantra to an improved standard of living for all. What was wrong with that argument?

The fallacy with globalization is that it wasn't trade, unless one wants to think of it as trading jobs for consumer electronics. When Ricardo postulated that comparative advantage and free trade would benefit all, England was on a gold standard, and trade meant an exchange of value for value and work for work. With a legal tender irredeemable paper-ticket-electronic monetary system, money is created without work. How much more work does it take to create a \$100 bill as opposed to a \$1 bill? None at all. And the amount of work it takes to create a \$1 bill is about two cents. In this light, globalization is not trade. It is wealth transfer.

Money Creation Effects on State and Local Taxes

Commodity money tends to facilitate lower tax rates and less taxation, since citizens see how much is being extracted from them. As fiat money is created out of nothing, there tends to be inflation and ordinary working people are pushed into higher tax brackets. People pay a larger percentage of their income to taxes.

Exhibit 38: State and Local Taxes 1952 – 2008; Source: government data

After the last tie to gold was broken in 1971, concomitant with money creation, state and local taxes increased greatly. Until recently, except for a very slight decrease in year 2003, tax collections were clearly in a long-term uptrend. Few made the connection between legal tender irredeemable paper-ticket-electronic money and tax revenues. The apparent prosperity generating the increased tax revenues was a mirage based on fiat money.

The result was that state and local politicians were induced to expand public services and to make promises, such as pensions and benefits, to public employees that they should not have made and which cannot be kept. One can well understand the fury of those who have been promised pensions and benefits, having worked their entire careers in anticipation of receiving them and then being told that these promises cannot be kept. Reality must be confronted in a way that will minimize the damage and pave the way for an honest monetary system that will provide genuine prosperity going forward.

The alternative of increased money creation along with so-called “inflation targeting,” while kicking the can down the road, will compound the catastrophe. The money issue needs to be addressed

now. *The Free Competition in Currency Act of 2011* provides a clear path.

Exhibit 39: State and Local Property Taxes 1952 – 2008; Source: Government data

A great deal of legal tender irredeemable paper-ticket-electronic money created out of nothing found its way to financing real estate. As a result, real estate values increased greatly and so did concomitant real estate taxes. One effect was that seniors whose income was fixed, and also on account of other increasing costs such as fuel, insurance, medical care etc., got squeezed out of their homes. Some, not being mindful of money creation and anticipating ever-increasing values of their homes, took out additional mortgages. Everyone knows how that turned out. Few have connected the dots to legal tender irredeemable paper-ticket-electronic money.

But legal tender irredeemable paper-ticket-electronic money is responsible for another and in my view more insidious effect. While bankers, Wall Street firms, mortgage brokers, real estate brokers and a small army of support personnel profited and walked off stage with major fortunes, manufacturers whose products were marginally profitable had to abandon their businesses and fire their employees.

For example, a couple of years ago *The New York Times* ran a story about Bartlett Manufacturing Company in Cary, Illinois, which had to close its printed circuit board factory because the property taxes were no longer affordable. As can be seen from the photo, this was a machine-intensive business.²⁵⁴

²⁵⁴ Uchitelle, Louis; "Obama's Strategy to Reverse Manufacturing's Fall"; *The New York Times*, 7/21/09

Exhibit 40: Bartlett Manufacturing Company shutdown on account of property taxes

After he closed the business he was quoted as saying: “I am going to tear down the building and sit on the land, and hopefully sell it after the recession when land prices hopefully rise.” As can be seen, this is a perfectly serviceable building.

Exhibit 41: Bartlett Manufacturing Company teardown on account of property taxes

The bottom line is that legal tender irredeemable paper-ticket-electronic money has myriad adverse effects, one of which, by causing taxes to increase at the state and local level, is contributing to the destruction of industry and jobs.

Exhibit 42: year-on-year percentage change in property taxes; Source: government data

Small digression: property taxes are not included in the CPI calculation. In addition to property taxes there are many other fees and charges that increase on account of money creation.

Exhibit 43: New York City Water & Sewage Charges year-on-year change 2000 – 2011; Source: New York City Government

Real Wages

With commodity money, real wages tend to increase, as does the standard of living. With fiat money, real wages tend either to stagnate or decrease, as does the standard of living. This is confirmed by the empirical data.

Exhibit 44: Average Weekly Earnings Of Production And Nonsupervisory Employees, 1982-84 Dollars; Source: BLS

The tipoff that legal tender irredeemable paper-ticket-electronic money adversely affects wages is the use of the adjective “real.” Without the modifier are wages imaginary? Yes they are. Even with the modifier, with fiat money wages are denominated not in dollars as the term is used in the *Constitution*, but in dishonored promissory notes, i.e., broken promises to pay dollars (see the section: Why legal tender irredeemable paper-ticket-electronic money is dishonest).

Common usage is for “real” to mean “adjusted for inflation” as measured by the CPI. As explained in the section: The perils of money creation, this adjustment understates the depreciation of the currency, and so real wages have suffered even more than shown in Exhibit 31. While there was a link to gold and our dollar was more stable, real wages had been increasing.

At the inception of the Labor Movement in America, circa 1830, working people were very mindful of the perils of paper money, which, while not legal tender, was redeemable into specie on demand. The problem from Labor’s point of view was that redemption had to take place at the bank of issue, which was not always geographically convenient. As a result, workers paid with paper money most times suffered a redemption cost when they redeemed it for specie.

Gold and silver as money, a.k.a. sound money (because it made a sound) or honest money, was one of the three issues that motivated men to join unions. The other two were the ten-hour workday and education for workers. Eli Moore, then president of the Typographers’

Union in 1832, was the first union official to win a seat in Congress. He was a staunch supporter of Andrew Jackson who got rid of the Second Bank of the United States by vetoing its renewal charter and who was an outspoken supporter of gold.

Propensity to Save

Commodity money is very savable because it doesn't obsolesce or deteriorate and is difficult to counterfeit. Purchasing power is not diminished. Fiat money is less savable and can discourage long-term savings altogether, since its future value is always in doubt. Why save a depreciating asset? This is confirmed by the empirical data.

Exhibit 45: U.S. Personal Savings Rate; source: <http://www.bea.gov/national/nipaweb/SelectTable.asp#S5>

The only way to build a rich society and improve everyone's standard of living is to save and invest. Provided one invests in a society that respects property rights and one can reasonably expect to enjoy positive results of an investment, should there be any, then one tends to risk a portion of one's accumulated savings by investing in productive enterprise. Otherwise, one might just as well spend and enjoy one's income. That is precisely what the empirical data confirms.

It is invested capital, both physical and intellectual, that are a precondition for high-wage jobs. The lack of accumulated capital in most of Africa is the principal reason why wages are so low in that region. Because legal tender irredeemable paper-ticket-electronic money always depreciates, especially for long-term investments, the eventual chance that one will enjoy a positive result from risking

one's savings is less than it would otherwise be, and so there is less of it.

Most important, since legal tender irredeemable paper-ticket-electronic money always depreciates, less of it is saved than otherwise. One deceptive escape hatch for some people is to allocate their savings to the equity markets and hope for the best. As will be shown, the capital markets benefit mostly those who get fees for facilitating transactions.

Pensions in Peril

Pension assets in physical gold are safe and secure. There is no counterparty risk. Because the amount of new gold produced each year is a tiny fraction, generally less than 2%, of the gold above ground, prices denominated in gold remain stable over time. Because it takes work to mine and produce gold, the amount of gold above ground cannot be increased by whim.

With legal tender irredeemable paper-ticket-electronic money, pension assets are vulnerable to volatility in interest rates, rate-of-return and discount rate assumptions by those charged with contributing to defined benefit plans, whether they are private or political entities. Because fiat money can be created out of nothing without limit, the purchasing power of pensions is vulnerable to severe depreciation.

The Free Competition in Currency Act of 2011, by speeding a transition to an honest monetary system, will make pensions more secure and more valuable for the putative beneficiaries.

With our current legal tender irredeemable paper-ticket-electronic monetary system, the real beneficiaries of pension plans are financial sector firms, especially banks, brokerage firms, and the army of professionals who service them. If retirees receive their promised pensions and benefits, it will be a happy accident. Already, millions of steel workers, textile workers, airline workers and many others have lost promised pensions and benefits which they have earned.

The short explanation is that financial sector firms get fees now in money that still has purchasing power, while pensioners are looking forward to getting their payments later. When later arrives, the money they receive will at best be worth a lot less than what they are expecting, and at worst will be worth nothing at all. In many ways, this is similar to the classic Ponzi scheme in that some people get paid sooner; when later arrives, folks are left with an empty bag.

An important way in which real assets are improperly transferred to the financial sector has to do with the manner in which assets are allocated to various financial vehicles.

Today, U.S. private and state and local pension funds have approximately \$9 trillion in assets.

Exhibit 46: U.S. private and state and local pension assets. Source: Federal Reserve Flow of Funds

Pension assets, while supposedly under the control and by law the fiduciary responsibility of pension plan trustees, are *de facto* under the control of consultants and Wall Street money managers from whom trustees take their marching orders. Order of magnitude, all factors considered, I estimate that fees and overhead for these funds is about one percent of assets, \$100 billion per year. This structure is enshrined in major legislation including *The Employee Retirement Income Security Act* (ERISA) and *The Pension Protection Act Of 2006* (PPA) which require trustees to be “prudent.”

In case something goes horribly wrong and pension assets are dissipated, virtually everyone has been given a “safe harbor” if they rely upon “standard industry practice.” In effect, what this means is that no one will be held liable if they diversified the allocation of assets and relied upon “experts.” The experts, however, have a conflict of interests with the beneficiaries, because their compensation is derived from fees which they have an incentive to maximize, and the diversification of assets is based on demonstrably phony methodologies.

Over the years, along with academic “experts” whom the financial sector has compromised through endowed chairs, prizes²⁵⁵, honorariums, research grants, consulting work, and who knows what else, demonstrably bogus methodologies have been conferred legitimacy that enhance fees to the detriment of pension plan beneficiaries.

The ranks of those who might become experts is highly restricted because journals that an academic must publish in to qualify for tenure and to move up the academic food chain are, for the most part, edited by folks who are present or former employees of the banking system, and especially the Federal Reserve.

“One critical way the Fed exerts control on academic economists is through its relationships with the field's gatekeepers. For instance, at the *Journal of Monetary Economics*, a must-publish venue for rising economists, more than half of the editorial board members are currently on the Fed payroll -- and the rest have been in the past.”²⁵⁶

These editors act as gatekeepers and do not publish anything that challenges fundamental assumptions nor the legitimacy or honesty of central banking and the legal tender irredeemable paper-ticket-electronic monetary system.

Here is another example of how the Federal Reserve has compromised the Academy: In 1994, Mr. Stephen Davies wrote an article citing evidence collected by then Chairman of the House Banking Committee Henry Gonzalez showing that the Fed has spent millions hiring economics faculty members as “consultants.” The article quotes Mr. Gonzalez:

“The Federal Reserve employs hundreds of researchers in their [sic] research departments, but inexplicably also spends millions to pay hundreds of outside economic consultants. . . *The Fed is simply buying off potential critics by holding out contracts that offer academics extra money and use of the Fed's facilities. No agency that has to justify its spending would dream of this kind of extravagance and waste.*” [Emphasis added.]

More telling, the article continues:

²⁵⁵ The Nobel Prize in Economics, for example, is not one of the prizes that were endowed by Alfred Nobel in 1895. It came in 1968, and the endower is the Central Bank of Sweden. The real name of the prize is Sveriges Riksbank Prize in Economic Sciences in Memory of Alfred Nobel. It is a bank prize, and it is not given to anyone who might challenge the honesty or legitimacy of central banking.

²⁵⁶ “Priceless: How The Federal Reserve Bought The Economics Profession” by Ryan Grim, 9-7-09, http://www.huffingtonpost.com/2009/09/07/priceless-how-the-federal_n_278805.html

Moreover, the *Bond Buyer* has learned that in the case of the Federal Reserve Board, all contractors are required to sign a non-disclosure statement... broadly worded *to prohibit the release of any information relating to past, present or future activities that can be considered damaging to the Board.*²⁵⁷ [Emphasis added.]

The bogus methodologies, e.g., Modern Portfolio Theory (MPT) and the Capital Asset Pricing Model (CAPM), which work to generate fees, would not be applicable if we had an honest monetary system without legal tender irredeemable paper-ticket-electronic money.

Allow me to explain. Modern portfolio theory is a theory of investment which attempts to:

- (1) Maximize portfolio expected return for a given amount of portfolio risk; or equivalently,
- (2) Minimize risk for a given level of expected return, by carefully choosing the proportions of various assets.

Notice the reference to “risk.” The meaning of “risk” in this context is crucial, because there needs to be some standard against which to measure risk. For MPT asset allocation, the standard is called the “riskless rate-of-return,” i.e., the rate of return on an asset allocation with zero risk over a period. In practice, the USD 3-month Treasury bill is considered to be a (near) riskless asset. But what about the risk that the dollar will lose purchasing power? That risk is not considered.

Furthermore, in the financial sector, the word “risk” has yet another meaning: it means “volatility.” The risk of the dollar losing purchasing power is also not considered. As price volatility increases, “risk” is said to increase. This special and limited definition gives birth to concepts such as the “risk-adjusted rate-of-return.” Thus, an allocation to gold might have a lower risk-adjusted rate-of-return than, say, an allocation to equities or real estate, despite the fact that an allocation to gold increased by about 18% per year since 2001 and without any down years!

257 Davies, Stephen A.; "Some Lawmakers Claim Fed Keeps Critics at Bay With Jobs", *The American Banker**Bond Buyer, December 2, 1994 page 3.

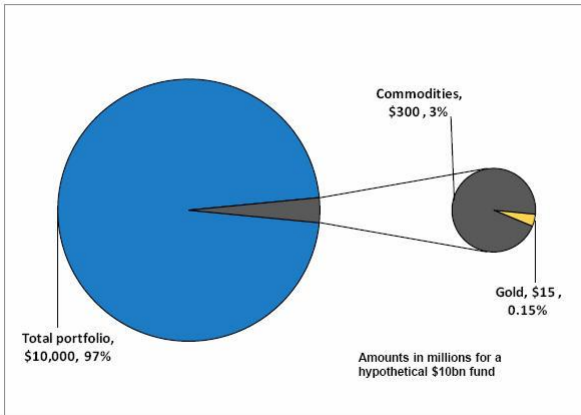

Exhibit 47: Gold appreciation vs. the dollar 2001 - 2010

But using standard industry practice, except for a unit of the Texas Teachers' Retirement Fund and a few others, U.S. pension funds are believed to have less than \$20 billion of their assets in gold out of their approximately \$10 trillion.²⁵⁸

Gold holdings at U.S. pension funds are negligible...

Source: TRS

Exhibit 48: Estimated gold holdings at U.S. pension funds; Source: Texas Teacher's Retirement Fund

²⁵⁸ An allocation to gold might pay a fee at the time of purchase, but then the fee stream stops.

From here, the story gets worse. Much worse. For almost everyone who is not in the financial sector or providing services to it, risk, according to the *Oxford English Dictionary*, means “(Exposure to) the possibility of loss, injury, or other adverse or unwelcome circumstance.”

What could be a more adverse or unwelcome circumstance than having one’s hard-earned savings, allocated to sovereign debt (either U.S. or some other country) and having it redeemed in currency whose purchasing power has greatly depreciated? How do the ratings agencies treat this risk in assigning ratings to various fixed income securities? This is important, because at home and abroad many pension funds are restricted by law to allocate to only “investment grade” securities.

To check this out, I queried the major ratings agencies (Fitch Ratings, Moody’s, and Standard and Poor’s):

“If the purchasing power of a sovereign’s currency, e.g., in the U.S. that would be the dollar, were to fall to zero, and all of the outstanding sovereign’s debt was paid down with worthless currency, would that or would that not constitute a default in the opinion of [rating agency]?”

Eduardo Barker, Communications Strategist, Sovereign and Latin America Moody’s sent me a sheet with its explanation of sovereign ratings that did not appear to address the question along with a statement “we would not comment beyond that.”

Fitch Ratings was more forthcoming. Brian D. Bertsch, Director, Corporate Communications, wrote me: “It is very hypothetical but most likely it would not be considered a default.”

Standard and Poor’s was the most straight forward. John Piecuch, Director, Standard & Poor’s Communications, wrote me: “In terms of your question, even in the case of hyperinflation, a currency’s purchasing power is still not zero (if it were zero, it would cease to be a currency). Even in that case, as long as the issuer were honoring the original terms of the contract (even if repaying with much cheaper currency than originally borrowed), this would not be a default.”

Thus, through the use of Modern Portfolio Theory and ratings from government-endorsed ratings agencies, pension plan assets are not being allocated to the one asset that would give beneficiaries the most protection against a decrease in the dollar’s purchasing power.

Empirical evidence, in the U.S. and elsewhere, is incontrovertible that currency depreciation is a material risk. Consider again the depreciation of the dollar from 1949, according to official CPI data:

Exhibit 49: Depreciation of the Dollar 1949 – 2008; Source: CPI data, BLS

Balance of Trade

With commodity money such as gold or silver trade balances because one is always trading work for work, and value for value. With gold-as-money, exports pay for imports and balance of trade deficits are small or nonexistent.

With fiat, irredeemable paper ticket-token or electronic-checkbook money, and provided that foreigners, especially foreign central banks, continue to save legal tender irredeemable paper-ticket-electronic dollars, which, by the way, are legal tender only in the U.S., as history shows, enormous trade deficits are possible. Not only are foreigners going to end up with an empty bag, along the way these huge trade deficits represent lost employment at home.

Exhibit 50: U.S. Balance of Trade 1960 – 2009: Source: Government data

This is a really ugly chart. It provides empirical evidence that after the last tie to gold was broken in 1971, partly as a result of many U.S.-based industries moving production overseas, the U.S. began to experience enormous trade deficits. Leaving aside the trillions of dollars that have accumulated as reserves in the other countries, especially China, Japan, South Korea, etc., this also reflects a huge transfer of good-paying manufacturing jobs to other locales.

While the Business Roundtable, along with the AFL-CIO and others were complaining about “currency manipulators,” and while Wall Street embraced the process, now called “globalization” and was cheerleading the globalization as concomitant to “wealth creation,” overlooked was the fact that the dollars accumulating overseas weren’t really dollars at all. It was, as Jefferson called it, “only the ghost of money, and not money itself.”

When the legal tender irredeemable paper-ticket-electronic dollar meets its fate, in addition to folks at home, there are going to be some very unhappy and angry people overseas. Are foreigners going to continue to sell us oil along with the myriad other products we now depend on from imports to keep our society functioning? This is a risk factor policy makers need to address.

Federal Taxes and Spending

With commodity money such as gold or silver, as government spending increases, taxes or borrowing (delayed taxation) must increase, because there is no other source of funding. People tend to resist higher taxes, thereby limiting government spending.

With fiat, irredeemable paper ticket-token or electronic-checkbook money, since government has easy access to money created out of nothing, it does not need to increase tax rates. In effect, it can borrow by so-called monetizing debt. In time, money is depreciated, which causes prices, including the price of labor, to increase in nominal terms, along with concomitant tax collections.

However, because of the delay in tax collections, spending almost always exceeds revenues. Eventually the purchasing power of the legal tender irredeemable paper-ticket-electronic money approaches its cost of production —near zero— there is a regime change and the party ends.

Exhibit 51: U.S. Government Receipts: 2955 – 2010; Source: U.S. Department of Treasury: Monthly Treasury Statement - Table 1; FRB 1.39 (for historical fills)

Notice that after the last tie to gold was broken tax collections accelerated greatly. Even before the gold link was defaulted, to fund the Vietnam War, there was material money creation. As some of that money leaked overseas to U.S.' major trading partners, Great Britain, France, Japan and Germany, both Britain and France, recognizing that too many dollars were being created for the U.S. to maintain its sovereign promise to redeem dollars for gold at the rate of one ounce of gold for \$35, began redeeming dollars in ever-increasing amounts. At the time when President Nixon defaulted, "temporarily," he said, it was clear that had he not defaulted all of the U.S. gold would have been gone anyway.

Exhibit 52: U.S. Government Outlays 1955 – 2010; Source: U.S. Department of Treasury: Monthly Treasury Statement - Table 1; FRB 1.39 (for historical fills)

As federal government receipts continued to increase year-after-year, politicians bought into the notion that this was the result of our growing economy. They were not mindful that the nominal numbers were being driven by ever-increasing money creation. True, there were some wakeup calls along the way, especially when inflation began to pick up at the end of the 1970s, but high interest rates, imposed by Mr. Volcker, appointed by President Carter, were thought to have “broken the back of inflation.”

On April 19, 1993 Mr. Greenspan gave a speech using the word “inflation” an incredible 58 times, in which he stated that “it is going away; it is not coming back; it is not a problem; it is diminished; it is nonrecurring; it is subdued; there’s no resurgence; we’ve learned our lesson.” Pronouncements such as these also diverted people’s attention from the amounts of money being created out of nothing. In addition, much of the newly-created money accumulated in the capital markets. The equity and real estate markets spiraled upwards. Investors were euphoric. The CPI was reformulated to take lesser account of the increase in housing prices, and so the monetary authorities could then claim that inflation was benign.

Because so much of the newly-created money found its way to the fixed income market, people who should have known better adopted the view that “deficits don’t matter.” President after president greatly increased spending. This would not have been possible if we had an honest monetary system.

Exhibit 53: U.S. Federal Deficit as a % of receipts; Source: U.S. Government

In an attempt to put the government deficit into perspective, most economists compare it to GDP. This is a grave error, in my view. The GDP, a specious metric to begin with, is not available to the government to service and, if was honestly incurred, repay its debt while meeting its promised obligations. For any entity, the money to service and repay debt must come from receipts.

As shown above for the period 1955 to 1970, prior to defaulting on the last promise to redeem dollars for gold, the federal deficit as a percentage of receipts was almost always less than 10%. These days, it is painfully clear that the deficit is completely out-of-control. Theoretically spending could be reduced to bring it in line with receipts. However, that would mean defaulting on benefit promises. It is difficult to imagine how that could happen.

Meanwhile, many trial balloons are appearing in the major media forecasting and endorsing currency debasement.

“Washington will therefore have little choice but to take the time-honoured course for big-time debtors: print more dollars, devalue the currency and service debt in ever cheaper greenbacks. In other words, the US will have to camouflage a slow-motion default because politically it is the easiest way out.”²⁵⁹

“Any inflation above 2 per cent may seem anathema to those who still remember the anti-inflation wars of the 1970s and 1980s, but a once-in-75-year crisis calls for outside-the-box measures.”²⁶⁰

²⁵⁹ Garten, Jeffrey, *Financial Times*, November 30, 2009; “We must get ready for a weak-dollar world”

²⁶⁰ Rogoff, Kenneth; “The bullets yet to be fired to stop the crisis”; *Financial Times* 8/9/2011

“In the future, central banks will have to realize that debt-financed expansions in asset prices can be a threat. For now, it would be nice if they would at least recognize that major deflations in asset prices can be much more important than the relatively small gains in commodities that show up in the Consumer Price Index.”²⁶¹

Government Deficits

It is difficult to sustain government deficits with commodity money because they would have to be funded by borrowing. Since a commodity money supply cannot arbitrarily be expanded, interest rates would increase if government increased borrowing. Manufacturers and others would then object to higher interest rates, causing government to reduce spending, and thereby causing deficits to decrease.

With legal tender irredeemable paper-ticket-electronic money, as long as someone, such as the Bank of Japan, the Bank of China, the Federal Reserve, or banks, will purchase government securities by creating money out of nothing (called “monetizing debt”), deficits can be funded without greatly increasing interest rates, and deficits can grow without limit (in theory). Also, government debt can be financed by pension plans and other institutions. Eventually, the debts are defaulted.

The empirical evidence confirms that government deficits are facilitated by legal tender irredeemable paper-ticket-electronic money.

Exhibit 54: U.S. Government Surplus/Deficit Cash Basis 1955 – 2011;
Source: BLS

²⁶¹ Norris, Floyd; “Sometimes, Inflation Is Not Evil”; *The New York Times*, August 11, 2011

Exhibit 55: Recent CBO Estimate of forecasted deficits; Source: Congressional Budget Office; Office of Management and Budget.

The data shows conclusively that while the dollar had a link to gold, government deficits were small. After the last tie to gold was broken, the deficits and resulting government debt accelerated greatly. Also, these deficits use the cash method of accounting.

If one factors in the present value of promises, e.g., Social Security, Medicare, Medicaid, etc., then the deficits are much greater. Some estimate that the accumulated obligations are on the order of \$100 to \$200 trillion! Because politicians cannot renege outright on their promises, especially if they want to be reelected, there will be motivation to continue to inflate the currency until it collapses. I don't see any alternative.

That's why *The Free Competition in Currency Act of 2011* is important. It provides a way to mitigate the damage and prepare our country for an honest monetary system.

Financial Market Instability and the Best Argument against Gold

Absent fraud and coercion, a monetary system based on gold-as-money is stable. With Legal tender irredeemable paper-ticket-electronic monetary systems, because there is no market-based mechanism that provides negative feedback to increasing the money supply, total debt and leverage will necessarily blow up.

The strongest argument against linking the dollar to gold, sometimes referred to as the "gold standard," is that financial

markets are *inherently* unstable. Because almost all other markets depend on the financial sector for payment processing, there needs to be a lender-of-last-resort. If the dollar is tied to gold, the lender-of-last-resort may not be able to function. Therefore, it is claimed, modern financial markets require a “properly managed” (to quote William Niskanen, former Chairman of the CATO Institute) fiat monetary system.

While it is true that over the last two centuries financial markets have been unstable, they are not inherently unstable. Misrepresentations and nondisclosure about our monetary system and about basic banking customer relationships enable financial sector firms to over-leverage. This is the root cause of financial instability. Remedies being put forth, such as a global lender of last resort, will be counterproductive and will result in greater instability. The solution is to change the structure of the world’s monetary systems to remove the cause of such instability: the ability of banking systems to create money out of nothing.

In the U.S. during the 19th and 20th centuries, there were numerous boom/bust periods in which financial markets soared and then collapsed. How come this malady wasn’t common to other markets, such as the ice cream market or the automobile market? What is it about financial markets that they tend to boom and bust? Also, it is essential to understand that because financial markets are interrelated with other markets, a financial market collapse can also result in a systemic collapse.

A distinguishing characteristic of financial markets that is absent from other markets is *excessive* leverage. On the futures exchanges, various commodities are leveraged, but no one would suggest that the markets for, say, copper or soybeans are inherently unstable. Clearly there is something different about financial markets. That difference is inadequate counterparty surveillance. And that inadequacy is the result of misrepresentations and nondisclosure, which is the indicia of fraud, on the part of key financial players: banks.

From inception, banks made fundamental misrepresentations to their customers regarding the basic banking relationship in two areas. First, banks told customers that they were “depositors.” At best, this was misleading. In fact and in law, depositors were, and continue to be, unsecured creditors of banks. Most depositors, especially small ones, put their money in banks for safe keeping; they were not heedful of the risks they were taking.

Second, banks told customers that they could get “their” money back “on demand.” However, in fact and in law, when people “deposit”

money in a bank, it becomes the bank's money to do with as the bank pleases. The bank may loan that money to someone else, invest it in whatever, including illiquid investments, or gamble with it. Further, what banks should have told depositors was that they could get their money back on demand provided: not too many of them wanted to do so at the same time; the money had not been invested in something that was illiquid and that could not quickly, and without much loss, be converted back into cash; and, finally, that the bank had not lost the money in some venture.

Third, when banks make a loan, they create the deposit with a book entry.

These misrepresentations lulled depositors into acquiescing to nondisclosure on the part of banks as to what they were doing with depositors' money and the amount of leverage banks were employing. If banks told depositors the truth about the basic relationship, depositors would have exerted more counterparty surveillance over banks, excessive leverage would never have occurred, and there would never have been anything approaching systemic failure, as almost occurred in 1907 and as did occur in 1932.

In his book, *Soros on Soros*, Mr. George Soros correctly observes that a lender of last resort and the gold standard are incompatible. What made the lender of last resort bailout facility necessary were banking misrepresentations and nondisclosures.

By abandoning the gold standard, banks enhanced their ability to, in effect, create money out of nothing. Whereas under the gold standard they were able to create money, called "fractional reserve lending," there were some (clearly inadequate) limitations on the amount of money they could create. First and foremost, since all of the newly created money, called banknotes, which were legally promissory notes, were redeemable on demand in gold, there was a physical limit beyond which market forces would close a bank that created money greatly in excess of its capital and its reserves, thereby curtailing additional money creation.

Second, with some limitations, bank officers and directors were personally liable to depositors. These two factors led many banks to keep something on the order of 40% of their reserves in gold, just in case. If those reserves could be reduced, then banks could garner more profits, and first some, and then many banks sought to do so. The notion that banks were acting improperly was well understood by some market participants.

"Perhaps Hugh McCulloch, our first Comptroller of the Currency, may have been somewhat over the edge, in this regard, when in 1863

he proposed that the National Bank Act 'be so amended that the failure of a national bank be declared prima facie fraudulent, and that the officers and directors, under whose administration such insolvency shall occur, be made personally liable for the debts of the bank, and be punished criminally, unless it shall appear, upon investigation, that its affairs were honestly administered.' So much for moral hazard. And surely, here we observe the intellectual origins of prompt corrective action." [Speech by Federal Reserve Chairman Alan Greenspan before the American Bankers Association, Washington, D.C., September 18, 2000]

After the Panic of 1907, which J. P. Morgan alleviated with a huge gold loan to banks so that they could meet the demands of depositors who were then withdrawing their funds, there were four words that terrified the banking community: "What if he [Morgan] dies.?" The answer was a government entity that would provide "liquidity" when the banks got caught short. Further, the formation of the Federal Reserve enabled bank reserves to be aggregated so that there would be a need for less of them, and the banks could leverage even more than before.

The banking system was thus able to finance World War I. Without such financing, and had there been full disclosure at that time about the causes of bank panics, some suggest that the War would have been over in just a couple of months with no Treaty of Versailles, no destruction of the German and Austrian currencies, no Hitler, no Lenin, no Stalin, no World War II, and the murder of 150 million, excluding those who died during wars during the Twentieth Century, would not have occurred.

No amount of regulation will eliminate the moral hazard issue. Further, the system, with moral hazard, is inherently unstable, and the moral hazard issue means that there will necessarily be wealth transfer from ordinary working people to those who benefit from the moral hazard: the financial sector. Not only is this unfair, it will not stand the light of day if ordinary people come to understand what is transpiring.

The solution is gold-as-money. There are compelling reasons why free men and free markets choose precious metals as money. In a nutshell, because of its physical attributes, precious metal as money is the most efficient medium of exchange—in terms of minimizing transaction costs—for transmitting value over time.

Levels of Debt

Because with commodity money prices tend to decrease, it becomes harder to service and pay down debt, and debt is discouraged. With fiat, irredeemable paper ticket-token or electronic-checkbook money, because debt gets serviced and repaid with cheaper money, increases in debt are encouraged. This also works to decrease the purchasing power of savings and future payments, the majority of which constitute pension funds. Today, booked debt (public and private), exclusive of the present value of promised “entitlements,” is more than \$52 trillion.

Exhibits 43, 44, 45, and 46 confirm that after the last tie to gold was defaulted, “temporarily” promised President Nixon, on August 15, 1971, debt levels in the U.S. greatly increased.

Exhibit 56: State and Local Debt 1955 – 2010: Source: Federal Reserve Flow of Funds

The level of debt at the state and local level does not include the present value of promised pensions and benefits to public employees. Because of the misallocation of pension assets, also largely the result of legal tender irredeemable paper-ticket-electronic money as I have explained, state and local finances will be under ever increasing pressure to increase taxes and/or to reduce services in order to meet obligations.

Exhibit 57: State and Local Debt 1955 – 2010 year-on-year changes;
Source: Federal Reserve Flow of Funds

The effects of fiat money on state and local debt are even more dramatic when one looks at the year-on-year change the state and local debt. Notice how much state debt accelerated after the last tie to gold was broken.

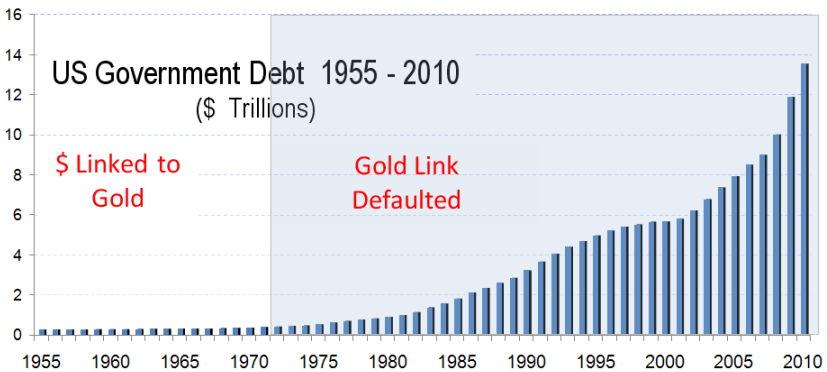

Exhibit 58: U.S. Government debt 1955 – 2010; Source: Federal Reserve Flow of Funds

It is now clear to many observers that U.S. Government debt is completely out-of-control. In my view, because there is neither the intention nor the ability to ever repay this debt with money of similar purchasing power at the time that the debt was incurred, this is fraudulent debt. The big losers will be ordinary people who have followed the rules, worked hard, and allocated their retirement

savings to U.S. Government securities, which they have been told are the safest in the world.

Exhibit 59: Total U.S. Debt 1955 – 2010; Source: Federal Reserve Flow of Funds

Total booked debt, exclusive of the present value of government and corporate promises for entitlements and pensions is now more than \$52 trillion. What is the collateral of \$52 trillion in debt instruments? Aside from government debt, the collateral is mostly residential and commercial mortgages along with car loans, credit card loans, etc. That collateral is melting away. This means that there are going to be material defaults, most likely through the ongoing depreciation of the currency. Every dollar of debt is somebody's asset, e.g., retirement savings. If we had an honest monetary system, these obscene debt levels would not have been possible.

Long-term Interest Rates

With commodity money, long-term interest rates have historically been about four percent; just equal to the time-value of money. There is good data from Great Britain going back almost 200 years attesting to this. With fiat money, interest rates include not only the time-value of money but also an additional increment—the so-called “inflation premium”—to compensate for the loss of purchasing power due to the actual and expected creation of additional money. Interest rates are much higher than with commodity money.

Exhibit 60: Long term U.S. interest rates 1800 – 2007;²⁶²

Notice that, from year 1800 almost until 1970, except for times of war, e.g., the War of 1812, the Civil War, and World War I, long-term interest rates hovered about 4%. It was only when the last link to gold was broken in 1971 that interest rates began to increase to unheard of levels. Is it any wonder that the price of gold accelerated greatly reaching \$850 per ounce in intraday trading circa 1981? Many thought the monetary system was collapsing at that time.

Low and stable long-term interest rates are necessary for long-term investment. As interest rates increase, the present value of a future payoff decreases, and activities for which the payoff is in the distant future are curtailed. For example, when I began my working career at IBM in 1964, IBM, along with Bell Labs, had one of the world's premier research and development facilities, the Watson Research Center. In those days, IBM was engaged in research at the molecular level where a commercial product was not expected well into the 21st century.

After long-term interest rates began to increase greatly the present value of future payoffs was reduced to a tiny fraction of what was originally anticipated. As a direct result, Bell Labs and almost all of IBM's pure research efforts were disbanded. If the U.S. can achieve an honest monetary system as discussed above, long-term research and development will increase greatly. This is a vital ingredient not only to increase our standard of living, but also for military preparedness.

²⁶² <http://www.measuringworth.org/datasets/interestrates/result.php>

Interest Rate and Foreign Exchange Rate Volatility

With commodity money, such as gold or silver, there is very little interest rate or foreign exchange volatility. With fiat money, there is inherent high volatility, which tends to be hedged by derivatives, and which adds additional cost to financing. Financial sector participants benefit. Workers, manufacturers, entrepreneurs and consumers pay the cost.

Almost everyone who is not a participant or supplier to the financial sector wants monetary stability. Manufacturers want low and stable interest rates so they can make long-term investments in plant, equipment, and research and development. Ordinary people want low stable interest rates so they can plan their futures, buy homes and have some idea what their return will be on assets they have saved for retirement. Those involved in international trade want stable foreign exchange rates to facilitate payment for goods to be delivered far into the future, e.g., airliners, and so on.

The financial sector does not want monetary stability. Because so much of its profits derive from trading, the financial sector wants volatility. Tragically, the financial sector has been left in charge of the monetary structure, and it has rigged that structure for its own benefit (really the benefit of top management) and to the detriment of everyone else. That is why the financial sector champions legal tender irredeemable paper-ticket-electronic money. The empirical evidence confirms that legal tender irredeemable paper-ticket-electronic money results in interest rate volatility:

Exhibit 61: U.S. 10-year bond year-on-year interest rate change; Source: Federal Reserve

Prior to the last link to gold being broken by President Nixon in 1971, going back almost 200 years in Britain, and for a lesser period in the U.S., interest rates were relatively stable, very rarely moving plus or minus 20 basis points in any year. After the last link to gold was broken, year-on-year volatility reached 200 basis points and even higher.

One shocking result was that interest rate volatility played havoc with defined benefit pension plans (DBPPs). The added risks to companies led many to replace DBPPs with defined contribution pension plans, which transfer the risk of the value of pension plan benefits to workers.

DBPPs allocate their investments to the fixed income and equity markets. Using General Accepted Accounting Principles (GAAP), because DBPP liabilities are discounted by interest rates, interest rate volatility resulted in volatility for pension plan liabilities. In the 1980s, in addition to interest rate volatility, there was also volatility in the equity markets. Changes in pension plan assets and liabilities flowed through to the income statements of the companies affected. Thus, volatility in pension assets and liabilities resulted in volatility in reported earnings.

Investors want earnings stability. Companies with great profit volatility are penalized with lower stock prices than they would otherwise enjoy. For company management, lower stock prices meant that they would be less likely to reap a benefit from their stock options. What was their remedy?

Corporate management appealed to their accountants who lobbied to change GAAP to allow management to smooth interest rates and changes in equity valuations on the theory that since pensions would not be due for many years, it was unfair to pay such close attention to yearly interest rate and equity fluctuations. This led to abominations called the expected rate-of-return and a smoothed discount rate. Accountants and actuaries did the calculations for the smoothing. Management hired and paid them.

Since contributions to a pension fund are considered a cost, in an effort to reduce costs, it is to management's benefit to have the assumed rate-of-return and the discount rate to be high as possible. The result is that, depending upon whom one listens to, public pension funds are underfunded by as much as \$3 trillion, and the DBPPs that remain in the private sector are underfunded by about \$½ trillion.

There was another wrinkle to this that adversely affected pension plan beneficiaries. Because pension fund liabilities are discounted by the “discount rate,” the higher the discount rate, the less the present value of the liabilities. In the 1980s, on account of high interest rates, some DBPPs became “over-funded.”

Then ensued a great deal of merger and acquisition activity whereby, if a firm could be liquidated, the pension plan could be frozen, and any “overfunding” could be recaptured. Recall the movie *Wall Street* whereby rationale for liquidating the airline Blue Star was its overfunded pension plan.

Working people who are depending on their DBPPs for retirement are not going to receive pensions and benefits they are expecting. None of this would have occurred if we had an honest monetary system. By passing *The Free Competition in Currency Act of 2011*, an anticipated new monetary system based on gold-as-money will avoid this kind of malfeasance.

For those who are engaged in international trade, stable exchange rates are essential. Foreign exchange rate volatility results in lower profit, or even losses. It reduces the international division of labor and our and our trading partners’ standard of living. Consider volatility between the U.S. dollar and the Canadian dollar:

Exhibit 62: Year-to-year currency volatility: Canadian dollar vs. U.S. dollar 1972 - 2008

Exhibit 63: Foreign Exchange Rate: Canadian dollar per U.S. dollar

With our European trading partners foreign exchange rate volatility is even more extreme. To protect themselves from catastrophic foreign exchange losses, firms buy derivative contracts from banks. This cost is a benefit to financial sector firms. As Mr. Paul Volcker has noted numerous times, “a global economy requires a global currency.” The open issue is what is the global currency going to be?

If the global currency is gold, then there is no foreign exchange volatility. Of course, that will mean an end to a material profit stream for financial sector firms. Is that a contributing reason why the International Monetary Fund changed its *Articles of Agreement* in 1978 to prohibit member countries from linking their currencies to gold and only to gold?²⁶³ What might be the public policy justification of that prohibition?

Wall Street and the Banks

With commodity money, such as gold and silver, Wall Street, while important, plays a minor role. Its primary function is to help asset allocation on a much-reduced scale. With fiat, legal tender irredeemable paper-ticket-electronic money, Wall Street, because it has easy access to money created out of nothing, plays a dominant role in society.

²⁶³ IMF *Articles of Agreement* Section 4-2b

Consider the growth of the financial sector after the last link to gold was broken in 1971.

Exhibit 64: Growth of the Financial Sector

In 1980, the broad money supply (M3) as reported by the Federal Reserve was slightly less than \$2 trillion. The U.S. stock market capitalization was about \$1 trillion, and financial sector firms accounted for about 5% of the total, about \$50 billion. On the plot above, one can barely see the valuation of the financial sector.

By 2007, the money supply, all created flat out of nothing, had zoomed to about \$13 trillion, but now the market capitalization of the equity markets was about \$19 trillion, and about \$4 trillion of that was from financial sector firms.

Forget about the multi-million dollar bonuses and salaries. That was chickenfeed compared to the value of stock options. Some folks in the financial sector garnered so much money they didn't know what to do with it. The extravagances are legend: 40,000 foot houses in multiple locations around the world, 200 foot boats, \$200 million airplanes with another \$100 million to outfit them. Some extreme excesses made the major media.

For instance, on February 26, 2002 it was reported that six investment bankers went out for dinner and spent \$60,000 for a meal! The media is fond of reporting financial sector management taking home tens of millions. Frank Raines, at one time a government employee earning government scale wages, is reported to have left Fannie Mae with more than \$100 million. The question that needs to be addressed is exactly what do these folks provide to society that they should be rewarded like this?

Here is another way of looking at the data:

Exhibit 65: Financial Sector as percent of S&P500; Source: Standard & Poor's

The growth of the financial sector, while noticed, was not criticized greatly because on the back of obscene money creation, equity valuations greatly increased, too. What's to say if one's Goldman Sachs or Merrill Lynch account is growing at double digits? When the equity markets lost nearly half their value almost overnight, for some people it was a wakeup call that something is seriously wrong.²⁶⁴

²⁶⁴ For Bear Stearns employees, the decline was over a weekend. They went to sleep on a Friday night when their stock had a book value of about \$85 per share. When they awoke Monday morning, the stock was trading for \$2. There was a clean certificate from the accountants, an investment-grade rating from the rating agencies, and no malfeasance. Again, there's something wrong with a system that can destroy accumulated savings in this manner. That something is our dishonest monetary system.

Exhibit 66: U.S. Stock Market Capitalization 1980 – 2005

Wall Street firm revenues, again, just for moving paper around, took off as well:

Exhibit 67: NYSE Member Firm Revenues 1965 – 2005; Source: SIFMA

Twenty-something-year-old youngsters, fresh out of college began taking down multimillion dollar salaries. Again, what was the product or service that they were providing to society that they should have received that level of compensation? Did they invent

anything that improved the lives of anyone? Did they cure some dread disease? Did they produce a useful product? No, no, and no. They were the fortunate beneficiaries of legal tender irredeemable paper-ticket-electronic money creation.

And look what happened to bank revenues after the last link to gold was broken:

Exhibit 68: U.S. Bank Revenues 1934 – 2007; Source: FDIC

And after paying out multimillion dollar salaries to “talent,” look at how bank net income increased after the last tie to gold was broken:

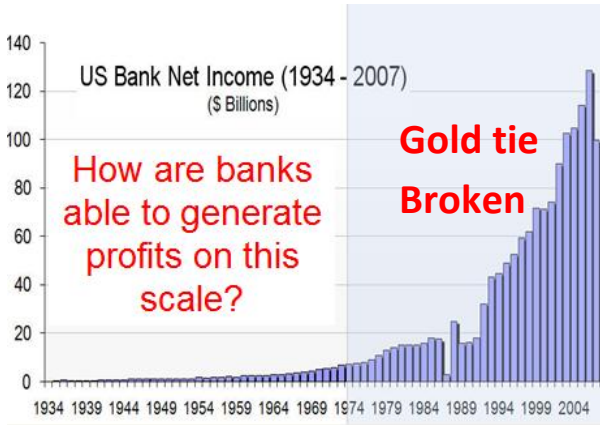

Exhibit 69: U.S. Bank Net Income 1934 – 2007; Source: FDIC

Consider the tradeoffs between commodity money and legal tender irredeemable paper-ticket-electronic money for banks. With commodity money, such as gold or silver, the role of bankers is limited to: (1) storing money for safekeeping; (2) acting as intermediaries between savers and credit-worthy borrowers; and (3) facilitating the payments transfer system. With legal tender irredeemable paper-ticket-electronic money, bankers have a greatly expanded role: they sell instruments to hedge interest rate and foreign exchange volatility; and they create fiat money (in the form of credit) for which they get the interest and fees. In effect, banks' traditional role as intermediaries between savers and borrowers decrease, and the banks become the equivalent of hedge funds whose downside is guaranteed and subsidized by ordinary working people. The euphemisms for these guarantees are called the "lender of last resort" bailout facility at the Federal Reserve, and so-called Federal Deposit Insurance, which is not insurance.

Again, focusing on stock options, look at what happened to Citibank stock as a result of money creation:

Exhibit 70: Citibank stock from about 1979 to about 2009

One can well imagine the amount of wealth garnered by executives fortunate enough to have stock options with long durations.

Exhibit 71: Bank Compensation to Employees 1934 – 2007; Source: FDIC

While financial sector compensation appears excessive by any standard, it is important to note that these folks have done nothing wrong. George Soros once said: “I’m just playing by the rules, and I didn’t make up the rules.” There is something seriously wrong with the rules. It is not a lack of regulation. It is our dishonest monetary structure. That needs to be changed. *The Free Competition in Currency Act of 2011* is necessary to get that done.

Special Privileges for Banks and Other Financial Players

With commodity money such as gold or silver, banks and other financial players receive no special privileges.

Because of the instability of fiat-based monetary regimes, to “protect” the efficacy of the payment transfer systems, there is a need for a “safety net” for the financial sector. This “safety net,” as Mr. Greenspan has pointed out, is a subsidy to the financial sector. It constitutes wealth transfer from ordinary taxpayers to the financial sector. While regulators are charged with monitoring the financial sector to reduce or make less likely massive wealth transfer, the financial sector has a history of compromising politicians who are nominally in charge of the regulators. At the end of the day, in all cases, regulation fails and the fiat system collapses.

Taxes on Money

When used as money, gold and silver *per se* is not taxed. When not used as money, and partially in an effort to suppress its use as money, the U.S. general government has arbitrarily classified gold and silver bullion, coins, and securities representing gold and silver as “collectibles” and subject to taxation at a much increased level as compared to capital gains for financial securities. Local jurisdictions also apply taxes, e.g., sales taxes, on transactions in gold or silver.

When used as money, fiat money *per se* is not taxed. However, taxes do apply for transactions whereby U.S. legal tender irredeemable paper-ticket-electronic money is converted to another country’s legal tender irredeemable paper-ticket-electronic money.

Another benefit of *The Free Competition in Currency Act of 2011* is that it abolishes taxation on gold and silver, the money mandated by the *Constitution*. Part of the human condition is that people must save for a time when they become too old or incapacitated to work. Ordinary people seek a medium that is the most secure form of savings.

Today, on account of coercion, misrepresentation and nondisclosure of material information, few are saving silver or any gold. Were they to convert their labor into gold instead of legal tender irredeemable paper-ticket-electronic money or securities denominated in legal tender irredeemable paper-ticket-electronic money, why should they have to give up a portion of their savings when the legal tender irredeemable paper-ticket-electronic money depreciates? That strikes one as blatantly unjust.

For example, if one works and allocates his earnings that are not consumed into gold, and the Federal Reserve, in Mr. Greenspan’s

exact words, creates money “without limit,” thereby depreciating the purchasing power of legal tender irredeemable paper-ticket-electronic money, why should one be penalized for having saved gold or silver by having to pay income or other taxes on the appreciation of his gold or silver relative to the legal tender irredeemable paper-ticket-electronic money?

Without the ability to save gold or silver, ordinary people are defenseless against the loss of their savings on account of our unconstitutional and dishonest monetary system. Current taxing schemes whereby the IRS has misclassified gold and silver as “collectibles” subject to a 28% tax on appreciation against legal tender irredeemable paper-ticket-electronic money provide a great disincentive for such saving. Justice cries out to get rid of this and other pernicious taxing schemes.

Summary and Recommendations

As I hope this testimony makes clear, in every area of our economy that is important, whether it be jobs, pensions, wages, debt levels, government fiscal responsibility at all levels, etc. legal tender irredeemable paper-ticket-electronic money works to the disadvantage of ordinary people and to our nation. For all of history, there have been no successes with paper money. Every one of them has resulted in a disaster. The U.S. experience is vulnerable to being qualitatively different in three critical areas.

First, in every country where the paper currency collapsed in the last century, there was always an alternate currency in which some people had saved. That alternate currency was almost always the dollar. In other words, there was always some accumulated wealth that could be used to rebuild. Because the dollar is the so-called “reserve currency of the world,” when the dollar collapses, most of the planet will be caught empty handed. This has the potential to almost destroy the division of labor for a long time, plunging the U.S. and much of the world into poverty.

Second, the U.S. is different in a very important aspect from every other country sans Switzerland. The U.S. is an armed country. There are more than 200 million guns in the hands of the public. When the dollar collapses and people lose their savings, their pensions, their annuities, and their jobs, it’s hard to say what action they will take. There is the potential for serious unrest.

Third, there is a contingency plan, although when I questioned authorities such as Paul Volcker, Larry Summers, and many others, they did not want to speak of it. The contingency plan, as set forth in

myriad legislation and Executive Orders, is martial law. That was what Henry Paulson was talking about when he was attempting to steamroll passing the TARP legislation. We could have a regime change that will set us back possibly for generations. That's why it is crucial to pass *The Free Competition in Currency Act of 2011* in order to mitigate the damage and prepare for an honest monetary system.

Mindful that our current monetary system is well on its way to blowing up, I hope that Congress will act quickly and decisively to set things right. For the American people to accept what will be perceived as drastic changes in the monetary structure, those changes will need the imprimatur of being in conformity with the *Constitution*. Fortunately, that is indeed the case.

While Congress is certainly culpable for allowing the monetary system to become unauthorized and dishonest, it was not this Congress. All of the malfeasance was set in train a long time ago, some as far back as 100 years ago when the Federal Reserve legislation was passed.

As a practical matter, absent the debacle of a complete collapse, there can be no abrupt changes to our monetary system. That is another reason why *The Free Competition in Currency Act of 2011* is so important and so timely. It leaves everything in place: the Federal Reserve, the irredeemable paper-ticket-electronic dollar (which will cease to be legal tender), and all of the mutual promises based on it.

For day-to-day transactions, eliminating legal tender is irrelevant. People work, they get paid, and they exchange their pay for daily needs: food, shelter, fuel, etc. Why would anyone care if the dollar is depreciating at the Federal Reserve's hoped-for rate of 2% or thereabout? I doubt they will.

But there are situations where some people will care: making sure that future payment will be made at a value that one is anticipating. Fortunately, we have precedent in the U.S. to guide us to how those situations will most likely be dealt with.

After the Civil War experience with Greenbacks, to protect against the depreciation of paper money, for long-term transactions, e.g., real property leases, long-term loans, bond issues, people inserted a "gold clause" in their contracts.²⁶⁵ This provided that future payments should be made in gold at the same weight and fineness as were current at the time that contracts were entered into.

²⁶⁵ When the U.S. Government sold Liberty Bonds to help finance World War I, the bonds had a gold clause. The promise of gold redemption was defaulted when President Roosevelt seized the nation's gold and made it a felony for American citizens to own monetary gold anywhere in the world.

In this way, provided there is no discontinuity in the purchasing power of the dollar and it continues to depreciate slowly, in time we will make a transition to a gold-as-money monetary system. Our country will then reap the benefits of a sound system that will encourage savings, capital investment, high paying jobs, and all the other benefits described above in this testimony.

Agreements for future payment in gold cannot be accomplished if there are taxes on the money itself. Thus, the provisions in *The Free Competition in Currency Act of 2011* to eliminate any taxes on gold and silver are also essential.

In addition, we need a way to get gold into the hands of the population at large. Thus, as envisioned by Alexander Hamilton, the mints should be opened for free coinage; people should be able to bring gold or silver to the mint to have it coined. While it would be helpful to allow private mints, they will certainly do no harm and may provide extra needed capacity, it's not clear to me that the death penalty could apply to a private mint that cheated on its coinage, as the penalty does apply for anyone who counterfeits coins from the U.S. mint.

Other recommendations that are not addressed by the proposed Act:

- (1) The U.S. supposedly has in the treasury about 288 million ounces of gold. (This gold reserve has not been audited since the Eisenhower years. It's time for an audit.) It would be helpful if that gold was coined and distributed per capita to every American citizen, perhaps a 25 gram coin each.
 - a. On the theory that they cannot replenish their savings when the legal tender irredeemable paper-ticket-electronic dollar collapses, perhaps older people should get extra and infants none at all on the theory that their parents would take care of them.
- (2) Relief could be brought to the real estate market by the president declaring real estate taxes (now under the jurisdiction of state and local governments) as against public policy. Eliminating real estate taxes will boost real estate valuation by a factor of about twenty times the eliminated tax. Nationwide, real estate taxes are about \$400 billion per year. Thus, order of magnitude, real estate valuations would increase by about \$8 trillion. That would give relief to almost all those whose mortgages are "underwater." Revenue from lost real estate taxes could be compensated by increasing

sales taxes.

Errata:

The original submission had the date of the Resumption Act as having been signed in 1869. The correct date of the Act is January 14, 1875.

**WRITTEN TESTIMONY OF
LAWRENCE H. WHITE, Ph.D.**

PROFESSOR OF ECONOMICS
GEORGE MASON UNIVERSITY

Chairman Paul, Ranking Member Clay, and members of the subcommittee: Thank you for the opportunity to discuss my views on HR 1098, the Free Competition in Currency Act of 2011 (hereafter “the Act”). As an economist specializing in monetary systems I have studied and written for many years about the role of free competition in currency. Indeed the second book of my three books on the topic, published in 1989 by New York University Press, was entitled *Competition and Currency*.

THE BENEFITS OF CURRENCY COMPETITION

It is widely understood that competition among private enterprises gives us technological improvements in all kinds of products, delivering higher quality at lower cost. For example, the competition of FedEx and UPS with the U.S. Postal Service in package delivery has been of great benefit to American consumers. Currency users also benefits from competition. My research indicates that currency has been better provided by competing private enterprises than by government monopoly. For example, private gold and silver mints during the American gold rushes provided trustworthy coins until they were suppressed by legislation. Scientific appraisals have found that the privately minted coins were produced even more precisely than the coins of the U.S. Mint. Private bank-issued currency was the most popular form of money around the world until government-sponsored central banks, with few exceptions, gained exclusive note-issuing privileges.

We do not rely on the Treasury or the Federal Reserve, but rather private financial institutions, to provide our checking accounts, credit cards, and traveler’s checks. The consumer benefits from the competition in payment services among banks. Consumers would likewise benefit from free and fair competition among coin issuers. Although Federal Reserve Notes and Treasury coins should of course be protected from counterfeiting, there is no good case for them to enjoy monopoly privileges in the market for currency.

HR 1098 would give currency competition a chance. It would not remove the Federal Reserve from the currency market, but it would give the Fed a stronger incentive to deliver the kind of trustworthy money that consumers want. The dollar already faces salutary

international competition from gold, silver, the euro, the Swiss Franc, and other stores of value. HR 1098 would allow salutary domestic competition between the Federal Reserve Note and other media of exchange. The Fed will have little to fear from competition so long as it provides the highest quality product on the market. Continuing to ban competition from the domestic U.S. currency market, or keeping it at a legal disadvantage, limits the options of American consumers who use money to their disadvantage.

What sort of competition might we see if currency were free from legislated restrictions? Here is one example. In 1998 a non-profit organization launched the “American Liberty Currency,” a private silver-based currency intended to compete with Federal Reserve currency. In the year 2000 I wrote an article about the project, entitled “A Competitor for the Fed?,” published by The Foundation for Economic Education’s magazine *The Freeman* (vol. 50, July 2000). I was skeptical that the project would attract many users, absent high inflation in the dollar. But I noted then, and I reiterate today, that in a high-inflation environment “silver-backed currency with widespread acceptance would provide a useful alternative to the Federal Reserve’s product. Then, if you don’t like the way the federal government manages (or mismanages) the value of the fiat dollar, you aren’t limited to complaining. You can switch to the private alternative.” If double-digit inflation should unfortunately return to the United States, then the American public, as I wrote, would “find a very practical advantage in a silver-backed alternative to the free-falling Federal Reserve note.”

The Act offers three reforms. I will comment on them in turn.

SECTION 2

Section 2 of the Act repeals 31 USC, §5103, which presently declares that “US coins and currency (including Federal Reserve notes ...) are legal tender for all debts, public charges, taxes, and dues.”

What are the likely economic consequences of removing legal tender status from US Treasury coins and Federal Reserve notes? The immediate consequences would be minimal. New forms of currency will not be introduced into the market any faster than the public is prepared to accept them. The longer-run consequence will be to enable a more level playing field for competition in the issue of currency.

Legal tender status is more limited in its scope than is sometimes believed. That Federal Reserve notes and Treasury coins have “legal tender” status does not mean that they are the only legal way to pay.

Any seller or creditor may (of course) voluntarily accept payment by transfer of bank-account balances, that is, by ordinary bank check, debit-card transfer, direct deposit, or wire transfer. Traveler's checks or cashier's checks may be accepted. The seller or creditor may even accept foreign currency or barter. Measured by dollar volume, payments in Federal Reserve notes or coin are a tiny share of all final payments in the United States (less than 20% of consumer payments, nearly 0% of business-to-business and financial payments). The great bulk of payments are electronic transfers of non-legal-tender bank balances.

Nor does legal-tender status mean that acceptance is mandatory when offered at a point of sale in a spot transaction. Large-denomination Federal Reserve notes are refused at many points of sale, and lawfully so. Vending machines refuse pennies. Mail-order sellers may refuse cash of any denomination. Millions of legal-tender one-dollar coins are piling up in the Federal Reserve's vault in Baltimore because nobody wants them.

Legal tender relates to the discharge of debts. The phrase "Legal tender for all debts" in 31 USC, §5103, quoted above, means that if Smith owes Jones \$125, then Smith's offering Jones \$125 in US coins or Federal Reserve notes legally extinguishes the debt, even if Jones would prefer payment in some other form (say, a check). In other words, the creditor is barred from refusing payment in legal tender notes or coins.

There is already an important exception, however. Debts in gold-clause contracts, made since 1977, are *not* unilaterally discharged by offer of US coin or Federal Reserve notes. 31 U.S.C. §5118(d)(2) reads: "An obligation issued containing a gold clause or governed by a gold clause is discharged on payment (dollar for dollar) in United States coin or currency that is legal tender at the time of payment. This paragraph *does not apply* to an obligation issued after October 27, 1977." [emphasis added] That is, the holder of a gold-clause bond is free to insist on receiving payments in gold, or in an amount of dollars indexed to the price of gold, whichever the bond contract specifies.

Removing legal-tender status from U.S. Treasury coins and Federal Reserve notes generally, as Section 2 of the Act does, essentially broadens the gold-clause exception to allow contractual obligations to specify payment in, or indexed to, any medium that is an alternative to Treasury coins and Federal Reserve notes. It opens the competition not just to private checks and banknotes, but also to gold units, silver units, units of foreign currency, Consumer Price Index bundles, wholesale commodity bundles, Bitcoins, and whatever

else a lender and a borrower might agree upon. If they prefer a unit for denominating their debt contract other than the Fed or Treasury dollar, they would be free to write a specifically enforceable contract in the unit of their choice.

Hand-to-hand currency does not need legal tender status to make it circulate easily. In jurisdictions where private commercial banks may issue circulating currency notes or “banknotes” (found today in Scotland, Northern Ireland, and Hong Kong), banknotes have the same legal status as checks. That is, they do not have legal tender status. Any creditor *might* refuse them if he preferred to be paid in another medium. (In Scotland and Northern Ireland, only pound sterling coins are legal tender.) I have spent a fair amount of time in Northern Ireland, visiting the Finance Department at the Queen’s University of Belfast, and have observed the circulation of banknotes there first-hand. There are four private banks that issue notes, and all of their notes are universally accepted. Legal tender status is clearly not necessary to have currency that circulates widely and is commonly accepted for payment of debts. Currency notes do not need legal tender status any more than credit cards, checks, debit cards, or traveler’s checks.

SECTION 3

Section 3 of the Act rules out federal or state taxes on precious-metal coins, whether minted by a foreign government or by a private firm. This section would allow precious-metal coins to compete with the US Treasury’s token coins (made of base metals, and denominated in fiat US dollars) without tax disadvantages (sales taxes on acquisition and capital gains taxes on holding, from which Federal Reserve Notes are exempt), and thereby a level playing field for competition among monetary standards.

SECTION 4

Section 4 of the Act repeals Title 18 §486 (relating to uttering or passing coins of gold, silver, or other metal) and §489 (making or possessing likeness of coins).

Section 486 is a relic of the Civil War, part of an effort to bolster the use of the wartime paper “greenback” currency by banning competition from the private gold coins I previously mentioned. The repeal of §486, combined with the previous section, would allow silver and gold coins to compete with the Treasury and the Fed on a level playing field.

I previously mentioned the American Liberty Currency project. The mover of that project, Bernard von Not Haus, was convicted in

March 2011 of violating §486, and presently awaits sentencing, for the victimless crime of producing one-ounce silver coins, of original design, that he hoped would compete with the Federal Reserve's currency. Regarding this case I commend to your attention the article by Seth Lipsky, "When Private Money Becomes a Felony Offense," *Wall St. Journal*, 31 March 2011.

The repeal of §486 would avoid a repeat of the injustice done to Mr. von Not Haus. I share Mr. Lipky's view that "it's a loser's game to suppress private money that is sound in order to protect government-issued money that is unsound."

Title 18 §489 of current law outlaws making or possessing "any token, disk, or device in the likeness or similitude as to design, color, or the inscription thereon of any of the coins of the United States or of any foreign country issued as money, either under the authority of the United States or under the authority of any foreign government". Von NotHaus was also charged with violating this section. In my view §489 is redundant at best and over-reaching at worst. It is redundant at best because if there is any fraudulent intent in making or passing such a device, it is already outlawed under §485, which bans the counterfeiting of US coins. To outlaw "likeness or similitude as to design, color, *or* the inscription" [emphasis added] in cases where it is not counterfeiting and has no fraudulent intent, is far too sweeping. Taken literally, §489 outlaws all commemorative silver medallions—and if you go on eBay, you'll find that there are thousands of them for sale—because it says that you are in violation of the law if you make or own any disk that merely has a color similar to that of a US quarter.

CONCLUSION

Competition in general creates incentives to provide a high quality product by taking business away from low-quality producers. Competition in currency is a practical idea that offers sizable benefits to the public when the quality of the incumbent currency becomes doubtful. In particular, US citizens would benefit from freedom of choice among monetary alternatives though the removal of current legal restrictions and obstacles against currencies that could compete with Federal Reserve Notes and US Treasury coins. HR 1098 would give currency competition a chance.

EXPERT COMMENTARY

LLEWELLYN H. ROCKWELL, Jr.

FOUNDER AND CEO
LUDWIG VON MISES INSTITUTE

ROTHBARD AND MONEY

The scholarly contributions of Murray Rothbard span numerous disciplines, and may be found in dozens of books and thousands of articles. But even if we confine ourselves to the topic of money, the subject of this volume, we still find his contributions copious and significant.

As an American monetary historian Rothbard traced the party politics, the pressure groups, and the academic apologists behind the various national banking schemes throughout American history. As a popularizer of monetary theory and history he showed the public what government was really up to as it took greater and greater control over money. As a business cycle expert he wrote scholarly books on the Panic of 1819 and the Great Depression, finding the roots of both in artificial credit expansion. And while the *locus classicus* of monetary theory in the tradition of the Austrian School is Ludwig von Mises' 1912 work *The Theory of Money and Credit*, the most thorough shorter overview of Austrian monetary theory is surely chapter 10 of Rothbard's treatise *Man, Economy and State*.

Rothbard placed great emphasis on the central monetary insight of classical economics, namely that the quantity of money is unimportant to economic progress. There is no need for the money supply to be artificially expanded in order to keep pace with population, economic growth, or any other factor. As long as prices are free to fluctuate, changes in the purchasing power of money can

accommodate increases in production, increases in money demand, changes in population, or whatever. If production increases, for example, prices simply fall, and the same amount of money can now facilitate an increased number of transactions commensurate with the greater abundance of goods. Any attempt by “monetary policy” to keep prices from falling, to accommodate an increase in the demand for money, or to establish “price stability,” will yield only instability, entrepreneurial confusion, and the boom-bust cycle. There is no way for central bank policy or any form of artificial credit expansion to improve upon the micro-level adjustments that take place at every moment in the market.

With the exception of the Austrian School of economics, to which Rothbard made so many important contributions throughout his career, professional economists have treated money as a good that must be produced by a monopoly – either the government itself or its authorized central bank. Rothbard, on the other hand, teaches that money is a commodity (albeit one with unique attributes) that can be produced without government involvement. Rothbard’s history of money, in fact, is a history of small steps, the importance of which are often appreciated only in hindsight, by which government insinuated its way into the business of money production.

It was Carl Menger who demonstrated how money could emerge on the free market, and Ludwig von Mises who demonstrated that it had to emerge that way. In this as in so many other areas, Mises broke with the reigning orthodoxy, which in this case held that money was a creation of the state and held its value because of the state’s seal of approval. A corollary of the Austrian view was that fiat paper money could not simply be created *ex nihilo* by the state and imposed on the public. The fiat paper we use today would have to come about in some other way.

It was one of Rothbard’s great contributions to show, in his classic *What Has Government Done to Our Money?* and elsewhere, the precise steps by which the fiat money in use throughout the world came into existence. First, a commodity money (for convenience, let’s suppose gold) comes into existence on the market, without central direction, simply because people recognize that the use of a highly valued good as a medium of exchange, as opposed to persisting in barter, will make it easier for them to facilitate their transactions. Second, money substitutes began to be issued, and circulate instead of the gold itself. This satisfies the desires of many people for convenience. They would rather carry paper, redeemable into gold, than the gold itself. Finally, government calls in the gold that backs

the paper, keeps the gold, and leaves the people with paper money redeemable into nothing. These steps, in turn, were preceded by the seemingly minor – but in retrospect portentous indeed – government interventions of monopolizing the mint, establishing national names for the money in a particular country (dollars, francs, etc.), and imposing legal tender laws.

Rothbard also brought the Austrian theory of the business cycle to a popular audience. Joseph Salerno, who has been called the best monetary economist working in the Austrian tradition today, was first drawn to the Austrian School by Rothbard's essay "Economic Depressions: Their Cause and Cure." There Rothbard laid out the problems that business cycle theory needed to solve. In particular, any theory of the cycle needed to account, first, for why entrepreneurs should make similar errors in a cluster, when these entrepreneurs have been chosen by the market for their skill at forecasting consumer demand. If these are the entrepreneurs who have done the best job of anticipating consumer demand in the past, why should they suddenly do such a poor job, and all at once? And why should these errors be especially clustered in the capital-goods sectors of the economy?

According to Rothbard, competing theories could not answer either of these questions satisfactorily. Certainly any theory that tried to blame the bust on a sudden fall in consumer spending could not explain why consumer-goods industries, as an empirical fact, tended to perform relatively better than capital-goods industries.

Only the Austrian theory of the business cycle adequately accounted for the phenomena we observe during the boom and bust. The cause of the entrepreneurial confusion, according to the Austrians, is the white noise the Federal Reserve introduces into the system by its manipulation of interest rates, which it accomplishes by injecting newly created money into the banking system. The artificially low rates mislead entrepreneurs into a different pattern of production than would have occurred otherwise. This structure of production is not what the free market and its price system would have led entrepreneurs to erect, and it would be sustainable only if the public were willing to defer consumption and provide investment capital to a greater degree than they actually are. With the passage of time this mismatch between consumer wants and the existing structure of production becomes evident, massive losses are suffered, and the process of reallocating resources into a sustainable pattern in the service of consumer demand commences. This latter process is the

bust, which is actually the beginning of the economy's restoration to health.

The concentration of losses in the capital-goods sector can be explained by the same factor: the artificially low interest rates brought about by the Fed's intervention into the economy. What Austrians call the higher-order stages of production, the stages farthest removed from finished consumer goods, are more interest-rate sensitive, and will therefore be given disproportionate stimulus by the Fed's policy of lowering interest rates.

Equipped with this theory, Rothbard wrote *America's Great Depression* (1963). There Rothbard did two things. First, he showed that the Great Depression had not been the fault of "unregulated capitalism." After explaining the Austrian theory of the business cycle and showing why it was superior to rival accounts, Rothbard went on to apply it to the most devastating event in U.S. economic history. In the first part of his exposition, Rothbard focused on showing the extent of the inflation during the 1920s, pointing out that the relatively flat consumer price level was misleading: given the explosion in productivity during the roaring '20s, prices should have been falling. He also pointed out how bloated the capital-goods sector became vis-a-vis consumer goods production. In other words, the ingredients and characteristics of the Austrian business cycle theory were very much present in the years leading up to the Depression.

Second, Rothbard showed that the persistence of the Depression was attributable to government policy. Herbert Hoover, far from a supporter of laissez-faire, had sought to prop up wages during a business depression, spent huge sums on public works, bailed out banks and railroads, increased the government's role in agriculture, impaired the international division of labor via the Smoot-Hawley Tariff, attacked short sellers, and raised taxes, to mention just a portion of the Hoover program.

Rothbard had been interested in business cycles since his days as a graduate student. He had intended to work on a history of American business cycles for his Ph.D. dissertation under Joseph Dorfman at Columbia University, but he found out that the first major cycle in American history, the Panic of 1819, provided ample material for study in itself. That dissertation eventually appeared as a book, via Columbia University Press, called *The Panic of 1819: Reactions and Policies* (1962). In that book, which the scholarly journals have declared to be the definitive study, Rothbard found that a great many contemporaries identified the Bank of the United States – which was supposed to be a source of stability – as the primary

culprit in that period of boom and bust. American statesmen who had once favored such banks, and who thought paper money inflation could be a source of economic progress, converted to hard money on the spot, and proposals for 100-percent specie banking proliferated.

In *A History of Money and Banking: The Colonial Era to World War II*, a collection of Rothbard's historical writings published after the author's death, Rothbard traced the history of money in the United States and came up with some unconventional findings. The most stable period of the nineteenth century from a monetary standpoint turns out to be the period of the Independent Treasury, the time when the banking system was burdened with the least government involvement. What's more, the various economic cycles of the nineteenth century were consistently tied to artificial credit expansion, either participated in or connived at by government and its privileged banks. Rothbard further showed that the traditional tale of the 1870s, when the United States was supposed to have been in the middle of the "Long Depression," was all wrong. This was actually a period of great prosperity, Rothbard said. Years later, economic historians have since concluded that Rothbard's position had been the correct one.

Rothbard's treatment of the Federal Reserve System itself, which he dealt with in numerous other works, involved the same kind of analysis that historians like Gabriel Kolko and Robert Wiebe applied to other fruits of the Progressive Era. The conventional wisdom, as conveyed in the textbooks, is that the Progressives were enlightened intellectuals who sought to employ the federal regulatory apparatus in the service of the public good. The wicked, grasping private sector was to be brought to heel at last by these advocates of social justice.

New Left revisionists demonstrated that this version of the Progressive Era was nothing but a caricature. The dominant theme in Progressive thought was expert control over various aspects of society and the economy. The Progressives were not populists. They placed their confidence in a technocratic elite administering federal agencies removed from regular public oversight. What's more, the resulting regulatory apparatus tended to favor the dominant firms in the market, which is why the forces of big business were in sympathy with, rather than irreconcilably opposed to, the Progressive program. "With such powerful interests as the Morgans, the Rockefellers, and Kuhn, Loeb in basic agreement on a new central bank," Rothbard wrote, "who could prevail against it?"

It is with these insights in mind that Rothbard scrutinized the Federal Reserve. He would have none of the idea that the Fed was

the creation of far-seeing public officials who sought to subject the banking system to wise regulation for the sake of the people's well-being. The Fed was created not to punish the banking system, but to make its fractional-reserve lending operate more smoothly. In *The Case Against the Fed, What Has Government Done to Our Money?*, and *The Mystery of Banking*, Rothbard took the reader through the step-by-step process by which the banks engaged in credit expansion, earning a return by lending money created out of thin air. Without a central bank to coordinate this process, Rothbard showed, the banks' position was precarious. If one bank inflated more than others, those others would seek to redeem those notes for specie and the issuing bank would be unable to honor all the redemption claims coming in.

The primary purpose of the central bank, therefore, in addition to propping up the banks through its various liquidity injections and its position as the lender of last resort, is to coordinate the inflationary process. When faced with the creation of new money by the Fed, the banks will inflate on top of this new money at the same rate (as determined by the Fed's reserve requirement for banks). Therefore, the various redemptions will tend, on net, to cancel each other out. This is what Rothbard meant when he said the central bank made it possible to "inflate the currency in a smooth, controlled, and uniform manner throughout the nation."

Although Rothbard distinguished himself as a monetary theorist and as a monetary historian, he did not confine himself to theory or history. He devoted plenty of attention to the here and now – to critiques of Federal Reserve policy, for example, or to criticisms of government responses to the various fiascoes, the Savings and Loan bailout among them, to which our financial system is especially prone. He likewise looked beyond the present system to a regime of sound money, and in *The Case for a 100 Percent Gold Dollar* and *The Mystery of Banking* laid out a practical, step-by-step plan to get there from here.

In his work on monetary theory and history, as in his work in so many other areas, Rothbard showed from both an economic and a moral point of view why a system of liberty was preferable to a system of government control. At a time when the political class and the banking establishment are being subjected to more scrutiny than ever, the message of Rothbard takes on a special urgency.

For that reason we should all be grateful that his monetary work, and that of the other great Austrian economists, is being carried on by Murray Rothbard's friend and colleague Ron Paul. By my

reckoning, no one in history has brought true monetary theory and history to a larger audience.

Llewellyn H. Rockwell, Jr, former editorial assistant to Ludwig von Mises and congressional chief of staff to Ron Paul, is founder and CEO of the Mises Institute, executor for the estate of Murray N. Rothbard, and editor of LewRockwell.com.

**SOUND MONEY: PARALLEL CURRENCIES AND
THE ROADMAP TO MONETARY FREEDOM**

THURSDAY, AUGUST 2, 2012

WITNESSES

Lewis, Nathan, Principal, Kiku Capital Management LLC.

Ebeling, Richard, Ph.D., Professor of Economics, Northwood
University

Gray, Rob, Executive Director, The American Open Currency
Standard

*B*ACKGROUND

The Subcommittee on Domestic Monetary Policy and Technology held a hearing entitled “Sound Money: Parallel Currencies and the Roadmap to Monetary Freedom” at 10:00 a.m. on Thursday, August 2, 2012 in Room 2128 of the Rayburn House Office Building.

This hearing examined parallel currencies and alternative forms of money, the effects of parallel currencies on the economy and monetary policy, and the obstacles that prevent the circulation of alternative forms of money. This was a one-panel hearing with the following witnesses:

- Dr. Richard Ebeling, Professor of Economics, Northwood University
- Mr. Nathan Lewis, Principal, Kiku Capital Management LLC
- Mr. Rob Gray, Executive Director, The American Open Currency Standard

“Parallel currency” is a term that describes alternative currencies or forms of money circulating alongside the dominant medium of exchange. Federal Reserve Notes and dollar-denominated bank deposits are the most common media of exchange in the United States. Parallel currencies would thus be any voluntarily-chosen alternative medium of exchange.

Fiat Monetary Regime

Since the breakdown of the Bretton Woods system of monetary management in 1971, which tied most international currencies to the partially gold-backed U.S. dollar, most of the world has operated

under a pure fiat currency system.²⁶⁶ Under a fiat currency system, the amount of money and currency in circulation is left to the discretion of the monetary authority, whose currency is made the legal tender. In the United States, the Federal Reserve System is the monetary authority and it has been given independent authority and responsibility to control the money supply and value of the currency, with a mandate to maintain full employment and price stability.

In the wake of the near-collapse of the financial system and the looming debt crises facing both Europe and the United States, those who view the pure fiat currency system as a contributing factor to these events have become both more vocal and also more widely acknowledged. These critics believe that allowing monetary authorities to create money and currency without some form of restraint has contributed to unsustainable expansion of debt, growing inflation, and instability in the global financial system.

In light of continued accommodative monetary policies being deployed by monetary authorities to stave off financial crisis, some critics worry that the experiment with pure fiat money is headed toward collapse unless changes are made. To that end, some advocate allowing alternative currencies to begin circulating alongside fiat currencies for two reasons: (1) parallel currencies could restrain monetary authorities from excessive money creation by allowing competition between government fiat money and private money, and thus promote stability; and (2) if the restraint proves ineffective, having in place a system of parallel currencies provides individuals with a safeguard, in the form of an alternative monetary system, should the experiment with pure fiat currencies come to a disorderly end.

Parallel Currencies

Parallel currencies are based on the notion that the market for currency is like the market for any other good or service. Markets provide consumers with choices between products, and producers compete for consumers by providing the best, most efficient product. In the currency market, the best, most efficient product would be the one that best satisfies all the properties of money: durability, portability, divisibility, ease of recognition, and stability.

²⁶⁶ A fiat currency derives its value from legal statute requiring it to be accepted as payment in a transaction, typically referred to as a legal tender statute. Alternatively, a commodity-backed currency has an intrinsic value based on the value of the commodity backing the currency. Both types of currency also derive value from their use as a means of exchange, known as exchange value.

With parallel currencies, any item could emerge as an alternative form of money, but precious metal currency would likely become the most dominant because precious metals contain all the properties necessary to be money and have historically been the forms of money most widely accepted around the world. Precious metals could circulate either as coins, paper certificates backed by coins or bullion, or as an electronic currency, all of which could be provided by private enterprises, each competing to provide the “best” money, *i.e.*, the soundest, most stable, and most convenient.

Obstacles to Parallel Currencies

While alternatives to fiat currencies exist in the U.S., their adoption and circulation are limited because of obstacles created by the federal government. These obstacles inhibit the circulation of parallel currencies, diminish the network effects needed for widespread adoption, and limit the use of parallel currencies. Three of the major obstacles are: (1) taxes on precious metals that prevent them from circulating as money; (2) provisions of the federal criminal code that prevent the private minting of coins as currency; and (3) legal tender laws that make U.S. coins and Federal Reserve Notes payment for all debts.

Taxation on Currencies

Capital gains taxes assessed on the appreciation of the precious metal content of coins have deterred the use of coins made from precious metals as a means of exchange. Under 26 U.S.C. 408(m)(2), coins are declared to be collectibles and are taxed at rates different from those for other capital assets. Coins held for less than one year are taxed at the short-term capital gains rate, while coins held for longer are taxed at a rate of 28 percent. Given the steadily-increasing dollar value of gold and silver coins, using these coins to pay salaries or to make purchases would require burdensome paperwork and tax payments, which makes it prohibitively expensive for precious metal coins to circulate as a parallel currency.

Private Mints

From the founding of the United States to the Civil War, numerous hard money currencies circulated within this country. These currencies were U.S. Mint coins, foreign coins, and privately minted coins that circulated based on their weight in gold and silver. During this time, individuals could bring in an amount of precious metal and have it assayed and minted by local branches of the U.S.

Mint. Private mints sprang up in areas that were underserved by U.S. Mint and Assay offices.

Federal laws enacted in the 1860s and 1870s outlawed the minting of currency by private mints. As greater centralization of government occurred after the Civil War, there was also a push by lawmakers for greater centralization and government control of money issuance. As legislation was passed to create a national banking system, two provisions—now codified at 18 U.S.C. 486 and 489—were enacted that prohibit the operation of private mints, outlawing the coinage of precious metal coins as currency except by the government.

Legal Tender Laws

Legal tender laws provide that a certain currency is “legal tender”: that is, the currency must be accepted for payments of debts, taxes, duties etc. Legal tender laws that apply to a certain geographic territory often ensure that the government-issued currency circulates in the economy to the exclusion of other currencies. Some historians and scholars have argued that the federal government does not have the authority under the U.S. Constitution to enact legal tender laws, but merely to coin money and regulate its value. The only reference in the Constitution to legal tender is contained in Article 1, Section 10, which prohibits states from making “any Thing but gold and silver Coin a Tender in Payment of Debts.”

Examples of Private Currencies

Liberty Dollar

The Liberty Dollar was created in 1998 by Bernard von Nothaus and issued through his company, Liberty Services and was intended for use as a circulating private currency. The Liberty Dollar existed in the form of gold and silver coins, gold and silver certificates backed by those coins, and as an electronic currency. Liberty Dollar coins were minted with a suggested U.S. dollar face value.

In November 2007, Liberty Services was raided by the FBI and Secret Service. Its gold, silver, platinum, and copper coins were seized by the U.S. government. Nothaus was charged in 2009 with violating 18 U.S.C. 485 (issuing coinage similar to U.S. coinage) and 18 U.S.C. 486 (minting coins of original design intended for use as money), among other laws, and was convicted in March 2011.

American Open Currency Standard (AOCS)

The AOCS was created in 2007 as an umbrella organization that both issues its own precious metal medallions and also approves those minted by other organizations which conform to AOCS standards of metal purity.

Given the experience of Liberty Dollar, AOCS has been cautious to avoid some of the problems that resulted in criminal charges being filed against Bernard von Nothaus. For example, AOCS issues “medallions,” “tokens,” or “rounds” rather than “coins” and refrains from using the word “coin.” Their medallions are struck with a medallic orientation, meaning that the reverse is right side up when the coin is flipped on its *vertical* axis. This makes their product dissimilar from United States coinage, which is struck with a coin orientation, meaning that the reverse is right side up when the coin is flipped on its *horizontal* axis. Unlike the Liberty Dollar, AOCS medallions are not marked with the term “dollar,” nor are they marked with a dollar sign.

AOCS-approved medallions are minted in copper (1 oz. avoirdupois), silver (1/10, 1/2, 1, and 5 troy ounces), and gold (1/10, 1/2, and 1 troy ounce). AOCS-approved medallions are minted with their weights and a face value number that corresponds proportionally to the metal content of medallions within each metal series. In general, merchants who accept AOCS medallions are willing to exchange them at a dollar to face value parity.

GoldMoney

GoldMoney was founded in 2001 by James Turk and his son Geoff Turk in recognition of gold’s usefulness as a financial asset as well as its worldwide role as money. GoldMoney now primarily sells gold, silver, platinum, and palladium to customers around the world and offers storage of those metals to its customers in warehouses in Hong Kong, the United Kingdom, and Switzerland. However, GoldMoney had long contemplated the use of gold in electronic commerce, and increased adoption of the Internet enabled GoldMoney to offer a digital gold currency, allowing its customers to make payments to each other using a patented digital gold currency with a unit of account in grams. GoldMoney holds four patents related to its digital gold currency. In January 2012, increased regulatory burdens and low usage caused GoldMoney to discontinue its digital gold currency for all customers outside of Jersey, a British crown dependency in the Channel Islands where GoldMoney is headquartered. GoldMoney has said that it plans to reinstate metal payments for its customers in other countries in the future.

*T*RANSCRIPT

The subcommittee met, pursuant to notice, at 10:04 a.m., in room 2128, Rayburn House Office Building, Hon. Ron Paul (chairman of the subcommittee) presiding.

Members present: Representatives Paul, Luetkemeyer, Schweikert; and Green.

Chairman PAUL. This hearing will come to order. Without objection, all Members' opening statements will be made a part of the record.

I also ask for unanimous consent to place in the record a letter with an attachment from Dr. Edwin Vieira, who could not appear on this panel today.²⁶⁷

Without objection, it is so ordered.

I will now recognize myself for 5 minutes to make an opening statement. First, I want to welcome our panel today to discuss a very important issue dealing with monetary policy. We have had a series of hearings and discussions in this committee dealing with monetary policy, mostly directed around Federal Reserve policy and the Federal Reserve.

Today, there will not be that much emphasis on the Federal Reserve itself, but rather on money: on money, the issue of what it means; what our history is like on money; whether we can have parallel currencies; and what the founders might have thought about parallel currencies.

The world is in the midst of a crisis today, and many of us believe it is related to a deeply flawed monetary system, a deeply flawed understanding of what money should be, a rejection of the notion that money should have real value and that money originated in the marketplace rather than originating from a computer over at the Federal Reserve.

²⁶⁷ The letter and attachment from Dr. Vieira can be found in Appendix C.

And though today the general public, as well as the financial markets, have a difficult time wanting to accept that or even understand it, ultimately it is the nature of money that I believe we will have to come to grips with, and make a decision about. Because as we speak, they are meeting in Europe and the ECD's are deciding what to do and manipulating their money and credit, as well as we here in the United States.

We in this country have been given some benefits, definitely, by being able to issue the reserve currency of the world. And because there is no definition to money, and because we can create money out of thin air, we have had some advantages.

But the whole world is engulfed in this problem because of this lack of determination, a lack of desire to understand what money is all about. So today, we want to discuss that, and get the testimony from our witnesses to try to further understand the nature of money and credit, and whether it is necessary to have a precise definition.

Also, really, we want to talk about parallel currencies, concurrencies circulate next to each other. And I think the answer is rather clear. They are doing it all the time internationally. Currencies are circulating all the time, and in the computer age, they adjust their values rather quickly.

But the question is, can we have parallel currencies within the United States? Would it be legal? Does it contradict the Constitution? What would the States' role be in this? And what can they do? Under these circumstances, it does raise a lot of questions, because it raises tax questions and the authorities on how they are going to respond and what one can do with currencies without having the wrath of Big Brother and Big Government coming down on us, and saying, "No, you can't do that."

But today, we have an absolute monopoly control over money and credit. They are managing a money that they can't even define. And then they wonder why we have chaos in the marketplace. I see a time coming where there will be a response to the problems that we have, a response that I will endorse. And that is for monetary reform.

But it won't happen because of our hearing today. I know we are going to have a great hearing and great testimony, and there will be lots of words of wisdom. But we are not going to walk away and all of a sudden the world is going to say, "You know, that makes a lot of sense. We have to deal with this."

The one thing that I am convinced of with the current system that we have, because we don't deal with the issue of money, is the financial system worldwide is going to get a lot worse, because they

are not admitting the truth of what is happening. Because the system that we have, we have had for so many years and so many decades that it has encouraged a system of horrendous debt.

And not only are many of our companies and banks and States and countries insolvent, they wonder why we have a problem. But if they don't admit to it, and think that, well, the solution is just creating more money. So that is an overwhelming task for that reform.

But in the meantime, is there anything that we can do to emphasize and to promote the interests of, and the understanding of what sound money would be by just permitting parallel currencies? Why can't we have the freedom to do this? We claim we live in a free country and a free society, but are we allowed to have parallel currencies, are we allowed to have competition, are we allowed to have something in addition to a cartel and a monopoly that has controlled money and credit and has created a worldwide monster for which they have no answers?

That is the reason I think this is a very, very important subject. And once again, I want to welcome our panel. I would like to know now if any other Members have an opening statement. No? Okay, thank you.

I will now introduce our guest speakers and the members of the panel. Our first guest, Mr. Nathan Lewis, is the principal of Kiku Capital Management, a private investment firm, and author of "Gold: the Once and Future Money," which is now published in five languages.

His writings can be found in the Financial Times, Forbes, and Dow Jones Newswires, among others. He has appeared on television networks, including Bloomberg TV and CNBC, and has been featured in several television documentaries.

Dr. Richard Ebeling is a professor of economics at Northwood University in Midland, Michigan. He is recognized as one of the leading members of the Austrian School of Economics. He is the former president of the Foundation for Economic Education, and author of "Political Economy, Public Policy, and Monetary Economics." Dr. Ebeling earned his Ph.D. in economics from Middlesex University in London.

Mr. Robert Gray is founder and executive director of the American Open Currency Standard. He is responsible for the creation and successful implementation of more than 150 circulating community currencies and silver-, gold- and copper-based token fund-raising programs.

Mr. Gray helped issue the official currency of the free and independent Lakota Indian Nation, and also founded the Mulligan Mint, a full-service mint in Dallas, Texas.

Without objection, your written statements will be made a part of the record, and you will now be recognized for a 5-minute summary of your testimony.

I now recognize Mr. Lewis.

**STATEMENT OF NATHAN LEWIS²⁶⁸
PRINCIPAL, KIKU CAPITAL MANAGEMENT LLC**

Mr. LEWIS. Thank you. The phrase “parallel currencies” tends to sound rather novel and experimental to us today, living in the United States. However, most people in the world are using parallel currencies today. U.S. dollars or euros are accepted in trade in goods and services.

In many countries that suffer from low-quality domestic currencies, the largest corporations finance themselves with dollar-denominated debt. The governments of such countries themselves issue dollar-denominated government bonds. By the end of World War II, the U.S. dollar, which had been considered an emerging market currency in 1900, had proved to be the most reliable currency in the world.

In practical terms, this meant that the U.S. dollar remained on a gold standard system while once-prominent European currencies were devalued and political situations became unstable. The dollar thus became the parallel currency of choice worldwide.

In 1971, the United States abandoned its then-nearly two-century-old commitment to the gold standard system. At this point, historically, currencies were often discarded for whatever the highest quality, most reliable alternative was which, in practice, meant a gold standard currency from a large developed country.

Despite the U.S.’s poor currency management since 1971, the alternatives have been even worse. This why the U.S. dollar remains the most popular currency in the world, and serves as a parallel currency in many, if not most, countries today.

Today, there are no particularly onerous barriers against using a parallel currency in the United States. People are free to do business in euros or Russian rubles if they so choose. There are over 150 currencies in the world, all of which could conceivably be used as parallel currencies within the United States or other countries.

²⁶⁸ [The prepared statement of Mr. Lewis can be found on page 1023.]

However, all of them are floating fiat currencies generally of lower quality than the U.S. dollar or euro. There is hardly any reason to introduce another. Plus, the most meaningful new parallel currency to be introduced in the United States or in another country would be one based on gold.

Although the use of other countries' national currencies is largely accepted in the United States, the issuance of alternative currencies within the United States can run afoul of what are collectively known as "legal tender laws," both de jure and de facto. The one person who attempted to issue a gold- and silver-based parallel currency in the United States was arrested in 2009 and convicted of charges related to counterfeiting and declared to be a domestic terrorist.

Gold, today, is regarded as a collectible, and subject to a different system of taxation than if one were to do a similar transaction using foreign currency such as euros or Canadian dollars. In addition, purchases or sales of small quantities of gold are subject to sales taxes in many States.

Thus, in practice, the U.S. Federal Government makes a powerful effort to suppress the introduction and use of alternative gold-and silver-based currencies today. This state of affairs has become intolerable to many. In 2011, the State of Utah declared that it would consider U.S. Mint gold and silver coins and monetary instruments based on these coins to be legal as currency.

This included the removal of all State-level taxes on transactions in gold and silver bullion. Twelve other State legislatures have had similar bills proposed. The Utah example could serve as a template for similar Federal-level legislation to legalize gold- and silver-based currencies within the United States. According to a study of 775 floating currencies by Mike Hewitt, no floating fiat currency has ever maintained its value.

The average life expectancy of a floating fiat currency was found to be 27 years. The U.S. dollar, which has been a floating fiat currency for 41 years now, is thus an unusual example of longevity. However, today's extreme reliance upon easy money approaches to deal with economic problems, with the Federal Reserve promising unprecedented zero percent policy rates for years, and real interest rates deeply negative, suggests to many that the floating fiat dollar does not have a long or successful future.

Governments of China, Russia, Malaysia, Switzerland, the Gulf States, and others have complained about the potential consequences of today's aggressive easy money techniques not only at the Federal Reserve, but also the European Central Bank, the Bank of England,

and the Bank of Japan, and have made preliminary steps toward a future alternative, including discussions of new gold-based parallel currencies.

On the international scale, the parallel gold-based currency, or many such currencies, would help ease this transition and form the basis of a new monetary order if that should become necessary. Each individual would be free to make increasing use of the gold-based alternative as it best suited their interests.

It would be no great day of transition, but a smooth, extended process, perhaps over years. The existence of a high-quality alternative could help people avoid much of the potentially disastrous consequences if today's floating fiat currencies meet the same end as the 599 floating currencies that no longer exist.

Thank you.

Chairman PAUL. I thank you.

And now, we will go to Dr. Ebeling.

**STATEMENT OF RICHARD M. EBELING²⁶⁹
PROFESSOR OF ECONOMICS, NORTHWOOD UNIVERSITY**

Mr. EBELING. Chairman Paul, and members of the subcommittee, I would like to thank you for this opportunity to share some ideas on this important theme of sound money, parallel currencies, and the roadmap to monetary freedom.

To discuss a possible roadmap to monitor a freedom in the United States requires us to first determine what may be viewed as sound or unsound money. Through most of the first 150 years of U.S. history, sound money was considered to be the one based on a commodity standard, most frequently gold or silver.

In contrast, the history of paper, or fiat, monies were seen as an account of abuse, mismanagement, and financial disaster, and therefore were viewed as unsound monies. The histories of our own American Continental notes during the Revolution, the assignat during the French Revolution, and the greenbacks and the Confederate notes during the American Civil War all warned of the dangers of unrestricted and discretionary government power over the monetary printing press.

That result was that in the second half of the 19th Century, all of the major countries of the world moved towards a monetary standard based upon a commodity, in this case, gold.

The important matter to be emphasized—that while it assured a degree of monetary stability while governments basically followed the

²⁶⁹ [The prepared statement of Dr. Ebeling can be found on page 1038.]

rules of the gold standard—that is, a fixed ratio was established between a unit of gold and the amount of notes or account deposits that were extended after a deposit was made; the ability to redeem them at that fixed rate; the monetary authority of the central banks at that time basically following the rules of the road of limiting the amount of notes or accounts open to the amount of gold that had been deposited, withdrawing notes and accounts when gold was withdrawn, the fact remains that it still was a system of government-managed money.

And once the ideologies and philosophies of the time changed and the shift was to a more activist government policy in the 20th Century of government targeting price levels, government attempting to influence and manipulate output and employment or inflation targets and so on, the reins of ability to manipulate the monetary system were already in the hands of the authority given responsibility for money and credit in the economy.

That raises the entire issue as to whether it is desirable to have government managing a monetary and banking system at all. The free market case for competition in general and, therefore, a similar case in the case of money is the fact that competition in a market does at least two essential things.

First, it decentralizes the impact of errors. If a businessman makes a mistake in his entrepreneurial judgments, it may have a negative effect on himself, some of his employees, or a few suppliers of the good that he produces. But it is decentralized. It does not affect the entire economy. When a central bank makes a mistake, its impact is potentially on the entire economy as a whole, since the monetary authority influences interest rates in general, affects the supply of money in the economy in general, distorts relative prices, and impacts the general rate of inflation in the economy as a whole.

Second, it is only through competition that we discover innovative and creative ways to give people the things that they want. And this, market advocates have argued, is no less true in the case of money. If government did not monopolize the control of money, individuals in the market would determine what commodities such as gold and silver they choose to use as media of exchange.

What type of financial intermediation and forms of financial intermediation they found most advantageous and profitable to use. And a diversity of such forms—as banks offered different features, issuing their own notes based upon commodity money deposits—and therefore acting as a check and a balance on each other to give

consumers what they wanted while restraining their ability to abuse their particular individual authorities.

So how would one move towards such a system of free banking and competitive choice in currency? I would like to suggest the following steps.

First, the repeal of the Federal Reserve Act of 1913 and all complementary and related legislation giving the Federal Government authority and control over the monetary and banking system.

Second, the repeal of the legal tender laws, giving the government the power to specify the medium of exchange through which people will transact and enter into contract.

Third, repeal all restrictions and regulations on the free entry into banking business and the practice of interstate banking.

Fourth, repeal all restrictions on the right of private banks to issue their own bank notes and to open accounts denominated in foreign currencies or in weights of gold and silver.

Fifth, repeal all Federal and State government rules, laws, and regulations concerning bank reserve requirements, interest rates, and capital requirements.

And sixth, abolish the Federal Deposit Insurance Corporation. Any deposit insurance arrangements and agreements between banks and their customers and between associations of banks should be private, voluntary, and market-based. In the absence of government regulation of this type, we would naturally move towards a system of competitive currencies and free banking.

Thank you.

Chairman PAUL. I thank the gentleman.

And now, we will go to Mr. Gray.

STATEMENT OF ROBERT J. GRAY²⁷⁰
EXECUTIVE DIRECTOR
THE AMERICAN OPEN CURRENCY STANDARD

Mr. GRAY. Thank you, Mr. Chairman, and members of the subcommittee. My name is Rob Gray, and I was asked to testify today on the theory of competing currencies and the practical challenges that make such a theory difficult or impossible to implement.

For nearly 5 years now, I have successfully directed the American Open Currency Standard, the standard for private voluntary silver, copper, and gold currencies that compete with each other, not against the U.S. dollar. Allow me to clarify. We do not consider AOCs-

²⁷⁰ [The prepared statement of Mr. Gray can be found on page 1055.]

approved medallions produced and traded in our private barter marketplace competition at all to the U.S. Federal Reserve note.

Because fair competition, as one would find in the free market, assumes the existence of a level playing field, existence of a standard set of rules. Those players who wish to compete honestly do so by simply relying on the merit of the value that they bring to the market.

Well, no fair challenge can be made between honest men and thieves. Now let me be clear that when I say, “thieves,” I refer directly to the current private central bank and the men in government who allow it to exist. It brings us to a critical point. According to your employee handbook, article one, section eight says that Congress shall have the power to coin money and regulate the value thereof.

I would argue that since 1913, Congress has failed to do the job with which it has been tasked. In the free market, since our inception, the Open Currency Standard has enjoyed nearly 5 years of growth and success, and our mission of issuing a means that allows valuable exchanges among those who produce.

In the next 5 years, we expect to expand our offerings and to increase our ability to keep up with the demand for our private currency. We are doing the job today that Congress would not. But back to theory. The use of community currencies here in the United States became popular back in the early 1930s.

At the time, the theory was that a group of the world's most powerful men were intentionally and systematically removing currency from circulation, creating artificial scarcity of money across the country. Small cities and towns felt it worse than anyone, but life did go on.

Then, during the greatest economic depression the country had ever seen, individuals across the country developed their own mediums of exchange. They still needed things like food, clothing, and daily essentials; they still needed to live. And they didn't have time to sit around and wait for the government to fix the problem.

And so, according to historical records, thousands of community currencies were created, circulated, and traded in places where the scarcity of dollars was interfering with humans' desire to live. Individuals took it upon themselves back then to secure the means for their own survival and potential prosperity.

More recently, community currencies have sprung up across Europe, as the euro and other national currencies become increasingly unavailable and undependable. Today, communities all across the

eurozone trade their own money instead of the euro. Community currencies today are not simply a good idea in theory.

Right now, alternative and complementary currencies circulate widely across the country in many different forms. Ithaca, New York, has Ithaca Hours that are loosely based on the value of time. Berkshire, Massachusetts, uses a fiat-backed fiat system. And many more communities circulate gold, silver, and copper AOCs-approved barter tokens as a medium of exchange.

As for the practical challenges in the issuance and circulation of complementary currencies, there are plenty. In a voluntary system, those that participate in the trading of private currencies must deal with the possibility of counterfeiting, fraud, scarcity, acceptance, accounting, storage, and other issues, all without the luxury of Big Brother holding a gun to anyone's head to ensure their success.

But even with all these risks, the market still moves on. As in any free market, good ideas circulate with success and bad ones eventually fade away. Participants voluntarily choose to accept and circulate the highest quality currencies in exchange for their best production.

Merchants accept complementary currencies based on the premise that someone else is willing to do the same thing later. Issues arise and are worked out by the market with only one light to guide them—the mutual exchange of value. No guns, no laws, nor force, just the willingness to think outside the box and act on principle.

Complimentary currencies are not new, in theory or in practice. Private currencies circulated long before governments erected themselves to interfere. But what is new, however, is the public's apathy towards the government and the Federal Reserve, and their policies. You have managed somehow for the last 100 years to convince the citizens of this country that you are relevant.

But now, just recently, we are beginning to see the tides change on this. And once it catches on, you will be rendered completely obsolete. The greatest hurdle you will face over the next 100 years is trying to convince We the People that you are still necessary in spite of your failure to get the job done.

Sure, some will rely on your for handouts. That is what they have always known their entire lives, and they will be slaves right up to the point of their own destruction. But they don't know any better, and I don't blame them for their ignorance. In the future, you will not have to worry about Million Man Marches or citizen journalists trying to catch you on camera.

What you need to fear is no one paying attention to you. The next American revolution will be fought not with bullets and bombs, but instead it will be won with the opposite consciousness. To that end, I am here today to propose a solution. My understanding of this committee is that you want to be part of the solution.

You want to believe that you are doing something good for the country. And so today, the greatest gift that you can offer to the people that you clearly represent—not to the legislature, but directly to the public—is what I call “IR-1207,” Individual Resolution 1207, commonly referred to as “Ignore the Fed.”

Store your wealth in silver, bank with non-fractional banks that pay real money on deposits, use the card service network to satisfy dollar obligations, do not try to compete with the Federal Reserve system; simply ignore them.

I ask you to leave the Fed their Federal Reserve notes and leave us our gold, silver, and copper. Do not push to redefine whatever representations we choose for our wealth. Let the Fed do what it wants with their legal tender, so long as they leave our money alone. I warn you, honest money legislation is a wolf in sheep's clothing.

The greatest thing this body can do is exactly what it has done so far: absolutely nothing. All I ask is that you stay out of the market's way. The people in our world are very happy to go right along saving you from your own destruction by producing value against all odds, regulations, codes, and challenges that you throw our way, but leave our money alone.

It doesn't belong to you, and it never will. The bottom line is very simple. Humanity is not going to wait for permission to survive. Things that cannot go on forever simply won't. The market will move on with or without you. And based on your rate of success to date, our preference is certainly without you.

Thank you for the time.

[QUESTIONS & ANSWERS]

Chairman PAUL. Thank you. I will now yield myself 5 minutes for questioning.

First off, I would like to talk about the legal tender laws a little bit more. I want to pose a question for all three of you. It was mentioned in your testimony about how important legal tender laws are and whether or not we can ignore them.

How important are the legal tender laws, and how important is it that we get rid of the legal tender laws if we really want to have a parallel currency and be assured that we can do it? Can we ignore it?

Should we work to repeal it? How far can you go without dealing with this issue?

Because it does provide the monopoly that will not go away easily. So if each one of you could expand your thoughts on the importance of legal tender laws and what we should try to do, and is it absolutely necessary that we do something before we can advance the cause of competition or parallel currencies?

Mr. Lewis?

Mr. LEWIS. Although I think that some communities are using small-scale metallic currencies, more or less under the radar, if a large corporation—let us take Ford Motors, for example—would begin to do business in gold and silver coins or related currencies, they would immediately come under Federal scrutiny and basically be prevented from doing so.

What I would like to see is basically for gold and silver, and currencies based on gold and silver, to be treated as legal currency within the United States. In practice, this will require a declaration of some sort to make it effective. And ultimately, at the very least, to be able to treat gold and silver the same way we treat euros or Canadian dollars today.

We can all do business in them in the United States, even though they are not necessarily declared as legal tender, and so on and so forth. It would be better to have a more official declaration to say, yes, we accept gold and silver as a legitimate means of monetary transaction and a legitimate foundation for business.

Chairman PAUL. Thank you.

Dr. Ebeling?

Mr. EBELING. Yes. Anyone who has traveled in a country that has been experiencing severe, or even hyperinflation knows that in spite of official legal tender laws—that is, the government declaring a certain money or its currency the lawful money—people start using alternative currencies that they view, given their circumstances, as having more confidence in shorter certain value.

So in spite of laws and regulations, at the end of the day what people will choose to use as money, even when it breaks the law, they will follow what they view as most effective and self-interested for themselves in the marketplace to secure their wealth and their transaction opportunities for themselves and their families.

But the fact remains that while the market, in a sense, finally supersedes and no longer recognizes government laws when it becomes serious enough, it is crucially important if we could eliminate the legal tender restrictions in the United States. Because basically,

it would say that now individuals—and the law, the government, the courts—will respect the contracting and the exchanging of any form of medium of exchange that the individual citizens of the society choose to use.

That would go a long way. For example, a well-known Nobel Laureate, Austrian economist Friedrich Hayek, once made the case for what he called “choice in currency.” He was doing this before the euro in the context of Europe. But he said one way to tame the inflationary tendencies of government is to allow citizens within their own country just to use the currencies of other countries within their domestic exchanges if they choose.

To be able to say I don't trust, and have confidence in, the monetary authority to restrain itself in issuing excessive quantities of that money. Also, if you eliminated the legal tender laws, then the people themselves would decide do we want to use dollars, do we want to use alternative to dollars, how much do we want to use notes, how much do we want to use, actually, coins of various sorts?

And it would be basically saying consumer sovereignty, consumer choice. But if we could do that, that would be the essential roadway, and path, to restoring a system of monetary freedom. But if, in the United States, we were to ever experience—and, of course, we hope we never do—a serious and hyperinflation, the market would basically tell the government what it thinks of its money because people will choose to use alternative currencies of choice.

Chairman PAUL. Thank you.

Mr. Gray?

Mr. GRAY. Mr. Chairman, before addressing or issuing the answer to that question, can you please summarize for me your understanding of the legal tender laws as they exist today?

Chairman PAUL. Not at this moment. I would like you to answer the question first.

Mr. GRAY. My answer is, very simply, leave them alone. My understanding of the legal tender laws is that the U.S. dollar, the Federal Reserve note, can be used to satisfy debt obligations. We don't need to change that at all. There is no law that restricts us from privately minting coinage—tokens, medallions as we refer to them.

There is no law that restricts us from engaging in private barter transactions with other men. And so, we don't need to change anything about the legal tender laws in order to do exactly what we are doing right now.

Chairman PAUL. Okay.

I now yield 5 minutes to Mr. Luetkemeyer from Missouri.

Mr. LUETKEMEYER. Thank you, Mr. Chairman.

As you talk about the different parallel currencies, I think we have a parallel currency situation over in Europe right now that is pretty obvious. How is the euro working over there, in your judgment, all three of you?

Mr. EBELING. I will begin by saying I think it is an unmitigated disaster. The fact is, this was not a choice by the people either making their demonstrated choice in market exchanges or even in a political vote or a referendum. This was basically imposed upon many of the E.U. countries as a discretionary choice of the politicians.

Some of the more prominent countries wanted to have a unified currency so as to be able to have the political clout to look down the dollar in the eye, to be explicit. That is my view of why the French were pushing it. The result is that this currency has been imposed upon systems that follow different regulatory paths, different fiscal paths in terms of debt and deficits, all of which has created this problem.

A lot of people in Europe are saying, "Oh, it would be disastrous if the Greeks pulled out and reestablished the drachma," for example, or "the Spaniards were to reestablish a peso," for instance. I think that would be the path to denationalize, or rather deinternationalize this monetary system because it is not working.

And it is dependent upon a central bank in one location to make the monetary choices and decisions for all of the hundreds of millions of people who participate in this system, rather than allowing even the competition of the national central banks, as had existed before. Because if you felt that the lira was being inflated, people escaped into marks.

That was the pattern in the post-war period. Where does an Italian escape to now as easily as into the market as was historically the case? So even in terms of competitive national currencies, the unification under the euro has been a disaster, and certainly for the freedom of the people there.

Mr. LUETKEMEYER. Mr. Lewis?

Mr. LEWIS. I would generally agree with Dr. Ebeling. I don't think the euro is a case of a parallel currency so much as a shared monopoly currency. With parallel currency, the idea is having the choice of two highly viable alternatives. For example, the euros, maybe, in Turkey, where the Turkish lira has a rather poor history, often people use Deutsch Marks in the past and now use the euro.

So I think that is probably a bad example of a parallel currency. Thank you.

Mr. LUETKEMEYER. Mr. Gray?

Mr. GRAY. I think the key thing to consider with what is going on right now in Europe, besides the fact that there is just no confidence whatsoever in the banking system is that still, in our country here today, we do have confidence in our currency, we do have confidence, for the most part, in the banking system, for whatever reason.

And that is very different over in Europe right now. As soon as money shows up and the banks are unfrozen, the people make a run on the bank. They pull out as much currency as they can, they turn it into anything they can get their hands on that is valuable; whether that is another currency, or hard goods, or gold and silver.

It is the same thing that we are seeing now that we saw in hyperinflation just before World War II, where the race was on to get rid of the currency as quickly as possible. The advantage we have right now is that we don't have that yet in our country. And I think the opportunity that lies before us is to help the people of this country get out of that system, deleverage the system, so that they don't have to experience the panics and the fear that are being experienced right now in Europe today.

Mr. LUETKEMEYER. You had a key word there that really describes all monetary systems and, basically, even economics. And that is "confidence." If people don't have confidence that the money that they are exchanging for goods is worth that amount of money, or whatever it is, there is very little transaction that takes place.

And so really, even at the highest levels of the biggest banks, we found in 2008 that it wasn't necessarily the entity that they were dealing with. It was the confidence in that entity to be able to transact business.

And so basically, you have a fall-back on confidence, which leads me to the question with regards to what we are talking about this morning, sound money and parallel money. If you work in a different monetary system parallel to another one, where is the level of confidence going to come from that allows that business to be transacted in a parallel currency?

Mr. GRAY. The simple answer to that question is the confidence comes from the fact that the currency is not based on debt. Every national fiat currency is put into circulation through loans and debt.

And so people today are starting to understand that there is so much money out there that people owe in loans, mortgages, credit card bills, all these derivatives out there—trillions and trillions of dollars—and all that money has to be paid back eventually.

That is where the lack of confidence comes from. And so when you start thinking and talking about alternative currencies, especially those that are issued in gold, silver, copper, and something real, some sort of commodity, people who understand the concept begin to realize that those are debt-free currencies that don't need to be paid back at some point to some bank.

Think about all the money that the people of America owe to the banks. Think about all the people who are in debt, all the States and the municipalities, the colleges, universities. Everyone is in debt. The real question is, who owns the other side of that debt?

And that is where the lack of confidence comes from. The fact that people are starting to ask that question, and realize that there is really no money out there to begin with.

Mr. LUETKEMEYER. I see my time is up.

Thank you, Mr. Chairman.

Chairman PAUL. Thank you.

If the gentleman from Arizona is ready, he could be recognized. If not, we can wait a couple of minutes. Are you ready? Okay, thank you. I will go on and have a second round of questions.

The question of taxation comes up with money, as well, because we think money is a commodity. And our government tends to think that any time you have a commodity transaction, you pay taxes on it. You have sales taxes and you have capital gains taxes. And that, I think, curtails this development of parallel currencies.

And I don't know how we could ignore this if we really want to promote some competition or allowing another currency. Because if you tax one currency but not another one, it is hardly a parallel currency. It is at a tremendous disadvantage.

So if a parallel currency really got off the ground, because of the conditions or the people became knowledgeable and they thought it was wise to do it, the people in Washington don't like to have their powers undermined. So they have the power of the IRS.

Isn't this a significant concern, or do you think we can just sort of bypass it, and say, "Well, it's a problem, but not a big problem. We will just go do our thing, and it can work." What is your opinion about the tax issue when it comes to a parallel currency, all three of you?

Mr. LEWIS. I think there are—just as you can have under-the-table transactions in U.S. dollars, small-scale that maybe you don't report to the IRS, you can also do so. And maybe people are doing so with gold and silver coins or copper coins today. But as soon as you get the business of any scale, you can't break the laws that easily.

I think that ultimately, just as you say, we have taxes that apply to transactions in dollars, capital gains taxes, for example. We have taxes that apply to transactions in euros and Canadian dollars and many other currencies. We have many thousands of corporations doing business in many currencies worldwide.

I think we should recognize that because gold and silver and related instruments are not recognized as currencies, they are under a different system of taxation. Gold, for example, has a different tax rate because it is a collectible. But I think more importantly, let's just take a very simple transaction. I wanted to buy a car from the Ford Motor Company, I wanted to pay them in gold coins, U.S. Mint American Eagles produced by the government.

When I give the gold coin to the auto dealer, that would be considered basically a sale of the coin and you would have to pay capital gains tax, taxes on what the dollar value of the coin was when you acquired it and when you dis-acquired and so on and so forth. Which is very different than if I were to, for some reason, do the same transaction in euros where that would not apply.

So I think that at the very minimum, we should endeavor to treat these the way we would treat other national currencies today, which we are actually doing business in. Not so much in the United States, but what American citizens, the American corporations are doing every day and accountants are very familiar with how this works.

So I think that there is definitely something for the Federal Government to do there to legitimize that and treat it as the same way we treat other national currencies today.

Thank you.

Mr. EBELING. Yes, I would argue that the parallel way of thinking about this is, in international trade, what we call the most favored nation clause. Any agreement that you reached with country X, you give the same best-favor treatment with import duties and so on to all other countries with which you trade.

The parallel argument would be that the government should recognize that anything that people use as a medium of exchange in transactions should be viewed as anything that they have historically viewed as a transaction. Basically, that there shouldn't be these extra taxes. That was just pointed out.

So that if people are now using gold and silver coins, the transaction should be more taxed or treated in a different way than any transaction with the Federal Reserve's own note. That gives a level playing field with neither an advantage nor disadvantage for the use of one currency versus the other.

Because otherwise, the government creates stumbling blocks and hurdles to give people those fair and level playing field choices. So the parallel should be some taxing of media of exchange along this notion of the most favored nation clause.

Chairman PAUL. Mr. Gray?

Mr. GRAY. First of all, Mr. Chairman, I want to clarify that we are not tax experts and we are not allowed to give tax advice, nor do we give tax advice to anyone who participates in our system. Our job is, very simply, to issue the currency and make sure we guarantee the weight and the purity. So we are just keeping an eye on what is going out there.

But tax applications vary from State to State, municipality to municipality. Some States, some cities and towns, allow you to barter. They say, well, you can do 100 barter transactions per month or per year, and they don't look at it as being under the table or underhanded. They look at it as just being private trade that is not a taxable event.

Certainly, my understanding is that the Federal Government would like us to report the profit or gain from any transaction. That is kind of strange because in a barter transaction, there is not really any profit or gain on either side of it. But in our voluntary system, we encourage the participants to explore and decide for themselves based on their own morals and values what their tax obligation is, and to report and to remit accordingly.

Chairman PAUL. Thank you.

Now, I recognize Mr. Luetkemeyer from Missouri again.

Mr. LUETKEMEYER. Thank you, Mr. Chairman.

Following up again on my comments earlier with regards to the confidence in the system and the ability to protect the citizens whenever you transact business like this, Dr. Ebeling, I think in your testimony you abolish the Federal Deposit Insurance Corporation. While you may not like it, that is also one of the things that adds confidence to the person who deposits money in the bank. To realize that if they deposit the money there, they are going to be able to get it back. Without that, the consumer is going to have to do an awful lot of work.

And as you gentlemen have described this morning, parallel monetary systems—you are going to put a tremendous onus on the individual to make sure that they get value back for whatever they exchange their money for, and that that money will have value down the road so they will not lose value and business continue to be transacted in that same form.

And so, I think one of the advantages of the system we have now is that it takes a lot of the work in trying to find ways for the money to be able to be secured and have confidence in away from the consumer. Am I wrong in that, or do you agree with that statement?

Mr. EBELING. I think that the problem with deposit insurance is that it creates a degree of confidence, but a false sense of security. The fact is, is that the impression is made that the bank is serving as a depository for your money and that it is always guaranteed to be gotten back.

The fact is, you put money into a bank to earn interest. The bank can pay you interest only through one way, and that is extending it and pooling your savings with others to worthy borrowers. They pay interest for the loan, the bank receives that loan. They take what they view as their service charge for financial intermediation, and then you as the depositor receive your interest, whether it be a savings account or most forms of checking accounts which pay interest now.

The fact is, you are putting your money at risk. You are lending it to others through the bank's good services. Federal Deposit Insurance has created this impression as if there is no risk with your money. And the fact is, I think the people would be more cautious and more attentive to the nature of the bank that they are doing business with, what the track record of the bank is in managing your funds, along with those of other depositors.

And on that basis, seeing what private insurance or guarantees or other forms of assurances bank competitively would establish. We take for granted that when you go in and buy, for example, a microwave or an oven or a refrigerator, what if it doesn't work?

Most large companies, for brand name reputation, give you various warranties and guarantees. And it is important for the company's success to stand by and guarantee that warranty and guarantee. Various banks, for competitive advantage, would offer various types of, perhaps, guarantees and warranties on deposits, but with the understanding that nothing is certain.

In a money market mutual fund, you realize that the value of your account may go up or down depending upon the value of the portfolio of the company with which you are dealing. The fact is, that is the case of a bank, too.

Mr. LUETKEMEYER. You are mixing apples and oranges here. You are talking about an investment account, where you know that the money is going to be invested and it has the ability to go up and

down, versus a deposit where you put the money in and you are going to write checks on that account.

And I think the deposit insurance takes some of the risk away. Over the last 4 years, we as a society have been educated to the fact that banks manage risk. That is what they do. Before, people thought they just take deposits, make loans, and turn around and pay out dividends and interest and whatever.

That is not what happens. They manage risk. And so, the deposit insurance actually minimizes the risk. It doesn't take it all away, but it minimizes it so that it gives some level of confidence to that investor. And I don't think you can sit there and say that somebody who invests in a money market account or some sort of investment account at the bank, that is a totally different relationship between the bank and the individual customer.

I have some concerns about that.

Mr. EBELING. If I could just sort of follow up on that, the mistake is that people view their checking accounts—I have a checking account, as I know you have—you feel as if, well, I have deposited my paycheck and I can draw that money down by writing checks or using my debit card, etc.

The fact is, that is not a warehouse deposit or like a safety deposit box. The fact is, under our current banking system that money is then taken—which you are viewing as 100 percent accessible to you—and using it as part of their investment funds to lenders. It is at risk as much as a savings account is, where you know that during the period of like a time deposit your money is being lent out to a lender.

The fact is, to a borrower, the same things applies with our checking accounts. People are given a false sense of security that this is not an investment account, when it is. It is as much of a risk as when you put your money in the bank and a savings account and you more consciously know the bank is using your money for a period of time with a risky loan.

Checking accounts are, in fact, with our system no different. And if you didn't have deposit insurance, I would suggest that people would become more aware of it and be more cautious, informed and intelligent in what type of banking institution they did business with.

I am talking about the long-run, institutional incentives of a system.

Mr. LUETKEMEYER. I see my time is up. Thank you, Mr. Chairman.

Chairman PAUL. Thank you.

I now recognize the gentleman from Arizona, Mr. Schweikert.

Mr. SCHWEIKERT. Thank you, Mr. Chairman. This may be a slightly more ethereal question, but I am trying to also understand how much of this is actually going on around us. And actually, also, if you have ever looked at the differential in high transaction cost jurisdictions: high sales tax; the barter economy; some of these things I now see on the Internet.

What was one of them called? Something “coin,” where you can actually develop—what was it?

Mr. GRAY. Big Coin, I believe?

Mr. SCHWEIKERT. Yes. And I think there are two or three versions of that, where, because of certain transactions or uses of Web sites or these things, you actually build accounts. How much of this is there already, even though in the scale it may be very small?

Is there actually, in sort of the barterer of economy, of this Internet exchange of value that is out there? I remember there was an explosion of it in the early 1980s, very early 1980s, when inflation—so I would trade something with my dentist for this. And even though inflation and other things, I knew I was getting a certain service for a certain service.

What is out there today?

Mr. GRAY. It is pretty substantial. The first thing to take a look at is the gray and black economics of the world which, right now, are really the only segment of the global marketplace that is actually growing. A lot of that is done with barter, direct trade. Some of it is done with alternative community currency, some of it is done with gold and silver.

So it is happening right now across the globe in a very big way. In the United States, there are probably 400 to 600 different community currencies in circulation right now. The total value of the currency in circulation is probably somewhere between \$1 billion and \$5 billion, I would estimate.

So it is small, but it is consistently growing.

Mr. SCHWEIKERT. I don't think a lot of folks even understand. My little sister was part of a baby-sitting exchange. She puts in so many hours, and she gets so many hours over there. In many ways, that was a barter economy, and folks don't realize they were basically transacting value for value.

What happens if we wake up tomorrow and a handful of our trading partners, competitors move to a basket or currencies? And so China and a couple other countries say, “We are going to do this new blended currency.” Does that actually now create a new method of exchange?

I have been trying to figure out if that actually creates an additional value of exchange with which we would have to deal.

Mr. GRAY. I think on the macro level in the global economy, yes, it does. As far as the micro level and the baby-sitters and the pet groomers and people in small towns and cities across the country, I don't think they would notice that any more than they notice, and are affected by, the international currency problems we have right now.

So I think, yes, globally sure.

Mr. SCHWEIKERT. But where that more comes from, Mr. Chairman, and to whoever would like to answer this, I don't know how often you see this, but I used to see it in the old days. A contract would have a gold clause in it, particularly contracts that were coming out of the late 1970s, very early 1980s when there was high inflation, saying, "Hey, we are going to write the contract denominated in U.S. dollars, but there will be a gold peg on it so if somehow inflation might—by the time we are going to do the take-down."

I am curious if we are seeing any more of that type of hedging. And that is actually what a blended commodity currency would do, also. I told you this was going to be a bit ethereal.

Mr. EBELING. I think what is sometimes being proposed, the Chinese and the Russians have talked about this instead of the dollar as an international currency for a lot of transactions. What this idea of a basket of commodities or series is, is to try to have an index of what currency A, let us say the U.S. dollar, is worth as sort of an index, or composite, of these other currencies to determine some value.

But the fact is that what would still be traded is actually some currency A for currency B. But the market estimate of what currency A is worth in relation to currency B would be that the currency B would, in fact, have its value based upon some composite index. It is a way of determining the exchange ratio, not so much that you would be trading the basket of the currencies for this other good, or this other currency.

Mr. SCHWEIKERT. And my fear is, often—and my good friend, Mr. Luetkemeyer, I think, that was also part of the dialogue of it—sometimes, it is not only you get back your dollar-for-dollar invested, but what was the actual ultimate purchasing power of that dollar when you get it back.

And I think that is actually a much more honest way to look at the value of a transaction.

Mr. EBELING. Right. And see, what happens—again, as I mentioned in an earlier question—is that if you have traveled in a country that is dealing with a severe or a hyperinflation, the uncertainty and

instability of that nation's own currency has reached such a point that people no longer either use that currency, or they calculate its real value in another currency, whether it be, let us say, a dollar or an ounce of gold.

And they say that based upon this other currency, that is what we are going to view as the value of my own currency in buying commodities.

Mr. SCHWEIKERT. Mr. Chairman, I know I am way over time. But if you have done lots of traveling, particularly in the third world, you will often see, here is the price in the local and here is the price, as I had an experience in Myanmar. There was a price for green, which was U.S. currency.

So thank you, Mr. Chairman.

Chairman PAUL. Thank you.

We will be having a vote shortly, but I believe we have time for another round of questions. I have a question for Dr. Ebeling. And it is a more generalized and philosophic question. Under the system we have today, it is very unfair to one group, where another group, I think, benefits.

And if you look at runaway inflation, it is not usually those who have been able to park their money overseas and escape the harm. Many times it is the average person who had savings in accounts and they lose everything. I think what we are dealing with on a monetary system is a reflection of a bigger philosophy.

And that is the philosophy of government, big government, and why we spend so much money. And money is not so much a means of exchange, like it should be. It is the vehicle for taxation. Because we have big government for various reasons and there is never enough tax money. But there is also the printing press and there is the printing of money.

Which is really a tax on the people, the middle class and the poor. Many people endorse that system because they have been convinced that the current system is helpful to the poor. We can have housing programs and we can provide welfare, and they really like the system. They don't want to give up on it.

Now, we might agree that a sound monetary system would be more fair and it wouldn't be beneficial to the very, very wealthy and to the Wall Streets and the bankers. But what about if we got a little further along on parallel currencies?

Do you see any way this could give a temporary reprieve, or would it once again been seen oh, this is just another gimmick to protect the rich, and the poor don't know anything about this, they

can't use this currency, and it is really not a solution; it doesn't even address the subject of this inequity in the system that we have today.

Do you have any thoughts on that at all?

Mr. EBELING. Yes, I think that is an important point. We can see the problem sort of magnified as one reads about it in the press, for example, is what has happened in Greece right now. The fact is, is that for years, decades, the Greek government promised more than it has turned out it can pay for, either with taxes or with continuing borrowing.

That is one of the reasons some in Greece want to return to a drachma so they can just print the money that they need to cover the promises for which the real resources in the society are not available. It is the long run versus the short run.

In the short run, if the government can tax, borrow or print money, it can create the illusion of generating wealth and benefits and special opportunities for various segments of the society. But in the longer run, the problem is that eventually the piper has to be paid. The tax money runs out.

Or it can't borrow anymore, or it becomes very expensive, as the Spanish and the Italians are now finding, as well as the Greeks. Or they resort to printing money. But at the end of the day printing money dilutes the value of every unit of money in people's pockets. It destroys savings, it undermines the ability to undertake exchanges. It diminishes the ability for profit-making decision-making. And therefore, it is most devastating on the poor.

The analogy is like the kid who goes to the circus and he eats too much cotton candy. And his Uncle Bob who took him said, "Gee, I am sorry that you have a tummy ache, so to make you feel better here's more cotton candy." That is just exacerbating the problem. At the end of the day, the boy gets home and he has a big tummy ache.

And that is what has to be emphasized, the illusion—

Chairman PAUL. Okay, I want to interrupt for a minute because I want to know about whether the parallel currencies affect this in any way, positively or negatively. Or does it help this inequity and this disadvantage over the kind of system we have today?

Mr. EBELING. Yes, I would argue that if people had a choice in currency—whether they be rich, middle-income or poor—they would have a way to park their income and wealth in an alternative medium of exchange, a unit of account, that they could have greater security of, that its value is more certain and more stable based upon their fears and expectations about the trend their own national currency is following.

Chairman PAUL. So there is even an advantage to incrementalism in moving in this direction if it is available to the people rather than saying, “Well, we can’t do a thing until we repeal the Federal Reserve Act,” and that sort of thing.

Mr. EBELING. Absolutely.

Chairman PAUL. Okay, very good.

Now, I want to go to Mr. Luetkemeyer, if he has another question.

Mr. LUETKEMEYER. Thank you, Mr. Chairman.

To follow up on that, how do you protect the citizen to make sure that they don’t get slipped up on with going to alternative or parallel currencies? How do they have, how can they enable—we have a whole group of folks here this morning. How can each one of them know that if they want to transact business and each one of them a different currency, it is going to be something that they will be able to trade down the road?

Mr. LEWIS. This relates to your previous comment about confidence. In practice, it will be a process of some institution establishing a track record. And also the institution being sort of visibly considered to be a long-term—

Mr. LUETKEMEYER. So in other words, whether it is a country or city or a state, whatever entity produces the currency there will have to be a certain level of confidence in that entity to be able to—

Mr. LEWIS. Right.

Mr. LUETKEMEYER. There would—

Mr. LEWIS. And it will have to be earned. You can’t decree it. You can’t have an advertising campaign. We are kind of talking about these very small kind of neighborhood currencies. And on a larger scale, that might be where we would begin.

On a larger scale, it could be Citibank, it could be the State of Utah. I know some of my colleagues here would be appalled at the idea of the U.S. Federal Government issuing a parallel gold currency. But I think it is an interesting idea.

Or it might be the state of Russia. In practice, the one that has the most confidence will be the one that people use. The reason that people used the U.S. dollar after World War II is because it had a long history, over 100 years, of sticking to the gold standard. It had a stable political system, it was militarily impervious.

And that is why they used that instead of the currency of China or what have you. It will be, ultimately, a process of track record, and probably very large organizations will dominate.

Mr. LUETKEMEYER. Okay, Mr. Lewis, we have before us this morning your book. I was trying to read the cover and the back of it

here, as well as the inside slips. Can you just briefly tell me how you would like to see us—or could be enabled to be able to move over to the gold standard? What are your thoughts on it?

Mr. LEWIS. Ideally, you would all have an epiphany and understand that this is the best system for all of us. However, in practice, one of the reasons we are here today, I think, is that typically, people have these epiphanies after a tremendous catastrophe. It happened many, many times in the past.

Usually, things go all the way. You don't stop halfway and say, "Oh, I think I know where this is going. Let us stop now and switch to a gold standard system." Usually, you end up in disaster. Whether it be China in 1949; the hyperinflation, Japan in 1949; hyperinflation, United States in 1784; hyperinflation, Germany 1923.

Hyperinflation, you tend to end up with some kind of catastrophe beforehand. One of the nice things about the parallel currency idea is maybe you can avoid that process, that political cycle. You could establish something, even by the Federal Government or by very many means, and you could have the two options available.

So when people simply decide to do business in one currency or another—say I am going to write the contract in U.S. gold dollars, not U.S. Bernanke bucks, they will start to buy and sell and do business in that way. And then over a period of a few years, perhaps, people will just naturally decide which system they like better, the Bernanke system or the gold system, and they can migrate and, eventually, have a very smooth, non-disruptive transition between one and the other, ideally.

Mr. LUETKEMEYER. But even in your system of moving over to the gold standard, there still has to be a level of confidence and that as the backup, as the standard, would it not?

Mr. LEWIS. You would have to have—ultimately every currency has an issuer. And ideally, that issuer will have a track record of managing the currency correctly. And will likely probably be, in my opinion, a large institution, maybe a national government, maybe a State government, maybe a—maybe a large bank, maybe some other large institution that emerges.

We are simply not going to have the entire United States do business in a currency that is issued by something in—a little storefront in Miami or something of that sort when we get to that scale. So the institution will earn the confidence.

Mr. LUETKEMEYER. All right, thank you.

Thank you, Mr. Chairman.

Chairman PAUL. I thank the gentleman.

The Chair notes that some Members may have additional questions for this panel, which they may wish to submit in writing. Without objection, the hearing record will remain open for 30 days for Members to submit written questions to these witnesses and to place their responses in the record.

This hearing is now adjourned. I appreciate your appearance today. Thank you very much.

{Whereupon, at 11:08 a.m., the hearing was adjourned.}

STATEMENTS

STATEMENT FOR THE RECORD
HON. RON PAUL
REPRESENTATIVE, 14TH DISTRICT OF TX
CHAIRMAN, SUBCOMMITTEE ON
DOMESTIC MONETARY POLICY & TECHNOLOGY
U.S. HOUSE OF REPRESENTATIVES

One of the most pressing issues of our time is the push for monetary freedom. The only sound monetary system is one which protects sound money and allows consumers, businesses, and investors the freedom to transact in the currency of their choice. The importance of sound money is summed up nicely by Ludwig von Mises: “It is impossible to grasp the meaning of the idea of sound money if one does not realize that it was devised as an instrument for the protection of civil liberties against despotic inroads on the part of governments.” It is no wonder that governments fight tooth and nail against sound money, as sound money protects the well-being of the middle class and the poor while preventing the expansion of government.

Governments throughout history have sought to monopolize the issuance of money, either directly or through the creation of central banks. The growth of central banking in the 20th century allowed governments to monetize their debt in an indirect manner while still ensuring a ready market for government debt. And central banks' slow but sure debasement of the currency allowed governments to repay their debts in devalued money. What debtor would not want such a sweetheart deal?

Indeed, the 20th century witnessed a revolt by governments against the strictures of sound money. In some countries such as

Weimar Germany the revolution came quickly and the results were both immediately apparent and instantaneously disastrous. In other countries such as the United States, the revolt came more gradually, with the destructive effects of money printing only recently becoming apparent to more and more Americans.

Over the past 100 years, the Federal Reserve has continually pumped new money into the economy, resulting in a 96 percent devaluation of the dollar. This devaluation does not affect everyone equally, as the banks who receive this new money first benefit from using it before prices rise, while average Americans suffer the price rises first and receive only a trickle of money well afterward. In this way the Fed enriches Wall Street while impoverishing Main Street, leading to a growing disparity of wealth.

The wealthy are always able to protect the value of their assets against inflation to an extent that the middle class and poor cannot. Anyone with enough money and resources can set up a foreign bank account denominated in euros or Hong Kong dollars, or purchase gold and silver that will be safely stored in London or Singapore. The rich are best able to purchase precious metals, the only ones able to invest in high-yielding hedge funds, and the ones most able to shelter their assets from punitive taxation.

All the legislation and regulation that ostensibly protects the average American from losing money in fact does exactly the opposite. It keeps the average American from being able to defend against inflation by investing in precious metals, forces him into mediocre investment opportunities that do not even keep up with inflation, and leaves him at the mercy of the taxman. Compared to their counterparts in other countries, the average American has far fewer financial options available to them.

Mexican workers can set up accounts that are denominated in ounces of silver, and can take delivery of that silver whenever they want, tax-free. In Singapore and some other Asian countries, individuals can set up bank accounts denominated in gold and silver. Debit cards can be linked to gold and silver accounts so that customers can use their gold and silver to make point of sale transactions, a service which is only available to non-Americans. In short, Americans have far fewer options to protect their wealth than citizens of many foreign countries do.

The solution to this problem is to legalize monetary freedom and allow the circulation of parallel and competing currencies. There is no reason why Americans should not be able to transact, save, and invest in the currency of their choosing. Unfortunately, decades of

government restrictions and regulations have hampered and prevented the circulation of parallel currencies and destroyed the familiarity of Americans with any sort of money aside from Federal Reserve Notes or bank deposits denominated in U.S. dollars. The thought of introducing parallel currencies undoubtedly scares many people who understandably wish to minimize their financial risk.

All financial activity is fraught with risk. Most people understand the risks inherent in stock or bond investment, but the risk of holding savings accounts or cash is still drastically underappreciated. Everyone is familiar with the maxim “Don't put all your eggs in one basket” and investors and savers are constantly urged to diversify their portfolios, yet the U.S. government continues to set roadblocks that force Americans to transact and save in dollars that continue to depreciate.

According to the government's official figures, price inflation runs around two percent per year which means that, since interest rates on savings accounts are near zero, the real rate of return on savings accounts is negative. Anyone holding a savings account or cash is losing nearly two percent of the value of his savings per year with this relatively mild inflation. Some private economists estimate that actual price inflation is running closer to nine percent per year, which would make the loss from holding dollars enormous.

Even greater danger comes during bouts of hyperinflation, such as during Weimar Germany and more recently in Zimbabwe. But when Zimbabwe's dollar became worthless, people began to use U.S. dollars, South African rand, and Zambian kwacha to conduct transactions. Similarly in Weimar Germany, many individuals resorted to using dollars, pounds, and precious metals. So despite the economic hardship wrought by hyperinflation, not all economic activity ground to a halt, largely due to the circulation of parallel currencies. Should the United States ever face a hyperinflationary crisis, which due to the Fed's quantitative easing is very possible, the only means of survival would be through the use of parallel currencies.

It is horribly unjust to force the American people to do business with a dollar that is continuously debased by the Federal Reserve. Forcing a monopoly currency with legal tender status onto the people benefits the issuer (government) while harming consumers, investors, and savers. The American people should be free to use the currency of their choice, whether gold, silver, or other currencies, with no legal restrictions or punitive taxation standing in the way. Restoring the

monetary system envisioned by the Constitution is the only way to ensure the economic security of the American people.

WITNESS TESTIMONY

WRITTEN TESTIMONY OF NATHAN LEWIS PRINCIPAL KIKU CAPITAL MANAGEMENT LLC

Use of Parallel Currencies

The phrase “parallel currencies” tends to sound rather novel and experimental to us today, living in the United States. However, most people in the world are using parallel currencies today. Many of us have found that, when traveling to some foreign countries, that shops and restaurants are happy to accept U.S. dollars in return for their goods and services. Often, people there also use U.S. dollars among themselves, in their own commerce and business dealings. In this case, the U.S. dollar is serving as a parallel currency, alongside the currency issued by the domestic government, such as Costa Rican colón or Vietnamese dong.

In such places, the U.S. dollar is used not only by sidewalk vendors, but often by the largest corporations in the country. Throughout Latin America, until only a few years ago, large corporations would typically finance their operations with loans or debt denominated in

U.S. dollars. Indeed, the governments of these countries themselves borrowed in dollars, issuing dollar-denominated government bonds. After many decades of bad experience, nobody would buy a bond denominated in the local currency, which the government could devalue at a whim. Before the introduction of the Euro in 1999, German marks were popular throughout Europe. During the 1990s, governments with a history of poor currency

management, such as that of Greece, issued government debt denominated in German marks.

It is perhaps only in the United States, and more recently in the eurozone, that people are not already accustomed to using a variety of currencies in their daily business and commerce. Large U.S. corporations regularly do business in a variety of currencies, and investors commonly buy or sell foreign stocks or bonds using foreign currencies. For most of us, however, we have no reason to use the Ukrainian hryvna in our daily affairs. We would much rather use dollars.

Ukrainians, at some points in their history, have also preferred to use U.S. dollars. Why is that? It is because the dollar has consistently been one of the best-managed, highest-quality currencies in the world. For 182 years, from the founding of the United States in 1789 to 1971, the United States government adhered to the principle of a gold standard for the dollar, even if, in practice, it deviated from that ideal from time to time. The United States was following the example demonstrated by the best European governments, especially Britain, whose gold standard system can be traced to 1698.

However, during the 20th century, those European governments made a mess of things numerous times, and their currencies became unreliable. The British pound, like most of the currencies of Europe, became a floating currency at the onset of World War I, and soon depreciated in value. People didn't even know if France or Britain would exist after the war.

In the early 1920s, more European currencies became unreliable, with the hyperinflation of the German mark perhaps the best remembered example. By 1926, Europe had mostly reconstructed the world gold standard system that existed before the war, just in time for the chaos of the Great Depression. During the Great Depression, currencies everywhere were devalued, led by Britain in 1931. Also, we tend to forget today that several European governments also defaulted on their sovereign debt during the 1930s, including Austria, Germany, Greece, Hungary, Poland, Romania and Turkey.

By the end of World War II, the U.S. dollar, which had been considered an emerging-market currency in 1900, had proved to be the most reliable currency in the world. It thus became the parallel currency of choice worldwide, and U.S. tourists in the 1950s found that they could spend their dollars throughout Europe. The British pound still had some fans, but after a devaluation in 1949 and again in 1967, few people were willing to give Britain anymore chances.

In 1971, the United States abandoned its then nearly two-

century-old commitment to the gold standard system. At this point, historically, currencies were often discarded for whatever the highest-quality, most reliable alternative was, which in practice meant a gold standard currency from a large developed country. However, a consequence of the U.S.'s abandonment of the gold standard in 1971, due to the nature of the Bretton Woods system, was that other governments' currencies left gold too. There was no gold standard alternative in the world.

Since 1971, the value of the U.S. dollar has fallen from $1/35^{\text{th}}$ of an ounce of gold to about $1/1600^{\text{th}}$ of an ounce today. The dollar today is worth only $1/46^{\text{th}}$ of its value during the Kennedy administration. As bad as this is, the alternatives have been even worse. This is why the U.S. dollar remains the most popular currency in the world, and serves as a parallel currency in many, if not most, countries today.

After several centuries of stability, the dollar became a floating fiat currency in 1971. Since then, it has fallen to about $1/46^{\text{th}}$ of its prior value. The decline in the 1780s represents the hyperinflation of the Continental dollar.

Use of Parallel Currencies in the U.S. Today

Today, there are no particularly onerous barriers against using a parallel currency in the United States. People are free to do business in euros or Russian rubles if they choose to. It would be easier if there were no tax consequences from this, such as a capital gains tax. This

is the case in Switzerland or Hong Kong, where people can do business in the currency of their choice without tax issues. At least one country, Zimbabwe, has no official currency, but rather a formal multi-currency policy where people can do business using any currency the like. In practice, this has turned out to be primarily U.S. dollars, with some use of South African rands.

Historically the preferred currency of business, in any country, is one based on a gold standard system. British pounds, and later U.S. dollars, became the preferred parallel currency throughout the world for this reason. It was the currency people chose to use instead of their own government's fiat junk.

Some people today, including myself, think that the United States should return to the monetary principles of the country's first 182 years – in other words, a gold standard system. However, that idea remains contentious, particularly among those who believe that a currency should be used as a tool for economic manipulation. Our present chief currency manager, Benjamin Bernanke, spent his academic career arguing for the merits of economic manipulation via currency manipulation. A gold standard system would prevent such things.

However, even among academics who share Mr. Bernanke's viewpoints, the idea of letting people choose whatever currency suits them best remains a popular one. The concept of parallel currencies, including those based on gold, within the United States seems to be relatively uncontroversial among the economic mainstream.

Today, there are over 150 currencies in the world, all of which could conceivably be used as parallel currencies within the United States or other countries. However, all of them are floating fiat currencies, generally of lower quality than the U.S. dollar or euro. There is hardly any reason to introduce another. Thus, the most meaningful new parallel currency to be introduced, in the U.S. or in another country, would be one based on gold.

Difficulties of Using Gold-and Silver-Based Parallel Currencies in the U.S. Today

Although the use of other countries' national currencies is largely accepted in the U.S., the issuance of alternative currencies within the U.S. can run afoul of what are collectively known as "legal tender laws," both *de jure* and *de facto*. Beginning in 1998, a private businessman, Bernard von NotHaus, issued a system of coinage and paper bills called Liberty Dollars that represented warehouse receipts for gold and silver bullion. The notes and coins bore no resemblance

Federal Reserve Notes or U.S. Mint coins. About 250,000 people apparently participated in the system. Although other alternative currencies have existed, such as “Phoenix dollars,” Baltimore’s “BNote,” “BerkShares,” “Ithaca Hours,” and “bitcoin,” this was apparently the only such system based on gold and silver.

Liberty Dollar notes and coins.

In 2006, the U.S. Mint issued a press release stating that the U.S. Justice Department had determined that using Liberty Dollars was a Federal crime. The press release stated:

Under 18 U.S.C. § 486, it is a Federal crime to pass, or attempt to pass, any coins of gold or silver intended for use as current money except as authorized by law. ...

NORFED’s “Liberty Dollar” medallions are specifically marketed to be used as current money in order to limit reliance on, and to compete with the circulating coinage of the United States. Consequently, prosecutors with the United States Department of Justice have concluded that the use of NORFED’s “Liberty Dollar” medallions violates 18 U.S.C. § 486, and is a crime.

In 2007, the Federal Bureau of Investigation (FBI) raided the warehouse used by the Liberty Dollar system at the Sunshine Mint in Coeur D’Alene, Idaho, confiscating a reported \$7 million of gold and silver bullion. The seizure warrant was for money laundering, mail fraud, wire fraud, counterfeiting, and conspiracy.

In 2009, von NotHaus was arrested and charged with: one count of conspiracy to possess and sell coins in resemblance and similitude of coins of a denomination higher than five cents, and silver coins in resemblance of genuine coins of the United States in denominations

of five dollars and greater, in violation of 18 U.S.C. § 485, 18 U.S.C. § 486, and 18 U.S.C. § 371; one count of mail fraud in violation of 18 U.S.C. § 1341 and 18 U.S.C. § 2; one count of selling, and possessing with intent to defraud, coins of resemblance and similitude of United States coins in denominations of five cents and higher, in violation of 18 U.S.C. § 485 and 18 U.S.C. § 2; and one count of uttering, passing, and attempting to utter and pass, silver coins in resemblance of genuine U.S. coins in denominations of five dollars or greater, in violation of 18 U.S.C. § 486 and 18 U.S.C. § 2.

In 2011, von NotHaus was convicted on several counts, and faced up to 15 years of jail time. In 2011, von NotHaus was labeled a domestic terrorist by the FBI.

Conceivably, people today could do business using gold coins produced by the U.S. Mint, such as the popular American Eagle gold and silver coins. However, they too would face unusual difficulties. Despite its long history as the foundation of monetary systems in the United States and elsewhere, gold today is regarded as a “collectible,” and subject to a different system of taxation than if one were to do a similar transaction using foreign currencies such as euros or Canadian dollars. The capital gains tax rate on “collectibles” held for one year or longer is 28%, compared to 15% for stocks and bonds.

For example, if a house were purchased using U.S. Mint gold coins, the transfer of the coins to the seller would be regarded as a “sale” of gold bullion for tax purposes, and subject to capital gains taxes. If the same transaction were done with euros, no such taxes would apply. (Capital gains taxes would apply to the eventual sale of the house, and if the euros were converted back to dollars.)

In addition, purchases or sales of small quantities of gold are subject to sales taxes in many states. California, for example, charges sales tax on bullion sales of less than \$1,500. Thus, a businessman who wished to pay employees using a 1/10th ounce U.S. Mint gold bullion coin, or one-ounce U.S. Mint silver coins, may face sales taxes on his “sale” of the bullion coins to the employee. (No such sales taxes apply to purchases of euros.)

Also, transactions in gold bullion are now subject to onerous surveillance, which does not apply to similar transactions in foreign currencies. To give an idea of the present state of affairs, here is some information from bullion dealer metallixdirectgold.com:

4. COMPLIANCE WITH GOVERNMENT AGENCIES; RECORDED CONVERSATIONS.

A. Documentation for Payment. Several states require that we obtain your driver's license number or other government-issued identification and a sworn statement from You as to the Merchandise and compliance with applicable law before we process any payment to You. Certain localities require completion of forms and a waiting period for a transaction in precious metal. If merchandise contains by weight or volume 50% or more of precious metal and is valued at more than \$3,000, federal anti-money laundering laws obligate us to obtain certain completed forms and identity information from you before we process the transaction (such local, state and federal documentation, "Compliance Documents"). You agree to supply such Compliance Documents to us upon our request. . If You fail to provide such Compliance Documents to us within 5 Business Days after the date of our notice to You requesting such information, we have the option to terminate the proposed Transaction and return your Merchandise in the form in which You furnished it to us or in a different form in accordance with this Agreement without providing You with additional notices.

Thus, in practice, the U.S. Federal Government makes a powerful effort to suppress the introduction and use of alternative gold-and silver-based currencies today.

This state of affairs has become intolerable to many. In 2011, the State of Utah declared that it would consider U.S. Mint gold and silver coins (and monetary instruments based on these coins) to be legal as currency. This included the removal of all state-level taxes on transactions in gold and silver bullion. The Utah example has been widely followed. Twelve other state legislatures have had similar bills proposed. ²⁷¹The Utah example could serve as a template for similar Federal-level legislation to legalize gold and silver (and associated monetary instruments) as currency within the United States.

Parallel Currencies Issued by National and State Governments

In the last decade, some governments have taken steps to introduce gold-based parallel currencies, intended to circulate alongside their existing currencies, and to be used internationally.

In 2002, the prime minister of Malaysia proposed the introduction of a gold dinar currency, for use throughout the Islamic world. In 2006, gold dinar coins (containing 4.25 grams of gold) were introduced by the government of the Malaysian state of Kelantan. This was

²⁷¹ South Carolina, North Carolina, Alabama, Virginia, Tennessee, Missouri, Idaho, California, Colorado, Washington, Indiana and Minnesota.

followed by the state of Perak in 2011. The coins have been quite popular. However, the effort to create a usable international currency based on the gold dinar has been hindered, in my opinion, by the fact that small denomination banknotes and coins have not yet been issued. Gold coins are much too valuable (have a high denomination) to be useful in small daily transactions by themselves. Also, banking arrangements based on the new currency have apparently not been established yet.

Malaysian gold dinar and silver dirham coins, produced by the state of Kelantan. In 2002, the prime minister of Malaysia stated the intent to create a gold dinar system to serve the entire Islamic world.

In 2011, the Swiss Parliament began discussions on the creation of a gold franc, which would be issued by the Swiss national government and circulate in parallel with the existing Swiss franc, a floating fiat currency. The initiative is part of the “Healthy Currency” campaign sponsored by the conservative Swiss People’s Party.

Governments of the Gulf States have discussed a common currency tentatively named the khaleeji, which some have speculated would be based on gold. In August 2011, the Dubai Multi Commodities Center introduced a gold coin, called the khalifa, intended to serve as legal currency. The DMCC is in talks with the central bank of the UAE to designate the coin as legal tender throughout the UAE and Middle East.

Proposed khalifa coin, intended to serve as legal currency in the Gulf States region.

What if the U.S. Federal government itself issued a parallel currency, in particular one based on a gold standard system? It could be quite popular both in the U.S. and abroad. The U.S. Federal government already has a long history of this. From 1882 to 1933, the Federal government issued gold certificates – a form of banknote, or paper money, redeemable for gold bullion – that constituted a major part of the U.S. currency system. During that time, both U.S. Treasury gold certificates and National Bank Notes issued by a menagerie of private banks circulated alongside. The gold certificates were more popular, due to their uniformity and the fact that people trusted the reliability of the Federal government far more than the small commercial banks of the day. In 1914, gold certificates accounted for 32% of circulating currency in the United States.

U.S. Treasury Gold Certificate, series 1922. These gold certificates circulated alongside many other types of banknotes, including Federal Reserve Notes and National Bank Notes. People were free to choose which banknote they preferred.

If the Federal government does not wish to undertake such a program, a state government, such as the State of Utah, could conceivably issue its own parallel currency.

Historically, before 1971, there was little reason for national governments to issue their own parallel currencies, because their primary currencies were already operating on a gold standard system. However, there is at least one example: in 1922, the Russian government introduced the gold-based chervonets currency, to circulate alongside the ruble, which at the time was a floating fiat currency. By 1947, the ruble itself had been pegged to gold, thus negating any need for a parallel gold-based currency. Thus, the chervonets was retired.

1937 Russian gold chervonets banknote. The chervonets was introduced by the Russian national government as a parallel currency to the floating fiat ruble

in 1922.

A similar example comes from Germany. In November of 1923, a new currency based on gold, the rentenmark, was introduced to replace the hyperinflated Reichsmark. For a short period, the two currencies circulated alongside, the rentenmark pegged to gold and the reichsmark continuing its plunge into oblivion. The rentenmark was quickly adopted by all, and the Reichsmark in effect disappeared from circulation.

German rentenmark banknote. The rentenmark was introduced by the nationally-sanctioned Rentenbank as a gold-based parallel currency, at first circulating alongside the hyperinflated reichsmark.

Gold and silver have reportedly been declared legal currency in China, and major state-owned commercial banks there now offer gold- and silver-denominated bank accounts.²⁷²

Significance of Gold-Based Parallel Currencies Today

The discussion today around parallel currencies is part of a broader discussion: whether to have a currency that can be manipulated for economic effect, or to have a currency which is as stable and reliable as possible, free of human intervention. Traditionally, these have been known as “soft money” and “hard money,” and, in practice, have meant either a floating fiat currency, or a gold standard system. The two options are, for the most part, mutually exclusive: it is not possible to have a gold standard system and a policy of monetary manipulation together for any length of time.

²⁷² See for example: <http://businesstimes.com.vn/chinas-banks-use-gold-as-legal-currency/>

Both options have been used, by one government or another, for literally thousands of years. We have a lot of experience in these matters. For the entire post-medieval history of capitalism -- stretching from the Italian city-states of the Renaissance era, through the heyday of Amsterdam as the world's financial center in the 17th century, through the entire history of the Industrial Revolution with London as the world's financial center in the 19th century, into the 20th century with the U.S. as the leader of the capitalist world -- a gold standard system was the preferred monetary foundation.

The worldwide transition to floating fiat currencies, or "soft money," in 1971 reflected the increasing popularity of currency manipulation ideas beginning in the 1930s. However, it also reflected simple incompetence. It was an accident. In 1971, the Bretton Woods gold standard system had delivered twenty years that were among the most prosperous in world history. There was no reason to change it. President Nixon himself said that the end of the gold standard in August 1971 would be temporary. Indeed, he tried to reinstate it with the Smithsonian Agreement in December 1971, which he called "the most significant monetary agreement in the world."

Thus, it is not surprising today that we are again trying to find a way back to the world gold standard system, which worked so well for literally centuries.

Rather than endlessly debating the merits of one system or another, a simpler method is to make both options available, and allow people to choose which they prefer. Just as people in Turkey today choose to do business either in the Turkish lira or euros, as suits their needs, people in the U.S. or elsewhere could choose to do business either in floating fiat dollars or some gold-based alternative.

According to a study of 775 floating fiat currencies by Michael Hewitt²⁷³, no floating fiat currency has ever maintained its value. In 20% of cases, they were destroyed in hyperinflation; 21% were destroyed by war; 12% disappeared in independence; 24% underwent a monetary reform; and 23% exist today, awaiting their final outcome. The average life expectancy of a floating fiat currency was found to be 27 years.

The U.S. dollar, which has been a floating fiat currency for 41 years now, is thus an unusual example of longevity. However, today's extreme reliance upon "easy money" approaches to deal with economic problems -- with the Federal Reserve promising

²⁷³ Hewitt, Michael. "The Fate of Paper Money," dollaraze.org, January 7, 2009. http://dollaraze.org/blog/?post_id=00405

unprecedented zero percent policy rates for years, and “real” interest rates deeply negative – suggests to many that the floating fiat dollar does not have a long or successful future. Unfortunately, with world currency arrangements still very dollar-centric, the management of the dollar has consequences for everyone. Governments of China, Russia, the Gulf States and others have complained about the potential consequences of today’s aggressive “soft money” techniques – not only at the Federal Reserve but also the European Central Bank, Bank of England, and Bank of Japan – and have made preliminary steps toward a future alternative.

At a G8 meeting in July 2009, Russian President Dmitry Medvedev illustrated his call for a supranational currency to replace the dollar with a coin that he called a sample of a “united future world currency.” The coin is half-ounce gold bullion coin. Such a “supranational currency” would be, in effect, a parallel currency, used alongside national currencies.

The coin held by President Medvedev. source: futureworldcurrency.com

On the international scale, a parallel gold-based currency, or many such currencies, would help ease this transition, and form the basis of a new monetary order if that should become necessary. Each individual would be free to make increasing use of the gold-based alternative, as it best suited their interests. There would be no great day of transition, but a smooth extended process perhaps over years. The existence of a high-quality alternative could help people avoid much of the potentially disastrous consequences if today's floating fiat currencies meet the same end as the 599 floating currencies that no longer exist.

If the United States government wishes to retain its leadership role in world monetary affairs, I suggest that this alternative be created in the United States – either by federal or state governments themselves, or by allowing private institutions to do so. Otherwise, governments that are clearly establishing the foundation for a future dollar alternative, likely based on gold, will take that role in the future.

**WRITTEN TESTIMONY OF
RICHARD EBELING, Ph.D.**
PROFESSOR OF ECONOMICS
NORTHWOOD UNIVERSITY

The gold standard alone is what the nineteenth-century freedom-loving leaders (who championed representative government, civil liberties, and prosperity for all) called “sound money.” The eminence and usefulness of the gold standard consists in the fact that it makes the supply of money depend on the profitability of mining gold, and thus checks large-scale inflationary ventures on the part of governments.²⁷⁴

--Ludwig von Mises

To discuss a possible roadmap to monetary freedom in the United States requires us to first determine what may be viewed as a “sound” or “unsound” money. Through most of the first 150 years of U.S. history, “sound money” was considered to be one based on a commodity standard, most frequently either gold or silver. In contrast, the history of paper, or fiat, monies was seen as an account of abuse, mismanagement and financial disaster, and thus “unsound” money.

The histories of the Continental Notes during the American Revolution, the *Assignats* during the French Revolution, and then Greenbacks and the Confederate Notes during the American Civil War, all warned of the dangers of unrestricted and discretionary government power over the monetary printing press.²⁷⁵ This view was summed up in the middle of the nineteenth century by the famous British economist, John Stuart Mill, whose *Principles of Political Economy* was a widely used textbook for decades not only in his native Great Britain, but in the United States, as well:

²⁷⁴ Ludwig von Mises, “The Gold Problem,” [1965] in *Planning for Freedom* (South Holland, Ill: Libertarian Press, 1980); see, also, Richard M. Ebeling, *Austrian Economics and the Political Economy of Freedom* (Northampton, MA: Edward Elgar, 2003), Chapter 5: “Ludwig von Mises and the Gold Standard,” pp. 136-158.

²⁷⁵ On the American Continental Notes, the French Revolutionary Assignats, and the Greenbacks and Confederate currency during the American Civil War, see, J. Laurence Laughlin, *A New Exposition of Money, Credit and Prices*, Vol. II (Chicago: University of Chicago Press, 1931), pp. 147-185 & 302-341; Edwin W. Kemmerer, *Money* (New York: MacMillan, 1935) pp. 173-197 & 230-270; and, Richard M. Ebeling, “Inflation and Controls in Revolutionary France: The Political Economy of the French Revolution,” in Stephen Tonsor, ed., *Reflections on the French Revolution* (Washington, D.C.: Regnary Gateway, 1990) pp. 138-156; and Richard M. Ebeling, “The Great French Inflation,” *The Freeman: Ideas on Liberty* (July/August, 2007) pp. 2-3.

The issuers may add to it indefinitely, lowering its value and raising prices in proportion; they may, in other words depreciate the currency without limit. Such a power, in whomsoever vested, is an intolerable evil ... To be able to pay off the national debt, defray the expenses of government without taxation, and in fine, to make the fortunes of the entire community, is a brilliant prospect, when once a man is capable of believing that printing a few characters on bits of paper will do it ... There is therefore a preponderance of reasons in favor of a convertible, in preference to even the best-regulated inconvertible currency. The temptation to over-issue, in certain financial emergencies is so strong, that nothing is admissible which can tend, in however slight a degree, to weaken the barriers that restrain it.²⁷⁶

Episodes of great inflations in countries like Germany, Austria, and China in the twentieth century only have reinforced the advocates of “sound money” on the dangers of paper money in the hands of any political authority.²⁷⁷

The importance of a monetary system based on gold, therefore, is that it limits the range of discretion open to governments to manipulate the quantity and value of money. The fundamental rule that the supply of money in the economy is anchored to the profitability of gold production as determined by market forces depoliticizes the monetary system to a significant degree.

Given an established redemption ratio between bank notes and deposit accounts and a quantity of gold on deposit in banks; given fixed reserve requirements on checking and other forms of bank deposits; given an established rule of the right of free import and export of gold between one's own country and the rest of the world; and assuming that the political authority with responsibility over the country's monetary system does not interfere with these conditions and rules, then political influences on the value and quantity of money would be minimized.

The Gold Standard in Practice

In the second half of the nineteenth century most of the major nations of the world put into place national monetary systems based

Ebeling, “The Lasting Legacy of World War I: Big Government, Paper Money, and Inflation” *Economic Education Bulletin*, Vol. XLVIII, No. 11 Great Barrington, MA: American Institute for Economic Research, November 2008); and on the hyperinflation in China during the 1930s and 1940s, see, Richard M. Ebeling, “The Great Chinese Inflation,” *The Freeman: Ideas on Liberty* (December 2004), pp. 2-3.

on gold. By the fact that such a large number of countries had each linked their respective currencies to gold at some fixed rate of redemption in this manner, there emerged an international gold standard. A person in any one of those countries could enter any number of established, authorized banks and trade in a certain quantity of bank notes for a stipulated sum of gold, in the form of either coin or bullion. He could transport that sum of gold to any of the other gold-based countries and readily convert it at a fixed rate of exchange into the currency of the country to which he had traveled.

As Murray Rothbard expressed it in, *What Has Government Done to Our Money?*:

The world was on a gold standard, which meant that each national currency (the dollar, pound, franc, etc.) was merely a name for a certain definite weight of gold. The "dollar," for example, was defined as 1/20 of a gold ounce, the pound sterling as slightly less than 1/4 of a gold ounce ... This meant that the "exchange rates" between various national currencies were fixed, not because they were arbitrarily controlled by government, but in the same way that one pound of weight is defined as being equal to sixteen ounces.²⁷⁸

Why did governments recognize and (with occasional exceptions) follow the rules of the gold standard through most of the nineteenth century? Because the gold standard was considered an integral element in the reigning political philosophy of the time, classical liberalism. As the German free-market economist Wilhelm Roepke explained in *International Order and Economic Integration*:

The international "open society" of the nineteenth century was the creation of the "liberal spirit" in the widest sense, [guided by] the liberal principle that economic affairs should be free from political direction, the principle of a thorough separation between the spheres of government and of economy . . . The economic process was thereby removed from the sphere of officialdom, of public and penal law, in short from the sphere of the "stat" to that of the "market," of private law, of property, in short to the sphere of "society."²⁷⁹

At the same time, said Roepke,

This [liberal] principle also solved an extremely important special problem of international integration . . . i.e., the problem of an international monetary system . . . in the form of a gold standard . . . It was a monetary system which rested upon the structural

²⁷⁸ Murray N. Rothbard, *What Has Government Done to Our Money?* (Auburn, AL: Ludwig von Mises Institute, 1990) p. 23-24.

²⁷⁹ Wilhelm Roepke, *International Order and Economic Integration* (Dordrecht, Holland: D. Reidel Publishing, 1959) p. 75.

similarity of the national systems, and which made currency dependent, not upon political decisions of national governments and their direction, but upon the objective economic laws, which applied once a national currency was linked to gold . . . But it was at the same time a phenomenon with a moral foundation . . . The obligations, namely, which a conscientious conformity with the rules of the gold standard imposed upon all participating countries formed at the same time a part of that system of written and unwritten standards which . . . comprised the [international] liberal order.²⁸⁰

In the nineteenth century, the ruling idea had been liberty. The wealth of nations was seen as arising from individual freedom in a social order respecting private property in the means of production. The relationships among men, it was believed, should be based on voluntary exchange for mutual benefit. Just as there were no inherent antagonisms among men in a free market within the same nation, there were no inherent antagonisms among men living in different nations. The mutual gains from trade could be expanded by extending the principle of division of labor to a global scale. If men were to benefit from those possibilities, a stable, sound, and trustworthy monetary order had to assist in the internationalization of trade. Gold was considered the commodity most proven through the ages to serve that function. And preservation of the gold standard, therefore, was given a prominent place among the limited duties assigned to the classical-liberal state in that earlier era.

In the nineteenth century there also was a greater humility among those who constructed and implemented various government economic policies. There was a general agreement with Adam Smith's observation that "the statesman, who should attempt to direct private people in what manner they ought to employ their capitals, would not only load himself with a most unnecessary attention, but assume an authority which could safely be trusted, not only to no single person, but to no council or senate, and which would nowhere be so dangerous as in the hands of a man who had the folly and presumption enough to fancy himself fit to exercise it."²⁸¹

The Gold Standard, Central Banking, and Changing Monetary Policy Goals

The classical liberals were deeply suspicious of government abuse of the printing press. They believed that only a monetary system

²⁸⁰ Ibid., pp. 76-77.

²⁸¹ Adam Smith, *An Inquiry into the Nature and Causes of the Wealth of Nations* (New York: New Modern Library, [1776] 1937), Book IV, Chapter II, p. 423.

under which all bank-issued notes and other deposit claims were redeemable on demand for gold could act as a sufficient check against the abuse and debasement of a currency.

However, even in the high-water mark of classical liberalism in the nineteenth century, practically all advocates of the free market and free trade believed that money was the one exception to the principle of private enterprise. The international monetary order of the last century, of which Wilhelm Roepke spoke in such glowing terms, was nonetheless the creation of a planning mentality. The decision to “go on” the gold standard in each of the major Western nations was a matter of state policy.

A central-banking structure for the management and control of a gold-backed currency was established in each country by its respective government, either by giving a private bank the monopoly control over gold reserves and issuing banknotes or by establishing a state institution assigned the task of managing the monetary system within the borders of a nation. The United States was the last of the major Western nations to establish a central bank, but it finally did so in 1913.

Central-banking authorities were given the power and responsibility to manage the gold reserves at their disposal and the quantity of notes and other bank deposit claims outstanding to maintain the soundness of the monetary system and to counteract various short-term fluctuations in the national currency's foreign-exchange rate, the balance of payments, and the quantity of financial credit available in the country's economy. Their policy “tools” included manipulation of short-term interest rates and the buying and selling of private-sector bills of trade and securities.

While the goals for monetary policy may have been considered modest and limited in the eyes of the classical liberals of the nineteenth century, it remained a fact that the monetary system was a subject for national government policy. In an era of relatively unrestricted free-market capitalism, money and the monetary system were a “nationalized industry.” And as such, even most of the advocates of economic liberty argued for monetary socialism and monetary central planning. They failed to call for and defend the privatization of the most important commodity in a market economy – the medium of exchange.

What they forgot was that once a government has control and responsibility for the monetary system within a country, little was outside the power of that government to influence and manipulate. This was clearly stated by a prominent German economist named

Gustav Stolper while a refugee in the United States from war-torn Europe during the Second World War:

Hardly ever do the advocates of free capitalism realize how utterly their ideal was frustrated at the moment the state assumed control of the monetary system . . . A “free” capitalism with government responsibility for money and credit has lost its innocence. From that point on it is no longer a matter of principle but one of expediency how far one wishes or permits governmental interference to go. Money control is the supreme and most comprehensive of all government controls short of expropriation.²⁸²

As a result, when economic collectivism, socialism, and interventionism gained popularity and power in the early decades of the twentieth century, money was the one area in which the central-planning ideal was already triumphant. For a hundred years, now, in the United States it had been taken for granted that the state should have either direct or indirect monopoly control over the supply of money in the market.

In the nearly one hundred years since the First World War, the goals assigned to monetary central planning changed, but the instrument for their application remained the same – central bank management of the money supply. In the 1920s, Federal Reserve policy was heavily focused on “price level” stabilization; its result was generating a variety of imbalances between saving and investment that set the stage for the Great Depression.²⁸³

Beginning in the 1930s, under the growing influence of Keynesian Economics the goal was to influence the levels of aggregate employment and output in the economy. After the disastrous experience with Keynesian-generated “stagflation” in the 1970s – a combination of significantly rising prices and persistently high unemployment – the monetary authorities in the 1980s and 1990s focused on slowing down and “controlling” inflation.²⁸⁴ In the late 1990s, the Federal Reserve switched back to a more “activist” monetary policy that fed the excesses of the “high tech” bubble that

Ebeling, *Political Economy, Public Policy, and Monetary Economics: Ludwig von Mises and the Austrian Tradition* (London/New York: Routledge, 2010), Chapter 7: “The Austrian Economists and the Keynesian Revolution: The Great Depression and the Economics of the Short-Run,” pp. 203-272.

²⁸⁴ On the “stagflation” of the 1970s, see, Gottfried Haberler, *The Problem of Stagflation: Reflections on the Microfoundation of Macroeconomic Theory and Policy* (Washington, D.C.: American Enterprise Institute, 1985).

went bust shortly after the turn of the new century. Then, in 2003, fearful of hypothetical “deflationary” forces,²⁸⁵ the Federal Reserve went on a policy of monetary expansion that created the monetary and credit wherewithal that produced the housing and investment and consumer spending boom that went dramatically bust in 2008 – and from which we are still attempting to recover, especially in terms of employment.²⁸⁶

In addition, throughout the last century, governments – including the United States government – loosened the limits that gold placed on the ability of their central banks to expand the money supply and manipulate the amount of credit created and issued through the banking system to further changing monetary and fiscal goals. For decades, now, governments – including the United States government – have completely eliminated this “break” on their discretionary monetary policy by virtually ending any connection between the paper currencies they control and gold.

The world economy operates in an economic environment of paper monies under the monopoly control central banks.

Central Banking is a Form of Central Planning – With the Same Defects

One of the primary benefits of economic freedom is that it decentralizes the negative effects that may arise from ordinary human error. Every one of us makes decisions that we hope will produce outcomes we desire.

Yet the actual outcomes from our actions often fail to match up to the hopes that motivated them. A businessman who misreads market trends in planning his private company's production and marketing strategies may experience losses that require him to cut back his activities, resulting in some of his employees' losing their jobs and in

²⁸⁵ See, Richard Ebeling, “The Hubris of Central Bankers and the Ghosts of Deflation Past,” *In Defense of Capitalism & Human Progress* blog (July 5, 2010), <http://blogs.northwood.edu/indefenseofcapitalism/2010/07/05/the-hubris-of-central-bankers-and-the-ghosts-of-deflation-past-by/>

²⁸⁶ On the current economic crisis, see my testimony before the House of Representatives Subcommittee on Domestic Monetary Policy and Technology delivered on May 11, 2011: Richard M. Ebeling, “Monetary Policy, the Federal Reserve, and the National Debt Problem,” *In Defense of Capitalism & Human Progress* blog (May 11, 2011), <http://blogs.northwood.edu/indefenseofcapitalism/2011/05/>.

resource suppliers' experiencing fewer sales because the loss-suffering businessman reduces his orders for what they have for sale.

But the negative ripple effects from his entrepreneurial mistakes are localized within one corner of the overall market. Other sectors of the market need not be directly penalized or subject to the unfortunate effects of his poor judgment. Profit-making enterprises can freely go about their business hiring, producing, and then selling the goods that they have more correctly anticipated the consuming public actually desires to buy.

Under government central planning, however, errors committed by the central planners are more likely to have an impact on the economy as a whole. Every sector of the economy is directly interlocked within the centrally planned blueprint for the allocation of resources, the quantities of different goods and services to be produced, and the distribution of the output to the consuming public.

Centralized failures in resource use or production decisions more directly affect every sector of the economy, since nothing can happen in any of the government-run industries independently of how the central planners try to fix their mistakes. Everyone more directly feels the consequences of the central planners' errors and must wait for those planners to devise a revised central plan to correct the problem.

Monetary central planning suffers from the same sort of defect. Changes in the money supply emanate from one central source and are determined by the monetary central planners' conceptions of the "optimal" or desired quantity of money that should be available in the economy. Their central decision can indirectly influence the pattern of interest rates (at least in the short run) and the market structure of relative prices and inevitably bring about changes in the general value, or purchasing power, of the monetary unit. The monetary central planners' policies work their way through the entire economy, possibly bringing about a cycle of an inflationary boom followed by general economic downturn or even depression.

Halting the inflation and bringing an unsustainable boom to an end depends upon the monetary central planners' discovery that things "may have gone too far" and a decision by them to reverse the course of monetary policy. Many, if not most, sectors of the market will then have to modify and correct investment, production, and employment decisions that had been made under the false, inflationary price signals the central planners' monetary policy has artificially created. Capital, wealth, and income spending patterns in

the market will have been misdirected and partly wasted because of the errors committed by the monetary central planners.

The opponents of central banking have argued that the occurrence of such errors would be less frequent and discovered more quickly under a system of competitive free banking. Any private bank that “over-issued” its currency would soon discover its mistake through the feedback of a loss of gold or other reserves through the interbank clearing process and withdrawal by its depositors. The bank would realize the necessity of reversing course to ensure that its gold- and other-reserve position was not seriously threatened and avoid the risk of losing the confidence of its own customers because of heavy withdrawals by depositors.

Moreover, the effect of such a private bank's following a “loose” and “easy” monetary policy would be localized by the fact that only its banknotes and check money would be increasing in supply because of the additional spending of those to whom that bank had extended additional loans. It could neither force an economy-wide monetary expansion throughout the entire banking system nor create an economy-wide price-inflationary effect. Any negative consequences, while being unfortunate, would be limited to a relatively narrow arena of market decisions and transactions.

Free Banking and the Benefits of Market Competition

One of the strongest arguments that advocates of the free market have made over the last 200 years has been to point out the benefits of competition and the harmfulness of government-supported monopoly. In a competitive market, individuals are at liberty to creatively transform the existing patterns of producing and consuming in ways they think will make life better and less expensive for themselves and other members of society as a whole.

Wherever legalized monopoly exists, the privileged producer is protected from potential rivals who would enter his corner of the market and supply an alternative product or service to those consumers who might prefer it to the one marketed by the monopolist. Innovation and opportunity are either prevented or delayed from developing in this politically guarded sector of the economy. Production methods remain unchanged or are modified only with great delay. Product improvements are slow in being developed and introduced. Incentives for cost efficiencies are less pressing and, when utilized, are often only sluggishly passed on to consumers in the form of lower sale prices.

Those who have the vision and daring to enter the market and successfully innovate and create newer or better products than the existing suppliers are offering are stymied or blocked from doing so in the protected sectors of the economy. They are forced to apply their entrepreneurial drive in less-profitable directions or are dissuaded by the political restrictions from even attempting to do so. The product improvements they would have supplied to the consuming public remain invisible “might-have-beens” lost to society.

Furthermore, as Friedrich A. Hayek especially emphasized, market competition is the great discovery procedure through which it is determined who can produce the better product with the most desired features and qualities and at the lowest possible price at any given time.²⁸⁷ It is the peaceful market method through which each participant in the social system of division of labor finds his most highly valued use as judged by the relative pattern and intensity of consumer demand for the various goods supplied. Competition's dynamic quality is that it is a never-ending process. In the arena of exchange, every day offers new opportunities and allows entrepreneurs and innovators to create new opportunities that they are free to test on the market in terms of possible profitability.

Every political restriction or barrier placed in the way of competition, therefore, closes the door on some potential creativity, risk-taking, and entrepreneurial discovery of more efficient and rational uses of men, materials, and money in the interdependent and mutually beneficial relationships of market specialization and cooperation. The choice is always between market freedom and political constraint, between the competitive process and governmentally created monopoly.

This general argument in favor of market competition and against politically provided monopoly is no less valid in the arena of money and banking. The participants in the market may choose money they find most advantageous to use, or government can impose the use of a medium of exchange on society and monopolize control over its supply and value. The benefit from market-chosen money is that it reflects the preferences and uses of the exchange participants themselves. Participants in the market process will sort out which commodities offer those qualities and characteristics most useful and convenient in a medium of exchange. As the Austrian economists persuasively demonstrated, while money is one of those social

²⁸⁷ F. A. Hayek, “Competition as a Discovery Procedure,” [1969] in *New Studies in Philosophy, Politics, Economics and the History of Ideas* (Chicago: University of Chicago Press, 1978) pp. 179-190.

institutions that are “the results of human action but not of human design,” it nonetheless remains the spontaneous composite outcome of multitudes of individual choices freely made by buying and selling in the marketplace.

The alternative is what the American economist Francis A. Walker referred to in 1887 as “political money.” Political money is one that the government determines shall be used as money and whose supply “is made to depend upon law or the will of the ruler.” He warned that under the best of circumstances the successful management of a government-controlled money would “depend upon an exercise of prudence, virtue and self-control, beyond what is reasonably and fairly to be expected of men in masses, and of rulers and legislators as we find them.” Governments would, in the long run, always be tempted to abuse the printing press for various political reasons.²⁸⁸

But besides the dangers of political mischief, the fact is that the government monetary monopoly prevents the market from easily discovering whether, over time, market participants would find it more advantageous to use some particular commodity or several alternative commodities as different types of media of exchange to serve changing and differing purposes. The “optimal” supply of money becomes an arbitrary decision by the central monetary monopoly authority rather than the more natural market result of the interactions between market demanders desiring to use money for various purposes and market suppliers supplying the amount of commodity money that reflects the profitability of mining various metals and minting them into money-usable forms.

But commodity money, as history has shown, has its inconveniences in everyday transactions in the market. There are benefits from financial depositories for purposes of safety and lowering the costs of facilitating transactions. But what type of financial and banking institutions would market participants find most useful and desirable under a regime of money and banking freedom? The answer is that we don't know at this time precisely

²⁸⁸ Francis A. Walker, *Political Economy* (New York: Henry Holt, 1887) p. 352. After the last one hundred years of even further monetary mischief and abuse than those in the nineteenth century had learned from, Walker's further comment is more pertinent today than when he wrote it, p. 353: “The man who advocates government issues [of paper money], without being prepared to show reasonable ground for believing that they will not be so abused as to accomplish more evil than of benefit, is not entitled to be listened to. After the experiences of the last hundred years intelligent men rightly refuse to take the trouble even to discuss political schemes that assume an impossible virtue, or which disregard the actual conditions under which alone they could be set to work.”

because government has monopolized the supplying of money; and it imposes, through various state and federal regulations, an institutional straitjacket that prevents the discovery of the actual and full array of preferences and possibilities that a free market in monetary institutions might be able to provide and develop over time.

The increasing globalization of commerce, trade, and financial intermediation during the last several decades has certainly demonstrated that there is a far greater range of possibilities that market suppliers of these services could provide and for which there are clear and profitable market demands than traditionally thought 20 or 30 years ago. But even in this more vibrant global competitive environment, it remains the case that whatever options have begun to emerge has done so in a restrictive climate of national and international governmental regulations, agreements, and constraints.

Suppose that monetary and banking freedom were established.²⁸⁹ What type of banking system would then come into existence? Some advocates of monetary freedom have insisted that a free banking system should be based on a 100 percent commodity money reserve. Others have argued that a free banking system would be based on a form of fractional-reserve banking, with the competitive nature of the banking structure serving as the check and balance on any excessive note issue by individual banks.

²⁸⁹ The literature on the potential, nature and workings of a private, competitive banking system with complete monetary freedom is large. Among the important works are: Ludwig von Mises, "Monetary Stabilization and Cyclical Policy [1928] in *On the Manipulation of Money and Credit* (Indianapolis, IN: Liberty Fund, 2010); Mises, *Human Action: A Treatise on Economics* (Chicago: Henry Regnary, 3rd revised ed., 1966), pp. 440-448; Mises, *The Theory of Money and Credit* (Indianapolis, IN: Liberty Fund, [1953] 1981) pp. 434-438; Vera Smith, *The Rational of Central Banking and the Free Banking Alternative* (Indianapolis, IN: Liberty Fund, [1936] 1990); F. A. Hayek, "Denationalization of Money: An Analysis of the Theory and Practice of Concurrent Currencies," [1978] in Stephen Kresge, ed., *The Collected Works of F. A. Hayek*, Vol. 6: *Good Money, Part II* (Chicago: University of Chicago Press, 1999) pp. 128-229; Lawrence H. White, *Free Banking in Britain: Theory, Evidence, and Debate, 1800-1845* (Cambridge: Cambridge University Press, 1984); White, *Competition and Currency: Essays on Free Banking* (New York: New York University Press, 1989); White, *The Theory of Monetary Institutions* (Wiley-Blackwell, 1999); George A. Selgin, *The Theory of Free Banking: Money Supply Under Competitive Note Issue* (Totowa, N.J.: Rowman & Littlefield, 1988); Selgin, *Bank Deregulation and Monetary Order* (New York: Routledge, 1996); Kevin Dowd, *Private Money: The Path to Monetary Stability* (London: Institute of Economic Affairs, 1988); Dowd, *The State and the Monetary System* (New York: St. Martin's Press, 1989); Dowd, *Laissez-Faire Banking* (New York: Routledge, 1993); Kevin Dowd, ed., *The Experience of Free Banking* (New York: Routledge, 1993); Steven Horwitz, *Monetary Evolution, Free Banking and Economic Order* (Boulder, CO: Westview Press, 1992); Murray N. Rothbard, *The Case for a 100 Percent Dollar* (Auburn, AL: Ludwig von Mises Institute, 1991); Mark Skousen, *Economics of a Pure Gold Standard* (Auburn, AL: Ludwig von Mises Institute, 1988).

Until monetary and banking freedom is established, we have no way of knowing which of the two alternatives would be the most preferred. This is for the simple reason that under the present government-managed and government-planned monetary and banking system, market competition is not allowed to demonstrate which options suppliers of financial intermediation might find it profitable to offer and which options users of money and financial institutions would decide are the ones best fitting their needs and preferences.

Given the diversity in people's tastes and preferences, the differing degrees of risk people are willing to bear for a promised interest return on their money, and the variety of market situations in which different types of monetary and financial instruments might be most useful for certain domestic and international transactions, it probably would be the case that a spectrum of financial institutions would come into existence side by side. At one end of this spectrum would be 100 percent reserve banks that guaranteed complete and immediate redemption of all commodity money deposits, even if every depositor were to appear at that bank within a very short period of time.

Along the rest of the spectrum would be various fractional-reserve banks at which lower or no fees would be charged for serving as a warehousing facility for deposited commodity money. Their checking accounts might offer different interest payments depending on the fractional-reserve basis on which they were issued and on the degree of risk or uncertainty concerning the banks' ability to redeem all deposits immediately under exceptional circumstances.

Some banks might offer both types: they might issue some bank notes and checking accounts that were guaranteed to be 100 percent redeemable on the basis of commodity money deposited against them; and they might issue other bank notes and checking accounts that, under exceptional circumstances, were not 100 percent redeemable.

And these banks might offer "option clauses" stipulating that if any designated notes or checking accounts were not redeemed on demand for some limited period of time, the note and account holder would receive a compensating rate of interest for the inconvenience and cost to himself.

Whether most banks would be closer to the 100 percent reserve end of this spectrum or farther from it is not - and cannot be - known until the monetary and banking system is set free from government regulation, planning, and control. As long as the government remains as the monetary monopolist, there is just no way to know all the

possibilities that the market could or would generate. Indeed, for all we know, the market might devise and evolve a monetary and banking system different from that conceived even by the most imaginative free-banking advocates.

Competition is thwarted by government monopoly money, and the creative possibilities that only free competition can discover remain invisible "might- have-beens." How then can the existing system be moved towards a regime of monetary and banking freedom?

For a System of Monetary and Banking Freedom

The great tragedy of the twentieth century was the arrogant and futile belief that man can master, control, and plan society. Man has found it difficult to accept that his mind is too finite to know enough to organize and direct his overall social surroundings according to an overarching design. The famous American journalist, Walter Lippmann, neatly explained the nature of this problem in his 1937 book, *An Inquiry into the Principles of the Good Society*:

The thinker, as he sits in his study drawing his plans for the direction of society, will do no thinking if his breakfast has not been produced for him by a social process that is beyond his detailed comprehension. He knows that his breakfast depends upon workers on the coffee plantations of Brazil, the citrus groves of Florida, the sugar fields of Cuba, the wheat farms of the Dakotas, the dairies of New York; that it has been assembled by ships, railroads, and trucks, has been cooked with coal from Pennsylvania in utensils made of aluminum, china, steel, and glass. But the intricacy of one breakfast, if every process that brought it to the table had deliberately to be planned, would be beyond the understanding of any mind. Only because he can count upon an infinitely complex system of working routines can a man eat his breakfast and then think about a new social order. The things he can think about are few compared with those that he must presuppose.... Of the little he has learned, he can, moreover, at any one time comprehend only a part, and of that part he can attend only to a fragment. The essential limitation, therefore, of all policy, of all government, is that the human mind must take a partial and simplified view of existence. The ocean of experience cannot be poured into the bottles of his intelligence.... Men deceive themselves when they imagine that they can take charge of the social order. They can never do more than break in at some point and cause a diversion.²⁹⁰

Money is one of those institutions that owes its origin and early development to social processes beyond what individual minds could

²⁹⁰ Walter Lippmann, *An Inquiry into the Principles of the Good Society* (Boston: Little, Brown, 1937) pp. 30 & 32.

have fully anticipated or comprehended.²⁹¹ But money's evolution has been constantly “diverted” from what would have been its market-determined course by governments and political authorities that saw in its control an ability to plunder the wealth of entire populations.

Debasement and depreciation of media of exchange through monetary manipulation has been the hallmark of recorded history. To prevent such abuses and their deleterious effects, advocates of freedom supported the gold standard to impose an external check on monetary expansion. Paper money was to be “convertible,” redeemable on demand to banknote and checking account holders at a fixed ratio of redemption.

But even this limit on government-managed money was eliminated in the twentieth century by the hubris of the central-planning mentality, under which money, too, was to be completely under the control of the monetary central planners as part of the vision of designing and directing the economic affairs of society.

Monetary central planning is one of the last vestiges of generally accepted out-and-out socialist central planning in the world. The fact is that even if monetary policy could somehow be shielded from the pressures and pulls of ideological and special-interest politics, there is no way to successfully centrally manage the monetary system.

Government can no more correctly plan for the “optimal” quantity of money or the properly “stabilized” general scale of prices than it can properly plan for the optimal supply and pricing of shoes, cigars, soap, or scissors.

The best monetary policy, therefore, is no monetary policy at all. The advocate of the free market believes that ending all trade restrictions or barriers and permitting free trade would eliminate the need for foreign trade policies.

He also believes that the need for domestic regulatory policies would be eliminated by abolishing the regulatory agencies and repealing the antitrust laws and simply permitting market-guided competition and exchange.

And logically the need for monetary policy would be eliminated by abolishing government monopoly control and regulation over the monetary and banking system.

As Austrian economist Hans Sennholz once concisely expressed it,

We seek no reform law, no restoration law, no conversion or parity, no government cooperation: merely freedom.... In freedom, the money and banking industry can create sound and honest

²⁹¹ Carl Menger, “On the Origin of Money,” [1892] in Richard M. Ebeling, ed., *Austrian Economics: A Reader* (Hillsdale, MI: Hillsdale College Press, 1910) pp. 483-504..

currencies, just as other free industries can provide efficient and reliable products. Freedom of money and freedom of banking, these are the principles that must guide our steps.²⁹²

An Agenda for Monetary Freedom

So what steps might be undertaken to move the American economy in the direction of establishing a regime of monetary freedom? At a minimum, they should include the following:

- (1) The repeal of the Federal Reserve Act of 1913, and all complementary and related legislation giving the federal government authority and control over the monetary and banking system.
- (2) The repeal of legal-tender laws, that gives government power to specify the medium through which all debts and other financial obligations, public and private, may be settled. Individuals, in their domestic and foreign transactions, would determine through contract the form of payment they mutually found most satisfactory for fulfilling all financial obligations and responsibilities into which they entered.
- (3) Repeal all restrictions and regulations on the free entry into the banking business and in the practice of interstate banking.
- (4) Repeal all restrictions on the right of private banks to issue their own bank notes and to open accounts denominated in foreign currencies or in weights of gold and silver.
- (5) Repeal of all federal and state government rules, laws, and regulations concerning bank-reserve requirements, interest rates, and capital requirements.
- (6) Abolish the Federal Deposit Insurance Corporation. Any deposit insurance arrangements and agreements between banks and their customers and between associations of banks would be private, voluntary, and market-based.

In the absence of government regulation and monopoly control, a free monetary and banking system would exist; it would not have to be created, designed, or supported. A market-based system would naturally emerge, take form, and develop out of the prior system of monetary central planning.

²⁹² Hans Sennholz, *Money and Freedom* (Cedar Fall, IA: Center for Futures Education, 1985) pp. 77 & 83.

What would be its shape and structure over time? What innovations and variety of services would a network of free, private banks offer to the public over time? What set of market-determined commodities might be selected as the most convenient and useful media of exchange? What types of money substitutes would be supplied and demanded in a free-market world of commerce and finance? Would many or most banks operate on the basis of fractional or 100% reserves?

There are no definite answers to these questions, nor can there be. It is deceptive to believe, as Walter Lippmann explained, that we could comprehend and anticipate all the outcomes that will arise from all the market interactions and discovered opportunities that the complex processes of the free society would generate. It is why liberty is so important. It allows for the possibilities that can only emerge if freedom prevails. It's why monetary freedom, too, must be on the agenda for economic liberty in this new twenty-first century.

WRITTEN TESTIMONY OF
ROB GRAY
EXECUTIVE DIRECTOR
THE AMERICAN OPEN CURRENCY STANDARD

Mr. Chairman and Members of the Committee,

My name is Rob Gray and I was asked to testify today on the theory of competing currencies, and the practical challenges that make such a theory difficult or impossible to implement.

For nearly 5 years now, I've successfully directed the American Open Currency Standard -the standard for private voluntary and complementary currencies that compete against each other, *not* against the US dollar. Allow me to clarify: we do not consider AOCs Approved medallions produced and traded in our private barter marketplace 'competition' to the US Federal Reserve Note. Because "fair competition", as one would find in the "free market", assumes the existence of a level playing field, the existence of a standard set of rules. Those players who wish to compete honestly do so by relying simply on the merit of the value they bring to the market.

No fair challenge can be made between honest men and thieves. Let me be clear that when I say thieves: I refer to the current private central bank and the men in government who allow it to exist.

This brings us to a critical point: according to your Employee Handbook, Article 1, Section 8 says: "The **Congress** shall have the Power ...To coin Money, regulate the Value thereof..." For anyone who has been a manager or business owner, it is not uncommon to find that you may have an employee who may choose to not do the work that is delegated to them, or even that they simply do it very badly. When such a time comes it is necessary for the manager or owner to step in and do the work themselves. I would argue that since 1913, Congress has failed to do the job with which it had been tasked. We the people are now bypassing you and are no longer waiting for you to make it right. It is far better to simply walk away from the system. We are walking away from toxic thoughts, relationships, investments and careers. We are taking the hard intellectual journey to rid ourselves of the indoctrination that keeps us in this system. We are realizing the power we have in ourselves and the everyday choices that we make to either empower some soulless collective or our own families. We are realizing that we simply need to withdraw our time, energy, and money from banks, politicians and corporations that do not serve our interests.

In the time since our inception, the American Open Currency

Standard has enjoyed nearly five years of growth and success in our mission of issuing a means that allows valuable exchanges among men who produce. In the next five years, we expect to expand our offerings and to increase our ability to keep up with the demand for our private currency. We are doing the job Congress would not.

The use of community currencies here in the US became popular back in the early 1930's. You see, at the time, the theory was that a group of the world's most powerful men, many of them international bankers, were intentionally and systematically removing currency from circulation, creating an artificial scarcity of money across America. Small cities and towns felt it worse than anyone. But life did go on.

Then, during the greatest economic depression this country had ever seen, individuals across this country developed their own mediums of exchange. They still needed things -food, clothing, daily essentials -they still needed to live, and they didn't have time to wait for the government to fix the problem, and they certainly weren't going to rely on the same bankers that caused the crash to offer solutions. And so, according to historical records, thousands of community currencies were created, circulated and traded in places where the scarcity of dollars was interfering with the human desire to live, and the market's desire to trade. And since their elected employees were not doing the job for which they were hired, these individuals took it upon themselves to secure the means to their own survival and potential prosperity.

More recently, community currencies have sprung up across Europe as the Euro and national fiat currencies become increasingly unavailable and undependable. Today, communities all across the Eurozone trade their own money instead of the Euro.

Community currencies are not simply a good idea in theory; they are necessary, alive, and true examples of the free market's unwillingness to be artificially manipulated. Right now alternative and complementary currencies circulate widely across this country and in many different forms: Ithaca, New York uses a local fiat currency based loosely on the value of time; Berkshire, Massachusetts uses a fiat-backed fiat system, while many more communities circulate gold, silver and copper AOCs Approved barter tokens as a medium of exchange. How they are issued, accepted, accounted for and reported varies widely, as the participants and procedures are as different as the markets they serve.

As for practical issues to overcome in the issuance and circulation of complementary currencies, there are plenty. In a voluntary system,

those that participate in the trading of private currencies must deal with the possibility of counterfeiting, fraud, scarcity, acceptance, accounting, storage and other issues, all without the luxury of big brother holding a gun to anyone's head to ensure their success.

Even with all the risks, the market moves on. As in any free market, good ideas circulate with success, and bad ones eventually fade away. Participants voluntarily choose to accept and circulate the highest quality and most valuable currencies in exchange for their best production. Merchants accept complementary currencies based on the premise that someone else is willing to do the same later. Issues arise and are worked out by the market with only one light to guide them: the mutual exchange of value. No guns, no laws, no force: just the willingness to think outside the box and act on principle.

Complementary currencies are not new, in theory or in practice. Further, private currencies circulated long before governments erected themselves to interfere. What's new, however, is the public's apathy towards you and your policies. You've managed for the last hundred years somehow to convince the citizenry that you're relevant. Now, just recently, we're beginning to see the tides change on this. And once it catches on, you'll be rendered completely obsolete.

The greatest hurdle you will face over the next few years is trying to convince "we, the people" that you are still necessary in spite of your failures to get the job done. Sure, some will continue to rely on you for hand-outs; it's what they've known their entire lives and they will be slaves right up and to the point of their own destruction. They don't know any better and I don't blame them for their ignorance. But as you continue to squeeze the life out of the middle class, watch out for their greatest weapon: apathy. They may not be ready to admit it, but soon they'll turn their backs on you and never believe another lie -the lie that you are willing and able to do the job for which you were hired. In the future you will not have to worry about million man marches or citizen journalists trying to catch you on camera. What you need to fear is no one paying attention to you. The next American revolution will not be fought with bullets and bombs; it will be won with the opposite consciousness.

"It is well enough that people of the nation do not understand our banking and monetary system, for if they did, I believe there would be a revolution before tomorrow morning." ~Henry Ford

To that end, I'm here today to propose a solution. My understanding of this subcommittee is that you desire to be part of the solution. You want to believe you're doing something good for the country. Today, the greatest gift you can offer to the people you

clearly represent is to introduce, not to the legislature but directly to the public, what I call IR 1207 -Individual Resolution 1207 - commonly referred to as 'Ignore the Fed'. Store your wealth in silver. Bank with a non-fractional bank that pays real money on deposits. Use the card services network to satisfy dollar obligations. Do not try to compete with the federal reserve system: ignore them. This country has succeeded in doing away with two central banks already over the course of its history -it is learning to do the same again.

Congressman Paul: on July 13, 2011, you asked Federal Reserve Chairman, Ben Bernanke, a question: 'Is gold money?' I ask that same question of you here today: is gold money? Is silver money? They most certainly are not. At least not by the current definition as handed down by Congress' money-issuing surrogate, the Federal Reserve. And that's just fine.

I respectfully petition you, sir, to seriously reconsider your position on this matter. The government has perverted the word money. My wife is a nutritionist, and she tells people, 'If your grandparents wouldn't recognize it as food, don't eat it.' I suggest to you that if your great-grandparents wouldn't recognize it as money, don't accept or spend it.

A great philosopher once said "When destroyers appear among men, they start by destroying money," Today, conventional wisdom tells us that money is a worthless pile of paper. And for the last 100 years Congress has for a third time (again) shunned its responsibility when it comes to issuing money. Since the creation of the Federal Reserve and Congress' abdication of their responsibility, the dollar has lost 98% of its value. I don't suspect anyone would call that stellar job performance. I must be blunt and say that, as employees, Congress, you have not been successful in your charge to "...coin money and regulate the value thereof..." and therefore your services in this area are no longer needed. It is sad that even the men and women in this chamber either do not understand the system they serve or are so dependent upon the system's favors that they dare not speak in opposition to it.

"It is difficult to get a man to understand something, when his salary depends upon his not understanding it!" ~Upton Sinclair

I ask you to leave the Fed their money and leave the people our silver, gold and copper. Do not push to redefine whatever representations we choose for our wealth as 'money'. Let the Fed do what it wants with their 'money', so long as they leave us alone. I warn you: 'honest money legislation' is a wolf in sheep's clothing. The record of Congress over time has proven that it will make a miserable

failure of this aspect of human survival as it has so many others.

The greatest thing this Congress can do is exactly what you've done so far: nothing.

"The nine most terrifying words in the English language are, "I'm from the government and I'm here to help." --Ronald Reagan.

I will not facilitate this government to "help" understand, control and ultimately destroy alternative currencies. All I ask is that you stay out of our way. The people in our world are happy to go right along saving you from your own destruction by producing value against all the odds, regulations, codes, and challenges thrown our way. But leave our money alone. It doesn't belong to you, and it never will.

If you really want to help, I would recommend that instead of trying to DO something, you could start by undoing some things. But that list is far too long for me to get into here today and as a responsible employer, I'll allow you some room for creativity.

One last thing I would like to leave you all to ponder...

How is it possible for every single person in the world to be in debt with credit card debt, student debt, consumer debt, auto debt, and mortgages?

How is it possible that every small business and corporation in the world is also in debt?

And finally how is it possible that every single local, county, province, state and nation on earth is also in debt?

Who owns the other side of that debt?

When you understand that, maybe just maybe, something positive will come out of this chamber.

The bottom line is simple: humanity is not going to wait for permission to survive. Things that cannot go on forever... won't. The market will move on -with or without you. And, based on your rate of success to date, our preference is without you.

I thank you for your attention to this matter of life and death.

There are thousands hacking at the branches of evil to one who is striking at the root. ~ Henry David Thoreau

EXPERT COMMENTARY

JAMES TURK²⁹³
FOUNDER & CHAIRMAN
GOLDMONEY

GOLD — THE BARBAROUS RELIC IS NOT WHAT YOU THINK

A Note from James Turk

Dear Reader,

The world today is a very different place than when I wrote this monograph six years ago. Unfortunately, by “different” I do not mean better, at least in regard to my main point — central banks are still the barbarous relic, not gold.

One noticeable difference from back then is the precipitous drop, particularly after the 2008 financial crisis, in the esteem with which central banks were previously viewed. The central bankers themselves are squandering this esteem. Their disregard for society is palpable, as despite their rhetoric to the contrary, they unflinchingly and single-mindedly cater to their own interests and of course those politicians who put banking favours ahead of the interests of the people they supposedly represent.

Central bankers are completely out of control. Having descended from the useful role they filled decades ago, their sole objective now is

²⁹³ [This essay is derived from Mr. Turk’s presentation at the Gold Rush 21 Conference (www.goldrush21.com) held in Dawson City, Yukon, Canada, August 8, 2005. This monograph and the introductory note are published with Mr. Turk’s permission.]

to protect the people in finance and government who participate in and profit from the outrageous cartel power central banks now exercise. By creating unlimited amounts of currency, they serve the omnipotent state that they indirectly control through their monetary power over politicians. They use this control over the political process to protect their interests and maintain their grip on economic activity. But perhaps things are changing.

An unreasonable burden has been placed on the backs of taxpayers around the globe by serial bailouts of foolhardy, reckless bankers. Combined with a corrupt system that allows unlimited quantities of money to be created out of thin air, and people everywhere are beginning to understand that a central bank does not serve their best interests, much less even care about their point of view. In the past central bankers have overcome this reality by claiming that they are a conduit to prosperity, which although false, has nevertheless enabled them to practice their financial witchcraft to create recurring booms and busts — to society's detriment.

During particularly tough economic times like the present, their arguments ring hollow. So instead central bankers and their apologists are now taking a new tack. They threaten us with a collapse of the whole financial edifice if their advice is not followed or if they are forced to disclose for public scrutiny the schemes and stratagems they concoct behind closed doors. When doing so, they blatantly ignore that this monetary system cobbled together over decades is rotten to the core with bad loans made by their banker collaborators. It is also inherently unfair given that bankers benefit during good times, and are then bailed out by taxpayers when the boom of illusory prosperity they created inevitably turns into the reality of a bust.

Despite the growing questions about their role and increasing awareness of their dubious track record, central bankers continue to run roughshod throughout the world by financing bubbles, debasing currency, bailing out irresponsible bankers and providing an unending stream of untrustworthy currency to profligate politicians. As the global financial crisis continues to damage economies and cause incalculable hardship, politicians under the control of central bankers are putting the ever-growing burden of banker bailouts on

the backs of taxpayers. To what end? Hopefully to the end of central banking as it is currently practised, and the speedy restoration of sound money by people everywhere who are now awakening to the fact that central banking — and not gold — is the barbarous relic.

Sincerely,
James Turk
Director, GoldMoney Foundation

Gold – The “Barbarous Relic” is Not What You Think

I am no fan of Keynesian economics. I find most Keynesian economic theories to be just plain wrong. But for the sake of truth and accuracy, I would like to correct a terrible injustice levied upon Keynes and, at the same time, also correct an equally terrible injustice that time and again is inflicted upon gold.

How many times have you heard gold described as the “barbarous relic”? It is a favorite phrase of gold-bashers everywhere who are trying to make gold the object of derision. I cringe every time I hear it, which is all too frequently, because gold is neither barbarous nor a relic, as can be explained easily by the following chart.

Copyright (c) 2000-2011 by GoldMoney.com

■ goldgrams

■ US Dollars

Source: GoldMoney.com

This chart presents a base 100 analysis of crude oil prices in terms of dollars and grams of gold (goldgrams). In other words, to establish the comparison depicted above, it is assumed in this analysis that one barrel of crude oil equals \$100 and 100 goldgrams as of December 1945. The month-end price is calculated afterward based on the actual dollar price of crude oil and the prevailing dollar-to-goldgram rate of exchange.

Gold Is Neither Barbarous nor a Relic

The price of crude oil in goldgrams essentially is unchanged throughout the period measured. It is clear, then, that gold communicates the economic value of oil very effectively, and the communication of economic value is the primary feature of money.

Because money is the tool upon which economic activity is based, which is a reality that makes money central to society, money is not barbaric. Consequently, gold cannot possibly be barbaric because gold is money. Gold also is not a relic because gold communicates value today as effectively as it did 50 years ago and much better than does the United States dollar, a point demonstrated clearly by the chart above. In contrast to national fiat currencies today, gold tends to hold its value; in other words, the purchasing power of gold remains relatively unchanged.²⁹⁴ In fact, this precious attribute of gold is timeless because the above-ground stock of gold grows approximately at the same rate as world population growth and new wealth creation.²⁹⁵ How could anything as valuable and useful as gold be

²⁹⁴ There are many examples that illustrate gold's ability to maintain its purchasing power. Items as dissimilar as men's suits, Colt-45 revolvers, and the set menu lunch at London's Savoy Hotel have been used to demonstrate that gold retains its purchasing power because the price of these items in terms of gold remains relatively unchanged over long periods of time. For a detailed analysis of the historical relationship of gold to commodity prices, see Roy W. Jastram, *The Golden Constant: The English and American Experience, 1560-1976*, New York, NY: John Wiley and Sons (1977).

²⁹⁵ This observation rests largely upon logic because it is difficult to locate all the hard facts needed to support it. World population growth is estimated at 1.14 per cent annually. See www.cia.gov/cia/publications/factbook/print/xx.html. The World Gold Council estimates that, as of 2002, 147,000 tons of gold have been mined throughout history. See www.gold.org/value/stts/faqs/index.html. Allowing for additional production since then of about 2,500 tons per year, total production is 167,000 tons. Because gold is accumulated — in contrast to other commodities, all of which are consumed — most of this gold still exists in the

barbaric? And because gold is as useful today as it ever was, how could it possibly be a relic?

While the pejorative reference to gold usually is attributed to Keynes, here is what he really wrote in 1923 in *A Tract on Monetary Reform*: “[T]he gold standard is already a barbarous relic.” The reader should note that gold is not the barbarous relic but, rather, in Keynes’s view, the *gold standard*. There is a big difference between the two concepts. The gold standard is the mechanism by which national currencies at one time were defined as weights of, and redeemable into, gold.

Though the United States continued to define the dollar in terms of gold when Keynes penned those now infamous words after World War I, it had become the exception. Most of Europe had stopped the redeemability of paper currency into gold with the outbreak of hostilities in 1914. What is more, after the war, European countries were slow to return to the gold standard because their currencies had become terribly debased by the expansion of credit and the concurrent printing of money that had occurred during the intervening years.

In effect, by the 1920s, the classical gold standard was essentially dead, which was the reality observed by Keynes. It was dead because banking interests, working hand in hand with governments, killed it. They killed it because governments wanted more money to meet their growing spending aspirations, and seeing the profit opportunity that this circumstance presented, bankers wanted to lend that money to them. The discipline of the classical gold standard prevented the unbridled extension of credit and the resulting creation of new

current above-ground stock. The weight of gold lost due to shipwrecks, attrition of circulating coinage, etc., is unknowable, but it generally is believed to be fairly small because of the care given to gold in view of its high value. If we assume, therefore, that the above-ground gold stock is around 162,500 tons after adjusting for the weight of gold lost over time, then 2,500 tons of new production is increasing that stock by around 1.54 per cent annually. The rate of new wealth creation is harder to determine. The CIA Factbook referenced above estimates that world gross domestic product (GDP) grew by 4.9 per cent last year, but not all of this economic production increased the world’s net wealth. In my view, therefore, it is not unreasonable to assume that the rate of new wealth creation remains approximately somewhere between 1.14 and 1.66 per cent, which explains why the purchasing power of gold remains consistent over long periods of time.

money, which meant that it had to go.²⁹⁶ So is that why the gold standard had become a “barbarous relic”?

To answer this question, we have to understand why the gold standard came into existence in the first place. The origin of the gold standard can be traced back to events resulting from the formation of the Bank of England in 1694. However, to be able to really understand the gold standard and to explain Keynes’s trenchant observation, we have to go back even further into monetary history to extract one key truth — the history of money is actually the history of currency.

The Distinction between Money and Currency

It is important to note that money does not really change. Money is the function it performs, so money is still the same thing it always has been from the moment when it first was invented in pre-history.²⁹⁷ Namely, money is a mental tool used for economic calculation²⁹⁸ that ingeniously enables each of us to communicate what we value in an exchange. What changes throughout monetary history is *currency*. It evolves, and the biggest change ever occurred in 1694.

Until 1694, currency was always an asset in the hands of whoever held it, something tangible. Gold and silver were the most popular forms of currency, but history records that other assets were also used, such as cows, food crops, shells, beads, and other tangible items considered to be useful or rare. The nature of currency evolved as mankind progressed, and various scientific achievements made

²⁹⁶ Of the books that explain how and why banking interests and governments killed the gold standard, my favorite is Edwin Vieira, Jr., *Pieces of Eight: The Monetary Powers and Disabilities of the United States Constitution*, Fredericksburg, VA: Sheridan Books (2002), www.piecesofeight.us. For my recent review of this book, see www.fgmr.com/pieces8.htm.

²⁹⁷ By its classic definition, money is both a medium of exchange and a store of value. However, this definition better describes *currency* than *money*. In its broadest sense, which is how I use the term here, money is simply a means that enables economic calculation.

²⁹⁸ See, Ludwig von Mises, *Human Action*, 4th ed., Irvington-on-Hudson, NY: Foundation for Economic Education (1996), p. 209. Mises describes the “exchange ratios between money and the various goods and services” as the “mental tools of economic planning.” Given that money is the means that enables individuals to communicate their subjective views of value, money itself also is a mental tool. Mises states (p. 177) that “Language is a tool of thinking as it is a tool of social action.” In my view, the same thing can be said about money because, like language, money is a means of communicating.

currency more efficient and more reliable. For example, if you look at the evolution of coins over the centuries, you can see marked improvement.

The improvements were important. As coins became more reliable, the costs of conducting commerce were reduced, and reducing costs is always a good thing. By lowering the impediments to commerce — and the costs of handling currency and making payments are an impediment — commerce itself is promoted, and as commerce expands and develops, our living standards rise. So it was natural that new advancements that improved the currency of the day were welcomed widely, as was the advancement introduced by the Bank of England concurrent with its creation in 1694.

Gold and silver coins had disadvantages that were well-recognized. They were bulky, hard to carry, impractical in large denominations because of the weight that would be required, etc. What is worse, coins wore out from usage, wasting some of the precious gold and silver contained in them.

To overcome the shortcomings of precious metal coinage, the Bank of England introduced an important advancement that made currency more efficient. That innovation enabled gold and silver coins to remain safe and secure in the Bank's vault while paper promises to pay weights of precious metal — dubbed “banknotes” — circulated as currency in place of the coins. Paper as a circulating medium had obvious advantages of efficiency and cost and at any time — or in other words, on demand — could be redeemed for coinage. What is more, because it was opened under a Royal Charter, the Bank of England and its paper currency were perceived to be safe, and so they were — for about three years. By 1697, the world's first banking crisis was under way. The Bank of England had issued far more paper than it had physical metal on hand,²⁹⁹ primarily silver, because that still was the preferred metal of the day in England. Therefore, the crisis arose because people rushed to convert their paper currency into

²⁹⁹ This process is known as fractional reserve banking. Under the gold standard as it generally operated, banks only kept in reserve a fraction of the total weight of metal needed to redeem all their liabilities to pay out metal. For a detailed discussion of fractional reserves, see Murray N. Rothbard, *The Case for a 100 Percent Gold Dollar: In Search of a Monetary Constitution*, Leland B. Yeager, ed., Cambridge, MA: Harvard University Press (1962), pp. 94-136, and Auburn, AL: Ludwig von Mises Institute (1991), www.mises.org/story/1829.

silver coin, with the result that the Bank of England's new currency appeared to be a failure.

Despite ongoing monetary upheaval, the Bank of England persevered (even back then, government-sponsored enterprises seemed to take on a death-defying life of their own). But that monetary crisis did have one beneficial and constructive result: It made self-evident to everyone at the time that a paper currency promising to pay metal (a money substitute) was different from money (gold or silver) itself. After all, a bank liability is fundamentally different from a tangible asset.

What the Bank of England had done was to stand currency on its head. Until 1694, currency always had been a tangible asset (mainly gold and silver fabricated into coins). Thereafter, the new paper currency was not money; it was only a money substitute circulating in place of coin. This new currency was no longer a tangible asset; it had become a liability of a financial institution. This difference is as great as that between night and day, or more to the point, between assets and liabilities.³⁰⁰

The impact of this change was so profound that it had an invasive impact on the economy, with many adverse consequences. The insidious monetary turmoil wrought by the Bank of England's new currency persisted. To figure it all out, William III of England turned for help to the greatest mind of the day: Sir Isaac Newton, who was appointed Master of the Mint in 1699.

Over the next several years, Newton restored order where there had been Bank of England-created chaos. He did this by inventing and putting into practice what we now call the classical gold standard. That was a monetary system operating under rules³⁰¹ that

³⁰⁰ Until the introduction of paper currency, payment risk was limited to making sure the coins accepted as payment in a transaction were genuine. Similarly, the seller still needed to make sure that the paper currency received was not counterfeit. But paper currency introduced a new type of payment risk — default. Even if the paper currency was genuine, the paper could prove to be worthless if the issuer of that currency defaulted on its liabilities — for example, in the case of a bank failure. There is no default risk if one accepts gold in payment, which explains why gold often is referred to as the only currency that is not someone's liability. Consequently, in contrast to all national currencies, finality of payment in gold is not contingent on the creditworthiness of a counterparty.

³⁰¹ The key rules accomplished the following: (1) defined the British pound in terms of a specific and unchanging weight of gold, (2) confirmed that pound banknotes circulating as money substitutes were redeemable into coinage upon demand of the holder of the banknote,

Newton established that were followed voluntarily by banks and later by other governments that eventually adopted in their own country the Bank of England's paper currency innovation.

Newton's rules resulted in automaticity, which is what made the gold standard so effective. It was reliable and predictable. It was self-regulating when left unhindered, with capital flows over time tending to harmonise trade imbalances that arose from disparate economic conditions in different countries.

Newton recognised that the paper banknote was an important advancement that made currency more efficient. But he also understood that paper currency was not money and, even more so, that paper currency could be created to excess, which would result in monetary turmoil that in turn would have an adverse impact on economic activity. In other words, he realised that paper currency was useful, but only if it had some standard by which it could be measured and controlled. He achieved these objectives with the gold standard that he created.

The Demise of the Gold Standard

Newton's invention remained largely untouched from its implementation in 1707 until 1914. I say "largely" because the rules of his classical gold standard occasionally were broken. During periods of war, for example, the redeemability of paper into coinage

(3) confirmed that pound coins and pound banknotes were of equivalent value, meaning that they could be exchanged one for one, and (4) established that the Bank of England was responsible for maintaining prudent policies to ensure redeemability of banknotes into coinage, which was essential for an orderly monetary system. The practical result is that it became accepted Bank of England practice in the 18th and 19th centuries to maintain a gold reserve nominally equal to approximately 40 per cent of its gold liabilities. But see, John H. Wood, *A History of Central Banking in Great Britain and the United States*, New York, New York: Cambridge University Press (2005), where Wood observes that, in practice, the Bank maintained only a "thin film of gold," at times as low as only six per cent of gold liabilities. The British pound became the world's international reserve currency, largely supplanting gold in that role, because even though the banknotes were not 100 per cent backed by gold, the pound generally was considered to be "as good as gold." The expansion of the British Empire was not just the result of the Royal Navy; sound money also played an important role. The pound – managed as it was under the classical gold standard — enabled the global expansion of commerce. "The gold standard had become, in effect, the global monetary system. In all but name, it was a sterling [i.e., British pound] standard." See Niall Ferguson, *Empire: The Rise and Demise of the British World Order and the Lessons for Global Power*, New York, NY: Basic Books (2003), p. 245.

often was suspended, and credit was expanded beyond the prudent limits that normally prevailed. But the rules governing the gold standard remained in place, more or less, with the wartime suspensions usually lifted soon after hostilities ceased. Further, redeemability of banknotes into coin was re-established at the pre-war rates, which deflated the war-induced credit expansions.

Over time, however, bankers and politicians began to understand that, if they broke Newton's rules, they could gain an advantage. Bankers would make a greater profit because they could expand credit (make loans) beyond the self-imposed constraints. Politicians could gain greater power because, instead of being restricted to just spending gold, they envisioned creating a seemingly unlimited amount of money substitutes and spending those instead. Newton's rules were voluntary and worked only insofar as banks and governments agreed to them. By the 20th century, bankers and politicians were not just breaking the rules — they were discarding them.

Thus, given the powerful interests lining up against it, it is not surprising that the classical gold standard began to be depicted as undesirable, despite its splendid 200-year track record of maintaining relatively stable prices. What was worse, the classical gold standard started to be blamed for things for which it was not responsible. For example, it was not the gold standard that caused the Great Depression but, rather, imprudent credit expansion by banks, which was made worse by the growth of government and the rising expenditures that the burden of government entailed.³⁰² The last vestiges of the gold standard were jettisoned in August 1971,³⁰³ ushering in the present era of fiat currency regimes.

It should be clear by now why Keynes was taking a potshot at the gold standard. It is not surprising that Keynes — whose iconoclastic theories supported government management of the monetary system

³⁰² The cause of the Great Depression should be “placed where it properly belongs: at the doors of politicians, bureaucrats, and the mass of ‘enlightened’ economists.” Murray N. Rothbard, *America's Great Depression*, 3rd ed., Lanham, MD: Sheed and Ward, Inc.(1975), p. 295.

³⁰³ On August 15, 1971, President Nixon declared the US Treasury's “gold window” at the Federal Reserve Bank of New York to be closed, which meant that foreign dollar claims no longer were redeemable in gold. See William A. Safire, *Before the Fall: Inside the Pre-Watergate Nixon White House*, Garden City, NY: Doubleday (1975), pp.509-528.

— would claim that the gold standard was a barbarous relic. Even though Keynes was no fan of gold, he no doubt understood that it would be foolhardy to attack gold itself. That would come later, from anti-gold propagandists and central bank apologists misusing what Keynes really wrote. But that is not quite the whole story.

The Real Barbarous Relic

There is indeed a barbarous relic, but we now know that it is neither gold nor the gold standard because of the useful role that gold played for two centuries before World War I. Rather, the barbarous relic is *central banking itself*.

Central banks are barbarous in part because they conspired to put an end to Newton's brilliant invention that safeguarded sound money for 200 years. It is the process of central banking itself, as it has come to be practised, that deserves to feel the public's wrath.

Central banking is barbarous for the following reasons:

- (1) Money is a product of the free market. It is a fundamental building block of our society because it allows people to interact with one another in the market process. Money existed long before governments and central banks began to “manage” it. Tragically, instead of being a neutral and unfettered tool in commerce, fair to one and all, money now has become a matter of force and decree, which is disruptive to the market process and therefore harmful to society.
- (2) Prior to the creation of the Bank of England, every exchange in the trading activity that we call the market process tendered value for value. In other words, gold was exchanged for land, silver for food, etc. — assets were traded for assets.³⁰⁴ The Bank of England changed this process by creating money substitutes. Its banknotes are not a tangible asset like gold or silver. Banknotes are merely money substitutes and not money itself. Money substitutes are a liability of the bank issuing that paper currency, and money substitutes create all sorts of payment risk that one does not have when using tangible assets as currency.

³⁰⁴ From Franklin Sanders, ed., *The Moneychanger* (July 2005), www.themoneychanger.com, which included a noteworthy critique of central banking.

- (3) Central banks act in secrecy; consequently, they are not held accountable. For example, the so-called “Open” Market Committee of the Federal Reserve is far from “open.” It meets and makes decisions behind closed doors, and the minutes released one month later are thoroughly redacted, leaving outsiders in the dark about the members’ deliberations. Central bankers consider themselves — and act as if they were — above the law. Moreover, this secrecy favors the insiders, and it is this fundamental principle upon which central banks’ market intervention has been constructed, including, for example, their intervention in the gold market.³⁰⁵
- (4) Central banks have freed governments from having to ask their citizens — through their elected representatives — for more taxes.³⁰⁶ Central banks can acquire government debt and use it to create currency out of “thin air” for governments to spend on their latest whims. Even worse, through their policies that create inflation, central banks enable governments to steal from their citizens.
- (5) There are several tools in the central banks’ arsenal, and one of them is disinformation, which they regularly practise. For example, central banks have come to make us believe that inflation is “rising prices.” But wet streets do not cause rain. By changing the definition of inflation to one of “rising prices” rather than what it really is — monetary debasement engineered by central banks — the true culprits (the central banks themselves) are masked.
- (6) Not only are central banks guilty of disinformation, but deception is one of their most frequently used tools. The history of banking is replete with examples that demonstrate not just a lack of disclosure but, rather, outright deception. To give just one example, consider how central banks today account for their gold loans. They carry both gold in the vault and gold out on loan as one line item on their balance sheets.³⁰⁷ In effect, central banks are saying that they can

³⁰⁵ See the work published at www.GATA.org for a detailed analysis of this intervention. I also recommend the analysis of John Embry and Andrew Hepburn, *Not Free, Not Fair: The Long-Term Manipulation of the Gold Price*, Spratt Asset Management, Toronto, Canada (August 2004), www.spratt.ca.

³⁰⁶ Sanders (2005), note 9 above.

³⁰⁷ See, e.g., the European Central Bank’s balance sheet,

ignore the truthful disclosure established by Generally Accepted Accounting Principles, and as a result they can report both cash and accounts receivable as one and the same thing. Accounting like that would make even the fraudsters at Enron blush.

- (7) Central banks in effect have turned the market into a command, i.e., state-run, economy. The power to create money out of thin air brings with it the much greater power to control a nation's economy and therefore the economic destiny of millions. Central bankers today act like politburo members in the former Soviet Union, who pulled strings and pushed buttons to try making the economy — which means each and every one of us who participate in the economy — bend to their control. But it is not only the economic destiny of millions that is determined by central banks; subtle but potentially more disturbing issues are raised by the exercise of power by central banks
- (8) Central bankers and their comrades in government know that the command economy power that they have claimed forces them to walk a fine line between prosperity and economic collapse, given the inherent fragility of the credit-based monetary system that they operate. To try to reduce this ever-growing fragility — in a vain attempt to make it easier for central banks to control the command economy effectively and totally — governments take away peoples' freedom. Central banks usher in controls like the reporting of bank accounts and funds transfers and policies such as the “too big to fail” doctrine that underwrites bad decisions at banks with taxpayers' money. Controls perpetuate a central bank's stranglehold on power regardless of whether they are doing a good or a bad job — and it is usually bad — in commanding the economy.
- (9) The command economy that central banks operate encourages the growth of debt, rather than savings. Banks want to expand their balance sheets — i.e., to make more loans — in order to earn greater profits, and governments want central banks to accommodate this objective. The resulting credit expansion provides the public with opportunities to acquire new things, which creates an illusion of prosperity that makes

people believe that their wealth is rising. The result of this debt-induced, pseudo prosperity is a complacent populace, the net effect of which tends to perpetuate governmental power and politicians' perquisites. Instead of following a sound and time-tested, "pay as you go" policy, consumers, businesses, and governments have adopted a new creed — "buy now and pay later." The mountain of debt that exists in the United States today and the excessive consumption that continues to enlarge that mountain are the direct results of central banks' activity and their need to grow more debt to avoid the inevitable bust that would follow if the debt growth were to stop. Newsletter writer Richard Russell explains it very simply in just three words: "Inflate or die."³⁰⁸ This is why US Federal Reserve Chairman Ben Bernanke famously said (in a speech given before he was appointed Fed chief) that he would drop \$100 bills from helicopters if necessary to inflate the economy.³⁰⁹

- (10) What central banks do domestically, they also do to the international monetary system. Thus, the inherent fragility and the huge structural imbalances arising from cross-border trading exist today because of central banks' actions. The automaticity of the classical gold standard ensured that imbalances such as trade deficits were relatively short-lived. In contrast, present central bank policies have perpetuated longrunning US trade deficits, which are now several decades old and still growing.³¹⁰

The debt being created to finance these deficits has an impact on the monetary environment of each US trading partner. Thus, central bank-engineered imbalances are not just domestic problems; they also have global implications.

³⁰⁸ Richard Russell is the editor of *Dow Theory Letters*, www.dowtheoryletters.com/dtlol.nsf.

³⁰⁹ See www.federalreserve.gov/boarddocs/speeches/2002/20021121/default.htm

³¹⁰ According to the International Monetary Fund's statistics, the last year in which the United States had a trade surplus was 1975. The trade deficit, about \$624 billion in 2004, was about 5.3 per cent of US gross domestic product. *IMF, International Financial Statistics* (November 2005) and *International Financial Statistics Yearbook* (1995).

Barbarians Dwelling in Relics

In sum, central banking has proved to be barbarous indeed, but only one-half of the demonstration is completed at this point. Barbarity being established, one also needs to know why central banking is a relic, but that demonstration is easy.

Central banking has been around for more than 300 years. In that time, an institution becomes either a venerable object or an obsolete relic. If central banks once served a useful purpose, it was when they were governed by the discipline of the classical gold standard. Having abandoned Newton's rules, central banks now are abusive to free markets and antithetical to sound money. The reasons that make central banks barbarous also make them an unwanted relic. Central banks are a relic of empire, nationalism, and war. Having existed now for hundreds of years, central banks have survived not because they advance commerce or contribute to raising mankind's standard of living, but because they are disingenuous, slavish parasites, dutifully serving the omnipotent state, no matter how mindless or harmful the state's bidding might be. Central banks pursue reckless policies that erode — and in some cases destroy — the value of their currencies. Because of that recklessness, central banking is not only a barbarous relic, it has become dangerous as well.

When confronted with attempts by anti-gold propagandists to bash gold, we now know how to respond. The barbarous relic is central banking, and any central bank that prevents the restoration of sound money increases the danger that the relic poses to the public interest.

Not too many years from now, when the US dollar collapses as just one in a long list of fiat currencies that have collapsed before it, people will look back and ask themselves how it was possible that barbarous institutions like central banks could have hoodwinked so many people into thinking that they were acting in the public interest. The answer is that central banks have created the illusion of prosperity. Because people think that they are well off, they have no reason to question basic tenets that they are led to believe. For this reason, people are easily cozened into believing that gold is the

barbarous relic, that central banks are doing a good job, that officially measured inflation is low, and that their financial future is secure. However, nothing could be further from the truth. Their misguided beliefs reflect what some on Wall Street like to call the “bubble mentality,” and while it may be true that this condition is a state of mind, it also is true that it arises without any thinking going into it.

Conclusion: Let Gold Circulate as Currency Again

The gold standard is dead, but as the chart at the beginning of this essay shows, gold remains the standard. It is the value by which all things are measured, just as it was when Newton’s great invention, the classical gold standard, reigned supreme. This observation is important. For gold to achieve its greatest usefulness, it needs to circulate once again as a parallel currency that competes with government-controlled and central bank-“managed” national currencies.

The future of gold depends on the opportunity for gold to do what it always has done throughout history, namely to provide a neutral tool that people can use voluntarily — without force or coercion — as currency. We should be able to use gold as we go about our business each day, participating in the market economy to fulfill our needs and wants.

Fortunately, currency is evolving yet again. In this high-tech age, gold is now being used as currency in economic transactions. Digital gold currency³¹¹ provides the means to achieve economic growth and prosperity with sound money while escaping the state-run currency of central banking. This achievement is a welcome advance in free-market currency because it restores gold’s rightful and traditional role as a circulating medium unfettered by government control and central bank restrictions, but it also does more. Digital gold currency makes evident gold’s enduring usefulness, proving that gold is neither barbarous nor a relic.

**IMPACT OF MONETARY POLICY ON THE
ECONOMY: A REGIONAL FED PERSPECTIVE ON
INFLATION, UNEMPLOYMENT, AND QE3MONEY**

TUESDAY, JULY 26, 2011

WITNESSES

Hoenig, Dr. Thomas M., President, Federal Reserve Bank of Kansas
City

*B*ACKGROUND

The Subcommittee on Domestic Monetary Policy and Technology held a hearing on the “Impact of Monetary Policy on the Economy: A Regional Fed Perspective on Inflation, Unemployment, and QE3” at 2:00 p.m. on July 26, 2011 in Room 2128 of the Rayburn House Office Building. Numerous regional Federal Reserve Bank presidents were approached to testify about their views on inflation, unemployment, and the Fed’s monetary policy. All but one of the presidents approached to testify either declined or were unable to testify. This was a one-panel hearing with the following witness:

- Dr. Thomas M. Hoenig, President, Federal Reserve Bank of Kansas City

Dr. Hoenig was asked to provide a regional Federal Reserve Bank perspective on the role of the Federal Reserve in the economy, focusing on the Federal Reserve’s execution of its mandate of price stability and full employment. Regional Federal Reserve Banks are supposed to be attuned to the economic conditions within their districts and to bring their knowledge and expertise to bear when meeting with other Fed officials. While Fed Chairman Bernanke’s statements and speeches receive significant amounts of media coverage, the views of the regional Federal Reserve Bank presidents do not receive similar attention.

This hearing examined the extensive liquidity operations undertaken by the Federal Reserve over the past few years; further actions that may be taken in the future by the Federal Reserve, including the possibility of further rounds of quantitative easing; and the outlook for inflation, unemployment, and GDP growth. The hearing also examined the exit strategies available to the Federal Reserve given its substantial involvement in the economy, the size of its balance sheet, and the excess reserves held by the banking system.

Regional Structure of the Fed

The Federal Reserve System is the central bank of the United States. The Federal Reserve formulates the nation's monetary policy, supervises and regulates banks, and provides a variety of financial services to depository institutions and the federal government. The Federal Reserve System consists of four major components: the Board of Governors, the twelve regional Federal Reserve Banks, the Federal Open Market Committee (FOMC), and member banks of the Federal Reserve System.

The twelve regional Federal Reserve Banks are responsible for the day-to-day operations of the Federal Reserve System, providing services to member banks within their districts, as well as regulating those banks. The regional Federal Reserve Banks are not entities of the federal government, like the Board of Governors, but private institutions chartered by the federal government and owned by the member banks in their districts. The board of directors of each regional Federal Reserve Bank appoints its own president of the Reserve Bank, who must then also be approved by the Board of Governors. The regional Federal Reserve Banks aim to balance the influence of the nation's financial centers on monetary policy at meetings of the FOMC, and to provide input on economic conditions across the country.

The FOMC sets the nation's monetary policy. The FOMC consists of up to twelve voting members: the seven members of the Board of Governors, who are political appointees of the President of the United States, and five of the twelve regional Federal Reserve Bank presidents. The president of the Federal Reserve Bank of New York is a permanent voting member of the FOMC. The other four regional slots rotate annually among the other Reserve Bank presidents.

Federal Reserve Policies During and After the Financial Crisis

During the financial crisis, the Federal Reserve undertook extraordinary measures to provide liquidity to the financial system. As the crisis deepened, the Federal Reserve began providing direct liquidity to the financial system, exercising its emergency lending authority, creating new credit facilities, and providing direct loans to non-bank financial firms—allowing non-banks and non-members of the Federal Reserve System to borrow directly from the Fed for the first time since the Great Depression. Most emergency lending was

conducted through the Federal Reserve Bank of New York, although other regional Reserve Banks also engaged in significant amounts of lending. At the peak of the Federal Reserve's emergency lending actions in December 2008, the Federal Reserve's balance sheet had more than doubled, by \$1.4 trillion, to over \$2.2 trillion.

From December 2008 to July 2011, the FOMC voted to keep the target federal funds rate between 0 and $\frac{1}{4}$ percent, the longest the Federal Reserve had held its target rate that low in modern times. The FOMC stated that it would maintain the target federal funds rate near zero as long as bank lending remained limited, unemployment remained high, and GDP growth was expected to remain low.

While the intensity of the financial crisis subsided in 2009, the Fed continued its accommodative monetary policies to prod the economy to grow. In February 2009, the Federal Reserve began to purchase large amounts of mortgage-backed securities (MBS) through its Mortgage-Backed Securities Purchase Program, the first installment of what has come to be known as quantitative easing (QE). By the summer of 2010, one year after the National Bureau of Economic Research had declared an end date of the recession, unemployment remained high and GDP growth remained sluggish.

The Federal Reserve then engaged in a second round of quantitative easing, known as QE2, by purchasing \$600 billion in Treasury securities between November 2010 and June 2011 in order to force down long-term interest rates to try to stimulate economic growth. When QE2 ended in June 2011, the Federal Reserve's balance sheet was approaching \$3 trillion and unemployment stood at 9.1%. Inflation measures saw a slight uptick at the beginning of 2011, mostly due to the rising prices of oil and other commodities. In addition, the inflation measure used by the Federal Reserve that excludes food and energy costs ("core consumer price index" or core CPI) also saw an upward trend during that time.

Concerns with Fed Policy

Many mainstream economists consider the actions taken by the Federal Reserve during the financial crisis to have been necessary to avoid a collapse of the financial system. In light of persistently poor economic performance since the supposed end of the recession, however, differences of opinion emerged about the Federal Reserve's later actions, such as maintaining a low target federal funds rate for an extended period and engaging in quantitative easing. The possibility that the Federal Reserve would embark on successive

rounds of quantitative easing only intensified the debate over monetary policy.

The FOMC decisions to maintain the low target federal funds rate were unanimous until 2010, when President Hoenig began to dissent and vote against the FOMC policy. Instead of supporting maintenance of a low target rate, President Hoenig called for a rate increase because of his concerns about inflation. While other regional Reserve Bank FOMC members expressed similar concerns about inflation, they continued to vote to keep the target federal funds rate near zero. Nonetheless, President Hoenig's willingness to vote against the FOMC policy, as well as his willingness to be outspoken about his dissent, has helped to embolden other Reserve Bank presidents to speak out, leading to a livelier debate about the Fed's monetary policy and the effects it has on the economy.

Some economists attributed a non-trivial portion of the recent rise in prices to the Federal Reserve's current monetary policy and to QE2, which they believed has greatly expanded the money supply. As Milton Friedman once said, "[i]nflation is always and everywhere a monetary phenomenon in the sense that it is and can be produced only by a more rapid increase in the quantity of money than in output." Critics of QE2 believed that the Federal Reserve's purchase of assets accelerated the expansion of the money supply and thus fuels inflation.

Other economists, most notably from the Austrian School of economic thought, also expressed concern that cheap funds resulting from the low target federal funds would prevent bad debts from clearing and could fuel another speculative bubble similar to the housing market bubble that precipitated the financial crisis. These economists pointed to the low target rate that the Federal Reserve maintained after the bursting of the dot-com bubble as one factor that helped inflate the real estate bubble, and they worry that a similar scenario may be developing. As of June 2011, excess reserves held by depository institutions stood at nearly \$1.6 trillion.

The Federal Reserve announced that it still had a number of tools available to stimulate the economy if economic conditions continued to worsen, and to withdraw liquidity support if improvements in the economy warranted a less-accommodative policy to ward off heightened inflation expectations. Some believed that the Federal Reserve had few policy tools left that it could use to further stimulate economic activity, while others believed that any additional options would only be minute variations on previous policies to purchase more securities and further increase bank reserves. In Congressional

testimony at that time, Chairman Bernanke noted an additional option: “more explicit guidance about the period over which the federal funds rate and the balance sheet would remain at current levels.”

While the Federal Reserve continued to weigh its options for further stimulating the economy through monetary policy, many believed that the time had come for the Federal Reserve to tighten monetary policy, given that the accommodative monetary policy had neither spurred employment nor economic growth, but had instead raised the spectre of future inflation. And of course, those from the Austrian School viewed the Federal Reserve exiting its heavy involvement in the economy as necessary to promote a healthy economic recovery.

*T*RANSCRIPT

The subcommittee met, pursuant to notice, at 2:12 p.m., in room 2128, Rayburn House Office Building, Hon. Ron Paul {chairman of the subcommittee} presiding.

Members present: Representatives Paul, Jones, Lucas, Luetkemeyer, Huizenga, Schweikert; Clay, Maloney, and Green.

Ex officio present: Representative Bachus.

Chairman PAUL. This hearing will come to order. Without objection, all members' opening statements will be made a part of the record.

I want to welcome our witness today, President Hoenig.

And I will begin the hearing with my opening statement.

Over the years, I have been interested in the transparency of the Federal Reserve (the Fed), and the Fed has been interested in the independence of the Fed. But since I know what Mr. Hoenig is interested in, I think he truly represents the right kind of independence that I like, because he is a rare individual to be at the Fed, or on occasion to be a member of the FOMC.

But I want to note that last year when virtually everybody was endorsing and welcoming QE2, he was dissenting against this position, I believe, about 8 times. So that to me is truly remarkable and shows that he is, obviously, an independent thinker.

My interest, of course, in the monetary system has been related to the accumulation of debt. I believe they are related and that the size of government is indirectly affected by monetary policy as well. If debt can be easily monetized, the temptation for Congress to spend money is always there. And I think that is a big, big distortion.

Mr. Hoenig has made his points made very clear, that maybe interest rates of 0 to 0.5 percent might be too much, and he actually has made statements about part of our problem prior to the crash of 2008 was the fact that interest rates were too low for too long.

And I often think about and like to clarify and expand as much as possible the relationship of the problems that we have today to our privilege of issuing the reserve currency of the world.

Obviously, nobody has quite that same benefit. And, therefore, our debt and our bubbles can get far more exaggerated than if you are an independent country and your debt is numbered in a currency that the world doesn't accept like they accept our dollars.

So though that might be a very positive thing in the short run, and give us some benefits, it also may be misleading to us, because it is deceiving us into thinking that this process can go on forever.

Today, we are in the middle of a default crisis. We are worrying about whether the national debt is going to be increased.

And I have an opinion that once the debt gets so big, default is virtually impossible to stop and that the default that we are worrying about right now is not strange and brand new, because in many ways, our country has already defaulted.

If you look at our inability to follow up on the promises to pay a gold certificate in the 1930s, that was a form of default. And then, we promised to pay foreigners gold for \$35, and we eventually had to quit doing that.

We promised to pay the American citizens a dollar for a silver certificate, and we defaulted on that. And eventually, those silver certificates were not worth a silver dollar, but they were then worth a Federal Reserve Note.

And even in 1978, we met a major crisis. It was a dollar crisis, and we were not able to maintain the value of the dollar. And we went hat in hand to the IMF and actually got approximately \$25 billion to \$30 billion of boost to prop up our dollar at that time.

So for me, that is a form of default, and I believe we have embarked on a system where default is going to come. And I think the argument and the impasse is because nobody wants to really admit that the default is here, and we have to face up to it.

The argument is, how do we default? Are we going to quit sending the checks out, or are we going to do the ordinary thing that countries have done for years and that we continually do, and that is, we pay off our debt with money with a lot less value.

To me, that is a default, but I see that as being unfair, because some people suffer more than others. And, therefore, we will eventually be pushed into some serious talks about monetary reform, which I believe are actually occurring already in international circles.

But my 5 minutes has expired.

And now, I will yield 5 minutes to Mr. Clay.

Mr. CLAY. Thank you, Mr. Chairman. And thank you for conducting this hearing on the impact of monetary policy and the state of the economy.

The Full Employment and Balanced Growth Act of 1978, better known as Humphrey-Hawkins, set four benchmarks for the economy: full employment; growth in production; price stability; and the balance of trade and budget.

The Humphrey-Hawkins Act also charges the Federal Reserve with a dual mandate: maintaining stable prices; and promoting full employment.

According to the Department of Labor, in June, the Nation's unemployment rate was 9.2 percent. Over 14 million Americans are looking for work. Another 5 million are underemployed at jobs that pay much less than they previously earned, and offer few benefits.

And in urban areas like the district that I represent in St. Louis, the unemployment rate among African Americans and other minorities is over 16 percent.

The Majority party has been in power in this House for over 200 days, and yet we have not seen one jobs bill, and America is still waiting.

I am eager to hear what additional steps the Federal Reserve is willing to take to free up the flow of credit to small businesses and to encourage major banks to finally invest in this recovery, instead of sitting on the sidelines with trillions of dollars that could be creating millions of jobs.

I also look forward to the witness' comments regarding what other urgent steps Congress can take to spur private sector job growth and restore confidence in our economic future.

And with that, Mr. Chairman, I yield back.

Chairman PAUL. I thank the gentleman.

Now, I yield to Mr. Luetkemeyer.

Mr. LUETKEMEYER. Thank you, Mr. Chairman. Thank you, Mr. Chairman, for holding this hearing today and for continuing the dialogue.

I first want to recognize today's witness. President Tom Hoenig has been a voice for reasons and fiscal conservatism during a time when many of our economic policies have been weak.

Tom has often been a lone dissenter who has encouraged sound economic principles over politically expedient ones. Our Nation is grateful for his service.

President Hoenig has expressed concern over Federal Reserve monetary policies. Personally, I remain troubled by the expansionary

role the Fed seems to have been championing over the last several years. What is more upsetting is the fact that we don't seem to be any closer to changing course and abandoning these policies, even though they don't seem to have worked.

While a Federal program of quantitative easing looms, our economy remains stagnant. Our jobless rate continues to hover above 9 percent. Bank lending is still constrained. And we have seen little evidence of a long-term economic growth.

Abroad, the credit markets have indicated that austere measures are being taken by troubled governments. We are headed down an identical path.

Since 2008, the Fed has purchased several trillion dollars of U.S. treasuries, many of which are still held by the bank. We have been warned time and time again that unless we get our fiscal house in order, our credit rating is likely to be downgraded. Considering the amount of treasuries held by the Fed, the solvency of our central bank will undoubtedly be affected by this downgrade, should it occur.

The current state of our economy, combined with the problems we could face in the near future, results in a recipe for economic distress. The Fed must begin to seriously examine the policies in place and plan for worst-case scenarios that could overwhelm our Nation in the coming months.

Congress rarely hears from the 12 regional Fed Presidents. This is unfortunate, given their role as a financial regulator in our communities and as an independent voting member on the Federal Open Market Committee.

I appreciate President Hoenig's willingness to be here today, and I look forward to his testimony.

With that, Mr. Chairman, I yield back.

Chairman PAUL. I thank the gentleman.

I now yield to Mr. Green from Texas.

Mr. GREEN. Thank you, Mr. Chairman.

And Dr. Hoenig, thank you for appearing today, sir. I trust that you will find our committee hospitable.

I think that we have many concerns that we can address. And, of course, I am concerned about inflation, concerned about unemployment, concerned about the quantitative easing and the possibility of another round of quantitative easing.

But I must also say to you, I still believe in America. I really don't want this to come across as, we have lost faith in the country that has produced so much for so many. America is still a pretty good place to

live. A pretty good place to have your dreams, your hopes, and your aspirations fulfilled.

So as I—I will speak for myself—make my queries and make my inquiries known, I don't want to give the impression that I no longer have faith and belief in this, the greatest country in the world.

I am concerned, sir, about the widening gap, and I am not sure that you can address this, but if you have some intelligence that you will share, I would appreciate it, but the widening gap between what we commonly call the haves and the have-nots.

That is a real concern. I have seen some information published indicating that Latinos, African Americans and Asians have had a great widening in the gap between these groups and some others. That concerns me.

I am also concerned about this crisis that you have very little control over—you may be able to influence it, but little control—and that is the raising of the debt ceiling, as we call it. This ceiling is something that has become a crisis, but it really is a political problem that has somehow evolved into a crisis, a political problem that has evolved into an economic crisis, if you will, only because the politics have not come together appropriately.

And I still believe that we will get it right. I think that there is still time for us to raise the debt ceiling.

But these are some of the concerns that I hope you will be able to address today from your regional perch. I think highly of you, and I am interested in hearing your views. I have a lot of respect for you, and I thank you for appearing.

I yield back the balance of my time, Mr. Chairman.

Chairman PAUL. I thank the gentleman.

Now, I yield to the full committee's chairman, Mr. Bachus.

Chairman BACHUS. Thank you, Chairman Paul.

I commend you for holding this hearing to examine the state of the economy from the perspective of a regional Federal Reserve Bank President, and I thank you for inviting Governor Hoenig, whom I consider to be a superb regional President.

Tom Hoenig, or Dr. Hoenig, is the longest-serving of the 12 Presidents of the regional Federal Reserve Banks. Perhaps happily for him, but sadly for many of us who admire his wisdom, he is soon to retire from that post.

You will be missed.

Dr. Hoenig has been a steadfast, independent voice among those in the inner circle of Federal Reserve Chairman Ben Bernanke, and before that, Chairman Alan Greenspan. He has been particularly

outspoken recently in cautioning against the overly stimulative efforts of the Fed, including the so-called QE2, quantitative easing program that ended last month after adding an additional \$600 billion in bonds onto the Fed's balance sheet.

The New York Times said that Dr. Hoenig's cautious views were clearly shaped by having worked at the Kansas City Fed during the runaway inflation of the 1970s and the bank failures of the 1980s, and "seem rooted in an agrarian and populist tradition that is mistrustful of concentrations of power."

I think that is a healthy fear. It is not surprising, then, that Dr. Hoenig has spoken forcefully on the subject of downsizing the biggest of the country's large banks, including a 2009 speech he titled, "Too Big Has Failed." I can tell you that on this side of the aisle, many of us are in wholehearted agreement with you. And we have looked on with alarm as there has been a greater and greater concentration of "too-big-to-fail" institutions.

I mention all this not only to salute you, Dr. Hoenig, for your career and your, I guess, bravery in speaking out, but also to make a comparison between your views and the view that is held by some in Washington that regional Fed Presidents should not be allowed to vote on monetary policy moves made by the Federal Open Market Committee.

Somehow, this view holds that regional Fed Presidents are captive of big business and the industry, and I can tell that you are a very good exhibit against that. In fact, I think that more often than not our regional banks are more attuned to Main Street.

And of course, you are not the only independent thinker among the regional Bank Presidents, but your appearance here today will serve as a good rebuttal to the view that the Federal Reserve Bank Board of Governors in Washington, D.C., need less input from the regional Feds and the rest of the country. Actually, they need more.

So thank you, Doctor.

And I yield back the balance of my time.

Chairman PAUL. I thank the chairman.

And if there are no other opening statements, we will go to the introduction of the witness.

I want to welcome Dr. Thomas Hoenig, who has been the President of the Federal Reserve Bank of Kansas City for the past 20 years and is the longest-serving policymaker at the Fed. While a voting member of the Federal Open Market Committee in 2010, he voted against keeping interest rates at zero, casting the only "no" vote at all 8 FOMC meetings.

He has been a vocal critic of the Fed's zero interest rate policy and QE2. He will be retiring in October, having reached the Fed's required retirement age of 65.

Mr. Hoenig, you are recognized.

**STATEMENT OF DR. THOMAS M. HOENIG³¹²
PRESIDENT, FEDERAL RESERVE BANK OF KANSAS CITY**

Mr. HOENIG. Thank you, Chairman Paul, and members of the subcommittee. I want to thank you for this opportunity to discuss my views on the economy from the perspective of a President of the Federal Reserve Bank of Kansas City, and, as you said, a 20-year member of the Federal Open Market Committee (FOMC).

The Federal Reserve's mandate reads: "The Board of Governors of the Federal Reserve System and the Federal Open Market Committee shall maintain long-run growth of the monetary and credit aggregates commensurate with the economy's long-run potential to increase production, so as to promote effectively the goals of maximum employment, stable prices, and moderate long-term interest rates."

Within the context, then, of "long-run," the role of the central bank is in fact to provide liquidity in a crisis and to create and foster an environment that supports long-run economic health. For that reason, as the financial crisis took hold in 2008, I supported the FOMC's cuts to the Federal funds rate that pushed the target range to 0 percent to 0.25 percent, as well as the other emergency liquidity actions taken to stanch the crisis. However, though I would support a generally accommodative monetary policy today, I have raised questions regarding the advisability of keeping the emergency monetary policy in place for 32 months with the promise of keeping it there for an extended period.

I have several concerns with zero rates. First, a guarantee of zero rates affects the allocation of resources. It is generally accepted that no good, service or transaction trades efficiently at the price of zero. Credit is no exception. Rather, a zero-rate policy increases the risk of misallocating real resources, creating a new set of imbalances or possibly a new set of bubbles.

For example, in the Tenth Federal Reserve District, fertile farmland was selling for \$6,000 an acre just 2 years ago. That land today is selling for as much as \$12,000 an acre, reflecting high commodity prices but also the fact that farmland loans increasingly carry an

³¹² [The prepared statement of President Hoenig can be found on page 1123.]

interest rate of far less than the 7.5 percent historic average for such loans. And with such low rates of return on financial assets, investors are quickly bidding up the price of farmland in search of a marginally better return.

I was in the banking supervision area during the banking crisis of the 1980s, when the collapse of a speculative bubble dramatically and negatively affected the agriculture, real estate, and energy industries, almost simultaneously. Because of this bubble, in the Federal Reserve Bank of Kansas City's district alone, I was involved in the closing of nearly 350 regional and community banks. Farms were lost, communities were devastated, and thousands of jobs were lost in the energy and real estate sectors. I am confident that the highly accommodative monetary policy of the decade of the 1970s contributed to this crisis.

Another important effect of zero rates is that it redistributes wealth in this country from the saver to the debtor by pushing interest rates on deposits and other types of assets below what they would otherwise be. This requires savers and those on fixed incomes to subsidize borrowers. This may be necessary during a crisis in order to avoid even more dire outcomes, but the longer it continues, the more dramatic the redistribution of wealth.

In addition, historically low rates affect the incentives of how the largest banks allocate assets. They can borrow for essentially a quarter-point and lend it back to the Federal Government by purchasing bonds and notes that pay about 3 percent. It provides them a means to generate earnings and restore capital but it also reflects a subsidy to their operations. It is not the Federal Reserve's job to pave the yield curve with guaranteed returns for any sector of the economy, and we should not be guaranteeing a return for Wall Street or any special interest groups.

Finally, my view is that unemployment is too high today, in part because interest rates were held to an artificially low level during the period of the early 2000s. In 2003, unemployment at 6.5 percent was thought to be too high. The Federal funds rate was continuously lowered to a level of 1 percent in an effort to avoid deflation and to lower unemployment. The policy worked, but only in the short run.

The full effect, however, was that the United States experienced a credit boom with consumers increasing their debt from 80 percent of disposable income to 125 percent. Banks increased their leverage ratios—asset to equity capital—from 15-to-1 to 30-to-1. This very active credit environment persisted over time and contributed to the bubble in the housing market. In just 5 years, the housing bubble

collapsed and asset values have fallen dramatically. The debt levels, however, remain, impeding our ability to recover from this recession. I would argue that the result of our short-run focus in 2003 was to contribute to 10 percent unemployment 5 years later.

That said, I am not advocating for tight monetary policy. I am advocating that the FOMC carefully move to non-zero rates. This will allow the market to begin to read credit conditions and allocate resources according to their best use rather than a response to artificial incentives.

More than a year ago, I advocated removing the “extended period” language to prepare the markets for a move to 1 percent by the fall of 2010. Then, depending on how the economy performed, I would move rates back towards more historic levels.

I want to see people back to work, but I want them back to work with some assurance of stability. I want to see our economy grow in a manner that encourages stable economic growth, stable prices, and long-run full employment. If zero rates could accomplish this goal, then I would support interest rates at zero.

Monetary policy, though, cannot solve every problem. I believe we put the economy at greater risk by attempting to do so.

Thank you, Mr. Chairman, and I do look forward to the committee's questions.

Chairman PAUL. I thank you for your statement, and I would note that without objection, your written statement will be made a part of the record as well.

Mr. HOENIG. Thank you.

[QUESTIONS & ANSWERS]

Chairman PAUL. I would like now to yield to Mr. Bachus for any questions he would like to ask.

Chairman BACHUS. I thank the chairman.

Dr. Hoenig, as I said in my opening statement, you have been firmly outspoken about monetary policy decisions.

The Fed recently issued guidelines on how and when Federal Open Market Committee members should discuss or could discuss monetary policy decisions. Do you view this as an attempt to control the message or to stifle dissenting voices?

And probably more importantly, Chairman Bernanke has promised a more open Fed, a more transparent Federal Reserve. And these guidelines, at least to me, seem a little inconsistent with restrictions on your ability to speak out. But I would like to know your views on that.

Mr. HOENIG. I hope not. I think part of the reason for the guidelines are that there were instances, frankly, where I would wake up on a Thursday morning and find what the future policy might be in the Wall Street Journal, not having known about it. And I think I raise objections to those kind of leaks and ask that they be vigorously pursued, to be quite frank. So I hope that is the reason.

Secondly, my approach is that I speak publicly, on the record. I try not to speak off the record, so that there isn't any confusion. And so when I come here, or wherever I go, I speak my views. I don't consult with the Board of Governors. I don't ask permission. I have until October, I realize, but I have never done so, and if I were staying on, I wouldn't do so in the future.

So I think it is a matter of personal choice. I don't think any of the members should disclose confidential information or leak to the media in advance. I strongly object to that, and I would have every intention to speak on the record my views publicly, regardless of what that statement might otherwise say. And I don't think that statement prevents me from doing so.

Chairman BACHUS. Good, so the guidelines are more designed to keep unauthorized releases and releases that aren't a part of the public record?

Mr. HOENIG. That is the context in which they came up.

The fact that they are there, I think could have the effect of stifling some, but I think that is a matter of someone saying, "I have spoken to this. This is my view," and show the leadership to speak their views.

Chairman BACHUS. Okay, good. And I am glad to hear that. I think that affirmation—I think Chairman Bernanke has tried to have a more open Fed, and I think he has been very candid with our committee.

In your testimony, you used the rapid increase in farmland value as an example of, maybe, credit misallocation resulting from what you see as a too-low Federal funds rate. Do you see any other bubbles building?

Mr. HOENIG. I don't—in fact, when people have asked me about the land, I have not said it is a bubble, but I—

Chairman BACHUS. Oh, yes.

Mr. HOENIG. But I do say that we have conditions. We have created conditions. Zero interest rates, QE1, QE2 create conditions that are amenable to bubbles.

And where we see asset values moving quickly, one example is in the farmland. I think you can see it in other areas, some of the bond markets and so forth. And so you have to be aware of that.

I think my issue is that, when you create conditions for certain outcomes, they will eventually arrive unless you withdraw those conditions in a timely fashion. And I think that is really the issue at hand.

Chairman BACHUS. Okay. The Fed used to say it specifically did not want to use monetary policy to reduce froth in the markets. Chairman Greenspan said it in front of this committee any number of times, or made that statement.

But is it appropriate for the Fed to avoid dealing with the buildup of asset bubbles but, on the other hand, conduct monetary policy aimed at reflating a market?

Mr. HOENIG. I think my view is that monetary policy should be conducted with a long-term focus, with, if you will, boundaries around its discretion, and therefore should not be in a position of creating froth in the market any more than it should try and somehow pinpoint some sector of the economy that it thinks is too frothy, and try and adjust that.

So, really, what you have to do is conduct monetary policy towards the long run. It is when you try and fine-tune monetary policy, direct it towards particular sectors, or to offset every short-term decline in the economy with extensive easing of monetary policy, that you create instability, as likely as deal with it.

Chairman BACHUS. Thank you. I will come back in the second round and ask other—I do want to say this, and I am just throwing it out for thought and not asking for a reply now. I have actually believed that QE2 gave the Congress an opportunity to—some time to move to make some long-term structural changes in our entitlement programs.

It is an opportunity that, whether it was intended for that purpose or not, it certainly gave us an opportunity, and kept financing the debt at a low rate, or lower rate, maybe. But the Congress has squandered that opportunity, at least at this time.

So I do believe that Chairman Bernanke's job has been made harder by the inability of this Congress to make the tough decisions and particularly to make needed structural changes in our entitlement programs. And I think we will continue to make problems for the Fed and probably result in inflation ourselves, some of our actions.

So, thank you.

Chairman PAUL. I thank the gentleman. I yield 5 minutes to Mr. Green.

Mr. GREEN. Thank you.

Again, I thank you for appearing today, sir.

Let us start with the debt ceiling. And if you could, be as terse as possible, because I have a couple of other questions. Can you give your opinion as to the consequences of our failure to raise the debt ceiling?

And if you can be brief, I would appreciate it, although I know it is impossible on this question.

Mr. HOENIG. The failure to address your budget issues is an action. It is a choice. And the consequences of doing that are to add to the uncertainty in the economy. So the effects will be, I think, in that sense, adverse.

I think the economy would do well with addressing the budget crisis and the budget problems and providing more stability and more certainty.

Mr. GREEN. In your opinion, would it be better to not raise the debt ceiling or to raise it and have it done in what we call a clean fashion—if it were those two choices?

I know there are many others, but is it better to raise it and have a clean raising of the debt ceiling, as opposed to not raise it at all?

Mr. HOENIG. The only answer I can give you to that is you really need—that is the Congress' area of responsibility—

Mr. GREEN. But I am talking about the consequences.

Mr. HOENIG. But you need to deal with it as forthrightly as possible.

Mr. GREEN. I understand, but are the consequences more severe if we don't raise it than if we raise it with a clean ceiling?

Mr. HOENIG. I think the consequences are there regardless. It is a matter of the timing of the consequences and how you want to accept those—

Mr. GREEN. So in your opinion, it could be just as bad to raise the debt ceiling as we have done in the past, just have a clean raising of the debt ceiling. That would be just as bad as not raising it at all?

Mr. HOENIG. I don't know what the consequences will be any more than anyone else does.

Mr. GREEN. I know, but you are in the business of prognosticating, because that is what you do to decide whether you should raise it the 1 percent that you are talking about here.

Mr. HOENIG. If you want my prognosis, honestly, I think what you need to do is address the budget crisis.

Mr. GREEN. I understand, but I am not ready to go there, you see. I am giving you a set of circumstances and I am asking you, if you would, to address this set of circumstances.

I know what you would like to do. I have been reading a little bit, here, and I understand your point of view. But I am taking you out of your comfort zone and—from time to time—

Mr. HOENIG. But it is not mine to decide. It is yours.

Mr. GREEN. I don't want you to decide. I just want you to tell me about consequences of not deciding.

Mr. HOENIG. If you don't raise the ceiling immediately, then the Congress and whomever else has to prioritize its future cash flows. If you do raise it, you also will have to prioritize it over time. In either case, you have—

Mr. GREEN. Let us go to another area, because—

Mr. HOENIG. —you have to make choices.

Mr. GREEN. I understand. My time is about up. Let me go to another area quickly.

You wanted to prepare the market for a 1 percent increase by the fall of 2010. Is that a fair statement?

Mr. HOENIG. Yes. And that was in an earlier part of 2010.

Mr. GREEN. Okay. All right, I understand the circumstances were different than now. But if we had done this, we had prepared the market, as you had hoped we would, what were your thoughts in terms of what would occur?

Mr. HOENIG. Interest rates would still be at historic low levels. Monetary policy would continue to be highly accommodative, but yet you would be off of zero. You would be no longer pumping enormous amounts of liquidity into the market.

And the market would know. Right now, the market—what you are doing is you are at zero. So you are creating—the market is adjusting to zero, in all its allocations, in its investments, in its bond funds, in its land, around an equilibrium of zero.

I think most people acknowledge that zero is not sustainable. So the longer you allow that to continue, the longer you allow that allocation of credit and assets around zero, the more fragile the equilibrium and the sharper the consequences when you finally do remove that zero.

And I think, the more—

Mr. GREEN. I wanted to have a quick follow up, because I only have 30-plus seconds.

You do agree that we don't have as much lending now as we need for the economy to recover. And if we don't have that lending at zero, what would be the circumstance at 1 percent?

Mr. HOENIG. I don't think that the issue around lending is related to the immediate policy of the Fed funds rate being zero. It is around the issues of the fiscal uncertainty. It is around the issues of whether we have a resurgence of manufacturing in this country that is sustainable. It is around the issues of how we create goods, because it is the creation of goods and services that brings jobs in.

And I don't think that the marginal choice for most businesses around whether they would do this of zero or a half a percentage point or 1 percentage point is the deciding factor in that instance.

Mr. GREEN. My time is up.

And you have been very generous, Mr. Chairman. I thank you. And I will wait for a second round.

Chairman PAUL. Thank you.

Mr. GREEN. And I will follow up.

Chairman PAUL. I thank the gentleman.

I will now take my 5 minutes.

I want to talk about the relationship of Federal Reserve policy and monetary policy with the debt increase. We all know that the Federal Reserve is the lender of last resort. The economy gets into trouble, liquidity dries up, the Fed is supposed to be there to help out.

But could it be that this concept of lender of last resort contributes to the deficit problem? And what I am thinking about here is that politicians, we in the Congress, get pressure from a lot of areas to spend money. And sometimes spending money helps us get reelected.

So, there are a lot of domestic needs, needs in our districts. And also, there is a lot of activity around the world, both violent and non-violent, that requires a lot of money.

And in the inflationary part of the cycle when things seem to be going well, it is very tempting for Congress to spend a lot of money.

But if the Fed is always there to keep interest rates low, doesn't that just encourage us? Congress generally is undisciplined, but doesn't the policy feed into this? Because if the Fed didn't do this, if they weren't our lender of last resort and interest rates started bumping up, we couldn't blame the Fed for our problems, we would have to blame ourselves—high interest rates—because we are sucking up all the credit.

Do you see a relationship between Fed policy and the encouragement or allowing Congress to spend more than they should be?

Mr. HOENIG. I think there is always the danger that the central bank can be put in the position of buying the government's debt. That is why you have an independent central bank and why the independent central bank has to pursue long-run monetary policy geared towards what the basic money-based requirements and needs are for the growth of that economy.

And it does require not only that the Congress be disciplined, but that the central bank be disciplined as well and not allow themselves to get drawn into that, yes.

Chairman PAUL. But in a way, doesn't your testimony verify that maybe the Fed didn't do their job because they kept interest rates too low for too long, and we were part of the problem. So how do you protect against that, if the Fed is as fallible as the Congress?

Mr. HOENIG. There is no system that is infallible. Whether it is the central bank doing this or the Congress doing it, there is no system that is infallible.

Yes, I think that in the early part of the decade of the 2000s— as I have said many times—the policy was kept too accommodative for too long. The consequence of that was to create a credit bubble. It affected not only the Congress, but, of course, the credit markets generally became very active.

That is why we had the tremendous expansion in credit in housing and later the consequence. That is an area that we have to learn from and go forward from. I don't think it is directly related in terms of the Congress and the debt, but it is related to the economic conditions broadly and the expansion of monetary policy during that period. And I think we have to be careful and mindful of that as a central bank.

Chairman PAUL. I would agree that no system is infallible, but it seems like we might get better information from the marketplace, dealing with interest rates. Prices are very important in the economy, and nobody is out there advocating wage and price controls. We have tried it and, hopefully, they never bring that back again.

But in a way, aren't we dealing with a price control and you are looking for the price of money, the cost of money? I think you talk about that, that the cost was too low. And it causes a misallocation of resources. So how do you know what the right price is?

Mr. HOENIG. I agree that you need to have a disciplined monetary policy that has a range. Our long-term growth over this decade has been about 3 percent real growth. Our policy should be mindful of that as we conduct monetary policy going forward.

And when we do go to zero and leave it there for an extended period, in reaction to a crisis, that is one thing. If we leave it there on a continuing basis, we do increase the risk that we misprice credit and misallocate resources, yes.

Chairman PAUL. It seems like it is a contest between confidence in the market setting the price or the interest rates versus somebody dealing with monetary policy. And some of us have come to the conclusion that we like the market to set that. We would like to see maybe the retirees get more for their CDs.

Mr. HOENIG. Right, and I understand, but the market makes terrible mistakes as well. And the market is responsible because it gets, if you will, euphoric in a direction, creates its own bubble around credit, because we are a fractional reserve system. It crashes. The market itself isn't perfect either. It causes—

Chairman PAUL. My time is up, but we are going to have a second round, and I want to ask about the fractional reserve system.

Mr. HOENIG. Okay.

Chairman PAUL. And now, I yield 5 minutes to Mr. Luetkemeyer.

Mr. LUETKEMEYER. Thank you, Mr. Chairman.

And welcome to my fellow Missourian.

Mr. HOENIG. Thank you.

Mr. LUETKEMEYER. Dr. Hoenig, it is good to have you here.

Mr. HOENIG. Thank you.

Mr. LUETKEMEYER. Since 2008, the Fed has purchased several trillion dollars worth of U.S. securities, treasury bills. And as we have seen over in Europe, over there the countries, in order to get their debt sold, have had to go to some very austere measures, sometimes go back 2 or 3 times to review their plans. Every time their interest rates have gone up in order to be able to accommodate them.

We are being told by the credit markets that if we don't do something within the next couple of weeks here, we are going to have our securities downgraded. How does that affect the solvency of the Federal Reserve to have all of those securities that they are holding all be downgraded suddenly?

Mr. HOENIG. It depends on how the markets view this downgrade. If it is downgraded and it doesn't affect the market pricing on those securities, because they have confidence that the Congress of the United States will come to a correct solution on that, I don't think it will have much effect at all on our solvency.

If the Congress fails to act, it will have a more lasting effect. But they are anticipating that the Congress will act.

Mr. LUETKEMEYER. As a former examiner, I am sure you—it would be interesting to have the Fed on the problem list, wouldn't it?

Mr. HOENIG. Yes.

Mr. LUETKEMEYER. Along that line, though, the same thing is happening with the rest of the banks in this country. If, for instance, we did get downgraded, suddenly now those banks—so your local community banks got a whole fistful of U.S. treasuries. And now they are being downgraded, and suddenly that affects their capital. It affects their rating.

How would you view that situation then—again, as a former examiner—the calamity that would happen to our local community banks?

Mr. HOENIG. If there was a serious effect from the downgrade on the pricing of the bonds to where there was capital loss in the bank, then of course it would have negative effects. I think the question is whether it would be a pricing effect, and I think that depends very much on the actions of the Congress.

Mr. LUETKEMEYER. It is an action that could happen on the part of the credit markets to where it could be an increase in risk that would have to be assumed there.

Mr. HOENIG. The failure to act is an action.

Mr. LUETKEMEYER. Okay. Thank you.

With regards to—you mentioned a while ago—my time is running out here—let me get to QE3.

We had Chairman Bernanke in here not too long ago, and he wouldn't say anything about QE3. But since he has been here, he certainly has not denied thinking about QE3. And to me, this is a devastating situation.

We have had a number of economists in here since he has been here, and every one of them I have asked the same question, "Do you see interest rates going up this fall as soon as QE2 stops here?" And every one of them said "Yes, unless you do a QE3, in which case you will probably have inflation."

Would you concur with that or do you have a different opinion on that?

Mr. HOENIG. First of all, I am not a supporter of QE3. I wasn't a supporter of QE2.

I think, by ceasing QE2, I don't know that interest rates necessarily will go up significantly. It depends on a whole host of factors in terms of how the economy is doing. It is not just whether you stop QE2 over time. I don't think we should mainly try and manage interest rates down. That is kind of the point of my testimony. I think

there are consequences of doing that, that misallocate resources, and we have to be mindful of that.

Mr. LUETKEMEYER. Obviously, I agree with that. I am just going along that line of thought, that among other things, the Fed's job is to look long term with regards to interest rates, with regards to unemployment.

And to me, this would seem to fit into a QE2, QE3. Where do we stop this? At some point, we have to get control of—at some point, the economy has to be resilient enough to stand on its own two feet. We have to wean them off this.

If we are going to absorb all the debt that we are incurring—and every budget whether it is Democrat, Republican or whomever, we have debt out there. Everybody is agreeing we are going to have more debt. So we are going to have to have somebody to purchase it. And if the Fed doesn't purchase it, somebody else is going to have to.

Mr. HOENIG. Correct.

Mr. LUETKEMEYER. And if we get our securities downgraded, risk is there, interest rates are going to necessarily go up. So long term, how do you manage those monies to see that you can minimize that? What would be your idea or a solution?

Mr. HOENIG. I think that the mandate is a long-term mandate, and we need to keep that in mind. And if we do and if we pursue a policy that is long-run oriented towards price stability, then the economy—a market economy adjusts on its own.

The market is not particularly brilliant, but it is harsh. It corrects itself when there is a misallocation. And so that is why monetary policy has to look to the long run, provide sufficient liquidity, but not try and fine-tune or manage the economy so that markets can in fact discipline themselves.

So we should not be doing QE3. This is my view. There are plenty of excess reserves out there on the order of \$2 trillion. I think that is plenty. Let the markets begin to heal, and let this market of ours allocate resources in our economy. And we should not try and fine-tune that.

I think when we do that, we inject instability as well, more likely than we do stability. So we have to be very mindful of that. In the short run, we can really inject instability. We have to have a long-run focus. And that is hard, I realize, but necessary.

Mr. LUETKEMEYER. Thank you for your comments.

And thank you for your indulgence, Mr. Chairman.

Chairman PAUL. I thank the gentleman.

I recognize Mr. Lucas for 5 minutes.

Mr. LUCAS. Thank you, Mr. Chairman.

Doctor, as you are well aware, of course, I live in the great Kansas City district in western Oklahoma. And about the time you were out doing all that hard work in the early 1980s, I was a senior at Oklahoma State. And I will always think of my father's lecture in the spring of 1982 when I would occasionally go to land sales with my grandfather: "Keep your hands in your pockets and your mouth shut."

It was wonderful advice in 1982. The reason I bring that up is we are now dealing with a set of circumstances here that you have discussed and touched around the edges that in some ways is reminiscent of those early 1980s. You remember, and sometimes there is an occasional view here that nothing is interconnected, that we are all little islands in the world.

You remember when Penn Square Bank went down, an energy-concentrated banking establishment, which then took down, directly or indirectly, Continental Illinois in Chicago, took down Seafirst in Seattle, took down two major, historic long-term players.

Partly that, in my opinion, and you can offer yours and I would be pleased to hear it, as a result of perhaps misguided fiscal policy by Congress and perhaps misguided monetary policy by the Fed in that late 1970s and early 1980s period. But it had a devastating consequence, and it wasn't just Oklahoma that imploded. We sucked people under with us.

I guess that brings me to my real question, and whatever comments you would care to offer. As my colleagues have alluded to, with the Fed balance sheet at a little under \$3 trillion now, and even by a Texan's definitions, Mr. Chairman, that is a lot of money.

It took us 15 years to recover from the agriculture and the energy sector hangover from credit that started in 1982. In my opinion, in my quadrant, it was 1997 before the ship righted itself.

Three trillion dollars is a whole lot more credit than Penn Square was manipulating. When the right policy decisions are made, how long is it going to take this credit hangover to clear?

Mr. HOENIG. Let me first comment. I was on the discount window on Penn Square and was part of the group that recommended against lending against Penn Square. And I think it was the right decision there, although the consequences, as you said, were very harsh.

Mr. LUCAS. And for the record, a few officers of Penn Square did go to the Federal penitentiary. It was more than just a few bad decisions.

Mr. HOENIG. They did. Absolutely.

To your question of the degree of liquidity, the amount of time it will take to bring the liquidity off our balance sheet, the \$3 trillion, I think, is reasonably a period of years.

Because we have brought this on, I think if you bring it out too sharply, you will shock the economy. And in our last minutes, the Open Market Committee talked about how they would go about doing it in terms of rates and no longer renewing their debt instruments.

But even under those, it will take years. How many years? It depends on how the economy does. It depends on what the roll-off of these instruments, the speed of the roll-off of these instruments and whether we choose to sell those. I don't know how long, other than I know it will take years, and there are risks to doing that.

And that is my point about zero interest rates and creating what I call "fragile equilibriums" around this very liquid policy that when you finally do begin to move has a negative effect, a negative consequence on the economy, both nationally and regionally. And that does get my attention.

Mr. LUCAS. Is it a fair statement to say, Doctor, that, of course, we will make a decision at some point. We will, at some point, I hope, achieve a consensus. We have legitimate disagreements within the ranks of the House over what the right policy is.

Mr. HOENIG. Right.

Mr. LUCAS. That is the nature of the body. But at some point, we will arrive at something. If we make the wrong decision, whatever decision we come to, are the consequences as frightening as I suspect they are?

Mr. HOENIG. Any time—

Mr. LUCAS. Without commenting on any particular decision.

Mr. HOENIG. Right, anytime you make a wrong decision, there are usually negative consequences. And if you make the wrong decision, there will be negative consequences, whatever that is.

Mr. LUCAS. And the financial markets are sophisticated enough that they will respond moment by moment with whatever policy decisions we make, and will, as prudent money managers, use what I would define from an Oklahoma perspective as "defensive policies" if they need to. And that will ripple, too.

Mr. HOENIG. The greater the uncertainty you create, the more defensive the actions will be. That much we can be sure of.

Mr. LUCAS. Thank you, Mr. President.

Thank you, Mr. Chairman. I yield back the time that I have left.

Chairman PAUL. I thank the gentleman.

We will go ahead and start a second round of questioning.

If we look at the markets in the last couple of weeks, in light of all the conversation about whether or not the debt limit will be raised, my estimation or my observation is that the markets aren't that worried. Would you agree with that? Or do you think the markets are showing problems, or at least potential problems?

Mr. HOENIG. To this point, I think the markets at least strike me as having the view that there will be a solution. And as long as that view is in place, they will tend to stay calm. If they lose that or if they begin to see more instability, more uncertainty around it, and therefore actions, then they would—as I said earlier—take more defensive actions.

But right now, I think they have confidence in you, the Congress, and the President to come to some kind of agreement.

Chairman PAUL. In monetary history, it has been said that when countries get to a certain level of debt, they have a lot of trouble, and the debt eventually has to be liquidated. I personally think we are at that point, so there will be liquidation of debt.

As a matter of fact, free market individuals recognize that whether it is government debt or whether it is private debt, liquidation actually serves a purpose in order to get back to square one and have economic growth again.

When we liquidate debt, I believe I mentioned in my opening statement, you can do it in two different ways. You can just default, which great nations don't do. Small nations will. But we are nowhere close, I believe, to doing that. I don't believe that for a minute.

But I do worry about the other part. I worry about the liquidation of debt, because if it is inevitable that the debt will be liquidated and what we do may be prolonging the agony, that is what I worry about, that instead of allowing the liquidation and rapidly getting back to square one like we did in 1921, that we prolong this, such as Japan did and such as we did in the 1930s.

Do you agree with that? Do you have concerns that liquidation will come in the form of inflation? And if you want to prevent that, what are your other options, if we are not going to default on our payments, which of course, I don't believe we will?

Mr. HOENIG. First of all, I agree with you. I don't think great nations default on their debt. Second of all, I will say that I agree with you also, that we have leveraged our economy.

As I mentioned in my remarks, the consumer has raised their debt-to-disposable income from 80 percent to 90 percent to 125 percent. The Federal Government has raised its debt to in gross numbers 100 percent of GDP. So we have increased our debt.

My concern is that, maybe back to your earlier point, perhaps, but when you have that kind of debt, over time there is increased pressure on the central banks to help relieve that debt pressure by helping finance that debt.

That puts pressure on the central bank. If they do that, it does risk inflationary outbreak, and then you basically repay your debt in cheaper dollars.

Chairman PAUL. But isn't that—

Mr. HOENIG. That is a risk, so how do you avoid that? The way you avoid that is you take, either through the Congress, through special committees, whatever, and develop a long-run plan that shows the American people how we are going to deal with our debt, Federal and otherwise, but in the Congress, Federal debt, and how the debt-to-GDP ratio is going to be brought back down.

And if it does that in a systematic fashion, with a strong binding point, then you will take care of the debt in a responsible way.

Chairman PAUL. But it seems to me in that attempt, the Fed came in and they propped up banks and corporations, that they were the ones that have been benefiting from this, and now they have been able to get back on their feet again.

At the same time, it really didn't help the people. The jobs didn't come back and the people lost their houses. So it seems like it is a failed policy to me.

Mr. HOENIG. I understand your point. My concern is that we have in this country allowed to develop "too-big-to-fail" institutions, the largest financial institutions, who bulked their assets, and became so important to the economy that any one of them that failed would bring down and risk the economy.

The market understood that and therefore gave them an advantage in terms of their position in the market, lowered their cost of capital, and allowed them unfettered access. And when we allowed that part, the safety net portion of that to get in with the high-risk portion, the investment bank, it only increased that by factors.

So we do need to address the issue of "too-big-to-fail." We do need to think about how we separate out the safety net from the high risk so that the economy can function under a market discipline, or at least more under market discipline, and we would all benefit from that.

Chairman PAUL. My 5 minutes are up, and I now yield to Mr. Green.

Mr. GREEN. Thank you, Mr. Chairman. I will be honored to let you have 30 seconds of my 5 minutes, if you need it.

Let us talk for a moment about lowering the debt-to-GDP ratio. Do you agree that there is more than one way to do it?

Mr. HOENIG. Of course.

Mr. GREEN. Do you agree that cutting is a way to do it?

Mr. HOENIG. You can grow your economy—

Mr. GREEN. Grow the economy. You could also increase revenue.

Mr. HOENIG. Of course. That is up to the Congress, how they—

Mr. GREEN. I understand. But I just want you to be on the record indicating that we have more than one way to do it.

Mr. HOENIG. Right. And every choice has a consequence.

Mr. GREEN. Every choice has consequences. And not making a choice at all has its consequences as well.

Mr. HOENIG. That is a choice.

Mr. GREEN. Yes, sir.

Let us move to another area. You talked about markets and the market being calm. You do agree that the markets, generally speaking, don't like big surprises. When you give the market a big surprise, it has a reaction to a surprise. If you lead the market to believe that you are going in one direction, and if you go in another direction, then the market responds.

Mr. HOENIG. Correct.

Mr. GREEN. I think one of the best examples of this occurred when we had the \$700 billion TARP vote, and the market anticipated one thing, and when the vote went another way, we saw the market spiral downward. You recall that, I am sure.

Mr. HOENIG. Sure.

Mr. GREEN. So you agree that markets don't, generally speaking, want to be shocked with surprises.

Mr. HOENIG. Correct.

Mr. GREEN. Okay. If this is true, and you have indicated that the market currently believes that we are going to resolve this—and, by the way, I pray that we will—but you agree that failure to bring about the resolution that the market anticipates will create a reaction in the market.

Mr. HOENIG. Sure. It certainly will. If the market is thinking one thing and you do something else, there will be a reaction.

Mr. GREEN. One final question—

Mr. HOENIG. And that also happens on Main Street.

Mr. GREEN. Yes. And Home Street as well.

Mr. HOENIG. As well.

Mr. GREEN. Yes. But let us go back now to your support for the 0 to 0.25 target.

Mr. HOENIG. I do not support it.

Mr. GREEN. You do not support it. But in 2008, you supported the cut in the Federal funds rate that pushed us to this target range, did you not?

Mr. HOENIG. I wasn't voting, but I am sure I would have supported it. Yes.

Mr. GREEN. Okay. And, by the way, reasonable people can have opinions that differ—

Mr. HOENIG. Absolutely.

Mr. GREEN. —even on the things that you supported, true?

Mr. HOENIG. Absolutely.

Mr. GREEN. And Mr. Bernanke, whom I happen to think highly of and I have a great deal of respect for, and he has opinions that are very well-respected, and there are other members of the board with opinions, and you meet and you confer and you vote, and then you come to conclusions.

Mr. HOENIG. Correct.

Mr. GREEN. So at the time what you were trying to do was provide what I am going to call a soft landing. Is that a fair statement, that we didn't want the economy to just crash?

Mr. HOENIG. Well—

Mr. GREEN. We wanted it to land a little bit softer than if we had done nothing at all.

Mr. HOENIG. “Soft landing” is a generous term. I think we did want to avoid a crash and depression, yes.

Mr. GREEN. Yes, a crash and a depression.

And if you say that you wanted to avoid it, it says to me that you are of the opinion that had we not acted, there could have been a crash and a depression.

Mr. HOENIG. Counterfactuals are always there, and that is a possibility, yes.

Mr. GREEN. And counterfactuals are hard to prove.

Mr. HOENIG. Right.

Mr. GREEN. But the reason you acted the way you did was because there was this concern—and I am being kind by saying “concern,” because there are a lot of other ways to connote what was happening—but there were these concerns that we were headed for something close to a crash or a depression.

And your actions, probably if you were to write a book, you would say that your actions helped to avert this, would you not?

Mr. HOENIG. If you are speaking of our movement to zero interest rates and the liquidity we provided, yes, sir.

Mr. GREEN. Yes. Yes, that liquidity was helpful.

Mr. HOENIG. Yes.

Mr. GREEN. And just as it is difficult to prove a counterfactual as it relates to what you did, it is equally as difficult to prove it with reference to what Congress has done. Do you agree?

Mr. HOENIG. I assume so, yes.

Mr. GREEN. Okay. All right. What I am trying to do is establish this, sir. People of good will, and I consider you a person of good will, acted at a time of crisis—

Mr. HOENIG. Correct.

Mr. GREEN. —a time when it appeared as though we were about to go over the edge into an abyss unlike many of us had seen in our lifetimes.

And many of these things that we did, we won't be able to prove that we averted a great cataclysm, but we can surely conclude that what we did probably helped to avoid a rougher landing, a harder landing than we had.

Mr. HOENIG. Right.

Mr. GREEN. I want to thank you, Mr. Chairman. I will yield back the balance of my time.

Chairman PAUL. Thank you. I thank the gentleman.

I will yield to Mr. Luetkemeyer.

Mr. LUETKEMEYER. Thank you, Mr. Chairman.

Dr. Hoenig, I have been watching what is going on over in Europe very carefully, and it is very concerning to me. And I know that in discussing this issue with a couple of other Fed members— board members—they don't seem to be quite as concerned about it as I am, so maybe I am an alarmist here. I don't know.

But I certainly see a contagion there that could easily spread to this country, especially whenever you look at our banks having about \$1.3 trillion loaned to the various governments, invested in bonds of the various governments over there as well as, now, Dodd-Frank tying all those big banks together with “too big to fail.”

It looks like there is a lot of connectivity between all of these things here. And you look at a line of dominoes, and it looks like we are in that line of dominoes.

So I know that the Fed has a swap line with the European central bank and perhaps some other reserve banks over there as well. And I am just wondering what your view is of that situation, how concerned are you?

Mr. HOENIG. I am concerned—do you mean about the European situation?

Mr. LUETKEMEYER. Yes, the European situation and how it will affect us or what kind of exposure we might have, our monetary policy, how it interacts. It is kind of a big question, but—

Mr. HOENIG. I understand your concern. The issues around those countries that keep coming up are also really around the banks, the European banks, because they, obviously, have exposure there. And that is a big part of the efforts we are trying to do to resolve this.

And like the United States, as I read it—and I only know from what I read in the paper—they are working toward some kind of solution, resolution around that.

But I think it proves to me not only in the United States, but internationally that we have institutions that are “too big to fail.” And that is what this is really about. We have taken the market discipline away. We are now working with institutions globally that are extremely important to those economies, to our economy.

And to me, the whole issue continues to be around institutions that are so large that their own difficulties have broad effects on the economy, and that makes them “too big to fail” and therefore forces, if you will, governments to come in and bail them out.

And that is really what, I think, is going on in Europe and that is really what has gone on in our crisis in the United States.

Until we change that formula, until we break those institutions up into those that are under the safety net and those that are allowed to engage in high-risk activities, we will have these crises periodically into the future—not right away, perhaps, but in years to come.

Mr. LUETKEMEYER. And the pitfall there is that we have our taxpayer dollars at risk, because we are backing these “too-big-to-fail” folks. Is that right?

Mr. HOENIG. When you put a safety net over them and put the government’s implied or explicit guarantee, the taxpayer is the backstop, yes.

Mr. LUETKEMEYER. In your position—and you are an economist, and having dealt with all of the financial things over the last several years, what do you see as the biggest concern to our economy today, whether it is international problems here we just discussed or oil prices or our monetary policy, our wars or—

What do you see as the biggest concern and how we can go to it from a financial aspect there?

Mr. HOENIG. That is a pretty important question.

Number one, I think that as far as our financial system goes, I continue to believe that “too big to fail” is an area that needs to be

further addressed, and these institutions need to have their risk better divided between what is under the safety net and what is not.

Number two, I think that the budget crisis in the United States is important because it is drawing all of our attention into that. And yet the economy is in difficulty and we should be thinking about our policies, do we want to see if we can bring greater manufacturing onshore?

In 1960, 25 percent of our GDP was contributed by manufacturing. Today, it is 12.5 percent. We have 14 million people out of work. So what is our attitude towards manufacturing? What is our attitude towards creating businesses that create things then that hire people?

By not being able to pay attention to that in the Congress and elsewhere, I think we are handicapping ourselves in an international, global, competitive market, and we need to pay more attention to it so we have a brighter future. I think that is essential.

Mr. LUETKEMEYER. I appreciate your comments. My time is up. Thank you again for visiting with us today. I always enjoy discussing things with you. I really appreciate your perspective and all your hard work as well. I thank you again for your service, sir.

Mr. HOENIG. Thank you, Congressman.

Mr. LUETKEMEYER. Thank you, Mr. Chairman.

Chairman PAUL. I thank the gentleman.

I have another additional question. If you care to stick around, you may.

But I am not going to let you go so easily. I need to find some answers. But I am very glad you are here and willing to take our questions.

In your introductory statement, you mentioned that one of the responsibilities of the Federal Reserve was to have maximum employment, which sounds like a good idea, and stable prices.

I would look around and I would say, results aren't all that good. When you look at stable prices of housing, you even brought up the subject of unstable prices in farmland. That quite possibly could be a bubble.

I would think that if you looked at bonds in prices, they are very unstable. And who knows where that is going. If the market overrides, which I believe is possible, markets are very, very powerful. I know the Fed is very powerful, but I also know markets are very powerful.

But also in your statement, I want to get back to it, we talked a little bit about this, and you said, "I have several concerns with zero

rates. First, a guarantee of zero rates affects the allocation of resources.”

To me, I think that is very key and very important, because it really brings up the subject that the free market economists are very attuned to.

Ludwig von Mises, in his “Human Action,” talks about this as the misallocations and of malinvestment, excessive debt, money going into the wrong sectors, like farmland maybe or NASDAQ bubbles and houses.

But he took that and carried it much further. It seems like you have part of that philosophy, but not the full philosophy, but you are, I am sure, aware of what von Mises says about the Austrian theory of the business cycle.

Mr. HOENIG. Sure.

Chairman PAUL. How do you look at that? Can you say something favorable about his approach to it? Or can you draw a sharp line where interest rates are harmful and know how to divide the two? And what is your opinion of the Austrian business cycle theory?

Mr. HOENIG. I have read “Human Action.” I have a lot of respect for von Mises and I have a lot of respect for the Austrian school of thinking. I think it has value.

I understand that when you overinvest, when you leave things artificially low and you overinvest you create a correction by doing that. There is an action with that.

My view is that is why central banks have to be mindful. No matter what the system is, if you have markets and capitalism, you are going to have cycles and you are going to have crises. And what you want the central bank to do is address the crises and provide over a long period of time a base liquidity of money that allows your economy to grow.

When you move beyond that, when you find the central bank focusing on short-term issues, trying to manage the economy, trying to fine-tune it, then you create, if you will, impulses of instability, because you are trying to take care of short-run issues instead of looking to the long run.

That is why when I say the duty of a central banker is to think long run, and that I think I am in agreement with the Austrian school, but I do think there is a role for central banks, as I have said.

Chairman PAUL. I certainly agree with your point. Once they overextend, they are into central economic planning, except many have accepted the notion that you get into central economic planning

earlier than that, at the initial stages of believing that you can know what the interest rates should be.

Maybe you can give me a quick comment on this. Do you think the problems in the world today—try to put that in perspective. I think it is a very big problem, because I don't think we have faced it quite the same way, because we have a fiat dollar standard, and we are the issuers of the reserve currency of the world.

Do you think that has had an effect on what we are facing, the fact that we are issuing the reserve currency in the world, and it is much different than anything we faced before?

Mr. HOENIG. What I think is that the fact that we are the reserve currency is a consequence of decades of very good economic policy, the fact that we have had an economy that has grown, become very important to the world, and therefore, its currency has become very important.

I think that is a consequence, something you, as someone also said, you have earned. With that is carried a responsibility to look to long-run policy.

And to your point, if you have a gold standard, that is a legitimate alternative monetary base for your economy. But it does not eliminate crises. There is gold hoarding, there is positioning, there is mercantile practices. You will have crises.

So it doesn't matter if it is Congress, it doesn't matter if it is the central bank, it doesn't matter what the standard is. Good policy leads to good outcomes. Bad policy leads to bad outcomes. That is what you have to keep in mind.

Chairman PAUL. I would question whether we earned it or not. In some ways I think it was defaulted, because we were the standard. At least we pretended to be a good reserve standard, even though we weren't allowed to own gold. It was an international gold standard.

And then the confidence continued, surprisingly to some people. So that is just a matter of an understanding or semantics about whether it was earned or we defaulted into it.

But I have one more question. Because I have been interested in the monetary issues, I am delighted that you are here and so willing to visit with us.

But last week, I learned that gold was not money. So I have been able to put that out of my mind. Gold is not money, so I am still trying to figure out what money is. And I have asked these questions a lot of times, I have asked the Federal Reserve Board Chairmen over the years. And if I asked about dollar policy, they would say, "We are not in charge of dollar policy."

They are in charge of creating all this money and regulating interest rates, but they are not in charge of the dollar. The Secretary of the Treasury does that. But the Secretary of the Treasury doesn't give me any straight answers.

What I need to know from you to further my education is, tell me what a dollar is and where can I find the definition in our code?

Mr. HOENIG. The denomination is, I think—or the title was given back at just about the founding of our country. It was based on a gold standard at that time.

But money is, as you know, a medium of exchange, deferred means of payment and stored value. And as long as the public and the world understands that the dollar that is produced by the central bank of the United States, the base money, and then credit goes on beyond that, it is money.

As long as they take it as a medium of exchange, deferred payment and stored value. When that is lost, then it will no longer be money.

Chairman PAUL. But it is a note, it is a promise to pay. Actually, you are right about it being—

Mr. HOENIG. But it fills the three functions of money.

Gold can do the same thing. And if Congress designated that gold was the medium of exchange—

Chairman PAUL. This is why I am looking through the code, because the code, when I understand it, actually in the early years they wrote a dollar into the Constitution like they would write a yard, because everybody knew what it was, they didn't even define it, it was so well known. It was 371 grains of silver.

But that has never been changed, as best as I can tell, and all of a sudden now we have a Federal Reserve Note, a promise to pay nothing, is now the dollar standard and we can create them at will out of thin air. And then sometimes people wonder why we have a shaky, rocky economy.

I will keep looking for the definition of a dollar. But as best as I can tell, we have never said a dollar is a Federal Reserve Note. And the dollar under the code still says it is 371 grains of silver.

I yield to Mr. Luetkemeyer.

Mr. LUETKEMEYER. I just have one follow-up question on something the chairman asked a minute ago with regards to the role of currency.

Because I think one of the consequences of us not doing something to resolve our debt crisis here and then be downgraded, it would

seem to me to be a step down the path toward allowing ourselves to be no longer the world's reserve currency.

With China sitting over on the sidelines watching us twiddle our thumbs and waiting for an opportunity to get in the game, this is an opportunity. We are stumbling here and allowing them to do that.

What would be your thoughts on that comment?

Mr. HOENIG. I do think it is a serious matter. I think the U.S. currency, the dollar, is the reserve currency of the world and will remain so for some time.

And part of it is, what are your alternatives? You always have to ask the question. And the United States, for all of our issues and all the debate going on right now, it still has the deepest markets, is a market economy, has all the advantages. It has open capital markets. China doesn't have that. Europe has its issues.

So we still are the dominant economy. However, there is nothing guaranteed about that. That can change based upon the policies we choose going forward from here, both from a fiscal side and from a monetary side and from basically how we choose to have our economy operate in terms of the private sector and markets.

Those will all define the future of us as an economy and therefore the future of us as a nation as a reserve currency. It will be what we choose to do.

Mr. LUETKEMEYER. You just made the case from the standpoint that almost by default, we are the reserve currency, because China doesn't have all its ducks in a row yet to be that currency. Europe has its own set of problems. And so you look for the safest harbor, you look for the strongest economy. We are still there.

But if we keep twiddling our thumbs here, it could be endangered from the standpoint of the world sort of looking at us and saying, "Those guys can't get their act together—"

Mr. HOENIG. I agree with that.

Mr. LUETKEMEYER. —and their economy is stumbling along. They don't have a manufacturing base anymore, and they are going to import almost all the oil, which means they are going to be at the mercy of the oil companies and the oil cartels around the world."

And all of a sudden our economy is looked at as kind of a shaky thing versus a very stable thing. And now, we have those other folks coming in there to fill the void.

And to me this debt debate, one of the sidelights and one of the side consequences is that we are going down this road, and nobody is thinking about allowing China to get their foot in the door on the world currency side.

It is not going to happen today or tomorrow, but I have heard some people project that in 5 or 10 years, if we don't get our fiscal house in order, by that time they will be in a position economically where they will have resolved a lot of the issues that you talked about, and they may be knocking on the door.

Mr. HOENIG. I agree.

Mr. LUETKEMEYER. So what do you see on the horizon for that?

Mr. HOENIG. I think that the debates that are going on right now are about the long-run future of this country—how we choose to deal with our debt, how we choose to deal with our economy going forward. Those are the debates that are in place right now.

My point is that monetary policy cannot manage the short run, it has to have a long-run focus also. And the Congress and how we choose to have our markets operate are choices that lie ahead of us. If we don't choose well, in a generation, I think the answer to that question could be different.

So it is in our power to change this or to keep us on the right path, but you have to choose to do it. And these debates are about the long run. There is no question about it.

Mr. LUETKEMEYER. I certainly appreciate your common sense and intellectual approach to all of our problems, Dr. Hoenig, and I hope that you stay engaged in some aspect—

Mr. HOENIG. I hope so, too.

Mr. LUETKEMEYER. —of monetary and fiscal and economic policy here. You are too much of a prized jewel to walk away from this. So thank you again for your service.

Thank you, Mr. Chairman.

Chairman PAUL. Thank you very much.

We are about to close, but I do have one more short question I think you can answer rather quickly. What would be the ramifications if they stripped away the voting rights of the regional Fed Presidents from the FOMC?

Mr. HOENIG. The ramifications would be you would lose an important set of voices in the Federal Open Market Committee. And I think it would be a mistake.

Right now in my region, as I deal with our board, a rancher from Wyoming, a bookseller in Oklahoma, a labor leader in Omaha— that is all input that comes into the process. I think you would lose that voice, and you would lose that input.

And you can say, make them advisers. But let me just tell you, voting and advising are two different things, and they are not even close to one another.

I would just say, since you have asked, I have been there. It is not democratic. It is not part of the political process. And my answer has been the selection of my successor will be a process that relies on our board, who represent, like I said, a grain dealer in Kansas City, an entrepreneur in Denver, a labor leader, a bookseller, a manufacturer, and a rancher from all over our region, six of our seven States.

And they very carefully go through a search, and then it has to be approved by the Board of Governors, the political appointees.

So, to me, that is a very democratic process. And it is in contrast to, if you select a Secretary of the Treasury who happens—if you are a Democrat and you select a former chairman of Goldman Sachs and you are a Republican and you select a chairman from Goldman Sachs, that is political, but I don't know that it is any more democratic than our process, and I don't recommend it.

Chairman PAUL. I thank you. I thank you for being here.

The Chair notes that some members may have additional questions for this witness, which they may wish to submit in writing. Without objection, the hearing record will remain open for 30 days for members to submit written questions to this witness and to place his responses in the record.

This hearing is now adjourned.

{Whereupon, at 3:37 p.m., the hearing was adjourned.}

STATEMENTS

STATEMENT FOR THE RECORD
HON. RON PAUL
REPRESENTATIVE, 14TH DISTRICT OF TX
CHAIRMAN, SUBCOMMITTEE ON
DOMESTIC MONETARY POLICY & TECHNOLOGY
U.S. HOUSE OF REPRESENTATIVES

Today's hearing is the second in a series of hearings examining the relationship between Federal Reserve policy and the performance of the United States economy. Today we are receiving testimony from the Federal Reserve banks. Of the half-dozen Reserve banks we contacted, only President Hoenig was willing to testify in front of this subcommittee, and we welcome him here today.

Like many critics of the Fed's monetary policy, I fear that quantitative easing will soon return. Despite what we hear from the cheerleaders in government and in the media, the economy remains in a complete shambles. Unemployment remains high and seven million jobs lost during the recession have yet to be regained. The Federal Reserve has kept interest rates at or near zero for over two and a half years and pumped trillions of dollars into the banking system in a vain attempt to revive the economy. Yet even now after the failure of the zero interest rate policy (ZIRP) and quantitative easing have become readily apparent, we still hear calls for more stimulus, more easing, more lose money. Like any other government program, the solution for failure is to throw more money at the problem, never mind the fact that throwing more bad money after good in such instances has never succeeded.

Reading the press releases from the Federal Open Market Committee (FOMC) we see that the FOMC intends to keep interest

rates at a low level for an extended period. Chairman Bernanke has hinted at a further round of quantitative easing, the effects of which will undoubtedly be calamitous. Moneyholders seek a return on their holdings, and in an era of near-zero interest courtesy of the Fed, saving makes no sense. Combined with the still-shaky condition of the banking and financial sector, it is not surprising that much of the recently-created easy money has flowed into tangibles such as agricultural commodities, metals, and land. Rather than allowing the housing bubble to burst, overall prices to return to normal and overleveraged banks to break up, the Fed has thrown more fuel onto the fire and created the conditions for an even larger bubble that will eventually burst.

The Fed's easy money policy has also enabled the federal government to increase its total debt by 56% since 2008, an increase of over \$5 trillion. Thanks to the Fed driving down interest rates and purchasing debt as fast as the Treasury has issued it, the federal government faces a crunch not only in terms of running up against the debt ceiling, but also in the structure of the debt. Large amounts of short-term debt are coming due in a short period of time. ZIRP and quantitative easing cannot hold down interest rates forever, as at some point investors will rebel and insist on higher interest rates for US debt. At this point this maturing debt will either have to be paid off or rolled over at higher interest rates, both of which will be very costly for taxpayers.

While I disagree with Pres. Hoenig on many matters of monetary policy and especially on key policy issues such as the existence of the Federal Reserve System, we both have been critical of the Fed's policy of quantitative easing and its maintenance of zero interest rates. Pres. Hoenig has been the most outspoken member of the Federal Reserve System against Chairman Bernanke's policies, consistently voting against the Chairman during meetings of the Federal Open Market Committee last year. Due to Pres. Hoenig's impending retirement, the Fed will lose a much-needed counterbalance to the inflationists who dominate at the Fed.

Both Pres. Hoenig and I realize that printing money out of thin air as the Fed has done and threatens to continue to do is not a panacea. If zero interest rates and quantitative easing could really solve unemployment, there would be no reason not to maintain such policies in perpetuity. Such policies, however, lead to the formation of asset bubbles, as both Pres. Hoenig and I know. Chairman Bernanke's predecessor Alan Greenspan fueled the dot-com bubble and attempted to stave off its collapse by resorting to one percent

interest rates. That created the housing bubble whose collapse Chairman Bernanke is attempting to stymie through zero percent interest and massive quantitative easing. The next bubble is already forming, although which sector will be hit hardest remains to be seen. Pres. Hoenig has alluded to some possible bubble sectors in his district, so I look forward to his testimony and his answers to our questions.

WITNESS TESTIMONY

WRITTEN TESTIMONY OF THOMAS M. HOENIG, Ph.D. PRESIDENT

FEDERAL RESERVE BANK OF KANSAS CITY

Chairman Paul, Ranking Member Clay and members of the subcommittee, thank you for the opportunity to discuss my views on the economy from the perspective of president of the Federal Reserve Bank of Kansas City and as a 20-year member of the Federal Reserve System's Federal Open Market Committee (FOMC).

The Fed's mandate reads: "The Board of Governors of the Federal Reserve System and the Federal Open Market Committee shall maintain long-run growth of the monetary and credit aggregates commensurate with the economy's long-run potential to increase production, so as to promote effectively the goals of maximum employment, stable prices, and moderate long-term interest rates."

The role of a central bank is to provide liquidity in a crisis and to create and foster an environment that supports long-run economic health. For that reason, as the financial crisis took hold in 2008, I supported the FOMC's cuts to the federal funds rate that pushed the target range to 0 percent to 0.25 percent, as well as the other emergency liquidity actions taken to staunch the crisis. However, though I would support a generally accommodative monetary policy today, I have raised questions regarding the advisability of keeping the emergency monetary policy in place for 32 months with the promise of keeping it there for an extended period.

I have several concerns with zero rates. First, a guarantee of zero rates affects the allocation of resources. It is generally accepted that no good, service or transaction trades efficiently at the price of zero. Credit is no exception. Rather, a zero-rate policy increases the risk of

misallocating real resources, creating a new set of imbalances or possibly a new set of bubbles.

For example, in the Tenth Federal Reserve District, fertile farmland was selling for \$6,000 an acre two years ago. That land today is selling for as much as \$12,000 an acre, reflecting high commodity prices but also the fact that farmland loans increasingly carry an interest rate of far less than the 7.5 percent historic average for such loans. And with such low rates of return on financial assets, investors are quickly bidding up the price of farmland in search of a marginally better return.

I was in the banking supervision area during the banking crisis of the 1980s, when the collapse of a speculative bubble dramatically and negatively affected the agriculture, real estate and energy industries, almost simultaneously. Because of this bubble, in the Federal Reserve Bank of Kansas City's district alone, I was involved in the closing of nearly 350 regional and community banks. Farms were lost, communities were devastated, and thousands of jobs were lost in the energy and real estate sectors. I am confident that the highly accommodative monetary policy of the decade of the '70s contributed to this crisis.

Another important effect of zero rates is that it redistributes wealth in this country from the saver to debtor by pushing interest rates on deposits and other types of assets below what they would otherwise be. This requires savers and those on fixed incomes to subsidize borrowers. This may be necessary during a crisis in order to avoid even more dire outcomes, but the longer it continues, the more dramatic the redistribution of wealth.

In addition, historically low rates affect the incentives of how the largest banks allocate assets. They can borrow for essentially a quarter-point and lend it back to the federal government by purchasing bonds and notes that pay about 3 percent. It provides them a means to generate earnings and restore capital but it also reflects a subsidy to their operations. It is not the Federal Reserve's job to pave the yield curve with guaranteed returns for any sector of the economy, and we should not be guaranteeing a return for Wall Street or any special interest groups.

Finally, my view is that unemployment is high today, in part, because interest rates were held to an artificially low level during the period of the early 2000s. In 2003, unemployment at 6.5 percent was thought to be too high. The federal funds rate was continuously lowered to a level of 1 percent in an effort to avoid deflation and to lower unemployment. The policy worked in the short term.

The full effect, however, was that the U.S. experienced a credit boom with consumers increasing their debt from 80 percent of disposable income to 125 percent. Banks increased their leverage ratios--assets to equity capital-- from 15-to-1 to 30-to-1. This very active credit environment persisted over time and contributed to the bubble in the housing market. In just five years, the housing bubble collapsed and asset values have fallen dramatically. The debt levels, however, remain, impeding our ability to recover from this recession. I would argue that the result of our short-run focus in 2003 was to contribute to 10 percent unemployment five years later.

That said, I am not advocating for tight monetary policy. I'm advocating that the FOMC move to carefully move to non-zero rates. This will allow the market to begin to read credit conditions and allocate resources according to their best use rather than in response to artificial incentives.

More than a year ago, I advocated removing the "extended period" language to prepare the markets for a move to 1 percent by the fall of 2010. Then, depending on how the economy performed, I would move rates back toward more historic levels.

I want to see people back to work, but I want them back to work with some assurance stability. I want to see our economy grow in a manner that encourages stable economic growth, stable prices and long-run full employment. If zero interest rates could accomplish this goal, then I would support interest rates at zero. In my written testimony, I have included three speeches that describe in more detail my position on monetary policy.

Monetary policy cannot solve every problem. I believe we put the economy at greater risk by attempting to do so.

Thank you Mr. Chairman. I look forward to your questions.

REBALANCING TOWARD SUSTAINABLE GROWTH

THOMAS M. HOENIG, PRESIDENT

FEDERAL RESERVE BANK OF KANSAS CITY³¹³

THE ROTARY CLUB OF DES MOINES AND THE GREATER DES MOINES

PARTNERSHIP

DES MOINES, IOWA

JUNE 30, 2011

Introduction

³¹³ The views expressed by the author are his own and do not necessarily reflect those of the Federal Reserve System, its governors, officers or representatives.

The U.S. economic recovery is under way, but it remains more uncertain and volatile than anyone would like. Some believe that the Federal Reserve can speed up the recovery by keeping the federal funds rate near zero, where it has been for nearly two-and-a-half years, and by promising to keep it there for an extended period. If I judged—or if evidence suggested—that a zero rate would solve our country's unemployment problem or speed up the recovery without causing other adverse consequences, I would support it. However, monetary policy is not a tool that can solve every problem.

In today's remarks, I will outline my current views on the economy, and suggest what alternative options and policies our leaders might consider as we search for ways to build a stronger, more resilient economy.

U.S. economic conditions

First, it is a testament to the U.S. economic system that even as this nation carries a heavy public and private debt burden, the economy is completing its second year in recovery. The level of activity, as measured by GDP, has now surpassed its pre-recession peak after growing at a nearly 3-percent pace last year. However, I am concerned that in working to offset the effects of this devastating crisis and to restore the economy to health, an extended zero-interest-rate policy is producing new sources of fragility that we need to be aware of and allow for in our future policy choices.

Governments, businesses and consumers have made financial choices and allocated resources with an understanding that a zero-interest-rate policy will remain in place indefinitely.

The longer we leave interest rates at zero, the more asset values will be defined by these low rates and the greater the negative impact will be once the inevitable move up in rates begins.

Complicating the fragility around monetary policy, fiscal policy as a pro-growth policy instrument also appears to be approaching its limit. The government's stimulus efforts to support the economy, along with lower tax revenues, have resulted in historically large fiscal deficits and a very large debt level. Without a dramatic change, the deficit and the debt will only become more daunting with the rising cost of entitlement programs and likely higher interest rates.

For well over a decade, the U.S. consumer has been a principal source of world demand and economic growth. As a result, the United States has incurred consistently large trade deficits, contributing to imbalances in the global economy. As we have painfully learned from the housing bust, growth built on imbalances is ultimately

unsustainable.

Circumstances require, therefore, that we transition from an economy that relies too heavily on consumption and government spending for growth toward more sustainable sources of demand and economic prosperity. How we undertake this transition will define our economy and country's economic future.

To start, over the next several years, we must change our national savings, consumption and investment habits. Such shifts, though fundamental to long-term economic health, are admittedly difficult to accomplish. They require changes in behavior and expectations. They involve dramatic shifts in resource use, which are not painless as workers are temporarily displaced and industries are disrupted. The pain is immediate, and the payoff comes slowly. However, the gains also can be significant, as more sustainable long-run economic growth is well worth the effort and sacrifice.

In a recent visit to Singapore, I witnessed that nation's commitment to job creation. For example, during the recent crisis and recession, Singapore developed a program to retrain unemployed workers to ensure they would have the skills needed when its manufacturing sector recovered. As is well understood, workforce training matters. I spoke with individuals who described the drive to bring new factories on-line, with the goal of bringing a factory on-line with minimal delays and, by their description, without compromising safety.

Lessons from Germany

Other countries have made similar changes out of necessity or during a time of economic distress such as we are experiencing today. Countries have made deliberate choices and not relied on chance to change economic incentives and behavior that served to improve economic performance. I'm not advocating that we pick winners and losers—in fact, that is my biggest argument against too-big-to-fail financial institutions. Rather, I have observed a number of countries that are building and expanding their manufacturing bases—such as Korea, Singapore and China—that have been able to experience strong GDP growth over long periods of time.

Germany offers another example of a country having made significant changes to accomplish real employment goals. In the mid-1990s, Germany's trade deficit was similar to that of the United States. Since then, Germany has moved away from trade deficits to surging surpluses, while the United States has continued to run large trade deficits. Complementing this shift, German levels of

employment have made great strides, and its unemployment rate has touched its lowest point in nearly 20 years.

I am not suggesting that the United States attempt to be Germany or Singapore, two countries that differ from us in many ways. I am also not advocating that we suddenly strive to achieve a large U.S. trade surplus. This might only create other global imbalances and distortions. However, adjustments in our economy are necessary, and other countries have shown it can be done.

Perhaps the most immediate, and obvious, observation is the simplest: We must change our national savings rate. To rebalance the U.S. trade position from deficit to balance requires that the sum of private and public savings match domestic investment. In other words, a country must not produce less than it consumes if it wishes to balance its trade position with the rest of the world.

During the 2000s, Germany's personal savings rate increased and is currently about double the U.S. rate. German households paid down debt and avoided heavily relying on debt, in contrast to the United States and so many other countries' households.

The personal savings rate in the United States has modestly increased since the start of the recession, which is an important positive trend. Unfortunately, this improvement has been more than offset by the dramatic deterioration in public saving reflected in the nation's fiscal deficits. Though a significant amount of the recent deterioration in public finances is related to the U.S. financial crisis, the fact remains that our national savings crisis has been under way for nearly three decades. Since the early 1980s, our nation has consistently chosen to spend rather than save, as witnessed by the long-term decline in our private savings rate and our tendency toward fiscal deficits. Most importantly, when we look across the more developed countries, we see that those with higher national savings rates tend to have smaller trade deficits and higher domestic production per person.

Germany has also benefitted from managing unit labor costs in a manner that keeps its labor force globally competitive. Over the last decade, the German economy experienced relatively modest wage increases and important productivity gains. Both of these factors contributed to keeping unit labor costs in check. However, another important component of its success came in the form of labor policy reforms.

In the early 2000s, Germany, with labor and management input, passed a series of labor market enhancements called the "Hartz laws." These laws modified some of the more generous employee

benefits and reduced restrictions on temporary workers and the ability to lay off workers. Germany's reforms also sought to incentivize unemployed workers to transition to employment by making changes to job training programs for the unemployed and creating targeted subsidies to support some manufacturing job creation.

Finally, Germany developed export markets by focusing on meeting the needs of parts of the world experiencing the fastest growth and demonstrating strong demand for capital goods that German manufacturers produce: emerging economies in Asia, Europe and Latin America.

The United States is well-positioned to match this kind of performance, if it chooses to do so. For example, since 2000, the share of our exports going to the BRIC countries—Brazil, Russia, India and China—has more than doubled. If we choose to increase our savings rate, if government, labor and management see the mutual advantage of investing in and building a competitive manufacturing environment, then job growth will follow.

As the U.S. economy shifts gears to shrink its trade imbalances, many parts of the country will have a role to play. I fully expect Iowa to be an integral participant in this shift. Iowa already possesses a strong manufacturing base that is a key driver of the state economy. By some estimates, about half of the manufacturing firms in the state are small-and medium-sized enterprises, which provide some parallels with Germany's renowned export powerhouses, known as the *Mittelstand*.

Real Solutions versus Economic Shortcuts

Rebalancing our economy and improving our trade position is a necessary development, but unfortunately, it will take time. And as our immediate desire is to rush to improve our economy, I warn against the all-too-common impulse to take shortcuts and suffer their unintended consequences. Here in Iowa, for example, one area where I suspect this tradeoff might be playing out is in the recent rapid run-up in agricultural land prices.

Agricultural exports have played a significant role in the rapid rise of land prices. Since 2000, agricultural exports from Iowa have increased by a factor of six. A portion of this growth reflects surging commodity prices due to factors on the supply side—such as extreme weather in parts of the world—and on the demand side, including the well-documented, rapidly growing food demands of emerging economies.

In addition to anticipated strong future demand for agricultural commodities, there is another factor affecting these prices: exceptionally low interest rates. As a bank regulator in the 1980s, responsible for financial institutions in Nebraska, Kansas, Oklahoma, Missouri, Wyoming, Colorado and New Mexico, I witnessed the devastating effects of easy credit and leverage in agriculture, real estate and energy. We closed or assisted nearly 350 banks in our region alone.

With interest rates near zero and with additional massive liquidity poured into our economy, all interest rates are affected. Therefore, asset values of every kind are also being affected, including land values in Iowa. Loans for land are available at rates well below historical levels—in some instances, 400 basis points below historical averages. The effect on land assets, like any asset, is to artificially boost its value. And there is ample experience that tells us that if rates were to rise quickly, this would affect world demand for commodities and raise the cost of capital on land almost instantly. When—not if—the adjustment occurs, we will see a dramatic drop in values. In the meantime, if operators and speculators have incurred large amounts of debt, then a new crisis will emerge.

Finally, we know that a crisis can affect more than one segment of the economy. It nearly always affects the broad economy and employment. Shortcuts don't work. We need to focus on the real economy. We need to focus on real reform.

Conclusion

My point today is simply that as powerful as monetary policy is, it sometimes is not enough. It cannot ensure an economy that balances its savings and investing needs. It by itself cannot correct our current account deficit or enhance savings and investment. These will require important changes in our real economy. Providing the right environment in which government can play its role in supporting business and the consumer to save, invest, manufacture and service national and global needs in the end will create real income and wealth.

We need to focus on long-term, stable monetary policy and fiscal policy goals that support these broader goals. Having seen the effects of financial crisis after financial crisis as short-term policies beget short-term policies, we should know that an ever-present short-run focus, even if well intentioned, is the road to ruin.

THE FEDERAL RESERVE'S MANDATE: LONG RUN

THOMAS M. HOENIG, PRESIDENT, FEDERAL RESERVE BANK OF KANSAS
CITY³¹⁴

NATIONAL ASSOCIATION OF BUSINESS ECONOMISTS ANNUAL MEETING
DENVER, COLORADO
OCTOBER 12, 2010

Introduction and Framework

Thank you, and it is a pleasure to welcome you to Denver. This is the largest metropolitan area in the Tenth Federal Reserve District and home to one of three branches of the Federal Reserve Bank of Kansas City. The Denver branch serves Colorado, Wyoming and New Mexico—three of the seven states of our region.

I appreciate this opportunity to engage and interact with business economists from around the country regarding the policy choices now confronting the nation, especially those confronting the Federal Reserve.

In setting out my views, I'll first spend a minute describing the economy's performance and then turn to the matter of quantitative easing versus my preferred path of gradual steps to a renormalization of monetary policy.

Short-Term Outlook

Currently, a major and necessary rebalancing is taking place within our economy. This includes the deleveraging of consumers, businesses and financial institutions, and it's during a time that state and local governments are struggling with budgets and mounting debt loads. In this context, a modest recovery with positive overall data trends should be seen as highly encouraging.

Following a bounce back from restocking earlier this year, the economy has slowed but it has not faltered. GDP growth has averaged about a 2½ percent annual pace since the first of the year. Industrial production is showing growth of almost 6 percent, and high-tech more than double that. The consumer continues to buy goods, with personal income growing at more than a 3 percent rate, personal consumption expenditures at about 3 percent, and retail sales at more than 4 percent. And the U.S. economy has added more than 850,000 net new private sector jobs since the first of the year. While modest, these are positive trends for the U.S. economy.

³¹⁴ The views expressed by the author are his own and do not necessarily reflect those of the Federal Reserve System, its governors, officers or representatives.

The issue is, of course, that while private jobs are being added within the economy, it is not enough to bring unemployment down to where we all would like to see it. Unemployment remains stubbornly high at 9.6 percent. With such numbers, there is, understandably, a desire and considerable pressure for the Federal Reserve to “do something, anything” to get the economy back to full employment. And for many, including many economists, this means having the Federal Reserve maintain its zero interest rate policy or further still, engage in a second round of quantitative easing – now called QE2. Some are even suggesting these actions are necessary for the Federal Reserve to comply with its statutory mandate.

Interpreting the Policy Mandate

The FOMC's policy mandate is defined in the Federal Reserve Act, which requires that: “The Board of Governors of the Federal Reserve System and the Federal Open Market Committee shall maintain long-run growth of the monetary and credit aggregates commensurate with the economy's long-run potential to increase production, so as to promote effectively the goals of maximum employment, stable prices, and moderate long-term interest rates.”

There is, within the Act, a clear recognition that our policy goals are long-run in nature. In this way, the Act recognizes that monetary policy works with long and variable lags. Thus, the FOMC should focus on fostering maximum employment and stable prices in the timeframe that monetary policy can legitimately affect – the future. The FOMC must be mindful of this fact and be cautious in pursuing elusive short-term goals that have unintended and sometimes disruptive effects.

In recent weeks, some have argued that with inflation low and the jobless rate high, the Federal Reserve should provide additional accommodation. Such an action – the purchase of assets by the central bank as a policy easing tool – would mark a second round of quantitative easing. While there are several ways to accomplish this, many suggest that the most likely method would be for the Federal Reserve to purchase additional long-term securities, including U.S. Treasuries.

Proponents of QE2 argue that it would provide a near-term boost to the economy by lowering long-term interest rates while raising inflation. These benefits would arise from the purchase of U.S. Treasury securities, which would lead to lower U.S. Treasury and corporate rates. These lower interest rates would then stimulate consumer and business demand in several ways, including

encouraging mortgage refinancing that could lead to increased consumer spending, boosting exports through a likely lower exchange rate, and fostering higher equity prices, thereby creating additional wealth. Such a move is said to be consistent with the FOMC's September 21, 2010 announcement, which stated that it was "prepared to provide additional accommodation if needed to support the economic recovery and to return inflation, over time, to levels consistent with its mandate."

Such easing, it is hoped, would bring inflation back up to something closer to 2 percent, a rate that many judge to be consistent with the Federal Reserve's mandate. In addition, higher inflation would increase demand as consumers move purchases forward to avoid paying higher prices in the future.

So, with these purported benefits, why would anyone disagree?

New Risks and QE2

I believe there are legitimate reasons to be cautious when considering this approach. A meaningful evaluation of QE2 must consider not simply whether benefits actually exist but, if they do, how large they are and whether they are larger than possible costs.

Based on recent research and the earlier program of purchasing long-term securities— known as LSAP—I think the benefits are likely to be smaller than the costs.

Some estimates suggest that purchasing \$500 billion of long-term securities might reduce interest rates by as little as 10 to 25 basis points. The LSAP program was effective, in part, because we were in a crisis. Financial markets were not functioning properly, or at all, during the depths of the financial crisis. In such a situation, it is reasonable that central bank purchases would be useful and effective. However, currently the markets are far calmer than in the fall of 2008. The financial crisis has passed and financial markets are operating more normally. One could argue, in fact, that with markets mostly restored to pre-crisis functioning, the effect of asset purchases could be even smaller than the 10 to 25 basis point estimate.

I would also suggest that even if we achieved slightly lower interest rates, the effect on economic activity is likely to be small. Interest rates have systematically been brought down to unprecedented low levels and kept there for an extended period. The economy's response has been positive but modest.

In fact, right now the economy and banking system are awash in liquidity with trillions of dollars lying idle or searching for places to be deployed or, perhaps more recently, going into inflation hedges.

Dumping another trillion dollars into the system now will most likely mean they will follow the same path into excess reserves, or government securities, or “safe” asset purchases. The effect on equity prices is likely to be minor as well. There simply is no strong evidence the additional liquidity would be particularly effective in spurring new investment, accelerating consumption, or cushioning or accelerating the deleveraging that is hopefully winding down.

If the purported benefits are small, what are the possible costs?

First, without clear terms and goals, quantitative easing becomes an open-ended commitment that leads to maintaining the funds rate too low and the Federal Reserve's balance sheet too large. The result is a further misallocation of resources, more imbalances and more volatility.

There is no working framework that defines how a quantitative easing program would be managed. How long would the program continue, and what would be the ultimate size? Would purchases of long-term assets continue until the unemployment rate is 9 percent or 8 percent or even less? Would purchases continue until inflation rises to 2 percent or 3 percent or more? Would the program aim to reduce the 10-year Treasury rate to 2¼ percent or 2 percent or even less? Without answers to these and other questions, QE2 becomes an open-ended policy that introduces additional uncertainty into markets with few offsetting benefits.

As central bank assets expand under quantitative easing, what will be the exit strategy? In the midst of a financial crisis, we may not have the luxury of thinking about the exit strategy. In current circumstances, however, we must define an exit strategy if the objective is to raise inflation but contain interest rate expectations. If history is any indication, without an exit strategy the natural tendency will be to maintain an accommodative policy for too long.

While I agree that the tools are available to reduce excess reserves when that becomes appropriate, I do not believe that the Federal Reserve, or anyone else, has the foresight to do it at the right time or right speed. It may work in theory. In practice, however, the Federal Reserve doesn't have a good track record of withdrawing policy accommodation in a timely manner.

Second, we risk undermining Federal Reserve independence. QE2 actions approach fiscal policy actions. Purchasing private assets or long-term Treasury securities shifts risk from investors to the Federal Reserve and, ultimately, to U.S. taxpayers. It also encourages greater attempts to influence what assets the Federal Reserve purchases. When the Federal Reserve

buys long-term securities – such as the \$1.2 trillion in mortgage backed securities it purchased during the financial crisis – it favors some segments of the market over others. And when the Federal Reserve is a ready buyer of government debt, it becomes a convenient source of cash for fiscal programs. During a crisis this may be justified, but as a policy instrument during normal times it is very dangerous precedent.

Third, rather than inflation rising to 2 or 3 percent, and demand rising in a systematic fashion, we have no idea at what level inflation might settle. It could remain where it is or inflation expectations could become unanchored and perhaps increase to 4 or 5 percent. Not knowing what the outcome might be makes quantitative easing a very risky strategy. It amounts to attempting to fine-tune inflation expectations—a variable we cannot precisely or accurately measure—over the next decade.

And why might inflation expectations become unanchored?

The budget deficit for 2011 is expected to be about \$1 trillion. Even if the Federal Reserve were to purchase only \$500 billion—and this amount in itself is a source of considerable uncertainty—that would appear to monetize one-half of the 2011 budget deficit. In addition, the size of the Federal Reserve’s balance sheet—now and over the next decade—will influence inflation expectations. Expanding the balance sheet by another \$500 billion to \$1 trillion over the next year, and perhaps keeping the balance sheet at \$3 trillion for the next several years, or increasing it even further, risks undermining the public’s confidence in the Fed’s commitment to long run price stability, a key element of its mandate.

While QE2 might work in clean theoretical models, I am less confident it will work in the real world. Again, I will note that the FOMC has never shown itself very good at fine-tuning exercises or in setting and managing inflation and inflation expectations to achieve the desired results.

Given the likely size of actions and the time horizon over which QE2 would be in place, inflation expectations might very well increase beyond targeted levels, soon followed by a rise in long-term Treasury rates, thereby negating one of the textbook benefits of the policy.

Non-Zero Rates as an Option

At this point, with a modest recovery underway and inflation low and stable, I believe the economy would be better served by beginning to normalize monetary policy. If long run stability is the goal, then re-

normalizing policy is an important step toward realizing that goal. How might we achieve this goal?

First, rather than expand the Federal Reserve's balance sheet by purchasing additional

U.S. Treasury securities, the Fed should consider discontinuing the policy of reinvesting principal payments from agency debt and mortgage-backed securities into Treasury securities. Given where we are, we would need to make such a change slowly but systematically. Allowing maturing mortgage backed securities to roll off, the Federal Reserve's balance sheet would shrink gradually, with relatively small consequences for financial markets.

Second, we should take the first early steps to normalize interest rate policy. This is not a call for high rates but a call for non-zero rates. In 2003 the FOMC delayed our efforts to raise rates. In that period we reduced the federal funds rate to 1 percent and committed to keeping it there for a considerable period. This policy fostered conditions that led to rapid credit growth, financial imbalances and the eventual financial collapse from which we are still recovering. Had we been more forceful in our action to renormalize policy then, it's likely we might have suffered far less in 2008 through 2010.

Also, any effort to renormalize policy would include signaling a clear intention to remove the commitment to maintain the federal funds rate at 0 to $\frac{1}{4}$ percent "for an extended period." As the public adjusts to this, we should then turn to determining the pace at which we return the funds rate to 1 percent. Once there, we should pause, assess and determine what additional adjustment might be warranted. A 1 percent federal funds rate is extremely accommodative, but from that point we could better judge the workings of the interbank and lending markets and determine the order of policy actions that would support sustained long-term growth.

Other Concerns Regarding Zero Rates

These are difficult times, no doubt, and it is tempting to think that zero interest rates can spark a quick recovery. However, we should not ignore the possible unintended consequences of such actions. Zero rates distort market functioning, including the interbank money and credit markets; zero rates lead to a search for yield and, ultimately, the mispricing of risk; zero rates subsidize borrowers at the expense of savers.

Finally, it is important to note, that business contacts continue to tell me that interest rates are not the pressing issue. Rather, they are

concerned with uncertainties around our tax structure; they are desperate to see this matter settled. They need time to work through the recent healthcare changes; and they are quite uncertain about how our unsustainable fiscal policy will be addressed. They are insistent that as these matters are addressed, they will once again invest and hire. QE2 cannot offset the fundamental factors that continue to impede our progress.

Conclusion

We are recovering from a set of shocks, and it will take time. These shocks did not develop overnight, but came after years of interest rates that were too low, leverage that was too high, and financial supervision that was too lax. If we have learned anything from this crisis, as well as past crises, it is that we must be careful not to repeat the policy patterns we have used in previous recoveries, such as 1990-91 and 2001. If we again leave rates too low for too long out of fear that the recovery is not strong enough, we are almost assured of suffering these same consequences yet again. I am fully committed to the Federal Reserve's dual mandate to maintain long-run growth so as to promote effectively the goals of maximum employment, stable prices and moderate long-term interest rates.

WHAT ABOUT ZERO?

THOMAS M. HOENIG, PRESIDENT, FEDERAL RESERVE BANK OF KANSAS
CITY
SANTA FE, NEW MEXICO
APRIL 7, 2010

Introduction

Good afternoon. I'm pleased to be in New Mexico today, and I extend my congratulations and best wishes to the city of Santa Fe on its 400th anniversary.

Last week, *The Wall Street Journal's* front page featured an article with a headline focused on the "epic comeback" of the corporate bond market. The article chronicled how a record \$31.5 billion in new high-yield, high-risk "junk" bonds came on the market last month and how investments in bond mutual funds last year were the highest on record. Thanks to the combination of near-zero short-term interest rates and the Federal Reserve's large-scale purchases of mortgage-backed securities, investors are flush with cash. And, as is sometimes the case, cash earning so little is an enticement to take on

additional risk in hopes of higher returns.

The bond market is not the only place where we are seeing the impact of cash-rich investors. Our contacts within the Tenth Federal Reserve District have shared anecdotal information suggesting that operators and investors in the Midwest are buying farmland and bidding up the price. We've seen this in the agricultural regions of our District in the past, notably in the run-up to the banking crisis of the 1980s.

Events such as these, along with new economic research now coming to light, are beginning to document a story about long-run risks that are created when money and credit are easy for too long, when interest rates are near zero, and when financial imbalances risk macroeconomic and financial instability.

As we all know, the last couple of years have been an extraordinary period in our nation's economic history. In response to the crisis, the Federal Reserve took unprecedented steps to drive down long-term interest rates and provide direct support to a fragile housing market. This was in addition to the steps taken by the administration and the Treasury. We will long study these events. Although we may disagree on the specifics of the actions taken during that period, most agree that without strong intervention, the outcome would have been dire.

But as the economy turns the corner and we move beyond the crisis, what about the challenges we now face, and what about policy actions over the next several quarters? The economy appears to be on the road to recovery, and we find ourselves having to face important questions of how the Federal Reserve will unwind the policy response to the crisis. In particular, what are the hazards of holding the federal funds rate target close to zero? The risks of raising rates too soon are clear and compelling. My comments, however, concern the risks of raising rates too late. Such risks also can be significant but all too often seem more distant and less compelling, and therefore hold great long-term danger for us all.

The Economic Outlook

As a preface to a discussion on the issues, I first should outline my expectation for the U.S. economy. Policy choices can be realistically considered only after first defining how we judge current conditions and our outlook for the future.

From my vantage point, the outlook is generally good. A number of indicators suggest the economy has begun to recover and is expanding at a steady pace since hitting bottom last summer. GDP

grew nearly 4 percent in the second half of last year, and growth of almost 3 percent is expected in the first quarter of this year. The pace of growth should modestly pick up over time, and looking ahead, I expect GDP growth of about 3 percent for 2010.

While labor markets remain weak, they seem to have stabilized. The pace of job losses gradually slowed over the course of 2009 and early 2010. In the first three months of the year, unemployment has remained essentially unchanged at 9.7 percent. Importantly though, Friday's report from the Labor Department showed the largest increase in non-farm payrolls in three years with more than 160,000 jobs added. Further, forward-looking indicators such as temporary help services, which has grown rapidly since the middle of last year, suggest broader job growth will continue. This is good news because such progress is essential for sustained growth. And like most, I am following it carefully. Unfortunately, it tends to lag the recovery and makes the implementation of policy always difficult to manage during the early stages of a recovery.

Consumer spending has been growing at a solid pace, and most forecasters put first quarter consumption growth at more than 3 percent. These are critical improvements because consumer spending, which has accounted for about 70 percent of GDP, will be a critical force strengthening the recovery. The manufacturing sector has followed the consumer and also has been expanding at a strong pace. Production has increased at an annual rate of about 8 percent since hitting bottom last summer. In turn, business spending on equipment and software appears to be picking up.

These are encouraging signs that the forces necessary for a sustained recovery seem to be moving into place and that this is not just a temporary boost from the fiscal stimulus package and sharp slowing in the pace of inventory liquidation.

Residential and non-residential construction continues to struggle, although to varying degrees. Residential construction spending has fallen sharply in the last few months after a strong uptick in the second half of last year, thanks in large part to the homebuyer tax credit. Looking ahead, spending should pick up considerably in response to the extended tax credit and then rise at a more moderate pace after the credit expires.

The picture is considerably bleaker for the non-residential sector. Private spending fell at an annualized rate of more than 25 percent in the last three months and is likely to fall further for most or all of this year. There has been an increase in vacancy rates for office, retail, and industrial space. Meanwhile, non-residential property values are

down. The soft market is due in part to problems with financing. With many banks facing the prospect of considerable losses in commercial real estate, lending remains weak.

Looking at the economy more broadly, inflation has drifted lower in recent months and is following the pattern common during and after a recession. While energy prices have kept consumer price inflation at around 2 percent, inflation in non-food and non-energy price – core inflation – stands at about 1 percent. In the absence of any current cost pressures from tight labor markets or other input prices, inflation will likely remain low for the next year or two.

Risks of a Commitment to Near-Zero Rates

With the economy gradually recovering from a severe recession, monetary policy is by any measure highly accommodative. The key challenge for the Federal Reserve's Federal Open Market Committee, is the question, "For how much longer should it remain so?"

The FOMC statement, issued after several meetings including the most recent, has said that "conditions will likely warrant keeping the fed funds rate, which is our key monetary policy tool, at exceptionally low levels for 'an extended period.'" The statement elaborates that this view is based on "economic conditions, including low rates of resource utilization, subdued inflation trends, and stable inflation expectations."

By itself, the current state of the economy warrants an accommodative monetary policy. However, as the economy continues to improve, risks emerge around the act of holding rates low for an extended period.

I have dissented at the last two FOMC meetings specifically because I believe the "extended period" language is no longer warranted and I am concerned about the buildup of financial imbalances creating long-run risks.

There is no question that low interest rates stimulate the interest-sensitive sectors of the economy and can, if held there too long, distort the allocation of resources in the economy. Artificially low interest rates tend to promote consumer spending over saving and, over time, systematically affect investment decisions and the relative cost and allocation of capital within the economy.

Today, as we look back over the past decade, there is a case to be made that too many resources were channeled into financial market activities and into real estate construction, both residential and non-residential. Some researchers have argued that keeping interest rates very low in 2002-2004 contributed to the housing boom and bust.

Exceptionally low rates, while perhaps not the single cause, played an important role in creating the conditions leading to our recent crisis.

We now find ourselves with a Federal Reserve System balance sheet that is more than twice its size of two years ago. The federal funds rate is near zero and the expectation, as signaled by the FOMC, is that rates will remain so for an extended period. And the market appears to interpret the extended period as at least six months. Such actions, moreover, have the effect of encouraging investors to place bets that rely on the continuance of exceptionally easy monetary policy. I have no doubt that many on Wall Street are looking at this as a rare opportunity.

These actions are not taken to enrich one group over another. They are taken with the well intended purpose of assuring a strong economic recovery and to create an environment of sustained job growth and strong business investment. I take no exception to this goal. However, the unintended negative consequences of such actions are real and severe if the monetary authority goes too long in creating such conditions.

Low rates, over time, systematically contribute to the buildup of financial imbalances by leading banks and investors to search for yield. *The Wall Street Journal* article tells a story about the market coming back that also makes my point. The search for yield involves investing in less-liquid assets and using short-term sources of funds to invest in long-term assets, which are necessarily riskier. Together, these forces lead banks and investors to take on additional risk, increase leverage, and in time bring in growing imbalances, perhaps a bubble and a financial collapse.

I make no pretense that I, or anyone, can reliably identify and “prick” an economic bubble in a timely fashion. However, I am confident that holding rates down at artificially low levels over extended periods encourages bubbles, because it encourages debt over equity and consumption over savings. While we may not know where the bubble will emerge, these conditions left unchanged will invite a credit boom and, inevitably, a bust.

What Next?

So, what options are available to policymakers?

I appreciate the inclination for staying the course that financial markets have come to expect: keeping the federal funds rate target near zero and maintaining a commitment to very low rates for an extended period of time. That view is motivated by concerns over an unemployment rate of nearly 10 percent and persuaded by the fact

that core inflation remains below 2 percent.

Continuing with current policy may also reflect confidence that the longer-term risks of financial imbalances are quite small and could be mitigated as they emerge. The Federal Reserve could correct imbalances through interest rate action or regulatory changes as the imbalances become apparent later.

However, in times of uncertainty policymakers tend to reassure themselves that an accommodative course of action can be reversed always in a timely fashion. Inevitably, though, the policy bias is to delay, to let accommodative conditions stand, and to reverse only when the economy is beyond recovery and into an expansion. The outcome too often is greater inflation, significant credit and market imbalances, and an eventual financial crisis.

An alternative policy option is to be more proactive, but cautious. This would require initiating a reversal of policy earlier in the recovery while the data are still mixed but generally positive. Small reversals in rates would leave policy highly accommodative and supportive of our economy's recovery but would put more weight on mitigating the risk of longer-run financial imbalances. It would end the borrowing subsidy more quickly and would moderate credit conditions in a more timely fashion. It would reduce the likelihood that inflationary pressures might build, or that financial imbalances might emerge. And over time it would contribute to greater macroeconomic stability.

Under this policy course, the FOMC would initiate sometime soon the process of raising the federal funds rate target toward 1 percent. I would view a move to 1 percent as simply a continuation of our strategy to remove measures that were originally implemented in response to the intensification of the financial crisis that erupted in the fall of 2008. In addition, a federal funds rate of 1 percent would still represent highly accommodative policy. From this point, further adjustments of the federal funds rate would depend on how economic and financial conditions develop.

Conclusion

As we look forward from here, I expect that all options will be considered and discussed fully as we navigate the course of monetary policy. As we consider our choices, I want to end my remarks by emphasizing that I am confident all of us want the best outcomes for the U.S. economy. The Federal Reserve understands its mission of stable prices and long-term, stable growth. Perhaps because I have been part of the history of the central bank for these past three

decades, I am as concerned about the introduction of instability into the economy as I am about managing it when it occurs. I am convinced that the time is right to put the market on notice that it must again manage its risk, be accountable for its actions, and cease its reliance on assurances that the Federal Reserve, not they, will manage the risks they must deal with in a market economy.

**FEDERAL RESERVE LENDING DISCLOSURE: FOIA,
DODD-FRANK, AND THE DATA DUMP**

WEDNESDAY, JUNE 1, 2011

WITNESSES

Alvarez, Scott G., General Counsel, Board of Governors of the
Federal Reserve System

Baxter, Thomas C. Jr., General Counsel, Federal Reserve Bank of
New York

*B*ACKGROUND

The Subcommittee on Domestic Monetary Policy and Technology held a hearing entitled “Federal Reserve Lending Disclosure: FOIA, Dodd-Frank, and the Data Dump” at 2:00 p.m. on Wednesday, June 1, 2011 in Room 2128 of the Rayburn House Office Building.

The hearing examined information disclosed by the Federal Reserve in compliance with the Dodd-Frank Wall Street Reform and Consumer Protection Act (P.L. 111-203) and the Freedom of Information Act (FOIA). Witnesses discussed information released by the Federal Reserve in December 2010 regarding emergency lending facilities and open market operations; documents released in March 2011 on discount window lending during the financial crisis; and the Federal Reserve’s compliance going forward with provisions of the Dodd–Frank Act requiring the Federal Reserve to disclose additional information.

This was a one-panel hearing. The witnesses were:

- Scott Alvarez, General Counsel, Board of Governors of the Federal Reserve System
- Thomas C. Baxter, Jr., General Counsel, Federal Reserve Bank of New York.

Fed Operations

The Federal Reserve System was established in 1913 as the central banking system of the United States. The Federal Reserve Board (the Board) formulates the monetary policy of the nation, supervises and regulates banks, and provides financial services to depository financial institutions and the federal government. In addition, the Federal Reserve serves as a lender of last resort through the operation of the discount window.

The discount window provides financial institutions with an outlet to exchange illiquid assets for liquid assets on a short-term basis to meet immediate obligations. Loans are secured by collateral, and the rate available through the discount window is typically higher than the federal funds rate (the overnight rate at which banks normally loan to each other), which discourages banks from relying on the discount window under normal circumstances. The Federal Reserve Board also has emergency lending authorities, set forth in Section 13(3) of the Federal Reserve Act. To invoke these emergency powers, the Board must make a finding of “unusual and exigent circumstances,” such as an institution’s inability to obtain credit from other banking institutions, and the Board must support the step through a vote. The Dodd-Frank Act added restrictions to the use of the “13(3)” authorities, so that they can no longer be used for the benefit of individual business entities.

Emergency Lending Facilities

The Federal Reserve Board used its emergency lending authority extensively and creatively during the financial crisis, creating a number of temporary lending programs to address perceived financial market liquidity shortages. As market conditions deteriorated and numerous companies experienced funding problems, the Board created lending facilities on an ad hoc basis, initially creating facilities to support individual entities and gradually creating larger facilities to provide market-wide assistance. Facilities were created by the Board and operated by the regional banks to provide liquidity to institutions and to stimulate the market for assets which had become illiquid. By the beginning of 2010, the Federal Reserve Board had injected large amounts of liquidity into the marketplace, expanding its balance sheet from roughly \$870 billion in August of 2007 to over \$2.2 trillion by the beginning of 2010. The Board also created several emergency facilities to address disruptions in financial markets, including the Asset-Backed Commercial Paper Money Market Mutual Fund Liquidity Facility (AMLF), the Term-Asset Backed Loan Facility (TALF), the Primary Dealer Credit Facility (PDCF), the Commercial Paper Funding Facility (CPFF), the Term Securities Lending Facility (TSLF), the TSLF Options Program (TOP), and the Term Auction Facility (TAF). The Board created dollar liquidity swaps with foreign central banks, assisted JP Morgan Chase in acquiring Bear Stearns by creating the Maiden Lane facility, and provided assistance to the American International Group (AIG) through the creation of Maiden Lane II and III.

The TAF and the CPFF were the most heavily used facilities. The TAF was the largest single temporary credit facility. The Board was concerned that firms appeared to be avoiding the discount window, perhaps fearing borrowing from the discount window would stigmatize them as weak institutions. To counteract widespread liquidity shortages, the Board created a facility that offered liquidity in the form of short-term (28-day maturity), fully collateralized loans.

The CPFF was created by the Board to provide a liquidity backstop to U.S. issuers of commercial paper. Many large firms issue commercial paper, which is short-term debt purchased by investors. Money market mutual funds (MMMFs) invest heavily in commercial paper. In September 2008, as market fears spread and a major MMMF (the Reserve Primary Fund) announced it had “broken the buck,” investors fled MMMFs, choking off a key source of short-term funding for the corporate sector. The Board created the CPFF in response. As part of this program, the Federal Reserve Bank of New York financed the purchase of highly rated unsecured and asset-backed commercial paper from eligible issuers. The CPFF closed in February 2010.

During the crisis, the Board provided only limited information about its lending decisions undertaken under these various emergency facilities. Information about lending facilities was limited to what could be discerned from statements on the Board’s weekly H.4.1 (Factors Affecting Reserve Balances) data release. Congressional interest in conducting thorough oversight of the Board’s intervention into the economy clashed with the Board’s desire to maintain its independence from political control and to protect borrowers’ expectations of confidentiality. The media also sought information about the Board’s lending facilities, arguing that the public had a right to know who had borrowed from these lending facilities because taxpayers were the ultimate backstop if the borrowers defaulted or if collateral proved insufficient.

Freedom of Information Requests

In 2008, Bloomberg News and the Fox News Network each sought information from the Federal Reserve under FOIA about the users of the Board’s temporary and emergency lending programs. Bloomberg requested information about users of three emergency lending facilities – the Primary Dealer Credit Facility, the Term Securities Lending Facility and the Term Auction Facility – and information about users of the discount window during the crisis. Bloomberg’s FOIA request sought information on each loan, including the name of

the borrower, the amount borrowed, the origination and maturity dates and the collateral pledged. Bloomberg also requested details on loans made by the Federal Reserve Bank of New York to J.P. Morgan Chase to facilitate the acquisition of Bear Stearns. Fox News' FOIA request sought information on the borrowers, loan amounts, and collateral pledged for all of the Board's temporary and emergency lending programs.

The Board refused to provide the information, arguing that the information was exempt from disclosure under exceptions contained within FOIA. Bloomberg and Fox sued to obtain the information, and in March 2010, the United States Court of Appeals for the Second Circuit held that the information was subject to FOIA and directed the Board to search the Federal Reserve System's records for responsive information to the FOIA requests and to disclose it. In response to the Second Circuit's order, the Board released internal documents to the news organizations on March 11, 2011, covering all the lending facilities, including the discount window, from August 2007 to March 2010. The Fed delivered an estimated 29,000 documents with redactions. The documents were not organized or delivered in any particular order.³¹⁵

Statutorily Required Disclosures

By statute, Congress also directed the Board to release additional information on the emergency lending facilities. Section 1109(c) of the Dodd-Frank Act required the Board to disclose detailed information about entities that borrowed from credit facilities established under Section 13(3) and about entities that participated in the agency mortgage-backed securities purchase program, used foreign currency liquidity swap lines, or borrowed through the TAF. The Dodd-Frank Act required the Board to disclose the type of assistance, the value or amount of the assistance, the date on which it was provided, the specific terms of expected repayment, including repayment time, interest charges, collateral, limitations on executive compensation or dividends and other terms, and the rationale for each such facility or program.

As required by Section 1109(c), the Board released information on December 1, 2010, regarding transactions made through emergency

³¹⁵ The Board delivered 894 PDF files on CD-ROM to Bloomberg headquarters. Bloomberg uploaded the files onto the Internet in the same format that the Board delivered them to Bloomberg, available at: http://cdn.gottraffic.net/downloads/30110331_fed_release_documents.zip. Last accessed on December 11, 2012.

lending facilities from December 1, 2007, until March 2010. The documents were made available on the Board's website by means of a spreadsheet that listed each transaction, the name of the borrower, the date, the lending bank, the loan amount, the interest rate, the amount and type of collateral.³¹⁶

Additional Federal Reserve Board Disclosures

Section 1109(a) of the Dodd-Frank Act required the Government Accountability Office (GAO) to review all loans and other Federal Reserve transactions between December 1, 2007, and July 21, 2010, that were effected under lending facilities and programs developed by the Federal Reserve during the financial crisis. The GAO's review focused on operational integrity, internal controls, collateral policy, favoritism and other factors.

Section 1102(a) gave the GAO the authority to audit any special credit facility created pursuant to Section 13(3) of the Federal Reserve Act. Activities related to the Federal Reserve's conduct of monetary policy remain beyond the GAO's audit authority.

Section 1103(b) requires disclosure of information about entities that use the discount window or section 13(3) lending facilities. The Board will be required to disclose information about borrowers from the discount window two years after the loan is made. The Board will be required to disclose information about borrowers from other lending facilities one year after authorization for the facility is terminated.

These sections are a modified and significantly more limited version of language originally introduced by Subcommittee Chairman Ron Paul in H.R. 1207 during the 111th Congress, which influenced discussions on increasing transparency of the Federal Reserve during the crisis.

³¹⁶ The Board published the data required by Dodd-Frank on its website at http://federalreserve.gov/newsevents/reform_transaction.htm. Last accessed on December 11, 2012. The credit facilities are listed as separate hyperlinks under the heading "Facilities and Programs," with each facility webpage containing an Excel data file link.

*T*RANSCRIPT

The subcommittee met, pursuant to notice, at 3:40 p.m., in room 2128, Rayburn House Office Building, Hon. Ron Paul {chairman of the subcommittee} presiding.

Members present: Representatives Paul, Jones, Luetkemeyer, Schweikert; Clay, Maloney, and Green.

Ex officio present: Representative Bachus.

Chairman PAUL. This hearing will come to order.

I would like to advise the members that the microphones we have improvised will be live all the time. So be careful what you say; the microphone is on. I imagine that is true down there, as well.

First, I want to welcome our two witnesses, and I will introduce them a little bit later. But, once again, I apologize to everybody for the inconvenience. I apologize to myself, because nobody likes to be inconvenienced. But it looks like we have a system set up here so that we can pursue our hearing.

And, without objection, all members' opening statements will be made a part of the record.

I will go ahead with an opening statement, and I will have time for anybody else who wants to have an opening statement.

I want to emphasize that I consider these hearings to be very, very important. They have come about because of many things that have happened over the last few years, and a lot of movement in the country for more transparency, in general, as well as with the Federal Reserve System. And I think my position on this is fairly well-known.

But, also, there has been legislation passed. The Dodd-Frank bill has stipulations about more information coming to us. That legislation passed last year. There have also been the court cases that are under the Freedom of Information Act. We will be dealing with a lot of that today. And, also, the provisions in the law that was language that was put in by, basically, Senator Sanders, that has required some additional information.

But, what is referred to today so often in hearings on the materials that came out of the Freedom of Information Act, it is called “the dump.” And I find that rather interesting, to call it that, because it sounds like a lot of material was dumped. And when you think of 29,000 pages of technical information, it is very large, and a lot of people have been studying it. Our staffs have been working very hard, and, quite frankly, it isn’t all that easy to figure out.

It reminds me of a story that was told, supposedly a true story, that an individual was being audited by the Federal Reserve. And they came to him, and they said, “We want 5 years of everything that you have ever done, every receipt you have ever had.” And, of course, that made him very unhappy, so he put them all together in a bushel basket and he dumped them. And I will tell you what, it didn’t go over very well, and he got into a lot of trouble. I am not suggesting this is similar, but it is a story that reminds me, when I look and try to figure out really what we have, it is a lot of material, and to sort this out is not easy.

One argument, and I understand the argument very clearly, on the hesitancy of the Federal Reserve not to give out too much information too early, with the idea that it might be proprietary and it might set the stage for concerns in the market.

But, I think it is in contrast to the purpose of the SEC. The SEC has a purpose to investigate, demand reports, and get the information out immediately, and that is their responsibility. And if a company doesn’t let us know exactly what they are doing and what their accounting procedures are, they get into a lot of difficulty. But the argument seems to be different for the Federal Reserve, that, oh, if we have information about a bank that might be in difficulty, in a market situation, that information should be available to us. So I take the position that information shouldn’t be that detrimental to us and the more we can get, the better.

I am hopeful that today we will be able to ask some pertinent questions to get more information and that members can follow up with more questions later on, and that there will be more transparency without ever injuring anybody. That certainly would be my goal.

I would now like to yield 5 minutes to Mr. Clay.

Mr. CLAY. Thank you, Mr. Chairman. And thank you so much for holding this hearing to examine information disclosed by the Federal Reserve in compliance with the Dodd-Frank Wall Street Reform and Consumer Protection Act and the Freedom of Information Act.

Also, I want to thank the witnesses for appearing today.

Due to the U.S. financial crisis, the Congress passed the Dodd-Frank Wall Street Reform and Consumer Protection Act of 2010. This legislation was crafted as a response to the financial crisis, which has cost nearly 10 million American jobs and over \$10 trillion in household wealth. Nearly 4 million families have lost their homes to foreclosure and an additional 4.5 million have slipped into the foreclosure process or are seriously behind on their mortgage payment.

According to the Financial Crisis Inquiry Report, a combination of excessive borrowing, risky investments, and a lack of transparency put the financial system on a collision course of self-destruction. In the years leading up to the crisis, too many financial institutions, as well as too many households, borrowed too much, leaving them vulnerable to financial distress if the value of their investments declined even modestly.

For example, as of 2007, the 5 major investment banks were operating with extraordinarily thin capital. By one measure, their leverage ratios were as high as 40:1, meaning for every \$40 in assets, there was only \$1 in capital to cover losses. Less than a 3 percent drop in asset value could wipe out a company.

Leverage was often hidden in off-balance-sheet entities, in derivatives positions, and through “window dressing” of financial reports available to the investing public. Within the financial system, the danger of this debt was increased because transparency was not required or desired. Undercover corporate dealings assisted in the financial meltdown which still plagues us today.

In order for democracy and capitalism to exist correctly, transparency must be at the core. Trust and transparency and the rule of law are fundamental to this Nation's success. And business depends in some way on trust—a trust that business produces good products and a trust that business will deliver good services. Democracy depends in some way on trust. Transparency promotes government accountability, free and fair elections, competition and free markets; and the rules of law are critical to it.

The Dodd-Frank Wall Street Reform and Consumer Protection Act addresses these issues by reforming the Federal Reserve in two ways:

One, it limits the Federal Reserve's 13(3) emergency lending authority by prohibiting emergency lending to an individual entity. The Secretary of the Treasury must approve any lending program, and the program must be broad-based and loans cannot be made to

insolvent firms. Collateral must be sufficient to protect taxpayers from losses.

And two, it requires the Federal Reserve to disclose counterparties and information about amounts, terms, and conditions of 13(3) and discount window lending, and open-market transactions on an ongoing basis, with specified time delays.

These are just a few examples of the importance of the Dodd-Frank Wall Street Reform and Consumer Protection Act.

Thank you, Mr. Chairman. I look forward to the witnesses' comments.

Chairman PAUL. I thank the gentleman.

Mr. Luetkemeyer, you are recognized for an opening statement.

Okay. There are no more opening statements, so I will go ahead and introduce our witnesses.

First, we have Mr. Scott Alvarez, who is General Counsel at the Board of Governors, a post he has held since 2004. He has been with the Board for 30 years. And, also, Mr. Thomas Baxter, Jr., has been General Counsel and Executive Vice President of the legal group at the Federal Reserve Bank of New York since 1995. He also serves as Deputy General Counsel of the FOMC. Mr. Baxter has been with the New York Fed for more than 30 years.

It has been agreed upon by the witnesses, Ranking Member Clay, and myself that Mr. Alvarez will deliver the oral remarks for the joint written testimony of Mr. Alvarez and Mr. Baxter. This testimony may run longer than the customary 5 minutes. And without objection, your joint written statement will be made a part of the record.

I now yield to Mr. Alvarez.

JOINT STATEMENT OF³¹⁷

**SCOTT G. ALVAREZ, GENERAL COUNSEL,
BOARD OF GOVERNORS OF THE FEDERAL RESERVE SYSTEM
AND THOMAS C. BAXTER, JR., GENERAL COUNSEL
FEDERAL RESERVE BANK OF NEW YORK**

Mr. ALVAREZ. Chairman Paul, Ranking Member Clay, members of the subcommittee, Thomas Baxter, the General Counsel of the Federal Reserve Bank of New York, and I appreciate the opportunity to discuss the ways the Federal Reserve informs the Congress and the American people about its policies and actions.

Central bank lending facilitates the implementation of monetary policy and allows the central bank to address short-term liquidity pressures in the banking system. This role of lender of last resort is a

³¹⁷ [The joint prepared statement of Mr. Alvarez and Mr. Baxter can be found on page 1194.]

critical one, long filled by central banks around the world, especially during times of economic crisis, when discount window lending can mitigate strains in financial markets that could otherwise escalate and lead to sharp declines in output and employment. In the United States, all discount window loans are fully secured, and the Federal Reserve has not suffered a loss to date on its discount window lending.

The Federal Reserve regularly releases significant detailed information about its operations in order to promote the understanding of how the Federal Reserve fosters financial stability and economic stability and to facilitate an evaluation of our actions while preserving the ability to effectively fulfill the responsibilities that Congress has given the Federal Reserve. Since 1914, the Federal Reserve has published its balance sheet every week.

We also publish full financial statements annually that are audited by an independent public accounting firm, which for the last 4 years has been Deloitte & Touche. These audits cover Maiden Lane, Maiden Lane II, and Maiden Lane III, as well as the transactions conducted through the discount window and with foreign central banks.

The Federal Reserve also publishes a special monthly report to Congress, posted on our Web site, that details the Federal Reserve's emergency lending programs, including providing information on the amount of lending under each program, the type and level of collateral associated with those loans, and information about the borrowers under those facilities.

In addition, the Federal Reserve Bank of New York maintains a Web site that includes schedules of purchases and sales of securities as part of open-market operations, with CUSIP information describing the securities involved.

The Federal Reserve is fully cooperating with the GAO in an extensive review of each of the special lending facilities developed during the crisis. This review will assess operational integrity, internal controls, security and collateral policies, policies governing third-party contractors, and the existence of any conflicts of interest or inappropriate favoritism in the establishment or operation of the facilities.

As provided by the Dodd-Frank Act, on December 1, 2010, the Board published detailed information on its Web site about the Federal Reserve's actions during the financial crisis. This release includes the names of borrowers, the amount borrowed, the date

credit was extended, the interest rate charged, information about collateral, and the description of the credit terms under each facility.

Similar information was provided for the draws of foreign central banks on their dollar liquidity swap lines with the Federal Reserve. For agency MBS transactions, details included the name of the counterparty, the security purchased or sold, and the date, amount, and price of the transaction.

On March 31, 2011, the Federal Reserve released documents related to the discount window in response to requests filed under the Freedom of Information Act. The March 31st release included documents containing information related to borrowers at the discount window between August 8, 2007, and March 1, 2010, that was not required to be disclosed under the Dodd-Frank Act.

Going forward, the Dodd-Frank Act provides for the release of information on any broad-based emergency lending facility 1 year after the termination of the facility, as well as a GAO audit of the facility. The Act also provides for the release of information regarding discount window lending and open-market operations conducted after July 21, 2010, with a 2-year lag.

For lending facilities, including both emergency lending facilities and the discount window, and for open-market operations, the Federal Reserve will publish information disclosing the identity of the borrower or counterparty, transaction amount, interest rate or discount paid, and the collateral pledged.

The Federal Reserve believes the lags provided by the Dodd-Frank Act for the release of transaction-level information establish an important balance between the public's interest in information about participants in transactions with the Federal Reserve and the need to ensure that the system can effectively use its congressionally authorized power to maintain the stability of the financial system and implement monetary policy.

We will carefully monitor developments in the use of the discount window and other Federal Reserve facilities and keep the Congress informed about their effectiveness. The Federal Reserve has worked and will continue to work with the Congress to ensure that our operations promote the highest standards of accountability, stewardship, and policy effectiveness, consistent with meeting our statutory responsibilities.

We appreciate the opportunity to describe the Federal Reserve's efforts on this important subject and are happy to answer any questions you may have. And we will be responsive to any written questions you may submit, as well.

Thank you very much, Mr. Chairman.
Chairman PAUL. I thank the gentleman.

[QUESTIONS & ANSWERS]

I will yield myself 5 minutes, but announce that we will likely be able to have repeat questioning. I think the time will permit that. But I will start off with 5 minutes.

I first want to ask unanimous consent to submit an article for the record from Bloomberg called, “Fed Gave Banks Crisis Gains on \$80 Billion Secretive Loans as Low as 0.01%.” Without objection, it is so ordered.³¹⁸

I want to refer to one document. And this little document from the material that we got from the Federal Reserve is called a “Chart Pack of Market Monitoring Metrics for Fed Facilities.” I am sure you know all 29,000 pages, and you probably know exactly what I am talking about, but it tells you about the problem that we have in trying to find out information.

And this particular document has 327 pages to it, but, in this particular document, it has some interesting material that I did not know about, and I want to ask about it. It reveals that there was a previously undisclosed Fed lending program known as the single-tranche open-market operations, and it is referred to as “ST OMO.” This is something new, and it allows the Fed to give .01 percent—that is, free money—to companies like Goldman Sachs and was essentially a free loan to these well-connected businesses.

But, also, the problem that we had in analyzing this to find out information that we are looking for is, it turns out that, just in this particular area, 81 percent of the contents has been redacted. So, we end up with a lot of pages, and then we end up with 19 percent that actually has information that we have to sort out.

The question is, why were these details not mentioned? Is it that everything has to be done in secret? We would like to know, the people would like to know, but we didn't see any evidence until this was dug out of here. And maybe it was mistakenly not redacted or something like that. It makes us wonder why we don't know about this.

That, of course, is one of my big beefs with the Federal Reserve, that the central bank wields so much power, so much financial power, you literally can have transactions greater than what we can do with

³¹⁸ [The article Rep. Paul placed in the hearing record can be found in Appendix D.]

our own budget. And that is why it is a deep concern to me, but to many other people as well.

But why was this not published? And are these and other programs that have yet to be disclosed—are there others? Why were so many pages redacted? Can you really claim this to be in compliance with FOIA, the Freedom of Information Act, when we don't know what has been excluded?

I would like to get your reaction to this and for you to talk specifically about this one program and what has been going on with it.

Mr. ALVAREZ. Mr. Chairman, the program you refer to, the single-tranche OMO program, was not a secret program. It was actually publicly announced by the Federal Reserve on March 7, 2008, when the program began. It was a short-term program that ended in January of 2009. And transactions that were conducted under that program as part of our open-market operations were reported, along with other open-market operations, on the New York Federal Reserve Bank Web site very quickly after the transactions occurred.

The documents you have before you are from the response for the Freedom of Information Act request. And so that, itself, should explain why there are redactions. The way the Freedom of Information Act works, it is a request for certain types of information in documents. First, the agency collects all documents that may have any information that relates to the request. Then, information that is not requested is taken out of the documents, redacted from the documents, simply because it is not responsive to the request.

So, it is not a desire to keep things secret. It is, instead, a desire to be responsive to the request. Often, when a requester asks for documents, there is information that is extraneous or not the kind of information that was requested, not relevant to the request, and that is taken out of the documentation. And that is why you see redaction in the documents before you.

These documents were reviewed by the court and released by the court in accordance with the Freedom of Information Act.

Chairman PAUL. Does that mean, if somebody were to follow up and broaden that request, all that material could become available? Would they have to just change the Freedom of Information Act request?

Mr. ALVAREZ. If another request was made for a broader range of information, we would review that information, determine what is confidential and what could be released, and a decision then would be made on that request.

Chairman PAUL. Could it be made so broad that you just turn over everything?

Mr. ALVAREZ. I am not sure there are enough people in the world to look at everything we have to turn over, but we would do the best we could.

Chairman PAUL. Okay.

My 5 minutes is up, and I now yield to Mr. Clay.

Mr. CLAY. Thank you, Mr. Chairman.

And thank you, Mr. Alvarez.

Just one question. Has the dramatic and, I believe, welcome increase in transparency, including your own initiatives and those called for in the Wall Street Reform Act of 2010, had any adverse or troubling consequences either for policymaking at the Fed or for the financial institutions that you regulate and interact with?

Mr. ALVAREZ. We think the increases in transparency, particularly around monetary policy, that we have taken in the last few years have been very helpful and responsive and have improved understanding of the Federal Reserve and the policy actions we are trying to take.

We have provided a lot of detailed information about the credit transactions we engaged in during the crisis. Congress, we think, struck a very important balance between the need for access to that information and providing a delay so that participants in the transaction don't experience the stigma that often occurs when there is an immediate release of information, allowing, therefore, an explanation for why institutions have participated in the facilities.

We are monitoring whether there will be any effect. We, of course, won't know until we see how these facilities operate in the future. We will keep the Congress informed on the effectiveness. If there is any bad effect, we will let you know.

Mr. CLAY. So you will inform the Congress as to if there needs to be changes in the—

Mr. ALVAREZ. Absolutely.

Mr. CLAY. Okay. Thank you for your response.

And, at this time, Mr. Chairman, I would like to yield the balance of my time to the gentlewoman from New York.

Mrs. MALONEY. I thank the gentleman for yielding, and I thank the chairman for holding this important hearing.

And I welcome both of our witnesses.

And I think we all have to remember that we were really on the verge of collapse, that this was a—we had the great recession instead

of a great depression because of the monetary policy and many of the steps that we took.

One of those steps that we have taken to stabilize our markets and move forward is the Dodd-Frank bill. And, in that, we required the GAO to conduct an audit of the Federal Reserve, and we also required the Fed to make information about the transactions through emergency lending facilities from December 2008 to March 2010 available to the public. In addition, Dodd-Frank required that the Fed disclose information about the entities that used the discount window or under I believe it was section 13(3) lending facilities.

But in addition to what we required in Dodd-Frank, the Federal Reserve is also already subject to robust congressional oversight. And I would like to ask our two witnesses, can you give the committee some examples of the types of congressional oversight that you are already required to do, even before Dodd-Frank?

Mr. ALVAREZ. Two of the most important types of oversight are: The Chairman of the Federal Reserve, who is also the Chairman of the FOMC, provides testimony on the economy twice each year, on the call of the House and the Senate. And that is an important check on monetary policy and the state of the economy.

Another important method is this hearing and hearings like this that we are going through. The staff and the Governors and the Chairman of the Federal Reserve, and the Presidents of the Reserve Bank have often been called to Congress to report on every aspect of our duties and how we implement various policies. And you use those as oversight of us, and we explain positions that we have taken.

So, I think it is the interaction between the Congress and the Federal Reserve in testimonies, in particular, that have been an effective form of oversight.

Mrs. MALONEY. Okay. My time is about to expire, but, as you know, there is a GAO audit authority now. Was there anything that is excluded from the GAO audit authority?

Mr. ALVAREZ. The GAO is authorized to audit a full range of the Federal Reserve's responsibilities. That includes all of the emergency transactions, the discount window, our supervisory authority, our consumer authority, all the various aspects of authority.

An area that Congress has reserved is the implementation of monetary policy, the actual policymaking decision process. The GAO does look at how we implement the policy, in the form of making sure that transactions actually occur as appropriate, that they are accounted for properly on the balance sheet, that they are fully

disclosed. But the decision-making process for monetary policy is the one thing outside the GAO's scope of authority.

Mrs. MALONEY. Mr. Chairman, may I follow up with one brief question on what are the arguments for excluding it? Why was that excluded? What is the argument for it?

Mr. Alvarez?

Mr. ALVAREZ. The importance of allowing the Federal Reserve and the FOMC to conduct monetary policy independently has been demonstrated throughout the world in both actions by other central banks and in a variety of studies of monetary policy.

The point, I think, is that the Congress wanted to reserve to the FOMC the ability to have discussions that are full and free and frank and to explore all the possible alternatives for monetary policy to reach the best monetary policy decision.

Moreover, the GAO doesn't do audits in the sense of a technical audit like a financial auditor might do, but does performance reviews and policy reviews. So that would mean that the GAO would review the alternatives considered for monetary policy, how the decisions were made, whether the decisions were actually appropriate. That would cause second-guessing of the FOMC, cast into doubt whether the FOMC was actually making the policy decisions or whether the GAO was making policy decisions in monetary policy, and make it more difficult for the monetary policy to be done effectively by the Federal Reserve.

Mrs. MALONEY. Thank you.

Thank you, Mr. Chairman.

Chairman PAUL. Thank you.

I now yield 5 minutes to the vice chairman, Mr. Jones from North Carolina.

Mr. JONES. Mr. Chairman, thank you very much. And I appreciate you holding these hearings, as others have said.

I am going to take a little different approach. I represent the Third District of eastern North Carolina. It is a great district to represent, the home to the Camp Lejeune Marine Base, Cherry Point Marine Air Station, and the Outer Banks.

The frustration of the average businessperson down in my district is very deep and severe. And we have had numerous inquiries from the Third District, the citizens of the Third District, about the Federal Reserve and how decisions are made.

I know you cannot go into some of the backroom negotiations at the Reserve; I am not even asking that. But how do you say to the small-business owner that, in this crisis situation, we seem to find

ways to help foreign banks, foreign entities? And I am looking here at the note that my staff prepared for me—Harley-Davidson, McDonald's, GE, Verizon, Toyota. And yet, I have people in my district saying, "I go to the local banks, and I can't get any loans, and my credit has always been good."

Why and how does the Federal Reserve seem to be able to find the way to help these entities that are gigantic? And through greed and manipulation, they cheated, and, yet, they get bailed out. They get the help, when the average businessperson down in eastern North Carolina and probably across America, they can't even go to a bank that they have been banking with for 15 or 20 years and get a loan. And yet, here we are at the Federal Reserve, looking at those foreign banks who might need some help or these corporations that might need some help.

It really is—that is why this hearing is very important. The transparency, the trust—and that is a big word to me, "trust"—is just not there with the average system, when it comes to the Federal Reserve. And yet, if it had not been for the push by—I won't name all the entities that pushed—to tell you to show the bottom line, to show what was in the closet of decisions, who was being helped, we never would have known it.

And yet, I know you gentlemen are attorneys, and you are probably not at the position where the person ought to be here who ought to be putting a hand on the Bible to tell the truth to the American people.

That is my concern, is, how do we build the confidence of the American people when we see what is happening at the Federal Reserve?

Mr. ALVAREZ. Congressman, we understand that and feel that same frustration.

The programs that were designed and implemented by the Federal Reserve during the financial crisis were not designed to aid big companies for the sake of aiding big companies. The programs that we designed—for example, the TALF program—were designed to pass money and credit and liquidity on to the American people. So, for example, the TALF resulted in 3 million more auto loans during the crisis than would have occurred, a million more student loans, and almost a million small-business loans.

The programs you are talking about that aided Harley-Davidson and Toyota and other companies were the commercial paper facility, which provided short-term funding to those companies so they could continue to keep employment up and manufacturing up in the United

States, so that they could continue to provide jobs and provide opportunities in the United States.

Our efforts were all designed to try to keep the economy moving in order to help individuals and small businesses, not for the sake of helping the larger institutions.

And I understand that there is a different perception. Part of that perception, I think, comes from the fact that most of the financial tools that we were given are designed to work through banks or work through large markets. So we use the tools the best we can in order to have the funding aid the broadest range of people possible.

Mr. JONES. Mr. Chairman, I know my time is about up. But I guess, in a way, that if it had not been for Bloomberg and the Wall Street Journal and all of these raising the questions, doing investigation, I don't know if we would be having this hearing today. I don't know.

Chairman PAUL. I thank the gentleman.

I yield 5 minutes to Mrs. Maloney from New York.

Mrs. MALONEY. I thank the chairman for yielding.

And, as he is well aware, on Friday the jobs numbers come out. And the economy has been improving, not as fast as we would all like, but we are digging our way out of that hole.

And now that we have the benefit of hindsight and we are slowly recovering from the financial crisis of 2008, I know that some have taken the position—a position that I do not agree with—that the Fed's lending during this time actually helped contribute to the crisis. And some have argued that the Fed didn't need to take the actions that it took because the situation would have stabilized on its own.

But I would like to ask our panelists today, isn't it true that, without the actions that the Fed took, that by not setting up the facilities it did, by not giving institutions access to the discount window to provide additional liquidity to our economy, that the crisis would have been far worse?

So your comments, please, Mr. Alvarez and Mr. Baxter?

Mr. ALVAREZ. Thank you, Congresswoman.

We believe that the facilities that the Federal Reserve established did ease the crisis, and they certainly were designed to do that. The studies that are beginning to come forward now show that they actually were successful in unfreezing various markets—the commercial paper market, the asset-backed securities market—and providing liquidity to the financial system that was important for the financial system to continue to operate.

The funding that we provided was without any losses to the taxpayer. Indeed, the emergency lending facilities resulted in \$9 billion worth of interest and fees that were passed on to the Treasury.

As I was explaining to Congressman Jones, the facilities were designed to provide real relief to American consumers and small businesses in the form of student loans, auto loans, small-business loans, credit card loans, as well as allowing the operation of companies that relied on the commercial paper market, which had frozen up, to continue to find a source of funding to keep their operations going.

So, we think that the facilities were successful and were a good use of taxpayer funds.

Mrs. MALONEY. I would say that there is an impression—I hear it, and I think other Members of Congress hear it—that is out there, that all of the actions the Fed took during the crisis served only to help financial institutions. But I want to make clear the point that, and I want to make sure that people understand, that all of these actions were in the form of loans, and, in fact, over \$125 billion has been returned to the Treasury over and above what was loaned out.

That is what I read. I want to know if that is true. Is that true?

Mr. ALVAREZ. We have, in the last 2 years, provided about \$127 billion in earnings to the Treasury. Yes, that is correct.

Mrs. MALONEY. But can you bring this down to Main Street? Can you give the committee members and the general public some examples of how that lending helped not only stabilize the economy and keep our financial institutions in place, but literally helped Main Street and working men and women?

Mr. ALVAREZ. I would like to return to the TALF program, which was one specifically designed to make sure that loans were made in the United States to help students obtain education loans for college, to help small businesses have SBA loans, credit card loans, to provide auto lending, to provide equipment leasing, and a variety of other kinds of loans that were not being made during the financial crisis because of liquidity shortages.

That program was extraordinarily successful—

Mrs. MALONEY. Is it still operating?

Mr. ALVAREZ. It is. It has closed, but there are still about \$14 billion in loans outstanding. There were \$70 billion of credits extended through the program through its life. Much of it has been repaid.

Mrs. MALONEY. I would like to ask about a number of programs that the Fed engages in, including holding gold for foreign countries,

account services, and liquidity programs. In your experience, are these common activities for central banks?

Mr. BAXTER. Yes, Congresswoman, they are common for central banks. It is common for central banks around the world to hold reserves, and, as you know, the dollar is the principal reserve currency. At the Federal Reserve in New York, we hold over \$3 trillion on behalf of foreign central banks and countries.

It is very important to hold those sizable reserves because those sizable reserves are principally invested in Treasury securities, which helps to finance the debt of the United States. So, holding dollar reserves is a very important function of the Federal Reserve, and we do that at the New York Fed. And it is similar to functions that other foreign central banks perform around the world.

Mrs. MALONEY. My time has expired. Thank you, Mr. Chairman.

Chairman PAUL. Thank you.

I yield 5 minutes to Mr. Green from Texas.

Mr. GREEN. Thank you, Mr. Chairman.

I thank the witnesses for appearing, as well.

I am interested in the central banks of other countries as compared to our country and this disclosure that they engage in compared to our country. I know that the systems are not going to be the same, but with reference to disclosure, can you give us some indication so that we can have some sort of comparison?

Mr. ALVAREZ. The practices of disclosure vary quite a bit across the world, but I believe the Federal Reserve is one of the, if not the, most transparent central banks.

Many central banks in developed countries do not, for example, announce their policy decision or the votes that are taken. The Federal Reserve does both of those. Many central banks do not provide minutes for their meetings. The Federal Reserve provides minutes 3 weeks after each meeting. Many foreign central banks do not publish at all the transcripts of their meetings, and the Federal Reserve publishes the transcript 5 years after each meeting.

On the discount window lending, that is a common power that foreign central banks have, but they are much less transparent in that area, as well. Indeed, you may recall that, at the start of the crisis, it was a leak about a discount window loan made by the Bank of England to Northern Rock that resulted in a run on Northern Rock there. So, the foreign countries tend to be more circumspect about the information they disclose about their discount window lending operation.

Mr. GREEN. Yes, sir?

Mr. BAXTER. With respect to the incident that Mr. Alvarez described, the British Parliament has written a report, which is entitled, "The Run on the Rock," and it has a section that describes how that run began. And that was triggered by public reports about a borrowing by Northern Rock at the Bank of England. With the permission of the Chair, we could submit that report for the benefit of the subcommittee.

Mr. GREEN. Thank you.

One other quick question, Mr. Chairman, if I may.

I know that you probably have gone through this, but explain to those who are viewing why it is important to have disclosure and why you try to achieve this balance that you have with reference to disclosure. For example, why not just have a CPA come in or someone come in and just audit everything all the time every day? What is the downside?

Mr. ALVAREZ. We do have a CPA come in—Deloitte & Touche, currently—to do an audit of our financial statements, including all of our transactions, our discount window lending and our open-market transactions.

The thought on disclosure is that disclosing the names of borrowers and the amount they have borrowed provides the American people with more information to make sure that the Federal Reserve is acting in a responsible way in its lending facilities.

The balance on the other side is that the discount window is a very important tool both in good times and in bad—in good times, for providing short-term liquidity to institutions when they need it and also as a monetary policy tool to help reduce the volatility of interest rates; and in emergency times, to provide liquidity to institutions that are generally healthy, but where panic has caused asset values to be out of whack, as it were, so that the institution can't fund itself in an appropriate way.

So the discount window is a very important tool. The concern is that, because it is often used by both healthy and troubled institutions, the public will be confused if it sees the names of a borrower at the discount window and not be certain if that institution is healthy or not. And if a healthy institution is wrongly thought to be troubled because it has accessed the discount window, then that could cause problems for that institution. That causes institutions to back away from using the discount window, and that makes it a much less effective tool, both in good times and in bad times, for addressing liquidity crises.

So it is important to have a balance in the disclosure. That is why we think the lag time, the 2-year period between the actual loan and the announcement of the borrower, is important. That leaves the institution some period of time to explain itself, to demonstrate its health, and to not be tied to a troubled transaction at a difficult time.

Mr. GREEN. I think my time is up. Thank you, Mr. Chairman.

Chairman PAUL. Thank you.

I would like to direct this question to Mr. Baxter. And I want to follow up on Mr. Jones' question about how some of these decisions are made and how sometimes the big guy seems to benefit and the little people lose their mortgages and lose their homes and they lose their jobs. And, quite frankly, it is very difficult at times in this country, because it seems like people are too-little-to-save—there are people who are too-big-to-forget about them, too-big-to-let-them-fail.

But I want to direct a question about the foreign loans. And it seems to me from the figures I look at, that nearly one-third of all the loans during this period of time went to foreign banks. And, at one time, at the peak of this, 88 percent of these overall discount window loans went to foreign banks. But at the New York Fed, I think practically, essentially 100 percent of the loans were going to foreign banks.

And the answer I get is that, they are foreign banks but they have subsidiaries, and they qualify under the rules—I wouldn't say under the law, but under the rules—that they can go to the discount window. But it just seems to be way out of proportion, when you think of that tremendous amount of loaning that went to these foreign banks. And this is not easy for the average American citizen to understand.

Could you enlighten us on why it seems to be disproportionate? I am sure they don't represent that percentage of the financial problems that existed. A third of the problems didn't deal with foreign banks, surely. What is the explanation for that?

Mr. BAXTER. Yes, Chairman Paul. Thank you for that question.

First, the starting point is Federal statutory law. And section 13, paragraph 14, of the Federal Reserve Act says to the Federal Reserve that, with respect to discount window borrowing, we are to treat the branch or the agency of a foreign bank just like we treat our own U.S.-chartered depository institutions. So, there is this principle of national treatment that we start with, and it is a principle that is embedded in the Federal Reserve Act itself. And so, we must treat the branch and agency of a foreign bank in the same manner we treat our own. That is the starting point.

The second is, New York is the money center of the United States. And with respect to foreign banks that intend to come to our country and invest in our people and form branches and agencies in the United States, many of those foreign banking organizations look to form those organizations in the money center, which is in New York.

The short answer to your question, Chairman Paul, is the law requires us to lend to branches and agencies. And with respect to New York in particular, that tends to be the place where foreign banking organizations enter our country.

Chairman PAUL. Okay. Proportionately, it still seems to be out of whack. Wouldn't the system invite foreign banks? They are making most of their money overseas. Just open up a subsidiary in New York. And, therefore, they get the line of credit and the protection of the bank, and it is almost like free insurance for them.

Do you think this is a good idea, that a foreign bank, all they have to do is open up and get these bailouts? It just doesn't seem fair at all.

Mr. BAXTER. These were loans, Chairman Paul. They weren't gifts in any way. And the foreign banks have to repay, just like everyone else, the principal and interest.

Second, if a foreign bank—and some do—decides that they would prefer not to form a branch or an agency but to start a subsidiary bank in the United States, that is their option. And some foreign banks do just that. And, of course, the subsidiary bank, which would have a U.S. charter, that has access to the discount window as well.

Mr. ALVAREZ. I would add one more thing.

There is a limit on the amount that they can borrow. They are limited by the amount of collateral that they have, that they can post at the discount window. So, that is dollar collateral in the United States. That doesn't allow the foreign bank to borrow to the full extent of its assets worldwide. It borrows in order to support its dollar activities. And those dollar activities are largely, though not exclusively—you have a point there—but largely in the United States.

Chairman PAUL. Could the argument be made that maybe the banks in Greece should have had a lot more subsidiaries in New York, and maybe then Greece wouldn't be in so much trouble, the Fed would have bailed them out too?

Mr. ALVAREZ. No, their assets are in Greece, so they are Greek assets. And they would go to the Greek central bank to borrow there, not to the United States.

Chairman PAUL. Okay.

Mr. Green, do you have any more questions?

No? Okay. Mr. Jones, for 5 minutes.

Mr. JONES. Mr. Chairman, thank you again.

Looking through a lot of these reports—and I want to go to Libya and see if you can help me understand the rationale by the Treasury and the Reserve.

I will just read one paragraph: “Arab Banking Corporation, the lender part-owned by the Central Bank of Libya, used a New York branch to get 73 loans from the U.S. Federal Reserve in the 18 months after Lehman Brothers Holdings collapsed.”

Help me understand, so that I can explain to people back in my district, that here we are, an undeclared war. Any time—and I thank God we haven't lost any American military at this point, but we certainly have fired a bunch of missiles. And we are spending millions and millions of dollars, probably billions by now. And we are helping other countries.

What is the protection if Libya is Gaddafi and Gaddafi is Libya—or, at least, it has been for a period of time—and we have made these loans to their affiliate or to Libyan banks, their relationships, what happens in a wartime situation, where we are trying to drive Gaddafi out of business and we have made these loans to him or to Libya?

How do you explain to that person that each and every one of us, on both sides of the political aisle, has talked about today that can't get the loans? How do you explain this to Walter Jones, who happens to be a Member of the Congress, so he can explain it to his people back home?

Mr. ALVAREZ. The Arab Banking Corporation is a bank located in Bahrain. It is not located in Libya. The Libyans bought a substantial part of that bank after all the loans that were extended by the Federal Reserve were repaid.

We work with the Treasury Department and the State Department, which have responsibility for identifying banks that the United States should not deal with for foreign policy reasons. The responsibility for designating those banks rests with them. We consult with them to make sure that we don't lend to institutions that they have determined we should not be lending to.

At the time our credits were extended, Arab Banking Corporation was not identified by Treasury or State Department as a bank that was of concern. It was a foreign bank that had an operation in the United States that was well-rated in all other respects, like another foreign bank from a foreign country.

Mr. JONES. Mr. Chairman, I tell you, knowing that you, for many years, have picked up more and more support for your legislation to

audit the Federal Reserve, I wish, truthfully—and it has nothing to do with you gentlemen here today, but I am telling you that the distrust out here by the American people is as deep and as severe as I have ever seen it. And not only Congress itself, not only the Administration, but the Federal Reserve is just, at this point, at a very low ebb as it relates to trust.

And I am not talking about you personally. You are two men of high integrity, I know that. But, right now, the Federal Reserve is not held in high esteem by many people in this country.

I will yield back.

Chairman PAUL. I thank the gentleman.

I have a few short questions, and then we will finish up.

One thing is, on a follow-up on what Mr. Jones says, is, the confidence is very low. But when you speak of independence—and I understand your terms, and I disagree with the need for that, but I understand it. But what people hear, when you say “independence,” they hear “secrecy.” You are going to keep it from us.

And like the point I made at the beginning, the SEC is to pressure companies to reveal information, where the Federal Reserve does the opposite. They want—no, we can’t tell anything because it might disturb the markets.

I have one question: During the crisis or at any time that you are aware of, has the Federal Reserve or Treasury participated in any gold swaps arrangements?

Mr. ALVAREZ. The Federal Reserve does not own any gold at all. We have not owned gold since 1934. So we have not engaged in any gold swaps.

Chairman PAUL. But it appears on your balance sheet that you hold gold.

Mr. ALVAREZ. What appears on our balance sheet is gold certificates. Before 1934, the Federal Reserve did own gold. We turned that over, by law, to the Treasury and received, in return for that, gold certificates.

Chairman PAUL. If the Treasury entered into—because under the Exchange Stabilization Fund, I would assume they probably have the legal authority to do it—they wouldn’t be able to do it, then, because you have the securities for essentially all the gold?

Mr. ALVAREZ. No, we have no interest in the gold that is owned by the Treasury. We have simply an accounting document that is called “gold certificates” that represents the value at a statutory rate of the gold that we gave to the Treasury in 1934.

Chairman PAUL. It is still measured at \$42 an ounce, which makes no sense whatsoever.

But, the conventional wisdom today says that gold is really not money. We don't want it to be money. If you are for the gold standard, there is something wrong with you. And, yet, we hold the gold.

And, there has been the suggestion made, and I have sort of encouraged the suggestion, if gold is not money and it is an asset and you don't even use it because it is on your balance sheets and you don't even use it at the real value, why—would you have a position on this? Why shouldn't the Treasury just sell the gold and give it back to the people? The people had it at one time. Let the people have it.

Would you have any objection to that? Would you advise us and say, "No, that is not good; we ought to hold the gold?" Do you think holding the gold is a good idea or a bad idea?

Mr. ALVAREZ. I have no position on that at all. That is clearly a matter for the Treasury.

Chairman PAUL. No position?

Mr. ALVAREZ. It is a matter for the Treasury. It is not within the purview of the Federal Reserve.

Chairman PAUL. Mr. Baxter, would you have an opinion?

Mr. BAXTER. My opinion is, I agree with Mr. Alvarez.

Chairman PAUL. No position.

It is amazing, because I have asked questions of the Federal Reserve, the Members of the Board, for years. And whether it has been Mr. Greenspan—I can't recall exactly what I have asked Mr. Bernanke—but it is always, "Well, no, we have to hold on to these assets." But if it is not money and we don't need it and we are not going on a gold standard, I would think that they shouldn't be holding it.

The reason I ask that is, the truth is, gold is money. And people don't throw it away, and people do cling to it. But I would be real-ly—there are a lot of people who suspect, because of this lack of transparency, that there have been a tremendous amount of gold swaps and loans made and central banks sold a lot of gold off after the last 10 years. A lot of the gold has left the West and has gone to the East. And the central banks now have positive trade balances; they buy up the gold.

There has to be a message in there and a significance, even for those who don't want the restraints of gold, there has to be a message out there that we should look at, because we are in a financial mess and it has to do with our monetary system, and it is being reflected

today in rising prices and a weak economy. And just printing all this money isn't doing any good.

All this stuff that has been done for 30 years—when you look at the economic statistics now, they are horrible. And these people who lost their jobs, they are still unemployed. The people who bought stocks in the year 2000, if they held on, they probably haven't even broken even. They probably lost purchasing power.

So, eventually, I think—I know this is off the subject a little bit. But it is reflected only in that we don't know exactly what goes on. And people, when they don't know, then they get suspicious, and they say, "Well, it is kept secret from us. Why aren't we allowed to know?" And we just march on.

And the type of dollars we are talking about, and when we hear about this money going to central banks and banks that Qadhafi was a part owner in, this really stirs up the emotions of a lot of people.

I do appreciate you being here. And I know that there will be a lot of questions, there will be written questions submitted. And we would appreciate your cooperation in sending us your answers.

The Chair notes that some members may have additional questions for this panel which they may wish to submit in writing. Without objection, the hearing record will remain open for 30 days for members to submit written questions to these witnesses and to place their responses in the record.

Also, I would like to emphasize at this time that this hearing deals with a very complex matter and is a large amount of material. And, therefore, written questions, I am sure, will be followed up. So I ask for as much cooperation as you can give us, because there are times when questions are sent in and they sort of get lost. But because there is so much and it is complicated and now that our time looks like it is going to be shortened, we may have to depend a lot on our written questions. So we ask you for your cooperation there.

And I thank you.

Mr. ALVAREZ. Thank you very much.

Mr. BAXTER. Thank you, Mr. Chairman.

Chairman PAUL. This hearing is adjourned.

[Whereupon, at 4:40 p.m., the hearing was adjourned.]

*Q*UESTIONS
FOR THE RECORD

FROM CHAIRMAN RON PAUL TO
THE HONORABLE SCOTT ALVAREZ, GENERAL COUNSEL, BOARD OF
GOVERNORS OF THE FEDERAL RESERVE SYSTEM AND THOMAS C. BAXTER,
GENERAL COUNSEL, FEDERAL RESERVE BANK OF NEW YORK

Question 1:

In testimony before the Subcommittee on June 1, 2011, Federal Reserve Bank of New York (FRBNY) General Counsel, Thomas Baxter, indicated that the FRBNY's lending during the financial crisis was more heavily weighted toward foreign institutions because New York, as a leading financial center, attracted more foreign institutions. However, this response did not explain the disproportionate use of Federal Reserve lending facilities by foreign institutions. Can the Federal Reserve provide statistics on the proportion of foreign institutions relative to U.S. institutions that are part of the Federal Reserve System? Can the Federal Reserve explain the factors that contributed to disproportionate borrowing by foreign institutions, especially in the following lending facilities which provided more than 50% of their total lending to foreign institutions: Commercial Paper Funding Facility, Mortgage-Backed Securities Purchase Program, Term Auction Facility; and Term Securities Lending Facility?

Answer:

As required by the provisions of the International Banking Act of 1978 and the Monetary Control Act of 1980, branches and agencies of foreign banks operating in the United States (foreign branches) have long had access to the Federal

Reserve's lending facilities on the same basis as domestic depository institutions. Foreign branches have a large presence in U.S. financial markets; in aggregate, they provide substantial amounts of credit to U.S. households and businesses and are active participants in U.S. fixed-income markets. In aggregate, these institutions account for about 10 percent of bank credit extended in the United States. Unlike most domestic banks, foreign branches do not have a large retail deposit base. As a result, they rely heavily on wholesale funding sources such as large time deposits and repurchase agreements to fund their assets. For example, these funding sources account for about 70 percent of the total liabilities of foreign branches. In contrast, large time deposits and repurchase agreements account for only about 10 percent of the liabilities of U.S. chartered depository institutions. As a result, foreign branches were particularly vulnerable to the intense liquidity pressures evident during the crisis when wholesale funding markets were severely disrupted. These institutions turned to the Federal Reserve's liquidity programs to address their dollar liquidity pressures and to avoid fire sales of assets that would otherwise have been necessary. The availability of these liquidity programs to foreign-owned financial institutions operating in the United States helped to address the severe strains in U.S. financial markets during the crisis and to support the flow of credit to U.S. households and businesses.

Question 2:

The Federal Reserve created the Term Asset-Backed Securities Loan Facility (TALF), which was intended to "lend up to 5200 billion ...to holders of certain AAA-rated ABS (asset-backed securities)." When TALF data was released in December 2010, they revealed that 18% of TALF loans were backed by subprime credit card and auto loan securities, 17% were backed by "legacy" (i.e. troubled) commercial real estate securities, and 13% were backed by student loan securities. Similarly, the Term Securities Lending Facility (TSLF) was to "lend up to 5200 billion...to primary dealers secured...by...securities, including federal agency debt, federal agency residential-mortgage-backed securities (MBS), and non-agency AAA/Aaa-rated private-label residential MBS." Data released for the TSLF revealed that 14% of loans were backed by collateral rated below AAA. Over 50% of all

collateral posted consisted of agency-backed MBS or CMO (collateralized mortgage obligations), whose ratings were not published. While it has generally been assumed that these Agency securities have a AAA rating due to their implicit government backing, the high collateral-to-loan ratio of the TSLF (4 to 1) implies that these securities were not in fact performing at a AAA level-not to mention that no one knew what any mortgage securities were actually worth during the financial crisis. Given that the Federal Reserve stated to the public that it would accept high-rated collateral in conducting loan operations through these facilities, yet nonetheless loaned funds against questionable or low-rated collateral, how is the public to trust the public statements made by the Federal Reserve? In accepting lower grade collateral than the lending facility originally intended, was there a protocol the Reserve Banks were to follow in accepting lower rated collateral? If not, how were determinations made about what collateral was acceptable? Additionally, what surety was given that AAA-rated collateral was truly AAA, especially given the uncertain quality of many MBS at the time?

Answer:

The TALF program accepted only AAA-rated securities backed by loan types approved by the Board of Governors and consistent with the program terms published on the websites of the Federal Reserve Bank of New York and Board of Governors. In addition to the AAA credit rating requirement, there were a number of additional requirements designed to ensure the quality of the collateral pledged to the program. For example, each loan was fully collateralized and the value of all collateral was discounted in determining the size of the loan it could support; for non-mortgage-backed ABS, an outside auditor had to attest to the accuracy of the information provided by the sponsor and issuer of all newly issued collateral regarding compliance with TALF collateral eligibility requirements; legacy CMBS were subject to an additional internal credit review by FRBNY staff; and TALF borrowers always had their own money at risk in a first-loss position if the collateral did not perform to expectations. Partly in response to the conservative terms offered on the TALF program, about four-fifths of TALF loans have been repaid early, all outstanding collateral is performing to

expectations, and all the outstanding loans remain well collateralized.

The Federal Reserve established the Term Securities Lending Facility (TSLF) in 2008 as a means of addressing the pressures faced by primary dealers in accessing term financing. When collateral markets became illiquid in 2008, primary dealers had increased difficulty obtaining funding and, therefore, were less able to support broader markets. The details, including the terms of acceptable collateral, were made public at the very start of the facility. Under this program, the Federal Reserve temporarily loaned its relatively liquid Treasury securities to primary dealers in exchange for less liquid securities that were harder to finance during a period of financial market stress. The TSLF loans were made with recourse to the borrower, meaning that the borrower was obligated to repay the loan regardless of the value of the collateral. In addition, the borrower pledged securities as collateral that met certain eligibility criteria, such as carrying an investment grade rating by major nationally recognized statistical rating organizations (NRSRO). All U.S. Treasury and U.S. government agency securities posted as collateral to the TSLF met the TSLF program criteria for collateral. The FRBNY conducts its own due diligence and analysis of collateral pledged against loans on a post-lending basis, primarily reviewing information provided by clearing banks, to ensure that these securities adhere to the eligibility requirements of the particular lending program in which the loan was made.

The collateral-to-loan ratio throughout the TSLF program was approximately 106%, not 400% as noted in the question. This ratio was driven by the haircuts specified on the collateral schedule and the composition of securities pledged as collateral. This ratio does not provide information on the performance of the pledged collateral. All credit extended under the TSLF has been fully repaid, with interest.

Question 3:

The Commercial Paper Funding Facility (CPFF) provided 60% of its total lending to foreign institutions. The CPFF also supplied funding predominantly to large firms, such as Harley Davidson, Chrysler, Caterpillar, ING, and AIG. To what extent did smaller firms that issued commercial paper know about and have access

to the CPFF? What efforts were made by the Federal Reserve to ensure that all eligible parties were made aware of the facility?

Answer:

The Board of Governors announced the creation of the facility on October 7, 2008 via a public press statement posted on its website. Information on how to access the facility was made available on both the FRBNY's website and the Board's website. As with other major Federal Reserve announcements, major media organizations reported on the CPFF to the general public. Following the initial announcement, FRBNY staff reached out to many CP market participants to inform them of the CPFF and receive feedback. The outreach included working with the FRBNY's Primary Dealers, the Depository Trust & Clearing Corporation (DTCC), the Securities Industry and Financial Markets Association (SIFMA) and the Commercial Paper Industry Working Group (CPIWG), who service or represent CP issuers in the market, to ensure information was disseminated to a wide group of CP market constituents.

The CPFF was open to any CP issuer who met the program eligibility requirements. To register for the facility, the CP issuer must have been a U.S. issuer issuing U.S. dollar-denominated commercial paper (including asset-backed commercial paper (ABCP)) that was rated at least A-1/P-1/F1 by a major NRSRO and, if rated by multiple major NRSROs, rated at least A-1/P-1/F1 by two or more major NRSROs. Only issuers that were active between January 1 and August 31, 2008 were eligible to issue to the facility. Inactive ABCP issuers were ineligible to participate in the CPFF from January 2009 on. An issuer was deemed inactive if it did not issue ABCP to entities other than the sponsoring institution for any consecutive period of three months.

Many large firms and a smaller-number of mid-sized firms registered for the program, though not all chose to issue to the facility. The composition of firms was largely reflective of the highly rated CP market more generally. Large firms with access to capital markets encompass the large majority of the CP market. Mid-sized firms have historically represented a much smaller segment of the highly rated CP market and small firms typically do not issue CP.

Question 4:

The Asset-Backed Commercial Paper Money Market Mutual Fund Liquidity Facility (AMLF) loaned primarily to two firms, JP Morgan and State Street. Each of the Maiden Lane facilities was set up to assist a particular institution. To what extent were lending facilities set up for the benefit of specific firms facing financial difficulties? To what extent were lending facilities created at the behest of specific firms, either through formal or informal lobbying?

Answer:

The AMLF was introduced to help money market mutual funds (MMMFs) meet investors' demands for redemptions in October 2008. While banking firms were intermediate participants in the AMLF, it was not established to assist banking firms. Under the AMLF, the Federal Reserve Bank of Boston lent to financial institutions that in turn used the funds to purchase asset backed securities from MMMFs in order to allow MMMFs to meet redemption demands by customers. Eleven banking entities from six organizations borrowed from the AMLF. These firms used AMLF loans to finance purchases of assets from nearly 200 money funds. All AMLF loans were repaid in full, on time, with interest.

The Federal Reserve authorized the establishment of six special facilities to provide assistance to specific institutions under section 13(3) of the Federal Reserve Act in the pursuit of financial stability during the crisis. The establishment of these facilities was aimed at stabilizing the financial system and mitigating the impact of financial stresses on the economy. Two of these facilities, those set up for Citigroup and Bank of America, ultimately did not require a loan from the Federal Reserve.

The loans provided to the four remaining facilities, Maiden Lane LLC, Maiden Lane II LLC, Maiden Lane III LLC and AIG Revolving Credit Facility were fully collateralized. Maiden Lane LLC received a loan from the Federal Reserve Bank of New York of \$28.8 billion to purchase assets from Bear Stearns to support JP Morgan Chase's acquisition of Bear Stearns. The Bear Stearns merger with JP Morgan Chase prevented a disorderly failure of Bear Stearns and potentially severe consequences on market functioning and

the economy. Maiden Lane II LLC received a loan from the Federal Reserve Bank of New York of \$19.5 billion to purchase residential mortgage-backed securities (RMBS) from AIG's insurance subsidiaries in order to alleviate capital and liquidity drains on AIG. Maiden Lane III LLC received a loan from the Federal Reserve Bank of New York of \$24.3 billion to purchase collateralized debt obligations (COOs) from certain counterparties of AIG Financial Products (AIGFP) in exchange for terminating the related credit default swaps (CDS) contracts between the counterparty and AIGFP which were contributing to capital and liquidity drains on AIG. The AIG Revolving Credit Facility (RCF) was a credit line extended by the Federal Reserve Bank of New York for up to \$85 billion to AIG. The RCF, Maiden Lane II LLC and Maiden Lane III LLC prevented a failure of AIG which would have had widespread consequences for the economy and indirectly impacted millions of Americans.

Question 5:

Given that information pertaining to discount window transactions during the financial crisis has been disclosed to the public, through the Bloomberg News and Fox News FOIA requests, without causing any material harm to institutions that used the discount window, will the Federal Reserve disclose the details of discount window transactions that occurred during the financial crisis on the Board's website in the same manner disclosures were made of the other facilities and programs conducted by the Federal Reserve during the crisis? If not, please provide an explanation of why the Federal Reserve will not make such information available.

Answer:

The FOIA Service Center page of the Board's public website makes available to any person upon request a copy of the records released on March 31, 2011 in the *Fox News* and *Bloomberg* FOIA lawsuits. Any person wishing to obtain a copy may submit a request using the Board's electronic FOIA request form, or by calling the Board's FOIA Service Center. The Board's public announcement, describing the records released on March 31, 2011 and the method for obtaining

copies can be found at:

<http://www.federalreserve.gov/generalinfo/foia/servicecenter.cfm>.

The March 31, 2011 releases resulted from litigation under the Freedom of Information Act ("FOIA"). Because FOIA requires disclosure of documents, as opposed to the underlying data or information, the Board made responsive documents available to the requesters and the public as noted above.

The Board's December 1, 2010 disclosures of section 13(3) lending information were made pursuant to section 1109(c) of the Dodd-Frank Wall Street Reform and Consumer Protection Act ("Dodd-Frank Act"), which requires publication of specified information "on [the Board's] website " 124 Stat. 2129.

The Federal Reserve's discount window has been an important source of liquidity for depository institutions, especially during times of financial stress. Discount window credit is a common and important tool among central banks around the world and one of the most important tools during a financial crisis. Unlike grant programs, the discount window involves the extension of credit on a fully secured basis. To date, the Federal Reserve has never lost money on discount window lending.

Depository institutions have argued that public disclosure of information regarding borrowing at the discount window will discourage use of the discount window. They contend that, because both healthy and troubled depository institutions access the discount window, the public may misconstrue use of the discount window as a sign of financial weakness. Indeed, disclosure of access to credit from the Bank of England by Northern Rock led to runs on that institution. In accordance with the Dodd-Frank Act, the Board will disclose information regarding borrowings through the discount window, including the identity of the borrowers, amount borrowed, terms of the borrowing and collateral information, no later than eight quarters following any discount window transaction entered into after July 21, 2010.

The Board believes that the disclosure of discount window borrowing after a reasonable delay appropriately balances the

need to hold the Federal Reserve accountable for its lending activities with the concerns about the viability of discount window. We will continue to inform Congress of any concerns that arise as we implement this provision.

Question 6:

Given that information pertaining to certain "covered transactions", a definition which includes open market operations, will have to be disclosed to the public under the provisions of the Dodd-Frank Act, will the Federal Reserve disclose the details of open market operations that took place during the financial crisis and before the passage of Dodd-Frank, such as Single-Tranche Open Market Operations? If not, please provide an explanation of why the Federal Reserve will not make such information available.

Answer:

As required by section 1109(c) of the Dodd-Frank Act, on December 1, 2010, the Board published detailed information on transactions conducted under the Federal Reserve's Agency Mortgage-Backed Securities Program, which were undertaken prior to the enactment of the Dodd-Frank Act pursuant to the System's open market operation (OMO) authority.

In addition, the Federal Reserve has released significant information about single-tranche OMOs, which were conducted with the intention of mitigating heightened liquidity stress that was occurring in funding markets during the financial crisis in 2008. The program itself had been disclosed publicly at the time of its inception, each auction was announced to the public on the website of the FRBNY at the same time it was announced to the primary dealers, and each auction's aggregated results were immediately posted to the same website. Additional aggregated information on the single tranche OMO program was included in the Board's H.4.1 weekly data release on the condition of the Federal Reserve Banks and in the System Open Market Account annual report for 2009. Information on single-tranche OMO transactions has also been made public in connection with the *Fox* FOIA litigation. On July 6, 2011, the Board published additional data concerning the program, including trade and settlement dates, counterparty names, amounts, and rates for

all transactions under the program. This information may be found at:
http://www.federalreserve.gov/monetarypolicy/bst_tranche.htm

Question 7:

Will the details of the "QE2" program and ongoing rollovers of maturing MBS into Treasury debt securities be disclosed to the public? If not, please provide an explanation of why the Federal Reserve will not publicize such information.

Answer:

The Federal Reserve has provided to the public a substantial amount of information concerning the program to purchase longer-term Treasury bonds. The Federal Open Market Committee announced on November 3, 2010 that, in order to promote a stronger pace of economic recovery and to help ensure that inflation, over time, is at levels consistent with its mandate, the Committee would purchase a further \$600 billion of longer-term Treasury securities by the end of the second quarter of 2011, at a pace of about \$75 billion per month. The FOMC's announcement can be found at: <http://www.federalreserve.gov/newsevents/press/monetary/20101103a.htm>. The program is part of the FOMC's open market operations ("OMO").³¹⁹

Moreover, the current holdings of SOMA, including maturity date, CUSIP, coupon, par value and other information regarding securities held in SOMA can be found at: http://www.newyorkfed.org/markets/soma/sysopen_accholding_s.html.

In the Dodd-Frank Act, Congress gave careful consideration to the public's interest in greater transparency in OMO transactions and to the legitimate expectations of

³¹⁹ Additional details regarding the program, including the Trading Desk at the Federal Reserve Bank of New York's plans for distributing purchases of Treasury securities for the System Open Market Account ("SOMA"), were made available November 3, 2010 on the Federal Reserve Bank of New York's website at: <http://www.newyorkfed.org/markets/operatingpolicy/01103.html>. The Federal Reserve Bank of New York currently publishes a list of FAQs regarding the purchase program which provides information such as: the maturity sectors of Treasury securities the Desk planned to purchase, how much the Desk planned to purchase in each issue, how much the Desk planned to purchase each month in Treasury securities, and other information. The FAQs can be found at: <http://www.newyorkfed.org/markets/treasfag.html>.

confidentiality of parties to OMO transactions and the potential effects that premature disclosure of counter-party information could have on the Federal Reserve's ability to execute OMO transactions efficiently and at the best price. In striking this balance, Congress concluded that the Board should be permitted to delay the release of information about OMO transactions. In accordance with the Dodd-Frank Act, the Board will disclose counter-party information with respect to OMO transactions, including the reinvestments of maturing MBS into Treasury securities, conducted after July 21, 2010, no later than eight quarters after the transactions.

Question 8:

The documents released by the Federal Reserve in response to the Freedom of Information Act requests from Bloomberg News and Fox News contained large amounts of information that was redacted. The Federal Reserve has indicated that the information was determined not responsive to the FOIA requests and was therefore redacted. Is the Federal Reserve willing to release all of these records in their original form to the House Committee on Financial Services? If not, please explain why.

Answer:

In providing to Bloomberg News and Fox News the documents at issue in their FOIA litigation, the Board redacted from those documents certain information that was not sought by the requests. Should the Board receive a request from the House Committee on Financial Services for the unredacted documents at issue in the *Bloomberg/Fox* FOIA litigation, it will work with the Committee, as it has in the past in response to other similar requests, to assist the Committee in accessing the information it needs.

Question 9:

In the documents disclosed by the Federal Reserve on discount window transactions, it appears that banks, especially primary dealers, used the discount window like a revolving line of credit, essentially acquiring longer term funding through what is typically an overnight program. Why was the discount window used in such a fashion even when emergency lending facilities were set up to provide longer term financing through programs such as the TSLF or PDCF?

Answer:

The Term Securities Lending Facility (TSLF) and the Primary Dealer Credit facility (PDCF) were liquidity facilities set up during the financial crisis for primary dealers. Under the TSLF, primary dealers engaged in temporary swap transactions with the Federal Reserve Bank of New York in which the dealer received Treasury securities and pledged other high-quality securities as collateral. The swaps were priced through competitive auctions and had maturities of 28 days. The PDCF extended overnight loans to primary dealers against collateral that was eligible for tri-party repurchase agreements. Primary dealers were discouraged from using the PDCF as a source of longer-term funds by usage fees that rose with the frequency of borrowing. All credit extended under both the TSLF and the PDCF has been fully repaid, with interest.

Discount window loans (primary, secondary, and seasonal credit) are available only to depository institutions, that is, commercial banks, thrifts, credit unions, and U.S. branches and agencies of foreign banks. None of the primary dealers at this time or over the past few years were depository institutions, so none of the primary dealers have had access to the discount window. Although there is no prohibition against primary dealers being depository institutions, currently all primary dealers are broker dealers. In several cases, however, the broker-dealer subsidiaries of bank holding companies are primary dealers. In such cases, the commercial bank subsidiary of the holding company is eligible to borrow from the discount window and the primary dealer/broker-dealer subsidiary would have been able to borrow from the other lending facilities established for the primary dealers.

Easing the terms on primary credit (discount window) loans was one of the first steps the Federal Reserve took in response to the financial crisis. The easing was intended to increase the liquidity of depository institutions and thereby support their ability to lend to businesses and households. On August 17, 2007, the Federal Reserve narrowed the spread of the primary credit rate over the FOMC's target rate from 100 basis points to 50 basis points, and lengthened the maximum maturity from overnight to 30 days. On March 16, 2008, the Federal Reserve lowered the spread to 25 basis points and

extended the maximum maturity to 90 days. The easing of terms on discount window borrowing was part of the Federal Reserve's broader efforts to address strains in term funding markets and the liquidity strains in financial markets. As financial market conditions improved, the Federal Reserve normalized the terms on primary credit. Over the first few months of 2010, the Federal Reserve returned the typical maximum maturity on primary credit to overnight and widened the spread of the primary credit rate over the top of the FOMC's range for the federal funds rate to 50 basis points. By June 2010, borrowing had again fallen near zero.

Question 10:

What was the necessity of setting up Single-Tranche Open Market Operations (ST OMO) and programs such as the TSLF when they accomplished essentially the same task of providing 28-day credit? Was the existence of these separate operations due to the fact that the TSLF allowed the Fed to purchase secondary credit and not just primary credit, something not legally permissible under the ST OMO conducted through the Fed's open market operation authority?

Both the single-tranche (ST) OMO and the TSLF programs were aimed at relieving strains in the term funding markets. Since these strains were quite significant, the Federal Reserve provided more than one way to help alleviate the pressures. Both programs addressed term funding pressures for the primary dealers, though the mechanics were different, as was the list of eligible securities.

Mechanically, the ST OMO allowed primary dealers to bid at auction for direct 28-day financing of any of their OMO-eligible securities (i.e., U.S. Government securities and U.S. agency issued or guaranteed securities); they pledged their securities and received funds in exchange. With TSLF, however, the dealers bid at auction to essentially swap their program-eligible securities for U.S. Treasury securities, which they then had to finance in the market. Presumably it was easier for them to find term financing for the U.S. Treasury securities they received than it was for them to finance the securities they pledged into the program. So, after winning a TSLF auction, the primary dealer would still have to obtain financing for the U.S. Treasury securities they received from

the FRBNY. . .

There are other key differences between the ST OMO and TSLF programs.

The ST OMO program relied on standard legal authorities for open market operations, and transactions under this program were very similar to the shorter-term repo operations long conducted by the Federal Reserve in implementing monetary policy. Under this program, primary dealers could deliver as collateral any of the types of securities--Treasuries, agencies, and agency MBS--that are typically accepted in open market operations.

The legal authority for a key part of the TSLF--the so-called "schedule 2" TSLF operations--relied partly on the Federal Reserve's emergency lending authority in section 13(3) of the Federal Reserve Act. Under TSLF, primary dealers could borrow Treasury securities from the Federal Reserve for a period of 28 days. In contrast to the ST OMO program, under the TSLF primary dealers could pledge as collateral a range of highly rated private securities. Rates and amounts borrowed by individual primary dealers under the TSLF were determined through competitive auctions. Initially, the securities accepted as collateral in TSLF operations were limited to AAA-rated securities. Later as the crisis intensified in September of 2008, the range of collateral accepted was expanded to include all investment-grade securities. The ability of primary dealers to finance private investment-grade securities through the TSLF was very important in addressing the disruptions in financial markets during the crisis.

Question 11:

Can the Federal Reserve provide to the Committee a graph and/or spreadsheet for each of the emergency lending facilities (including the ST OMO) showing the high, low, and average rates charged in the facility over its lifetime in conjunction with the prevailing market rate for the same type of transaction over the same period?

Answer:

[See Appendix D]

STATEMENTS

STATEMENT FOR THE RECORD
HON. RON PAUL
REPRESENTATIVE, 14TH DISTRICT OF TX
CHAIRMAN, SUBCOMMITTEE ON
DOMESTIC MONETARY POLICY & TECHNOLOGY
U.S. HOUSE OF REPRESENTATIVES

Today's hearing deals with one of the most pressing issues this subcommittee will face during this Congress, the issue of Federal Reserve transparency. While the Federal Reserve is still far less transparent than it should be, recent disclosures of the Federal Reserve's lending programs have greatly increased our knowledge of the Fed's monetary policy during the height of the financial crisis.

In December 2010 and March 2011, a remarkable thing happened: the Fed disclosed information on its lending facilities and discount window operations, including who borrowed money, what amounts were loaned, maturity dates, interest rates, and collateral. It took an act of Congress, the Dodd-Frank Act, to bring about the December releases that discovered the details of the emergency lending facilities set up by the Fed during the crisis. The March 2011 disclosures covered discount window lending, the oldest Fed lending tool, whose operations had never before been disclosed. It took a three year legal battle regarding the Freedom of Information Act's (FOIA) applicability to the Fed in order to gain access to this information. The suits brought by Bloomberg and Fox News resulted in 29,000 pages of unorganized, heavily redacted documents being provided. Combining these two data releases has given us a fuller, if still woefully incomplete, picture of the Fed's operations during the financial crisis and the nearly \$3 trillion balance sheet it has built up.

On November 25, 2008, the Fed created the Term Asset-Backed Securities Loan Facility (TALF) which was intended to “lend up to \$200 billion... to holders of certain AAA-rated ABS [asset-backed securities].” When the Fed released TALF data in December of 2010, 18% of TALF loans were backed by subprime credit card and auto loan securities, 17% of TALF loans were backed by “legacy”, a.k.a. troubled, commercial real estate securities, and 13% of TALF loans were backed by student loan securities. On March 11, 2008, the Fed created the Term Securities Lending Facility (TSLF) to “lend up to \$200 billion...to primary dealers... secured... by... securities, including federal agency debt, federal agency residential mortgage-backed securities (MBS), and non-agency AAA/Aaa-rated private-label residential MBS.” When the Fed released TSLF data in December of 2010, 26% of loans were backed by AAA/Aaa-rated securities, 17% were backed by non-AAA-rated securities, and 57% of loans were backed by collateral whose rating was not published by the Fed.

Recent news reports have brought to light the existence of a previously undisclosed Fed lending program known as “single-tranche open market operations” (ST OMO). This program loaned money at rates as low as 0.01% to major firms such as Goldman Sachs, and was essentially a free loan to these politically well-connected firms. Data about this program was not published, but instead was gleaned through examination of charts published in March as a result of the Fed's Freedom of Information Act (FOIA) disclosure. The charts were found within a 327-page document which had 81% of its content redacted.

Out of the funds loaned through the Fed's credit facilities, nearly one-third was loaned to foreign banks. Some facilities and programs, such as the Mortgage-Backed Securities Purchase Program, the Commercial Paper Funding Facility, and the TSLF, provided more than half of their funding to foreign banks. During the peak of the financial crisis, up to 88% of overall discount window lending went to foreign banks, and nearly 100% of the New York Fed's discount window lending went to foreign banks.

Not surprisingly, these data disclosures have raised significant new questions about the Fed's behavior. Among many questions raised are: Why did foreign firms receive such a large percentage of Fed lending? What advantages were given to large financial institutions that had access to multiple lending facilities for prolonged periods of time? Did extending loans to non-financial firms go beyond the Fed's emergency lending authority? Why did investors who participated in TALF have to have a relationship with the Fed's

primary dealers, and did this give an unfair advantage to wealthy investors, such as the wives of two Morgan Stanley executives? Why did the Fed set up single-tranche open-market operations (ST OMO) which gave primary dealers access to \$80 billion at rates as low as 0.01%, essentially providing a direct government subsidy to these firms, and why did the Fed only disclose this information in chart form? Are there other programs that have yet to be disclosed? Why were so many pages redacted in the 327-page document that alluded to ST OMO? Can you really claim to be in compliance with FOIA when such significant portions of documents are redacted? How can we trust that this data was “not responsive” to the FOIA request? Are we to trust the nontransparent Fed that we really don't need to see that information? If the Fed claims to lend against AAA collateral and then does not, can we trust anything the Fed publishes in a press release? Can we trust that collateral classified by the Fed as AAA really is AAA?

More issues emerge from the Fed's handling of the FOIA requests brought by Bloomberg and Fox News. The Fed used several arguments in refusing to comply. Among them was the Fed's claim that it was a private institution and not subject to FOIA, since the documents requested were held by the New York Fed, a private bank, and thus exempt. Fortunately for the American people, the court rejected that assertion. But what exactly is the legal relationship between the private regional banks and the Board of Governors? The Fed also claimed that lending records of discount window borrowers were privileged or confidential information that could cause imminent competitive harm if disclosed, or even cause a run on banks, and therefore should be exempt from FOIA. This has been the Fed's long-standing defense of the secrecy of the discount window. One of the judges in the case summed up the Fed's secrecy succinctly: “[T]he risk of looking weak to competitors and shareholders is an inherent risk of market participation; information tending to increase that risk does not make the information privileged or confidential.”

Given the massive amount of data released last December and this March, and the fact that much information in the March data release was redacted, it is all but certain that there remains much to be discovered about the Fed's bailouts through the discount window and its credit facilities. The Federal Reserve's actions in bailing out Wall Street through credit facilities and quantitative easing provoked a backlash among the American people and among many members of Congress. Trillions of dollars worth of loans and guarantees were provided to rich bankers and their worthless holdings of mortgage

debt were snapped up by the Fed, while Main Street Americans continued to suffocate under harsh taxation and the prospect of increasing inflation. These events have awakened many Americans to the problems with the Fed's loose monetary policy, the bubbles it has created in the past, and the potential hyperinflation it might cause in the future. We should not neglect the fundamental need for more transparency of the Fed and a thorough audit that can help shed light on operations of the Federal Reserve System. We need stronger audit authority over the Fed, both looking back at previous market interventions and also ensuring that any future credit facilities, bailout vehicles, or large-scale asset purchase programs are subject to oversight.

At this hearing we hope to receive substantive answers from the Fed about its lending behavior during the worst part of the financial crisis, and we hope to receive assurances about the Fed's future compliance with the Dodd-Frank bill's requirements for public access to lending information. Aside from our ability to ask questions at the hearing, the hearing record will remain open for 30 days to allow the Fed time to respond to our written questions. At a time when the Fed's balance sheet is rapidly approaching the \$3 trillion dollar mark, it is absolutely imperative that the Fed come clean with the details of its open market operations, lending operations, and asset purchases. Pumping trillions of dollars into the banking system with no oversight by Congress and no accountability to the American people cannot be allowed to continue.

STATEMENT FOR THE RECORD

HON. WM. LACY CLAY

REPRESENTATIVE, 1ST DISTRICT OF MO
U.S. HOUSE OF REPRESENTATIVES

Thank you Mr. Chairman

For holding this hearing to examine information disclosed by the Federal Reserve in compliance with the Dodd-Frank Wall Street Reform and Consumer Protection Act and the Freedom of Information Act. Also, I want to thank the witnesses for appearing.

Due to the U.S. financial crisis, the United States Congress passed the Dodd-Frank Wall Street Reform and Consumer protection Act of 2010. This Legislation was crafted as a response to the financial crisis which has cost nearly 10 million American jobs and over \$10 trillion in household wealth. Nearly 4 million families have lost their homes to foreclosure and an additional 4.5 million have slipped into the foreclosure process or are seriously behind on their mortgage payment.

According to the financial crisis inquiry report; a combination of excessive borrowing, risky investments, and the lack of transparency put the financial system on a collision course of self destruction.

In the years leading up to the crisis, too many financial institutions, as well as too many households, borrowed too much, leaving them vulnerable to financial distress if the value of the investments declined even modestly.

For example, as of 2007, the five major investment banks were operating with extraordinarily thin capital. By one measure, their leverage ratios were as high as 40 to 1, meaning for every \$40 in assets, there was only \$1 in capital to cover losses. Less than a 3% drop in asset value could wipe out a company.

Leverage was often hidden in off-balance sheet entities; in derivatives positions; and through “window dressing” of financial reports available to the investing public. Within the financial system, the danger of this debt was increased because transparency was not required or desired; undercover corporate dealings assisted in the financial meltdown which still plagues us today.

In order for democracy and capitalism to exist correctly, transparency must be at the core; trust, transparency and the rule of law are fundamental to this nation success.

Business depends in some way on trust; a trust that business produces good products and a trust that business will deliver good services.

Democracy depends in some way on trust. Transparency promotes government accountability, free and fair election, competition and free markets, and the rule of law are critical to it.

The Dodd-Frank Wall Street Reform and Consumer Protection Act addresses these issues by reforming the Federal Reserve:

1) It limits the Federal Reserve's 13 (3) emergency lending authority by prohibiting emergency lending to an individual entity. The secretary of Treasury must approve any lending program, program must be broad based, and loans cannot be made to insolvent firms. Collateral must be sufficient to protect taxpayers from losses.

2) It requires the Federal Reserve to disclose counterparties and information about amounts, terms and conditions of 13 (3) and discount window lending, and Open Market transactions on an ongoing basis with specified time delays. These are just a few examples of the importance of the Dodd-Frank Wall Street Reform and Consumer Protection Act.

Thank you again Mr. Chairman and I look forward to the witnesses comments!

WITNESS TESTIMONY

**JOINT
WRITTEN TESTIMONY OF
SCOTT G. ALVAREZ**

GENERAL COUNSEL
BOARD OF GOVERNORS OF THE FEDERAL RESERVE SYSTEM
AND

MR. THOMAS C. BAXTER, JR.

GENERAL COUNSEL
FEDERAL RESERVE BANK OF NEW YORK

Chairman Paul, Ranking Member Clay, and members of the Subcommittee, we appreciate the opportunity to discuss the different ways in which the Federal Reserve informs the Congress and the American people about our policies and actions. The Federal Reserve regularly releases significant, detailed information about its operations. Our aim in doing so is to promote understanding of how the Federal Reserve fosters financial and economic stability and to facilitate an evaluation of our actions while also preserving the ability to effectively fulfill the responsibilities that the Congress has given the Federal Reserve. In that context, we will describe the Federal Reserve's compliance with the disclosure provisions of the Dodd-Frank Wall Street Reform and Consumer Protection Act (Dodd-Frank Act), including the data we released in December 2010 about the transactions we conducted to stabilize markets during the recent financial crisis, restore the flow of credit to American families and businesses, and support economic recovery and job creation in the aftermath of the crisis. We will also address our March 2011 release, under the Freedom of Information Act, of documents regarding the use of the Federal Reserve's discount window during the crisis.

The role of lender of last resort is a critical responsibility long filled by central banks around the world. Central bank lending facilitates the implementation of monetary policy and allows the central bank to address short-term liquidity pressures in the banking system. During normal times, the Federal Reserve's discount window provides a backup source of liquidity for depository institutions in sound financial condition to address unexpected, short-term funding pressures. In doing so, the discount window facilitates the smooth and efficient flow of credit to U.S. households and businesses. In periods of crisis, the discount window is a tool that can be used to support market liquidity, and thereby mitigate strains in financial markets that could otherwise escalate and lead to sharp declines in output and employment. All discount window loans are fully secured and the Federal Reserve has not suffered a loss on any discount window loans.

Disclosure and Integrity of the Federal Reserve's Financial Statements

Since it began operation in 1914, the Federal Reserve has published full financial statements. We release our balance sheet every week, both by individual Reserve Bank and on a consolidated basis for the entire Federal Reserve System.³²⁰ In addition, the Federal Reserve publishes annual financial statements with information on our assets and liabilities as well as income and expenses in the same detail as a publicly traded corporation.³²¹

During the recent financial crisis, the Federal Reserve expanded its weekly balance sheet disclosures to include information about the amount of credit outstanding under each of the credit facilities established during the crisis. The Federal Reserve also initiated in June 2009 a special monthly report, which we provide to the Congress and publish on the Board's website, that provides additional detail about the Federal Reserve's emergency lending programs, including information on the amount of lending under each program, a description of the type and level of collateral associated with those

³²⁰ This information is published each Thursday, for the week ending the preceding Wednesday, through the Federal Reserve's H.4.1 Statistical Release, "Factors Affecting Reserve Balances of Depository Institutions and Condition Statement of Federal Reserve Banks." The current release, as well as past releases dating from 1996, is available on the Board's website at www.federalreserve.gov/releases/h41/default.htm. The website also provides descriptive information and an interactive guide for each table in the release.

³²¹ This information is included in the Board's annual report, which is submitted to the Congress each spring and published on the Board's website at www.federalreserve.gov/boarddocs/rptcongress.

loans, and information about the borrowers under those facilities.³²² This report includes aggregate information about credit provided to depository institutions through the discount window as well as information on the Federal Reserve's securities holdings and the holdings of Maiden Lane, Maiden Lane II, and Maiden Lane III. The Board's website also contains detailed information about the terms and conditions of each of the emergency lending programs, the availability of discount window lending, the swap lines opened with foreign central banks, and the arrangements with third-party vendors used by the System during the financial crisis, as well as expansive data and numerous reports and other information on all aspects of Federal Reserve operations.³²³

The Federal Reserve Bank of New York (FRBNY) also maintains a website that offers detailed information on open market operations taken to implement the monetary policy decisions of the Federal Open Market Committee. This information includes schedules of purchases and sales of securities as part of open market operations with CUSIP information describing the securities involved. With this information, a description of every open market operation can be examined shortly after it is conducted. Other open market information available on the FRBNY website includes summary and individual data on the securities held in the System Open Market Account and information about the federal funds rate.³²⁴ The site also contains a great deal of additional data related to FRBNY operations, including the names of the primary dealers, some legal forms for transacting business, and other information about fiscal agency activities on behalf of the U.S. Treasury.

The Federal Reserve's annual financial statements are audited by an independent public accounting firm, which performs customary procedures to assure their accuracy and integrity. For the last four years, for example, Deloitte and Touche has audited the financial statements of the Federal Reserve Board and the Federal Reserve System as a whole. In each year, the Federal Reserve has received a clean auditor opinion, meaning that the financial statements present fairly the financial positions of the Federal Reserve. Further, the

³²² See the *Monthly Report on Credit and Liquidity Programs and the Balance Sheet*, available at www.federalreserve.gov/monetarypolicy/clbsreports.htm. For more information on the various Federal Reserve liquidity and credit facilities and further background on the Federal Reserve's balance sheet, see www.federalreserve.gov/monetarypolicy/bst.htm.

³²³ The Board's website is at www.federalreserve.gov.

³²⁴ FRBNY's website is at www.newyorkfed.org. See www.newyorkfed.org/markets/openmarket.html for information about open market operations.

external auditor also opines that the Federal Reserve has maintained effective internal controls over financial reporting. The independent audit also covers transactions conducted through each of the special lending facilities established by the Federal Reserve under section 13(3) of the Federal Reserve Act and the financial statements of Maiden Lane, Maiden Lane II, and Maiden Lane III, as well as the transactions conducted through the discount window and with foreign central banks. By statute, the Board's Office of Inspector General (OIG) is responsible for ensuring that the auditor and the audits are independent. The results of these financial audits are reported annually to the Congress along with the audited financial statements of the Federal Reserve System and published on the Board's website.³²⁵

In addition to these audits, the Federal Reserve, and in particular, the special lending facilities established by the Federal Reserve during the recent financial crisis, have been subject to a number of other audits and reviews. These include special audits by the Office of the Special Inspector General for the Troubled Asset Relief Program for each program that involved any funding from the TARP program.³²⁶ The Congressional Oversight Panel and the Financial Crisis Inquiry Commission also conducted reviews and both have issued public reports.³²⁷

Moreover, the Federal Reserve's financial statements and a broad range of our functions are subject to review by the Government Accountability Office (GAO). For example, in recent years the GAO has conducted reviews of the policies and practices of the Federal Reserve in its supervision and regulation of bank holding companies, state-chartered banks that are members of the Federal Reserve System, and other banking organizations. It has also conducted reviews of the Federal Reserve in other areas, including our oversight and operation of payment systems; our implementation and enforcement of consumer protection laws; our policies on the acquisition of U.S. banking organizations by sovereign wealth funds; our efforts to address cyber security; and the need for financial regulatory reform. These reviews are not limited to auditing the

³²⁵ The latest *Annual Report of the Board of Governors of the Federal Reserve System* is available on the Board's website at www.federalreserve.gov/boarddocs/rptcongress.

³²⁶ See www.sig tarp.gov/audits.shtml.

integrity of the financial statements or public reporting of these activities. Rather, the GAO reviews the development of policies and provides assessments of and suggestions regarding appropriate policies.

In response to a directive from the Congress in the Dodd-Frank Act, the GAO is currently conducting a special review of all loans and other Federal Reserve transactions between December 1, 2007, and July 21, 2010, under the special lending facilities and other programs developed during the financial crisis.³²⁸ This review will assess operational integrity, internal controls, security and collateral policies, policies governing third-party contractors, and the existence of any conflicts of interest or inappropriate favoritism in the establishment or operations of the facilities.³²⁹ The Federal Reserve is fully cooperating with the GAO in its conduct of this extensive review and will continue its close cooperation with the GAO to assist in its reviews of Federal Reserve functions generally.

Recent Information Releases

As provided by the Dodd-Frank Act, on December 1, 2010, the Board published detailed information on its website about the Federal Reserve's actions during the financial crisis, including transactions to stabilize markets, restore the flow of credit to American families and businesses, and support economic recovery and job creation in the aftermath of the crisis.^{330 331}

In the December 1 data release, the Federal Reserve provided vast amounts of information about the programs and the terms and conditions of the individual transactions made under them. The information provided detailed explanations as well as definitions of

³²⁸ This audit is being undertaken pursuant to section 1109 of the Dodd-Frank Act and is to be completed in July 2011.

³²⁹ See 31 U.S.C. § 714(f).

³³⁰ See section 1103(b) of the Dodd-Frank Act. The data released on December 1, 2010, included transaction-level information about the following programs: the Asset-Backed Commercial Paper Money Market Mutual Fund Liquidity Facility (AMLF); the Term Asset-Backed Securities Loan Facility (TALF); the Primary Dealer Credit Facility (PDCF); the Commercial Paper Funding Facility (CPFF); the Term Securities Lending Facility (TSLF); the TSLF Options Program (TOP); the Term Auction Facility (TAF); agency MBS purchases; dollar liquidity swap lines with foreign central banks; assistance to Bear Stearns, including Maiden Lane; and assistance to American International Group, including Maiden Lane II and III. The information can be found on the Board's website at www.federalreserve.gov/newsevents/press/monetary/20101201a.htm.

³³¹ The Dodd-Frank Act has substantially modified the ability of the Federal Reserve to extend emergency credit to single identified non-banking companies. Now, credit under section 13(3) of the Federal Reserve Act may only be offered through credit facilities with broad-based eligibility.

the material terms for each facility. Data concerning the material terms were made available in multiple formats, including Excel files that allow users to search, sort, and filter the data for each program in multiple categories. For the broad-based lending facilities, details included the name of the borrower, the amount borrowed, the date the credit was extended, the interest rate charged, information about collateral, and other relevant credit terms. Similar information was provided for the draws of foreign central banks on their dollar liquidity swap lines with the Federal Reserve. For agency MBS transactions, details included the name of the counterparty, the security purchased or sold, and the date, amount, and price of the transaction.

In addition, as mandated by the Dodd-Frank Act, the Board's website directly links to the Federal Reserve's audit-related information, including GAO reports, annual audited financial statements, and reports related to emergency lending authority provided to the Congress.³³² The Board has also charged staff with identifying other information that could be posted to this site that would help to explain the accounting, financial reporting, and internal controls of the Board and the Reserve Banks.

On March 31, 2011, the Federal Reserve released documents related to the discount window in response to requests filed by Bloomberg L.P. and Fox News Network LLC under the Freedom of Information Act. Discount window lending under section 10B of the Federal Reserve Act offers secured, short-term loans from the Reserve Banks to depository institutions located in the lending Reserve Bank's district. The March 31 release included documents containing information related to borrowers at the discount window between August 8, 2007, and March 1, 2010, that was not required to be disclosed under the Dodd-Frank Act.

Future Information Disclosures

Going forward, the Dodd-Frank Act provides for the release of information on any broad-based emergency lending facility one year after the termination of the facility. The act also provides for the release of information regarding discount window lending and open market operations conducted by the Federal Reserve after July 21, 2010, with a two-year lag. For lending facilities (including both emergency lending facilities and the discount window) and for open market operations, the Federal Reserve will publish information

³³² See www.federalreserve.gov/newsevents/reform_audit.htm.

disclosing the identity of the borrower or counterparty, transaction amount, interest rate or discount paid, and collateral pledged.

The Federal Reserve believes that the lags provided by the Dodd-Frank Act for the release of transaction-level information about open market operations, emergency lending facilities, and discount window lending activities establish an important balance between the public's interest in information about participants in transactions with the Federal Reserve and the need to ensure that the System can effectively use its congressionally authorized powers to maintain the stability of the financial system and implement monetary policy. We remain concerned that a more rapid release of information about borrowers accessing the discount window and emergency lending facilities could impair the ability of the Federal Reserve to provide the liquidity needed to ensure the smooth working of the financial system. If institutions believe that publication of their use of Federal Reserve lending facilities will impair public confidence in the institution, then institutions may choose not to participate in these facilities. Experience has shown that banks' unwillingness to use the discount window can result in more volatile short-term interest rates and reduced financial market liquidity that, in turn, can contribute to declining asset prices and reduced lending to consumers and small businesses.

We will carefully monitor developments in the use of the discount window and other Federal Reserve facilities and keep the Congress informed about their effectiveness.

Conclusion

The Federal Reserve has worked and will continue to work with the Congress to ensure that our operations promote the highest standards of accountability, stewardship, and policy effectiveness, consistent with meeting our statutory responsibilities. We appreciate the opportunity to describe the Federal Reserve's efforts on this important subject and are happy to answer any questions you may have.

*H*EARING XI.

AUDIT THE FED: DODD-FRANK, QE3, AND FEDERAL RESERVE TRANSPARENCY

TUESDAY, OCTOBER 4, 2011

WITNESSES

Brown, Orice Williams, Managing Director, Financial Markets and
Community Investment, U.S. Government Accountability
Office

Auerbach, Robert D., Ph.D., Professor of Public Affairs, Lyndon B.
Johnson School of Public Affairs, University of Texas Austin

Calabria, Mark A., Ph.D., Director of Financial Regulations
Studies, Cato Institute

*B*ACKGROUND

The Subcommittee on Domestic Monetary Policy and Technology held a hearing entitled “Audit the Fed: Dodd-Frank, QE3, and Federal Reserve Transparency” on Tuesday, October 4, 2011 at 10:00 a.m. in Room 2128 of the Rayburn House Office Building.

This hearing examined the audit findings by the Government Accountability Office (GAO) of their Federal Reserve audit, which was mandated by the Dodd-Frank Wall-Street Reform and Consumer Protection Act (P.L. 111-203). Also discussed were earlier legislative efforts to audit the Federal Reserve; current statutory Federal Reserve audit and data disclosure requirements; and the larger issue of the economic and public policy importance of requiring transparency in the Federal Reserves’ actions – particularly in light of the Federal Reserve’s monetary policy efforts during the financial crisis of 2008-2009, its continued unconventional support to financial markets, and its engagement in the Eurozone’s financial crisis.

This was a two-panel hearing with the following witnesses:

Panel I

- Ms. Orice Williams Brown, Managing Director, Financial Markets and Community Investment, GAO

Panel II

- Dr. Robert D. Auerbach, Professor of Public Affairs, Lyndon B. Johnson School of Public Affairs, University of Texas, Austin
- Dr. Mark A. Calabria, Director of Financial Regulation Studies, Cato Institute

History

The Federal Reserve System has been the central bank of the United States for nearly 100 years. Over the course of that century, the Federal Reserve has steadily gained more power over the nation's monetary policy, while Congress has simultaneously abdicated its own Constitutional responsibility for, and authority over, monetary policy.

Throughout its long history, the Federal Reserve has provided very little disclosure to the public regarding its operations and actions. For the past several decades, numerous bills requiring audits, greater disclosure, and other accountability from the Federal Reserve to Congress about its conduct of monetary policy have been introduced in Congress, but have met with steep opposition. Advocates for these bills have consistently cited the seminal impact the Federal Reserve's monetary actions and policies have on the nation's economic and fiscal well-being as justification for requiring greater public disclosure regarding the Federal Reserve's actions and decision-making. Opponents argue that auditing and disclosing the Federal Reserve's conduct of monetary policy would interfere with the Federal Reserve's independence by subjecting its monetary policy decision-making to political pressure.

Limited Audit Authority

Although current law technically subjects the Federal Reserve to audits, the scope of those audits is limited. In 1999, the Gramm-Leach-Bliley Act (P.L. 106-102) required annual independent audits of the financial statements of each regional Federal Reserve Bank and the Board of Governors. Prior to that, P.L. 95-320 enacted in 1978 also authorized the GAO to conduct limited audits of the Federal Reserve. Despite that authorization, the GAO never actually audited the Federal Reserve. In hearings on the 1978 legislation, and again after the bill was enacted, GAO officials said that the GAO could not satisfactorily audit the Federal Reserve without being able to audit its open market operations as well, which it was not authorized to do. In fact, the GAO currently lacks the authority to fully audit the following Federal Reserve actions:

- (1) Transactions for or with a foreign central bank, government of a foreign country, or non-private international financing organization;

- a) Deliberations, decisions, or actions on monetary policy matters, including discount window operations, reserves of member banks, securities credit, interest on deposits, and open market operations;
- b) Transactions made under the direction of the Federal Open Market Committee; and
- c) Discussions or communications among or between members of the Board and officers and employees of the Federal Reserve System related to items (1)-(3).³³³

In the 111th Congress, concerns about the Federal Reserve's extraordinary actions in its conduct of monetary policy and its extensive assistance to financial markets during the 2008-2009 financial crisis led to a renewed interest in fully auditing the Federal Reserve. Several legislative proposals were introduced in both houses of Congress to provide the public greater transparency for the Federal Reserve's actions that helped pick winners and losers in the financial system. Among the bills was H.R. 1207, the popularly titled "Audit the Fed" bill, which repealed all of the current statutory restrictions on the GAO's ability to fully audit the Federal Reserve. H.R. 1207 was introduced by then-Ranking Member of the Domestic Monetary Policy Subcommittee, Rep. Ron Paul. The bill was cosponsored by 320 Members of the House on both sides of the aisle and formed the basis of the audit provisions in the original House-passed version of what eventually became known as the Dodd-Frank Act.

The Dodd-Frank GAO Audit of the Federal Reserve's Emergency Lending Facilities

Unfortunately, the final language of the Dodd-Frank Act as passed into law mandated only a one-time GAO audit of the Federal Reserve—and then only of the procedural elements of its emergency lending facilities. The GAO was given a year from the law's passage to issue both the required audit and a report on it. While the language enacted was much narrower in scope than the original House-passed audit requirement, the provision still constituted the first statutorily enacted directive authorizing the GAO to examine the Federal Reserve's conduct of monetary policy.

The Fed's Emergency Lending Authority

³³³ 31 U.S.C. 714(b)

Section 13(3) of the Federal Reserve Act grants the Federal Reserve the authority to lend money to institutions under “unusual and exigent circumstances.” During the financial crisis, the Federal Reserve relied upon Section 13(3) to create several new lending facilities and to lend to non-depository institutions. The Dodd-Frank Act required the GAO to audit these emergency lending facilities that the Federal Reserve had operated between December 2007 and July 2010. The GAO evaluated the lending facilities and presented its findings in an audit and report issued in July, 2011.³³⁴ The GAO report included the following information:

- (1) A description of the basis and purpose for the establishment of the programs, ostensibly to stabilize markets and institutions through liquidity programs.
- (2) An assessment of the Reserve Banks’ control over financial reporting and accounting. The GAO found no significant accounting, financial reporting, or internal control issues concerning the emergency programs.
- (3) An evaluation of the Reserve Banks’ policies and practices for the use, selection, and payment of vendors. The GAO found that the individual Reserve Banks would benefit from strengthened guidance for noncompetitive contracts awarded in exigent circumstances.
- (4) An evaluation of the policies for identifying and managing conflicts of interest for Reserve Bank employees, vendors, and members of Reserve Bank boards of directors. The GAO found that conflict-of-interest polices could be strengthened.
- (5) An assessment of the security and collateral policies in place to mitigate risk of losses. The GAO found risk management policies and practices for future emergency programs could be strengthened.
- (6) An examination of whether competing eligible participants were treated equitably. The GAO found that the Federal Reserve Board lacked guidance and documentation regarding decisions about granting access for some participants to the emergency facilities.

³³⁴ U.S. Government Accountability Office, *Federal Reserve System: Opportunities Exist to Strengthen Policies and Process for Managing Emergency Assistance*, GAO-11-696 (July 2011), available at <http://www.gao.gov/new.items/d11696.pdf>. Last accessed December 11, 2012.

The GAO report also compiled much of the publicly available information that had been released by the Federal Reserve in December 2010 as required by Dodd-Frank’s disclosure provisions. The information was published on the Board of Governors’ website and included detailed information about individual transactions and the entities that had borrowed funds from the emergency lending facilities. That information was presented in spreadsheets for each program with thousands of entries each, which helped to coin the phrase “Data Dump.”

The GAO tabulated the Federal Reserve’s total transaction amounts for its emergency lending facilities on both a term-adjusted, and non-term-adjusted, basis. Non-term-adjusted lending totaled more than \$16 trillion, and term-adjusted lending totaled \$1.1 trillion. The GAO found that large global institutions were among the largest recipients of the Federal Reserve’s emergency lending -- receiving over 50 percent of the total dollar amounts provided by the Term Auction Facility and the Commercial Paper Funding Facility.

Notwithstanding the data compiled and presented by the GAO, many argue that the audit mandated by the Dodd-Frank Act provided insufficient information regarding the decision-making and the amounts provided by the Fed’s emergency lending facilities. They point out that although the GAO audit examined the procedures and protocols that governed the lending facilities, it did not examine the actual lending transactions themselves and the individual evaluations and decisions the Federal Reserve made regarding them. In addition, the Dodd-Frank audit language also did not authorize the GAO to audit the Fed’s discount window or open market operations.³³⁵

The Future of Federal Reserve Transparency

In addition to the one-time audit requirement, the Dodd-Frank Act contained other provisions that provide additional on-going transparency for the Federal Reserve’s operations. Under Section 1102, the GAO is authorized to audit any special credit facility created under the Federal Reserve’s emergency lending authority. The Federal Reserve under section 1103 must disclose information about discount window borrowing by a financial institution two years after a loan is made. Also under section 1103, the Federal Reserve

³³⁵ The Federal Reserve released data on some discount window and open market operations in March 2011, in response to Freedom of Information Act requests from Bloomberg News and FOX News. The Federal Reserve had initially refused to provide the information, and the news agencies sued to obtain the data.

must disclose information about open market operations two years after a transaction occurs,³³⁶ and disclose information about borrowers from emergency lending facilities one year after authorization for that facility is terminated.

Notwithstanding the provisions of the Dodd-Frank Act, the Federal Reserve's subsequent and continued interventions in the markets long after the worst of the financial crisis passed led to calls for increased transparency. Among these interventions were the Federal Reserve's quantitative-easing programs (so-called QE1 and QE2³³⁷); the Federal Open Market Committee's announcement that it would sell \$400 billion in short-term bonds in order to purchase long-term bonds (the so-called Operation Twist); the Federal Reserve's swap agreements with foreign central banks; and its agreement with four foreign central banks to make unlimited dollar funding available to European banks. While the Dodd-Frank Act has made the Federal Reserve more transparent in regards to its mechanics, monetary policy operations and the decision-making criteria regarding them remain largely exempt from effective, much less timely, oversight.

The unprecedented scope, novelty, and self-determined expansions of its authority evidenced by the Federal Reserve's monetary efforts during the financial crisis and its aftermath have raised fundamental questions about Congress's ability to oversee the Federal Reserve -- and ensure that Federal Reserve officials are held accountable for their actions. The quantitative easing programs, for example, have raised concerns that the Federal Reserve may be purchasing bonds from favored institutions or that advance notice of the Federal Reserve's buying programs may signal to market participants that they should purchase or sell certain assets to gain profits or avoid losses.

The delay between the conduct of open market operations and disclosures about those operations also makes oversight of those operations difficult. The Federal Reserve is not required to disclose information about open market operations until two years after they take place. Because the last three major asset purchase programs have taken place over the last two and a half years, there are concerns that information about these programs will not be released

³³⁶Discount window transactions and open market transactions that took place before the Dodd-Frank Act was enacted are exempt from these disclosure requirements. Except for the FOIA requests from Bloomberg and FOX News, these transactions would still be undisclosed.

³³⁷ As of December 2012, the Fed had begun further quantitative easing programs that were to purchase a total of \$85 billion per month of mortgage-backed securities and Treasuries. These programs were referred to as QE3 and an extension of QE3 respectively—although the term QE infinity had been used as well, since the Fed gave no end date for the programs.

in time for Congress to provide effective oversight of these programs. In addition, the Federal Reserve has opened swap lines with foreign central banks to provide dollar liquidity to foreign markets; however, the frequency with which these lines have been opened and the size of the swap lines has led some to question whether the Federal Reserve is bailing out insolvent European banks—ultimately at U.S. taxpayers, savers, and consumers’ expense.

Proponents of Federal Reserve independence believe that the conduct of monetary policy requires that the Federal Reserve be insulated from political influence. However, the large sums being lent and circulated by the Federal Reserve could affect the U.S. economy as well as holders of dollars and dollar-denominated assets. With such large sums and consequences at stake, Americans should be as worried about the Federal Reserve’s influence in picking winners and losers in financial markets.

Given the significant effects that actions taken by the Federal Reserve have upon the economy, advocates of greater transparency continue to look for ways to increase accountability and oversight over the Federal Reserve. Of particular note was the passage of H.R. 459, the Federal Reserve Transparency Act, in the 112th Congress. A reintroduced version of Rep. Paul’s H.R. 1207 “Audit the Fed” bill from the 111th Congress, the bill passed with an overwhelming bipartisan majority of 327 to 98 in July 2012.

*T*RANSCRIPT

The subcommittee met, pursuant to notice, at 10:05 a.m., in room 2128, Rayburn House Office Building, Hon. Ron Paul (chairman of the subcommittee) presiding. Members present: Representatives Paul, Luetkemeyer, Huizenga, Hayworth, Schweikert; and Peters.

Chairman PAUL. This hearing will come to order.

Without objection, all members' opening statements will be made a part of the record.

This morning, we are holding a hearing entitled, "Audit the Fed: Dodd-Frank, QE3, and Federal Reserve Transparency." I will yield myself 5 minutes for opening remarks.

Transparency of the Federal Reserve has been an issue that I have been working on for many years, and I consider it very, very important, and we have been making some progress on this. Back in the 1970s, there was a major effort made to get more transparency of the Fed, but unfortunately it actually backfired and gave more protection to the Fed from any inquiries made by the Congress.

One thing I would like to make clear is my efforts to have more transparency of the Fed aren't equated to that of wanting Congress to manage day-to-day operations of the monetary policy. Quite frankly, I think managing of the monetary policy should be more involved with a free market, free market of interest rates, rather than anybody believing they can manage that from a day-to-day viewpoint.

Frequently, it is said that the independence of the Fed must be protected at all costs. I usually think once there is an emphasis on independence of the Fed, it usually means the secrecy of the Fed, and it is quite a bit of a difference, but the Fed hides behind this independence so there is no political influence.

But I think more people now are starting to realize that the Fed isn't truly independent from political influence because indirectly, and sometimes more directly, it is involved in political decisions or at

least private and secret decisions made to serve some political interest.

The Constitution is rather clear on if anybody is to have any oversight, it would be the Congress rather than the Executive Branch. The ability to do this, of course, has been hindered. The Congress created the Federal Reserve with the Federal Reserve Act of 1913, and therefore, obviously the Congress has something to say about it. Not only did they create the Fed, but they have changed the rules. Congress has passed laws giving instructions to the Federal Reserve, so clearly, Congress has the responsibility of oversight of the Federal Reserve.

I think it is very interesting that one of the arguments for independence is that we can't allow the people to know what is going on with the banks; that if all of the sudden, we knew that a bank was having a problem, this would be bad information for the people to know. And then that is used as an excuse to prop up certain banks and make sure bailouts occur and that there is a lender of last resort, and there is no confusion or, otherwise, no correction that might be necessary.

But in many ways, the Fed performs a function exactly opposite of what the SEC is supposed to do. The SEC is a regulator that is supposed to go in and look at the books and throw out some rules so that people know what is going on and get information out. It seems to me at least, that the Federal Reserve does exactly the opposite.

The significance of monetary policy is really the overriding issue about the Federal Reserve, and what has happened since 1913 and actually what is happening today, because we are in the midst of a major crisis, and there are many of us who have come to the conclusion that the business cycle is very much related to monetary policy. So, if the business cycle is related to monetary policy, this should be of vital interest to all of us. If we connect the two, the Federal Reserve and the business cycle, then we see that recessions and depressions are a result of the business cycle. First, you have the boom and you have to have the correction, so you have to have the bust.

The other important relationship of the Federal Reserve to what Congress does, and for too long, it has actually been symbiotic, the Congress has been negligent in oversight, but they have been very complacent about deficits being accommodated. If the Fed was not so accommodative and always buy the debt and keep interest rates artificially low, there would be a lot more restraints on the Congress. But as long as Congress wants to spend money and they don't want to

raise taxes—that is not popular—and borrowing becomes difficult, then there is a better way from their viewpoint to do it, and that is just to allow the Fed to create money out of thin air, which for those of us who believe in less government is better than more government, whether it is warfare or welfare, we see that the Federal Reserve has a strong influence in allowing our government to grow.

So I am very pleased to chair this hearing today, and I am very pleased to know that we are making progress. We didn't get a full audit last year, but we did get an audit coming out of the Dodd-Frank Act. We did get a lot more information, and today we are going to receive more information, as well as the court cases that have come about. So compared to even 4 years ago, a lot of progress has been made in the right direction, but from my view point, we have a long way to go.

I have concluded my opening statement.

Do any other members wish to make an opening statement?

[PANEL I]

Okay. We will then go ahead and start with our first panel. Our first panel consists of Ms. Orice Williams Brown, who has spent her 21-year career in civil service at the GAO office. She is currently the Managing Director of GAO's Financial Markets and Community Investment team. Her portfolio of work includes banking, securities futures, and insurance issues. Most recently, she has been responsible for leading much of GAO's work on the financial crisis, Treasury's Troubled Asset Relief Program, the Federal Reserve System and its emergency lending programs, and regulatory reform. Ms. Brown received her MBA with a concentration in finance from Virginia Tech. I now recognize Ms. Brown for her testimony.

STATEMENT OF ORICE WILLIAMS BROWN³³⁸

MANAGING DIRECTOR, FINANCIAL MARKETS AND COMMUNITY INVESTMENT, U.S. GOVERNMENT ACCOUNTABILITY OFFICE

Ms. BROWN. Thank you. Chairman Paul, members of the subcommittee, I am pleased to be here today to discuss our recent report on the Federal Reserve's emergency programs.

As you well know, the study was required by the Dodd-Frank Wall Street Reform and Consumer Protection Act. It is the first comprehensive assessment of the Federal Reserve's use of emergency authority under section 13(3) of the Federal Reserve Act in response to the recent financial crisis. It also covers a number of programs that

³³⁸ [The prepared statement of Ms. Williams Brown can be found on page 1252.]

were carried out under sections 10(b) and 14 of the Federal Reserve Act.

This morning, I would like to briefly highlight a few of our findings.

First, we found that the Federal Reserve and its emergency programs were subject to a number of internal and external audits. None of these audits found material weaknesses, and when issues were uncovered, the reserve banks generally addressed the deficiency in a timely manner. However, we did find that some operational audits had not been completed until the emergency programs had been operational for over a year.

Second, the New York Fed was the primary player in executing most of the emergency programs authorized by the Board of Governors and the Open Market Committee. However, one program, the Term Auction Facility, was executed across all 12 Federal Reserve Banks through their discount window operations. To implement and operate the various programs, the New York Fed used over 100 vendors to provide a variety of services, ranging from legal services to asset management. We found that most of the contracts were awarded noncompetitively and they were not recompeted after the period of exigency had passed. For a significant portion of vendor fees, Reserve Banks were reimbursed by program recipients or fees were paid from program income.

Third, we found that while the Federal Reserve took steps to manage conflicts of interest, opportunities exist to strengthen its policies for employees, directors, and vendors. During the crisis, the New York Fed expanded its guidance and monitoring for employee conflicts. However, while the crisis highlighted the potential for Reserve Banks to provide emergency assistance to a broad range of institutions, the New York Fed had not yet revised its conflict policies and procedures to more fully reflect potential conflicts that could arise with this new, expanded role.

Fourth, we looked at the Federal Reserve's risk management practices. We found that it took steps to mitigate the risk of loss, such as requiring collateral amounts beyond the loan exposure for the early programs, and accepting only highly rated assets as collateral for some of the latter, more novel, programs. For actions to assist individual institutions, it negotiated specific protections. Over time, the New York Fed expanded its risk management capabilities and strengthened its management of risks across all programs. However, we found that neither the Reserve Bank nor the Board of Governors tracked total potential loss exposures across all emergency programs.

Finally, we found that while the Board of Governors took steps to promote consistent treatment of participants, it lacked guidance and documentation for some decisions. For example, Reserve Banks lacked documented procedures to guide decisions about restricting or denying access to the programs. We made seven recommendations to the Board of Governors to strengthen policies for managing noncompetitive vendor selections, conflicts of interests, risks related to emergency lending, and documentation of emergency program decisions. In response, the Reserve Board indicated that it recognized the benefits of our recommendations and would strongly consider how best to respond.

In closing, I would also note that many of these programs were established at the height of the financial crisis, and little public information was provided initially. Over time, the Board of Governors and the New York Fed increased the amount of information provided to the public, and going forward, the Dodd-Frank Act requires even greater transparency and accountability for any future actions.

Mr. Chairman and members of the subcommittee, this concludes my oral statement, and I will be happy to answer any questions at this time. Thank you.

Chairman PAUL. Thank you very much.

[PANEL I QUESTIONS & ANSWERS]

I will yield 5 minutes to myself for questions.

Overall, having done this audit and been involved, was there any one thing that you were more frustrated with? Was there any obstacle or misunderstanding or the law was confusing? Or was this a pretty clear-cut responsibility and there weren't that many problems? How do you look at it in general?

Ms. BROWN. In general, I would say that the Act laid out a pretty clear level of expectation for us in terms of what was expected, the programs that we were to cover, and exactly what aspects of the program and the operations of the programs that we were supposed to cover. So I would say it was fairly straightforward.

Chairman PAUL. Okay. And this was a 1-year audit; you just have to perform this one time?

Ms. BROWN. Correct.

Chairman PAUL. Would there be much of a problem if we were doing this every year as far as accomplishing what you have done? What kind of a task is this?

Ms. BROWN. This particular audit, while it was fairly straightforward, was an enormous undertaking given the number of emer-

agency programs involved. Going forward, if—one, we would have to keep in mind the current structure that we have around the future ability to perform perform audits. And Dodd-Frank includes in section 1102 some additional authority for us to look at any future credit facilities that the Fed may establish and also certain open market or monetary policy activities that are delineated in the Dodd-Frank Act. So if we were asked to audit those, we would look at any particular request in turn, and approach it very much the way we approach this.

Chairman PAUL. And from your own experience, you have not had to look into the Federal Reserve in the way you did this time? Is this something rather unique for your experience?

Ms. BROWN. Yes.

Chairman PAUL. Many say that it is unnecessary to audit the Fed because they are already audited annually by an independent auditor. These audits are of the Fed's financial statements and became a legal requirement in the late 1990s.

Can you describe to us the difference between these financial audits that they would like to say, well, they are all inclusive and we know everything, versus an audit conducted by the GAO—could you describe the difference between the two?

Ms. BROWN. Yes. GAO actually also does financial audits and we do performance evaluations, and the audit that we did and issued in July of 2011 falls under the program evaluation performance audit arena, and the biggest difference is that we in this were asked to look at specific operational issues. We were asked to look at the operational integrity issues like internal controls over the operations of the programs. We were also asked to look at how the programs were implemented and stood up.

Financial audits tend to focus on if—whether or not the financial statements are being fairly and accurately presented and the controls around the financial reporting. So it tends to be much broader and also more in-depth.

Chairman PAUL. Along that line, I want to follow up with a similar question. The Dodd-Frank GAO audit has been described as a procedural audit. It seems that most of the analysis was looking at the protocol and guidelines in place for the various emergency lending facilities. What do we know about individual transactions? How were they conducted, how was collateral evaluated, and who all had knowledge and access to the facilities and those things in general? Are they included in the GAO's audit or were they not part of the directives given by the Dodd-Frank Act, especially on the individual transactions, and who knew about them and why they occurred?

Ms. BROWN. We were specifically asked to look at the operational aspects of the program, but that includes looking at certain individual transactions, specifically when it came to assistance to individual institutions. But in terms of looking at the broad-based programs, we did look at eligibility requirements. We looked at who the largest users were of the particular programs, and we also looked at how the decision was made from the perspective of who approved the particular emergency program—was it the Board of Governors, was it the Open Market Committee—and then how the particular Reserve Bank implemented the action that had been authorized by the Board of Governors or the FOMC.

Chairman PAUL. Thank you. My 5 minutes has expired. So we will move on to the next member, the gentleman from Missouri, Blaine Luetkemeyer, for 5 minutes.

Mr. LUETKEMEYER. Thank you, Mr. Chairman. One of the things that is concerning to me is the fact that all banks, credit unions, thrifts, what have you, they have some entity that provides oversight over them. And yet the Fed, which is the central bank basically, I guess you would say, of our country, has very little if any oversight over it, you know. And some of the things that you say here are the things that were not—because of the prohibitions—you were not able to go into. I think it is kind of interesting. Where do you think we need to draw the line on this?

Ms. BROWN. GAO's position is that this is a policy decision, and wherever the line is drawn and the bar is set for us to do whatever action, we will do what Congress asks us to do.

Mr. LUETKEMEYER. Okay. Along that line, with regard to the emergency loans that were done during the height of the situation we had in this country, you say in here that the Federal Reserve banks required borrowers in several programs to post collateral in excess of the loan amount, programs that do not require pledge assets with high ratings, etc., etc. Did you see in the way that they handled the loans, was it, in normal banking terms—in other words, did they have the normal set of requirements for collateral excess over the loan they made, normal repayment terms, or what did you see there?

Ms. BROWN. We did look at the security and collateral procedures around loans that were made and we evaluated the processes they had in place. And we found that they did have controls around those, that they did have requirements that certain loans be overcollateralized. And in other cases, there was a requirement that the collateral posted be highly rated. So there were certain controls that were built around the loans that were being made.

Mr. LUETKEMEYER. Did you see anything there that was of concern to you?

Ms. BROWN. We didn't see anything that raised a major concern. We did point out that some of the internal audits that had been done had raised some questions around increasing the controls around the collateral, and we did look at the extent to which those had been addressed, and we found that at some point when an issue was raised, the bank would take steps to improve the controls that were in place.

Mr. LUETKEMEYER. Have all of those loans been paid back?

Ms. BROWN. For many of the broad programs, they have been. There are outstanding loans for the three Maiden Lane LLCs related to the assistance to Bear Stearns and AIG.

Mr. LUETKEMEYER. Okay. The point I am going to try and get to here, though, is they haven't all been paid back?

Ms. BROWN. Correct.

Mr. LUETKEMEYER. Your audit authority is over with; is that correct?

Ms. BROWN. Correct.

Mr. LUETKEMEYER. Therefore, at this point, there is no audit authority on those loans that have been paid subsequent to your audit or those that are yet to be paid; is that correct?

Ms. BROWN. In all cases except for any that involve assistance to individual institutions.

Mr. LUETKEMEYER. Do you think it would be a good idea if we went back and had a requirement to audit those whenever they are all paid off to see if everything is done according to sound financial tenets?

Ms. BROWN. It is something that if we were asked to do, we would definitely do.

Mr. LUETKEMEYER. That is a policy decision, right?

Ms. BROWN. Yes.

Mr. LUETKEMEYER. Okay. With regard to the open market operations of the Fed, one of the things it says here is that they are not required to disclose their operations until 2 years after they take place. How do you get ahold of information that is pertinent, that is time-sensitive, that we can actually get a good job of seeing everything that is going on here? If we can't do it within a 2-year timeframe, that seems almost beyond the ability to implement any sort of controls or corrections.

Ms. BROWN. We would note that in the audit that we did that was issued in July, it was done in many cases less than a 2-year time period.

Mr. LUETKEMEYER. And one more quick question: With regard to the swap lines of things that they have with foreign banks, were you able to do anything at all with oversight of that? Were you able to look into any of the activities along those lines?

Ms. BROWN. That was one of the specific programs listed under our authority in Dodd-Frank.

Mr. LUETKEMEYER. What did you find?

Ms. BROWN. We basically looked at how they were structured. We found that the Fed had engaged in a number of swap line transactions with foreign central banks, and the biggest takeaway was that once the Fed engaged in the swap with the foreign central bank, any activity of the central bank—the foreign central bank was really, from the Fed's perspective, that was the central bank's responsibility, and the foreign central bank assumed any credit risk from the activities that it engaged in.

Mr. LUETKEMEYER. If the chairman will bear with me, just one more question. Do you see any risk to the Fed with the way it is structured right now?

Ms. BROWN. That is one program that remains open, and the authority for that program is open through August of 2012. It was one of the programs that had been extended, and as with swaps, there is currency risk associated with currency swap-type of transactions.

Mr. LUETKEMEYER. Okay. I see my time is up. Thank you, Mr. Chairman, for your indulgence.

Chairman PAUL. Thank you. I now yield 5 minutes to Congresswoman Hayworth from New York.

Dr. HAYWORTH. Thank you, Mr. Chairman, and thank you for conducting this hearing. Thank you, Ms. Williams Brown, for being with us.

There is a notable statement in the GAO report that some Federal Reserve Board decisions to extend credit to certain borrowers were not fully documented. And I was wondering if you could elaborate on that. What sort of documentation would you like to have seen? Was there an explanation as to why the documentation was lacking?

Ms. BROWN. In the area of documentation prior to Dodd-Frank, there wasn't an explicit requirement for the Fed to document its decisions. From an audit perspective, that often presents a challenge

in determining exactly what happened. So that requires us to have a number of conversations with the relevant players.

But what we noted is, with the programs, there were generally broad eligibility requirements, and institutions that were generally considered to be in good financial condition were able to participate in a particular program. But to the extent that there were exceptions that didn't necessarily appear to coincide with the particular process in place, we had to have conversations to find out why things happened.

One example is with the commercial paper lending facility. An AIG subsidiary was allowed to continue to participate in the facility, even though they no longer met the new requirements—and that is, that they had been an active participant in the commercial paper market—but they were still allowed to participate in the facility.

Dr. HAYWORTH. Is there further work ongoing to determine why that was allowed to occur or—

Ms. BROWN. No.

Dr. HAYWORTH. So that now lies with us, I guess, here to—

Ms. BROWN. And we did make a recommendation to the Fed, going forward, that if they were to engage in credit facilities or any emergency lending in the future, that it is important to document decisions, and the Dodd-Frank Act now has a reporting requirement. So we pointed out that in order to fulfill that reporting requirement in the future, there is documentation that has to go along with the decision-making.

Dr. HAYWORTH. In order to encourage—

Ms. BROWN. Report it.

Dr. HAYWORTH. And presumably to encourage sound decision-making—

Ms. BROWN. Yes.

Dr. HAYWORTH. —so that we are not doing things that don't make sense fiscally.

Ms. BROWN. Yes, that. And to be able to then report to the Congress what was being done and why.

Dr. HAYWORTH. Thank you, Ms. Williams Brown, I appreciate that. Mr. Chairman, I yield back the remainder of my time.

Chairman PAUL. I now yield 5 minutes to the Congressman from Arizona, Mr. Schweikert.

Mr. SCHWEIKERT. Thank you, Mr. Chairman.

Ms. Williams Brown, part of this is actually—and my good friend from New York was almost touching on parts of this. First of all, on the emergency facilities, were you able to take a look at how well

documented the requests were, the systemization of the decision-making? And part of where I am leading on this is just your opinion, when you are playing auditor, if we were to have another hiccup, do they have mechanical rules and steps that are consistent? What did you see?

Ms. BROWN. In the retrospective audit, there weren't requirements for them to document specific decision points. So from that perspective, it required us to go back and attempt to reconstruct how decisions were made. Going forward, there are new requirements in terms of being able to report out that should help provide some additional structure around it, and that is one of the things that we also spoke to in some of our recommendations.

Mr. SCHWEIKERT. I heard some discussions about—even before—some of the new requirements. But do they seem to now have been adopted in the—if you and I were to lay out a flowchart and say, here is our decision-making process, with you and I also understanding this may be a process that sometimes has to be done very quickly.

Ms. BROWN. Correct.

Mr. SCHWEIKERT. But it also helps to know what checkboxes you are going through saying, okay, we have this, we have this, we have this. And from what you are seeing, have those documentation requirements, the new ones, been built into the system?

Ms. BROWN. I will say that since July, we haven't gone back to update the status of the recommendations that we made. So I can't say if they have addressed the recommendations that we made, for example, for a better documentation process. That is not something I am in a position today to say that they have or have not done those types of things.

Mr. SCHWEIKERT. Okay. Mr. Chairman, Ms. Williams Brown, with that—because where I am sort of hunting is, how did they document what assets were being pledged future forward, what was being swapped, and how well that was locked in, saying, yes, you are pledging this, and once you have pledged it, you can't go and touch it anywhere else, and we also have the proper mechanics telling us any exposure, like are there any sort of—where these assets may have also lent out their value to other pledges? I am just—I am trying to understand the decision tree, but also the quality of the documentation on assets pledged.

Ms. BROWN. In terms of pledging collateral and tracking that, we did look at the control process around the collateral process, and we did specific drilldowns on two of the facilities that the borrowers

were able to pledge a wide variety of collateral for a single loan. And we did a drilldown to look at the collateral that was pledged, and we also did some independent evaluation and testing to make sure that those controls around those were operational. So there was a process around that.

Mr. SCHWEIKERT. When you were looking at some of that, did you find some of the assets didn't really—ultimately, the market value—add up to what they were put into the pledge?

Ms. BROWN. We looked at the pricing of the collateral, and we found in a small percent of cases, somewhere around 2 percent, that there was some discrepancy in the price of the particular collateral that we tracked versus what was included in the data that we had gotten from the Federal Reserve. But we did not find any type of systematic bias one way or the other in terms of how that collateral had been priced.

Mr. SCHWEIKERT. But only about 2 percent?

Ms. BROWN. It was a fairly small percentage.

Mr. SCHWEIKERT. I am surprised. And would some of that have been MBS, mortgage-backed securities, because of the way you would price it?

Ms. BROWN. Right. I think it cut across a variety of other types of collateral that had been posted.

Mr. SCHWEIKERT. Last one, and I am partially doing this from writing, and seeing if I can find it in my notes, and this one may be asking more of an opinion.

The Inspector General for the Fed, I think, has also been given additional duties for the Consumer Financial Protection Bureau; almost wearing two hats, even though they are now separated. Any opinion on whether that works?

Ms. BROWN. That is not something we have specifically looked at, so I am not in a position to offer an opinion.

Mr. SCHWEIKERT. Gosh darn on that one. Mr. Chairman, I yield back my time. Thank you.

Chairman PAUL. I thank the gentleman. I yield 5 minutes to the gentleman from Michigan, Mr. Huizenga.

Mr. HUIZENGA. Thank you, Mr. Chairman, and I just want to express my appreciation for you holding this hearing. I think this is very important. I appreciate your time coming in as well, and I won't plan on using this full 5 minutes.

But I am struck by the theme that we are hearing of a need for oversight, and I don't want to put words in your mouth, but that certainly is the tone that I am catching, that this is a good thing that

we should—or that has happened. I think it is up to us, then, to decide whether this is something we should continue. It seems to me that we should.

I am curious a bit about if you could talk—and I apologize if you had—I had to step out for a phone call, but maybe you touched on this. I am wondering if you could talk a little bit about what some of the lending facilities were used by branches and subsidiaries of foreign banks, and were you really able to determine why several of those emergency lending facilities were primarily used by foreign institutions? I wonder if you could talk a little bit about that.

Ms. BROWN. We did look at the largest users across the facilities, and we did find that there are certain facilities that tended to be used by the branches and agencies of foreign banks. And in conversations and following up with the Federal Reserve about the reason for that, we found that usually the largest lenders of facilities were driven by the composition of the market. So if it is a market that there were major foreign banks that had branches and agencies in the United States, they would have been as likely as a U.S. bank to tap a particular facility.

Mr. HUIZENGA. And so that wasn't necessarily a region when you are saying that could be a product line or—

Ms. BROWN. Product line or a particular market that they were active in, because many of the broad-based programs were aimed at a particular disruption that was going on in a particular market. Commercial paper, some of the money market mutual funds had also experienced problems.

Mr. HUIZENGA. Thank you. And could you characterize the ratio of domestic versus the foreign?

Ms. BROWN. It really varies by program, and I would be more than happy to provide a breakdown for each facility for the record.

Mr. HUIZENGA. That would be great. How many facilities, as you are using the term “facility,” how many facilities are there? How many breakdowns do you think that would be?

Ms. BROWN. There were—I think it was somewhere in the 10 to 12 range.

Mr. HUIZENGA. Okay. I would appreciate the follow-up on that. So thank you. Thank you, Mr. Chairman. I appreciate that and I yield back.

Chairman PAUL. Thank you. And I now yield additional time to the gentleman from Missouri, Mr. Luetkemeyer, for a follow-up question.

Mr. LUETKEMEYER. Thank you, Mr. Chairman. I would like to follow up just a little bit more on the swap line discussion we had a little bit ago. Can you tell me how many times the line has been used, or is it just beyond this—number of times per day—or has it just been only 3 or 4 times in the last 6 or 8 months?

Ms. BROWN. I am not sure that we tracked it by the number of times used, but we focused on the number of foreign central banks that were permitted to participate in the swap line. And there, would have been through the July timeframe.

Mr. LUETKEMEYER. Do you have an idea of how many times that was? We had the Chairman in here not too long ago, and he indicated that there was almost zero activity.

Ms. BROWN. I will say that when we issued our report, as of the end of June, the balance on the swap lines was zero at that time. So it may have been used and repaid.

Mr. LUETKEMEYER. Okay. Looking at those transactions, did you see anything in there that would pose a risk to the Fed or, therefore, our taxpayers?

Ms. BROWN. I think the potential for—because the Fed would be swapping dollars for foreign currency, with an agreement that the foreign central bank would reverse the swap at the same rate that the other—to the extent that rates move, there is a potential risk built into.

Mr. LUETKEMEYER. Did you see where it is a pass-through from other existing banks over in Europe through the central bank there, or was it just a direct swap through the European Central Bank?

Ms. BROWN. It was—once the swap happened with the particular central bank that the Fed engaged in swap activity with, the Federal Reserve didn't track what happened to those dollars once they were in the hands of the foreign central bank.

Mr. LUETKEMEYER. Okay. So basically there is a firewall, then, between the transaction and wherever else those moneys would go to, those other dollars would go to?

Ms. BROWN. Correct.

Mr. LUETKEMEYER. Is that a fair statement?

Ms. BROWN. I guess I am pausing on the firewall, but there is definitely a separation, yes.

Mr. LUETKEMEYER. Okay. There is no tangible liability exposure to us from one of the other banks in Europe that is going to be passed through the European Central Bank? I guess that is a better way to put it.

Ms. BROWN. The Central Bank would assume that risk.

Mr. LUETKEMEYER. Okay. So basically, then, there is no other risk that the Fed has assumed from those activities.

Ms. BROWN. Right, beyond the swap.

Mr. LUETKEMEYER. Okay. And the only risk that you see there is just the normal currency activity or the daily ups-and-downs of the value of the currency itself? All those other things in the transaction—

Ms. BROWN. There could potentially be others, but that was the one that immediately comes to mind.

Mr. LUETKEMEYER. Has the biggest risk?

Ms. BROWN. I would say that is the one that immediately comes to mind to me, and I do have a total on the number of transactions; 569, that is how many transactions there were.

Mr. LUETKEMEYER. During what time period?

Ms. BROWN. This would have been from the beginning of the program through June 29, 2011.

Mr. LUETKEMEYER. Really? Okay. One more quick question. In your report, you indicate that there is—the GAO found that conflict-of-interest policies could be strengthened. Can you give me an example of where there is a conflict of interest that you found, that there is a problem or exposure or concern?

Ms. BROWN. We found a number that raised issues. They raised an appearance of a conflict, and one had to do with senior Federal Reserve Bank of New York officials. They held stock in some of the institutions that had received assistance. AIG was one example.

Mr. LUETKEMEYER. Did you see a pattern with individuals or with particular companies, particular entities, like through AIG or other companies or other entities that were out there, that they were trying to work with?

Ms. BROWN. I wouldn't say we observed any type of pattern. We observed with the vendors that there were situations that the Federal Reserve Bank of New York, for example, could have taken additional steps to strengthen their management of conflicts of interest that may have existed within vendors, and done additional oversight of what the vendors were actually doing to make sure that they weren't exposed to conflicts.

Mr. LUETKEMEYER. Okay. Very good. Thank you, Mr. Chairman. I appreciate the second round.

Chairman PAUL. Thank you. And I now yield for follow-up question to Mr. Schweikert from Arizona.

Mr. SCHWEIKERT. And forgive me, I just want to make sure I was listening carefully to Congressman Luetkemeyer. On facilities that were with foreign central banks, was there a currency risk when the assets were moved back?

Ms. BROWN. That issue really comes up on the dollar swap lines, because that is actually a swap of U.S. dollars for foreign currency, with the agreement to reverse the swap.

Mr. SCHWEIKERT. It would be an unusual instrument to unwind it back to the value of the previous swap if there had been movement in the currency? That sort of defeats the purpose a bit.

Ms. BROWN. It is the nature of the swap, that you agree to exchange the currency and reverse it at a particular price, at a particular date in the future.

Mr. SCHWEIKERT. Okay. So there was—from what you were seeing, there was always a pledge on the value at the end—

Ms. BROWN. For the dollar swap line only.

Mr. SCHWEIKERT. Yes, that is the only one I was interested in.

Second of all, and I know this is a little on the annoying side, but if you would have one of your staff reach out to our office sometime in a couple of weeks, we would love to be able to chase down in writing—as you were saying, it was 2 percent that you saw that—of pledged assets that you thought may have been outliers. And this is one of those occasions I have to go through my file cabinet and find an article from a couple of months ago that I think was talking about specifically private label MBS that may have been pledged, that may have been much further in the dispute of what its true value was. And I am just trying to get my head around having read one thing and now in testimony making sure I am using the same definitions today.

Ms. BROWN. It is not only an issue of the same definitions, but this is something that could vary from facility to facility. And my comment was specific to two credit facilities; but this could actually be the case in one of the others.

Mr. SCHWEIKERT. It absolutely would be that way. It would absolutely be that way. There were five hundred and some different ones, as I think I just heard you say—

Ms. BROWN. For the transactions for the dollar swap lines, yes.

Mr. SCHWEIKERT. Okay. Last one is: Also, as long as we are asking to throw something into note, so that Inspector General comment before—I know this really isn't your area—but I would love someone, if there is a policy statement somewhere in the agency in regard to whether this really works to have one Inspector General

doing both the Consumer Financial Protection Bureau and the Fed, even though they now wear very separate hats. And with that, Mr. Chairman, I yield back, and I thank you.

Chairman PAUL. I thank you. Does anybody else have any follow-up questions? If not, I want to thank the witness for appearing. And also, without objection, your written statement will be made a part of the record, and you are now dismissed and the second panel may come to the table.

Ms. BROWN. Thank you.

[PANEL II]

Chairman PAUL. We will now receive testimony from our second panel.

Our first panelist, Dr. Robert Auerbach, is Professor of Public Affairs at the LBJ School of Public Affairs at the University of Texas in Austin. He was an economist with the House of Representatives' Committee on Financial Services, formerly the Committee on Banking, Finance, and Urban Affairs, for 11 years. He assisted Chairman Henry Reuss in the 1970s and the 1980s and Chairman Henry Gonzalez in the 1990s with oversight of the Fed, spanning four Fed Chairmen: Burns; Miller; Volcker; and Greenspan. He is the author of the book, "Deception and Abuse at the Fed: Henry B. Gonzalez Battles Alan Greenspan's Bank." He received two master's degrees in economics, one from the University of Chicago and one from Roosevelt University under Abba Lerner. He received his Ph.D. in economics from the University of Chicago where he studied under Milton Friedman.

Our second panelist is Dr. Mark Calabria who is the Director of Financial Regulation Studies at the CATO Institute. Prior to joining CATO in 2009, he spent 7 years as a member of the senior professional staff of the Senate Committee on Banking, Housing, & Urban Affairs, where he handled issues related to housing, mortgage finance, economics, banking, and insurance. Dr. Calabria has served as Deputy Assistant Secretary for Regulatory Affairs at the Department of Housing and Urban Development and has been a research associate with the U.S. Census Bureau's Center for Economic Studies. He is a frequent contributor to the New York Post, National Review, and Investors Business Daily, and frequently appears on CNBC, Bloomberg, Fox Business, BBC, and BNN. He received his Ph.D. in economics from George Mason University.

I would like to now recognize the second panel and also, under unanimous consent, your written testimony will be made a part of the record.

So I recognize Dr. Auerbach.

STATEMENT OF ROBERT D. AUERBACH, PH.D.³³⁹
PROFESSOR OF PUBLIC AFFAIRS
LYNDON B. JOHNSON SCHOOL OF PUBLIC AFFAIRS
UNIVERSITY OF TEXAS AT AUSTIN

Mr. AUERBACH. Thank you very much, Chairman Paul and members of the subcommittee. I am honored to come back here where I worked for 11 years. One thing you left out: I also worked in the Reagan Administration, saying the same things, in between the periods I worked at the Treasury Department.

I want to talk about transparency at the Fed. The Fed is the powerful central bank of the United States that controls the money supply, regulates the banking system, and since 1962 makes loans to foreign banks without congressional authorization. The historical record of Federal Reserve officials blocking transparency and individual accountability, including destroying source records of its policymaking committee since 1995, is clear.

I want to especially thank Chairman Ron Paul and Senator Bernie Sanders for finally getting some kind of an audit at the Federal Reserve in the Dodd-Frank Act.

In 1976, when I was here, I assisted Henry Reuss in putting up an audit bill of the Fed. The Fed immediately mounted a huge lobbying campaign using the bankers that it regulates to come to Washington and go into all the offices here and stop the audit. Chairman Reuss went to the Floor of the House later when we got direct evidence of how the Fed used their offices and their facilities to organize the bankers they regulate to come to the Congress and lobby.

Finally, the bill was passed in 1978 down the hall at the Government Operations Committee with two glaring no-audit parts of the bill. One is anything to do with monetary policy or international transactions at the Fed.

Let me just talk one moment about those two areas. In the monetary policy area, there are tremendous opportunities to make billions of dollars on inside information from the many leaks of Fed monetary policy which I helped the committee investigate for many years. Let me just give you one little taste of it.

³³⁹ [The prepared statement of Dr. Auerbach can be found on page 1281.]

First of all, then-Chairman Greenspan said after a number of leaks, when the newspapers were publishing what they had said the previous day in their secret meetings, that we are beginning to look like a bunch of buffoons. They had at those secret meetings at the Kansas City Fed, where I used to work, central bankers from Bulgaria, China, the Czech Republic, Hungary, Poland, Romania, and Russia attending and listening to interest rate information that they would not give the Congress at that time.

Finally, the Federal Reserve decided that they would not like to have any more public minutes of their central policymaking committee. That was Arthur Burns in 1976 from a law then that was being passed, Government in the Sunshine Act, and a suit from a student at a university in Washington, D.C. So the Fed voted then in 1976, a 10–1 vote, that they would no longer have any transcripts of their central policymaking committee, and it was a 10–1 vote and the 17-year lie began.

Finally, in 1992 I came back for the second time, and I spoke with the great Henry B., as we called him in his district in San Antonio: How could it be that the most powerful central bank in the world had no transcripts of its meetings that they used to send out? What happened to them? So, Mr. Gonzalez had all the Fed Presidents come. All but two showed up. Chairman Greenspan sat in the middle, right where I am sitting, Members of the Board of Governors on each side, and they misled the Congress.

We put a lot of heat on them because they were Federal witnesses, and a few days later the Cleveland Fed broke and said, well, they had had a meeting 4 days earlier where they just decided how they would mislead the Congress. One person at that meeting, a staff person, a very good staff person who used to work with me at the Kansas City Fed, but he was assisting Greenspan, said, “the Chairman is not highlighting these transcripts. We are not waving red flags.” And when Congressman Maurice Hinchey had asked him at the hearing right here, “Do you have any records?” Greenspan replied, “just some notes we keep.”

After that, Greenspan sent a letter over here and said, this is 17 years later, we have those transcripts. I took a group of Republican and Democratic staffers over to the Board of Governors and found them right around the corner from Greenspan's office neatly typed. So they decided then that they would start issuing the transcripts again after a 5-year lag, much too long for timely accountability.

After I left the committee, and went down to Texas, I read that they had decided in 1995 to shred the records of the Federal Open

Market Committee. Those transcripts had been kept and sent to the National Archives, but they decided to destroy them. So I wrote a letter to Alan Greenspan asking why they were doing that, and his Vice Chairman, a very good person inside the Fed—these are good people; they just have bad policies—Donald Kohn, who worked there for many years and became Vice Chairman, started at the Kansas City Fed, he wrote to me saying yes, we decided to destroy the transcripts of the meetings, but we think it is legal.

I just want to go through a few other things on the audits so you can get an idea of how bad the audits have been of the Fed, just two little points. One is the Los Angeles branch of the Kansas City Fed. You can ask me questions about it, when we found out that the auditing system there was corrupt. I took an excellent GAO team. Zoliason went in there and found that the system was completely corrupt. Greenspan admitted in a letter to the committee that they knew that the employees of the Fed had stolen at least \$500,000 in the previous 10 years from the vault system of the 12 banks.

One other thing, and then I will quit. The airplane fleet of the Fed, 50-plus airplanes, the audit there was a joke. There was no audit. The people running the fleet in Boston used to laugh about it. And they appeared here. Mr. Castle allowed them to come, and they were very courageous, and they talked about it right in the committee room here. Carolyn Maloney, Congresswoman Maloney, helped in investigating them. That was a completely corrupted thing. It was typified by their backup plane that the Fed paid for in Teterboro airport that didn't exist most of the time. That is all I am going to say about that.

I have two other points. One is about paying off all the economists throughout academia on investigation of Henry B. Gonzalez; and what I consider malpractice, the present monetary policy of the Fed that was begun in October 2008 that has caused a lot of unemployment in the United States.

Chairman PAUL. Thank you.

We will go to Dr. Calabria now.

**STATEMENT OF MARK A. CALABRIA, PH.D.³⁴⁰
DIRECTOR OF FINANCIAL REGULATION STUDIES
CATO INSTITUTE**

Mr. CALABRIA. Chairman Paul, distinguished members of the subcommittee, I thank you for the invitation to appear at today's important hearing.

³⁴⁰ [The prepared statement of Dr. Calabria can be found on page 1291.]

As the subcommittee is well aware, the events of 2008 witnessed not only unprecedented disruptions to our financial markets, but also extraordinary responses on the part of our financial regulators and central bank. No entity was more deeply involved than the Federal Reserve System, particularly the New York Federal Reserve. Yet the Fed has consistently and repeatedly resisted efforts to bring accountability and transparency to its actions.

Congress and the public repeatedly warned that if details of the Fed's actions became public, further panic would ensue in our financial markets. Yet when that information, such as AIG's derivatives counterparties, finally did become public, disruptions were minimal or nonexistent.

Despite some notable attempts by the Fed to increase its communications with the public, I believe, given its track record, the public cannot rely on the Fed to voluntarily provide us with sufficient information to monitor its activities and judge the effectiveness of its actions. While the requirements of the Dodd-Frank Act in relation to auditing the Fed's activities are an important advance, they fall far too short of providing sufficient oversight of the Federal Reserve.

What auditing has been conducted so far has been focused on the Fed's response to the crisis. Accordingly, much of the audit requirements in Dodd-Frank have something of an historical feel about them. However, it is not enough just to get history right, although we are lucky if we do that, but also to ensure that future mistakes are avoided. I can think of few areas requiring as much mistake avoidance as monetary policy.

The Fed's role in helping to create the crisis via its easy money policies in the aftermath of the dot.com bubble and the events of 9/11 remain largely uninvestigated by Congress. If we truly wish to end financial crises, then I believe it is absolutely essential that Congress receive a full and objective evaluation of the Fed's role in fostering the housing bubble, particularly as it relates to monetary policy decisions between 2002 and 2005.

Disagreement as to the appropriate stance of current monetary policy I think also demonstrates Congress' need for objective, independent analysis of monetary policy.

Some might object that a GAO audit of the Fed subjects the Fed to political pressure. I think that such an objection ignores the simple fact that the GAO is not a political organization.

As mentioned, I served as staff on the Banking Committee for a number of years. I can say through all of my interactions with GAO, they are independent, they are unbiased, they are nonpolitical. I have

not always agreed with the conclusions of GAO, but I have never felt that any of those disagreements were the result of politics or bias.

I think the subcommittee should also keep in mind that GAO exists for a very simple reason: that no Member of Congress or their staff are fully knowledgeable about the functioning of all the various government agencies. GAO simply exists to inform.

I would argue that there are few areas less understood than monetary policy and macroeconomics. Hence, I would argue there are few areas more in need of an audit than monetary policy and macroeconomics. Again, the purpose of GAO here is to try to provide some information so that Members can more actively engage, I think, and more effectively engage in oversight of the Federal Reserve.

Another objection to a GAO audit of the Fed is that such an audit would compromise the Fed's independence and subject it to political influence. I think such an objection confuses the very nature of Fed independence. The Fed's authority to regulate the value of money is one that is delegated from Congress. As Congress can and has legislated changes to the Fed, it should be beyond a doubt that the Fed is not independent of Congress; it is quite the opposite. It is a creature of Congress, and Congress has every right in that avenue to interject and regulate the activities of the Fed itself.

Setting aside the debate of the desirability and legitimacy of so-called independent agencies, it should be clear that their independence in any operational sense is supposed to be from the Executive Branch, not from Congress. It should also be clear, however, that in recent years, the Federal Reserve has coordinated its actions quite closely with the Treasury Department, in my opinion eroding any independence from the Treasury. The revolving door, both at the political and career levels, between the Federal Reserve and the Treasury Department further undermines the Fed's operational independence. I believe a GAO audit would help shine light on this relationship, actually helping to insulate the Federal Reserve from continued interference by the Treasury Department.

Again, the Dodd-Frank Act has made important advances in bringing transparency and accountability to the Federal Reserve. Unfortunately, it falls short in allowing Congress and the public to truly gauge the effectiveness of the Federal Reserve.

In order to improve Federal Reserve transparency, I would suggest that Congress mandate a regular audit of all Federal Reserve activities, including monetary policy. Such audits could be performed in a manner so as to minimize the disruptions to any ongoing deliberations of the Federal Open Market Committee. For instance,

these audits could be kept confidential for a short amount of time, 6 months, a year. That is certainly something that could be done not to try to unduly influence ongoing activities, but again, this audit should be made public at some point.

I think it is also important to emphasize that evaluating the effectiveness of any government agency is made all the more difficult when that agency faces a variety of competing and sometimes conflicting objectives. If the Federal Reserve feels it is free to abandon price stability in order to achieve other objectives, such as rescue the financial industry or misguided attempts to influence the labor market, then I believe the value of an audit may potentially be very limited.

At a minimum, Congress should consider restricting the Federal Reserve to a single goal, that of price stability. Congress should also restrict the ability of the Fed to have discretion implementing that goal. On a very basic level, a central bank that is free to define price stability or define its own objective is a central bank without any meaningful constraints.

With that, again, I thank the chairman, I thank the subcommittee, and I look forward to your questions.

Chairman PAUL. Thank you very much.

[QUESTIONS & ANSWERS]

Chairman PAUL. I yield myself 5 minutes for questioning.

My first question is for Dr. Calabria. I want you to follow up— I know you have talked about it in your statement—on this relationship of the Fed and the Treasury. You indicate that if there is to be any oversight or connection, it is more with the Congress than with the Executive Branch and the Treasury. Could you talk a little bit more about that, and exactly what you mean? And what has happened in the past that might suggest that we should be looking into the relationship of Treasury and the Fed and how that could be a negative, or why some people think it is a positive?

Mr. CALABRIA. There are a variety of different things. I will most directly touch on first the negotiation, implementation of Dodd-Frank. Treasury was the point person in negotiating Dodd-Frank for the Administration, yet several of the senior advisors at Treasury representing the Administration were staff on loan from the Federal Reserve. So again, I think many of us remember there was about a whole 5 minutes during the Dodd-Frank negotiations where maybe there really were going to be serious constraints on the Federal Reserve, where there would be a serious examination of the bank

supervision and regulatory powers. Again, I think the Congress and GAO should take a look at whether the Fed should be supervising banks in general, and whether that conflicts and provides any conflict of interest with the monetary policy decisions.

But, having essentially Federal Reserve staff at Treasury negotiating on behalf of the Administration certainly, in my opinion, meant that there was going to be no chance that Congress was actually going to be able to peel back any of the powers of the Federal Reserve. So, again, the Treasury relies very heavily on Federal Reserve expertise and legislative decisionmaking.

Most importantly, however, and it is important to keep in mind that Fed independence really came out of this Treasury-Fed accord where, prior to the 1960s, the Federal Reserve supported Treasury prices essentially and tried to maintain the price of long-term Treasuries in order so that the Treasury Department could more easily and more cheaply fund its activities. And again, if you have this relationship—and you see this particularly with the second round of quantitative easing where the amount that the Fed was purchasing on a monthly basis was coincidentally very close to the amount that was being issued by the Treasury. And so the extent that we go down that road of potentially “monetarizing” the debt, which I think is the ultimate concern, that you have the Treasury market supported by the Federal Reserve, which, of course, reduces discipline on not only the Treasury, but reduces discipline on Congress to get its fiscal house in order.

So again, we rely on the markets to send us signals, and the Treasury market should be sending us a signal that we are headed towards a financial train wreck, but it is, of course, not, because the Federal Reserve is intervening in that market to reduce the price cycle that we would be receiving.

So that is an important part of the debt market. I think it is ultimately one of the more important aspects of this, but, again, you also see it in financial regulation.

I want to emphasize again the nature of independence is supposed to be not from Congress, but from the Executive Branch. There is a variety of literature, for instance, in economics that talks about a political business cycle where you would see the Federal Reserve try to loosen monetary policy in expectation of Presidential elections.

Again, I would say that the empirical results in this literature are mixed, but, again, the emphasis is on the Administration. We know that in terms of any President’s reelection, it is going to be far more important what the Fed does compared to what any Member of

Congress wants. So again, there are far different interests and far different incentives in Congress, where you have a unified incentive in the Executive Branch.

So, I would emphasize again the importance is to draw some independence from the Executive Branch and the Federal Reserve rather than from Congress.

Chairman PAUL. So just in summary, the way I understand that is when they talk about independence, they are really not talking about independence, they want to eliminate the role of the Congress, which you are arguing has a responsibility. So they want to be excluded from that supervision, but they don't want to be independent from the Treasury.

What about political or private interest influence? When the bail-outs came, there had to have been some special interests and political interests. Would that—could that be said to be not independent either, but influenced by not only the Treasury, but outside interests? Do you think there is much—should there be concern about that?

Mr. CALABRIA. I think there should absolutely be strong concern about that on several levels. One could just look at monetary policy where monetary policy is conducted in partnership with the Federal Reserve's primary dealers in which it buys and sells Treasury securities with to conduct its monetary policy. Of course, if you are doing bank supervision, you have a financial crisis, and these primary dealers find themselves in trouble, the Federal Reserve has an incentive to try to essentially make sure that those primary dealers survive. And, of course, it doesn't want to make any of that public. I am sure you could ask any of the largest firms that were assisted. Whether it was Goldman or whether it was Societe Generale, they have not welcomed the attention that they have gotten when all of this information has come out.

We heard a little bit earlier about the GAO report. One of the things that struck me is that if you look through the tables and you look through the information in the GAO report, regardless of the program, it is the same companies that keep repeatedly coming up. Repeatedly we see Citi, repeatedly we see Bank of America, repeatedly we see Morgan Stanley. Regardless of the program, it seems to be that the concentration of the benefits of these programs are with a handful of corporations. And, of course, those corporations, I think, do not want the public attention that they have repeatedly received incredible assistance from the Federal Reserve or credible assistance that has been off budget.

So again, that relationship and that revolving door, we have seen it. And again, this is something that was talked about in Dodd-Frank, some of the governance issues. We all remember very much the role of Goldman essentially being the Chair of the Board at the New York Fed and some of the conflict of interest there. And certainly those were saying that the current president of New York Fed is a former Goldman employee. So not only am I concerned about the revolving door between Treasury and the Fed, I am also very concerned about the revolving door between Wall Street and the Fed.

Chairman PAUL. Thank you.

I yield 5 minutes to Mr. Luetkemeyer from Missouri.

Mr. LUETKEMEYER. Thank you, Mr. Chairman.

Dr. Auerbach, in your testimony you mentioned two or three things; the L.A. Fed whenever there was some corruption exposed, and some folks stole some money, the Federal airplane—the Federal Reserve airplane fleet. The audits that are being performed or should be performed, would they have caught these abuses?

Mr. AUERBACH. Did the audits have abuses?

Mr. LUETKEMEYER. Would the audits that are being proposed—in other words, right now we have the Inspector General folks, or GAO, they are now doing the audit on the emergency loan program that was administered.

Mr. AUERBACH. Right. They don't touch any of these.

Mr. LUETKEMEYER. You are saying we should expand—

Mr. AUERBACH. Definitely.

Mr. LUETKEMEYER. —audit procedures because existing auditing procedures are not catching these things?

Mr. AUERBACH. Definitely. There are tremendous problems inside the Fed, and the in-house audits were no good at the Boston Fed. The courageous people there who testified right here about it said that someone came from upstairs at the Boston Fed near the harbor. Officials of the Fed are at the top; the people who run the airplane fleet were down below. Someone came down asking, is everything all right here? That was about the extent of the in-house audit.

There were all kinds of corruptions, and so many corruptions that Henry Gonzalez, the Chairman, asked me to call the Janet Reno Justice Department, which I did, and they didn't want to get into it. Nobody likes to attack the Fed in Washington. So they said, call the Inspector General at the Fed, which I did, a very nice man, Brent Bowen, and he said, "I don't know if I have jurisdiction up in Boston."

And that is one of the major problems of the Fed and this new consumer protection agency that is located inside the Fed. The IG of

the Federal Reserve is appointed by the head of the Federal Reserve, so how can they investigate these things? Chairman Bernanke cannot be investigated, and his officials are the people they appoint. This should be a Presidential appointment and an independent IG at the Fed, if you want to start cleaning up this mess.

Mr. LUETKEMEYER. Do you think there is anything that should be off limits whenever it comes to disclosure of the Fed activities?

Mr. AUERBACH. That is a very interesting question, because the Fed is now shredding their documents. But Arthur Burns, who was the head of the Fed back in the 1970s, he died in 1987, and he sent his transcripts of the meetings up to the University of Michigan, the Ford Library. They had people from the National Archives, professional archivists who took out anything that had to do anything with national security, personnel. They were lightly edited.

So I was able to go up there and get copies of them all. They are very different from the kind of thing that the Fed issues. Ask any reporter who has received something from the Fed; it is mostly blanked out. This was a much better record.

What should be done now is that the Fed should be told that they cannot destroy those records. The records go to the National Archives after 30 years. There will be somebody looking at that.

And also on the FOIA requests, you should get professional archivists who know the rules in cooperation with the Fed instead of sending reporters blank pages.

Mr. LUETKEMEYER. Dr. Calabria, what do you think about that? Are there some things that you believe should not be disclosed or are off limits, or do you think everything is open to everybody?

Mr. CALABRIA. I think the way I would look at it is the question of when should it be disclosed. Ultimately, any sort of deliberations, any sort of economic forecasts should be disclosed at some point. I would be comfortable having some sort of time lag.

For instance, one of the things that Dodd-Frank does, and I think does correctly, despite much of what the bill doesn't do correctly, is require a disclosure of future discount window lending. And so the concern for the Federal Reserve would be if you disclose at the time that banks are coming to the discount window, that is a signal that such banks are weak, and I think that is a legitimate concern to raise.

But I think if you—and again, in Dodd-Frank it allows up to a 2-year delay for that disclosure. I would prefer something closer to a year, but I do—I would say a 6-month, a year delay on something like discount window is legitimate in that it will not scare away people from using a discount window. Of course, we could have a totally

separate discussion of whether this should be a lender of last resort in a discount window. But again, if you are going to have one, and you want it to be effective, a delay in disclosure in that, I think, is reasonable.

A delay on disclosure on deliberations at the Federal Open Market Committee meetings, I think, is again reasonable. Ultimately, in a timely basis, all of this information should be made public, and I want to emphasize 5, 10 years is not timely. So again, we need to get it out in a reasonable amount of time.

Mr. LUETKEMEYER. Thank you. I yield back, Mr. Chairman.

Chairman PAUL. I thank the gentleman, and we will go into a second series of questions.

This question is for Dr. Auerbach, and it has to do with what you talked about when you were trying get an audit in the 1970s, and you didn't get too far in the Banking Committee even though it was the chairman of the Banking Committee who wanted to do it. Then they took it and they sent it over to the Government Operations Committee. And then when they gave the authority for the audit, it was actually exactly the opposite and closed that.

I want you to expand on that. And also, why don't you tell me why it is that the individuals either in the Fed or see to it that their people get in the Fed, how come they have this much power that they are able to control even the Banking Committee chairman and then pass legislation exactly opposite of it? I think it was at that time that they really put into it to—seems like where the greatest protection is on these foreign operations, I think that is where there is a lot of mischief, and even now with our partial audit, we hear about it, but we don't know exactly what transpired. Could you expand on that a little bit?

Mr. AUERBACH. Sure. Let me take the second part first on international operations. You were right about the bill that was finally passed where the GAO is not allowed to go into anything that has to do with the operations, international operations, or monetary policy, trophies that remained on the shelf of the Fed for a long time.

In international operations, when the Fed goes, for instance, and notifies brokers all over the world, brokers who are not investigated by anybody in the United States, and tells them, we want to buy, say, 5 billion in euros, that information is given to the brokers ahead of time. I am not saying the brokers are dishonest, but when there are billions at stake in these markets, they can place orders, or people in their office can place orders, long before the order is consummated.

The chairman wrote to Alan Greenspan and asked, “Why are you doing this? Why not just make an announcement that you are going in with 5 billion and let everybody in the market get in on it at the same time?” And he wrote back, “I think there is only about a 10-minute delay between the time we tell them to do it and they make these huge purchases. That is ample time to make a lot of money in the market. And so, the international operations should be audited by the GAO. It is really important, and I think when the Fed is going to do something, they should announce it.

I disagree a little bit with Dr. Calabria. I would not leave these decisions for discount rate changes and for anything the Federal Open Market Committee does for more than 6 months—even that is very long—because there have been so many leaks at the Fed. The FBI has been called in, all the rest. It is going to leak out anyway. There are several ways it leaks out. One is when we asked how many people at the Fed know about these secret interest rate decisions, we got a whole bunch of pages, single-spaced, of hundreds of people all over the country on these conference calls. And as Greenspan reported, he was saying he opens the Singapore edition of the Wall Street Journal and found out what the Fed did at their meetings before. So you can't tie up information that is so valuable for months that just benefits inside traders. And those trophies, when they did go over and put them in there, it kept the GAO out of a lot of the problems.

Can I say one other thing that I think is important? We have sitting in the audience Walter Charlton, who has had suits against the GAO since 1983 because the GAO has had a policy, alleged policy against older workers. I had excellent GAO people who were at the Los Angeles Fed who did the audits. They were excellent. They were old-timers at the GAO who knew how a central bank works, and knew what to get into and what to look at.

The suits now in the courts all these years, some of them have been adjudicated. The suits allege that they try to get rid of the older people. In a recent suit, I gather that after a joint session of Congress, 200 were rehired by the GAO. But they try to get rid of the older people, people who are 55 or older, around there, and hire young people. And I know they hire young people, because I used to have lunch with David Walker when he came to the LBJ school to get some of our excellent young students, but that lowers the amount they have to pay the people by a huge amount.

But what we need in the GAO are experienced auditors who know how central banks work and can get in there and really find out what

is going on. That takes a lot of training to find out how to audit a vault facility.

The vault facility, since we found that team that was in there that I worked with, was excellent. They found out what was missing. It was just awful. The main ledger, the vault on the computer, everybody could get in there without a password. What happened to those officials when that went public? Nothing has happened since then at the Fed.

I think it is very important to get better GAO auditors—now, maybe they have them—who are experienced on how to audit a huge, enormous central bank with 20,000 employees. And they have vaults all over the country that hold all the money for the commercial banks, and the Bureau of Engraving ships it there. All the new money is in there also. It is a national security problem, and if Greenspan thought that the employees were stealing \$500,000 in 10 years—we thought that was a tremendous understatement and so did the GAO crew—but I believe shortly thereafter, most of them were no longer at the GAO.

Chairman PAUL. Thank you.

I yield 5 minutes to Mr. Luetkemeyer.

Mr. LUETKEMEYER. Thank you, Mr. Chairman.

I have a feeling that both of you gentlemen have a lot more to say and a lot more suggestions for us, so I think I will just use my time a little differently this time.

Dr. Calabria, you were the Director of Financial Regulatory Studies. What one regulation would you suggest would be impactful. Audit the full Fed? Is there something else that you see that would really protect our monetary system and really make an impact? What would be your suggestion?

Mr. CALABRIA. I think the focus really needs to be on defining and limiting the discretion for the Fed on price stability. So, again, you can do things like reduce—eliminate the dual mandate, having some sort of inflation targeting.

I would emphasize that ultimately what is going to be a constraint on the Fed is some sort of competition, so obviously encouraging alternative monetary mechanisms is something we should be looking at the in the long run, but certainly trying to find a way to constrain the Fed. So I would have a full audit. I would get rid of the dual mandates. I would put some statutory flesh around what exactly price stability means, because again, you can get rid of the dual mandate, but if the Fed decides that price stability is 3 or 4 percent, it

doesn't really matter. You have to take some of these definitions back into Congress.

And again, I want to emphasize one of the reasons I think the Federal Reserve has been so effective over the years at thwarting Congress is that they come up here and they give you all this gobbledegook about M1, M2, and all this, and they try to confuse you. Again, the most important thing is to get information out there so that Members of Congress can even start with the very right questions and can push them and basically not let them get around that. So the most important thing we can do is educate Congress and the public on how exactly monetary policy works.

Mr. LUETKEMEYER. Very good. I asked for one, and got three. Must be D.C. Thank you.

Dr. Auerbach, with regard to the same question, you have had a lot of advice for us in some of your previous comments here. What piece of advice or regulation would you suggest?

Mr. AUERBACH. Price stability is certainly important, but the Fed should understand it is the 1949 Employment Act that said they have to do full employment also; that price stability helps produce full employment. And right now we have quite a bit of inflation. Year over year, 1 month it was 4 percent, then 5 percent. Then Chairman Bernanke testified that he doesn't see any inflation. How high does it have to go before he sees it? That is year-over-year inflation.

The other thing that I think that Congress should have something to say about is what I call malpractice at the Fed. In September 2008, when Lehman Brothers collapsed and the markets went crazy all over the world, one month later, the Fed decided that they would start paying the banks interest in order for them to hold their reserves.

I have that diagram—I wonder if you would put it up—of the amount of—there it is. The amount of excess reserve. You will notice that since—this is the Federal Reserve of St. Louis. It is zero. All of a sudden in 2010, the banks are intelligent. They say, look, we can get a quarter percent interest risk-free from the Fed; why should we loan it to businesses?

So the Fed begins pumping in their monetary base, they pumped in \$1.9 trillion. How much of that got out for loans to banks and to businesses? \$1.7 trillion was parked as excess reserves. It is there today. The total today is \$1.6 trillion in excess reserves. It went through the roof.

We are in a position today where people inside the Fed, economists inside the Fed, like William Gavin, a great economist at the St.

Louis Fed, published in their literature for the banks it is a much better investment to hold the money as excess reserves, tie it up, than to lend it out to people, because they get a quarter percent for sure, and we are in a terrible environment.

What should be done immediately? I call this malpractice. It has certainly increased unemployment in the United States. The Fed must stop paying the banks to hold reserves instead of lending it to businesses. And if they do that, they have to be very careful that the money supply doesn't balloon out or we will have a huge inflation. They will have to slightly raise their target interest rate to about a half percent. They should be doing that. They have been at zero long enough, and you can see what good that has done for the country.

Mr. LUETKEMEYER. Thank you very much. I yield back.

Chairman PAUL. Thank you.

I have one more question for the two of you. We talk about the transparency, and how to get information out, and how dangerous it is if someone gets the information, they can make some money on it because they anticipate what the market will do. And also, there is so often the unintended consequences of manipulating what they do, the economic consequences. And we talk and discuss, and there was a slight disagreement on exactly when we release information, when did the Fed do this, and when do we get a record of the history.

My question is a little bit different. It has actually to do with monetary policy per se, not how we tell—how the Fed manages monetary policy. My viewpoint, they have had two mandates, full employment, and I don't think either one of you enjoy that. If you really look at the old-fashioned way of measuring it, it is probably over 20 percent. Dr. Auerbach admitted that price stability, they are not doing very well there. But I got the indication from both of you that it wasn't the principle of setting the interest rates, it is how they do it, and when it is released, and the details of it.

But what about the question of whether or not they should be messing around with interest rates? Most economists these days, ever since the 1970s, they have played down wage and price controls. Wage and price controls aren't very good as a solution to solve the problem of price inflation created by too much money.

But setting interest rates is a pretty big deal. If interest rates— if prices are the signal that tells the businessman what to do and the consumer what to do, the supply and demand—and, of course, free-market economists predicted that socialism would absolutely fail without a pricing structure—why is it that we have accepted this idea that the Fed is all-knowing with their record?

So could you each tell me, do you think it would be bad to have a system where the Fed wasn't involved with setting interest rates, and maybe market rates would help? Maybe market rates would help savings. Maybe interest rates would go up, and the people who tend not to want to gamble in the stock market and the bond market, wouldn't this be a help to the economy? Could both of you make a comment about whether or not the Fed should be setting interest rates?

Mr. AUERBACH. I think that is a really good question. In 1979, we had a little party right here in this room, and the new Chairman was coming on board. He was a very good Chairman, Chairman Volcker. And at that time, by 1980, the inflation of the United States was going over 13 percent. Interest rates went up over 20 percent. There were mass bankruptcies in the country. And Volcker was laughing with us and said to two of us from the University of Chicago, you give me a pain in my you know what, and we laughed together. But then Volcker decided he wouldn't control interest rates, he would control the money supply and stop printing so much money, which he did. He paid a big price, but he stopped the country from going into a terrible inflation. I was in the Reagan Administration, and we had a double-dip recession, 10 percent unemployed, but then we had a long period of no inflation. So he did a great job, but we paid a terrible price.

But when Alan Greenspan came in, the idea of controlling the money supply was considered, oh, that is University of Chicago "monetarists," and they don't know what they are doing. So by the end of the 1980s, he decided the Fed would no longer target money. He would do what other central banks do: just target the interest rates.

And I think they should do both. They should watch the money supply, but they should do what Congressman Paul said: try to let the interest rates go to market rates instead of sitting on them.

Mr. CALABRIA. I would start by saying that I believe there is probably no more important price in the economy than the interest rate. You really do balance savings investment and you balance time preferences. Accordingly, when we get that wrong, we get a whole lot wrong, and you can have all sorts of disruptions to the economy. So ultimately, the answer should be a very strong "no," we should not have the Fed manipulating what is the most important price in the economy.

Chairman PAUL. I thank the panel for appearing. The Chair notes that some of the members may have additional questions for

the first and second panel of witnesses which they may wish to submit in writing. Without objection, the hearing record will remain open for 30 days for members to submit written questions to these witnesses and to place their responses in the record.

This committee is now adjourned.

{Whereupon, at 11:40 a.m., the hearing was adjourned.}

QUESTIONS

FOR THE RECORD

[GAO] ADDENDUM TO THREE RESPONSES PROVIDED BY
MS. ORICE WILLIAMS BROWN

The first is a clarification and amplification to my response to Rep. Leutkemeyer's questions on the risk of the dollar swap line transactions to the Federal Reserve. As stated on p.19 of our report (GAO-11-696), in a typical swap line transaction, the Federal Reserve Bank of New York (FRBN[Y]) exchanged dollars for the foreign central bank's currency at the prevailing exchange rate and the foreign central bank agreed to buy back its currency (to "unwind" the exchange) at this same exchange rate at an agreed upon future date. The foreign central bank would then lend the dollars to banks in its jurisdiction. Foreign central banks assumed the risk of losses on these dollar loans and paid FRBNY the interest collected on these loans. FRBNY did not pay interest on the foreign currency it received under the swap lines. To avoid difficulties that could arise for foreign central banks in managing the level of their currency reserves, FRBNY agreed not to lend or invest the foreign currency. However, as I noted at the hearing, in the unlikely event that a foreign central bank would fail to repay the dollars, FRBNY would be exposed to currency risk related to the foreign currency it held to collateralize the dollar swap transaction. For example, if a foreign central bank defaulted on a dollar swap line, the value of its currency held by FRBNY could decline significantly in value, exposing FRBNY to losses.

The second item is a follow up to my response to Rep. Schweikert's question on GAO's opinion with respect to the Federal

Reserve Inspector General's additional duties to audit the Consumer Financial Protection Bureau (CFPB). While GAO has not specifically examined the Federal Reserve IG's new duties, we have commented on the consolidation of IG offices in our prior work (see GAO-02-575 and GAO-04-117T). As you know, the Dodd-Frank Act provides that the Federal Reserve IG shall have all the authorities and responsibilities provided by the Inspector General Act of 1978 (IG Act) with respect to CFPB, as if the Bureau were part of the Federal Reserve Board. This provision essentially consolidates the oversight of both the Board and the Bureau under one IG. In our prior report, *Inspectors General: Office Consolidation and Related Issues* (GAO-02-575), we addressed the issue of consolidating IG oversight so that certain IG offices would have oversight authorities and responsibilities for a number of other federal agencies, much like the Dodd-Frank Act tasks FRB IG with the oversight of CFPB. Our report stated that such consolidation would serve to enhance the overall independence, economy, efficiency, and effectiveness of the IG community. We also stated that consolidation of IG offices would serve to strengthen the ability of IGs to improve the allocation of human and financial resources. Our report added that any weaknesses associated with IG consolidation could be mitigated by providing an IG presence at each agency to plan oversight and provide adequate audit coverage. Therefore, the Federal Reserve IG would be expected to maintain a presence at CFPB to provide adequate oversight. Also, as our report explains, this type of consolidation is already being applied across the government with examples of the State Department IG providing oversight for the Broadcasting Board of Governors; the Agency for International Development IG providing oversight of the Overseas Private Investment Corporation and the Millennium Challenge Corporation; and the Transportation IG providing oversight of the National Transportation Safety Board. In addition, our report recommended that the Congress consider elevating the FRB IG to appointment by the President with Senate confirmation rather than appointment by the FRB Chairman .

Finally, table 1 [Table 4] responds to Rep. Huizenga's question on the usage of broad-based emergency lending facilities by entities with a foreign parent company. As I testified, the use by U.S. branches and agencies of foreign-owned banks varied by program. While there are eight broad-based programs, not all were used by entities owned by a foreign-parent company. The dollar swap lines were used by foreign central banks, for example.

Table 1: Lending to Entities with a Foreign Parent Company as a Percentage of the Total Dollar Transaction Amount for Each Broad-Based Emergency Facility

Facility Name	Percent of Total Lending
Asset-Backed Commercial Paper Money Market Mutual Fund Liquidity Facility (AMLF)	0.1%
Commercial Paper Funding Facility (CPFF)	59.5
Money Market Investor Funding Facility (MMIFF)	N/A ^a
Primary Dealer Credit Facility (PDCF)	7.5
Term Asset-Backed Securities Loan Facility (TALF)	See note
Term Auction Facility (TAF)	64.6
Term Securities Lending Facility (TSLF)	51.0

Source: GAO analysis of Federal Reserve Bank of New York data

^aMMIFF was never used.

Note: The Federal Reserve Board's analysis of TALF showed that while the majority of the U.S. companies that received TALF loans had U.S. domiciled material investors, 36 percent had one or more non-U.S. domiciled "material investors." A "material investor" was defined as an investor who owned, directly or indirectly, an interest in any class of securities of a borrower that was greater than or equal to a 10 percent interest in such outstanding class of securities.

Table 4

STATEMENTS

STATEMENT FOR THE RECORD
HON. RON PAUL
REPRESENTATIVE, 14TH DISTRICT OF TX
CHAIRMAN, SUBCOMMITTEE ON
DOMESTIC MONETARY POLICY & TECHNOLOGY
U.S. HOUSE OF REPRESENTATIVES

In his 1974 Nobel Prize address, the late Austrian economist Friedrich von Hayek attacked the pretense of knowledge, the idea that policymakers have sufficient knowledge and power to shape society as they wish. Our political leaders failed to take Hayek's message to heart, as succeeding generations have continued to allow this intellectual arrogance to continue unabated. Just as the New Mandarins squandered America's wealth, resources, and young men during the 1960s, today's economic Mandarins seem hell-bent on destroying every last vestige of the free market and driving the economy into ruin. Congress has abdicated its oversight over these "expert" economists at the Federal Reserve, to the detriment of the economic well-being of the American people. Despite overwhelming grassroots support behind auditing the Fed, only incremental progress has been made toward unmasking the Federal Reserve's activities. Full transparency of the Fed's operations remains an elusive goal, but one towards which I intend to devote my remaining time in Congress.

The Fed has been given a monopoly by Congress to conduct monetary policy, and in so doing it tinkers with the most important price of all, the rate of interest. Interest rates reflect the price of time, and changes in the interest rate affect the structure of production. Forcing changes to the interest rate, as the Fed does, has a more pronounced effect on the economy than any law Congress has ever passed. Interest rates are used by individuals to make decisions

about what type of investments they undertake, how much money they invest, and for how long. The higher the interest rate, the more likely an individual is to save money; the lower the interest rate, the less likely he is to save. Borrowers take the interest rate into account when borrowing money to buy a house, pay college tuition, or start or expand a business. The lower the interest rate, the cheaper it becomes to borrow money and the more likely individuals are to borrow; the higher the interest rate, the less likely they are to borrow. In a free market, some people will want to save while others will want to borrow, and the interest rate is the price that coordinates the actions of borrowers and savers.

Manipulating the interest rate as the Federal Reserve does causes an enormous ripple effect throughout the economy. Most people do not think about how interest rates came to be, they merely make their economic calculations and decisions based on what the prevailing rate of interest is. Every day people go to work, buy and sell goods, and move their money in and out of the banking system. The isolated actions undertaken by individuals combine to create the market. The market is a truly awesome thing which most of us take for granted. No one marvels that bananas and oranges are available in supermarkets year-round, that cars from Germany and Japan travel our roads, or that our houses have electric lighting and indoor plumbing. Yet it was the actions of millions of people, each acting in his own self-interest and without any knowledge of how his actions might affect other people down the road, that resulted in each of those things happening. When government begins to interfere in that process, it leads to all sorts of problems.

As we meet here in this hearing room, the Federal Reserve is engaging in the second coming of Operation Twist, attempting to force already-low interest rates even lower. This crisis was begun because of the Federal Reserve's low interest rate policy which distorted the economy by shuttling resources and investment that would have been better allocated elsewhere into the housing sector. Instead of recognizing the futility of trying to inflate our way to prosperity with artificially low interest rates, and allowing the interest rates to reset to a true, market-determined rate, and allowing prices to fall so as to allow malinvested resources to be put to better use, the Fed repeated the mistakes of the past by pumping more money into the economy. With an official inflation rate of nearly four percent, interest rates on savings accounts of well less than one percent, and a stock market that has stagnated over the past three years, there is no incentive whatsoever for consumers to

save or invest. Money sitting in the bank a year ago would have lost nearly four percent of its value by now, money invested in the stock market just as much, and money invested in Treasury bonds over one and a quarter percent. Is it any wonder that people have decided to consume rather than to save?

Savings and investment are required for economic growth, deferring present consumption in the hopes of gaining some greater future consumption. Imagine savings and investment in terms of wheat. Most of the wheat that is grown will be consumed after harvest, but a small amount will have to be saved for seed, in order to grow next year's crop. The more that is able to be saved for seed, the larger the crop will be in future years, enabling increased wheat consumption. What the Federal Reserve's actions are telling people is: don't save, there is no need. Consume that seed and don't worry about the future. And that is what this country has been doing for years. Capital is being consumed through the government's spurring of consumption, encouraging people to take on debt to fund frivolous spending and failing not only to increase present capital but also failing to replenish capital that is used up in the production process.

This all leads us to the need for Federal Reserve transparency. Congressional oversight of the Fed amounts to about twelve hours of hearings per year, and that's as far as it goes. Of those twelve hours, no more than five or ten minutes goes to any one Congressman, who has the opportunity to ask at most one question of Chairman Bernanke every six months. To claim that this is effective oversight is laughable. Even the increased amount of data disclosure mandated by the Dodd-Frank Act, a relative sea change, is only due to be released two years after the fact. The legislative cycle in Congress is so fast that many of us up here do not even remember what took place two weeks ago, let alone two years ago. Trying to set up a hearing such as this one requires weeks, if not months, of advance planning. To imagine that two years after the fact Congress will really seek to dig into the details of the Federal Reserve's lending activities defies common sense. Two years ago the Fed was already well into its first round of quantitative easing, it has since completed a second round, and it is now embarking on a third intervention into bond markets.

Attempting to audit the Fed through passage of new legislation is time-consuming as well. It took nearly a year and a half of effort to enact the few measures that made it into the Dodd-Frank Act. And this year my Audit the Fed bill has been referred, not to the Financial Services Committee as Fed audit bills have been for 40+ years, but to

the Oversight and Government Reform Committee. While I am hopeful that Chairman Issa will act on that bill, which has over 180 cosponsors, time is quickly slipping away for this Congress to act.

While the Federal Reserve is not fully transparent, what is transparent are the effects the Fed's policy actions have on everyday people. A young couple is thrilled that interest rates are at historic lows so they take out a mortgage in order to buy the house they had always wanted. But as the Fed continues to print money in order to suppress interest rates, the price of food and heating begins to rise. Expenses rise faster than their paycheck, and they find themselves falling behind on their mortgage and eventually face foreclosure. Or imagine the elderly retiree dependent on Social Security and a small amount of savings. She has not received a cost of living increase to her Social Security in years, despite the ever-increasing cost of food and health care. Extended low interest rates mean that her savings account earns almost no interest each year, so her savings are rapidly depleting. She fears that within a couple of years she may be left with no money and no way to support herself. And then there is the single mother who has been laid off from work for the past 18 months because the rising prices of production inputs caused by the Fed's inflationary monetary policy forced her employer to downsize the company in order to reduce costs. And with prices for the company's finished goods continuing to rise as the Fed continues pumping new money into the economy, consumer demand has dropped, making it all the more likely that her company will never be able to rehire her.

But rest assured, the Fed tells us, as long as the bankers are doing alright, everything will be fine. Indeed, the banks do appear to be doing fine. Flush with cash and receiving interest payments from the Fed on their excess reserves, the financial sector has continued to record amazing profits. Every time a new piece of disappointing economic data comes out, we hear renewed cries from Wall Street for more action on the part of the Federal Reserve. Amazingly, some people are complaining that the latest round of \$400 billion in bond purchases is too small. The fact that a \$400 billion operation, equivalent to half the size of the Fed's pre-crisis balance sheet, is considered paltry is a sad indicator of how easily so many Americans are willing to accept big government. Bailouts of the financial sector are the new normal, only now they are conducted covertly through the Fed rather than through Congressional action so as not to arouse public ire as in 2008.

The Federal Reserve is a creature of Congress and should be treated as such, not as an organization exempt from Congressional

oversight. Claims from the Fed and its defenders that a full audit of the Fed would endanger the Fed's independence are an attempt at provoking fears that Congress would directly intervene in the conduct of monetary policy. A bill that sets interest rates would endanger the Fed's independence; a bill that audits the Fed does not. Nowhere in any audit proposals has anyone ever expressed the desire that Congress dictate monetary policy or attempt to set interest rates. Congress does not have this power, nor should it, but it is accountable to the people through the ballot box; not so with the Federal Reserve, which tries to remain unaccountable both to Congress and to the American people. Pumping trillions of dollars into the economy with no oversight and accountability cannot be allowed to continue. Audit the Fed now.

WITNESS TESTIMONY

WRITTEN TESTIMONY OF ORICE WILLIAMS BROWN

MANAGING DIRECTOR
FINANCIAL MARKETS AND COMMUNITY INVESTMENT
GOVERNMENT ACCOUNTABILITY OFFICE

FEDERAL RESERVE SYSTEM: OPPORTUNITIES EXIST TO STRENGTHEN POLICIES AND PROCESSES FOR MANAGING EMERGENCY ASSISTANCE

Highlights of GAO-12-122T, a testimony before the Subcommittee on Domestic Monetary Policy and Technology, Committee on Financial Services, House of Representatives

Why GAO Did This Study

The Dodd-Frank Wall Street Reform and Consumer Protection Act directed GAO to conduct a one-time audit of the emergency loan programs and other assistance authorized by the Board of Governors of the Federal Reserve System (Federal Reserve Board) during the recent financial crisis. This testimony summarizes the results of GAO's July 2011 report (GAO-11-696) examining the emergency actions taken by the Federal Reserve Board from December 1, 2007, through July 21, 2010. For these actions, where relevant, this statement addresses (1) accounting and financial reporting internal controls; (2) the use, selection, and payment of vendors; (3) management of conflicts of interest; (4) policies in place to secure loan repayment; and (5) the treatment of program participants. To meet these objectives, GAO reviewed program documentation, analyzed

program data, and interviewed officials from the Federal Reserve Board and Reserve Banks (Federal Reserve System).

What GAO Recommends

GAO made seven recommendations to the Federal Reserve Board to strengthen policies for managing noncompetitive vendor selections, conflicts of interest, risks related to emergency lending, and documentation of emergency program decisions. The Federal Reserve Board agreed that GAO's recommendations would benefit its response to future crises and agreed to strongly consider how best to respond to them.

What GAO Found

On numerous occasions in 2008 and 2009, the Federal Reserve Board invoked emergency authority under the Federal Reserve Act of 1913 to authorize new broad-based programs and financial assistance to individual institutions to stabilize financial markets. Loans outstanding for the emergency programs peaked at more than \$1 trillion in late 2008. The Federal Reserve Board directed the Federal Reserve Bank of New York (FRBNY) to implement most of these emergency actions. In a few cases, the Federal Reserve Board authorized a Reserve Bank to lend to a limited liability corporation (LLC) to finance the purchase of assets from a single institution. In 2009 and 2010, FRBNY also executed large-scale purchases of agency mortgage-backed securities to support the housing market. The Reserve Banks' and LLCs' financial statements, which include the emergency programs' accounts and activities, and their related financial reporting internal controls, are audited annually by an independent auditing firm. These independent financial statement audits, as well as other audits and reviews conducted by the Federal Reserve Board, its Inspector General, and the Reserve Banks' internal audit function, did not report any significant accounting or financial reporting internal control issues concerning the emergency programs.

The Reserve Banks, primarily FRBNY, awarded 103 contracts worth \$659.4 million from 2008 through 2010 to help carry out their emergency activities. A few contracts accounted for most of the spending on vendor services. For a significant portion of the fees, program recipients reimbursed the Reserve Banks or the fees were paid from program income. The Reserve Banks relied more extensively on vendors for programs that assisted a single institution than for broad-based programs. Most of the contracts, including 8 of the 10 highest-value contracts, were awarded noncompetitively,

primarily due to exigent circumstances. These contract awards were consistent with FRBNY's acquisition policies, but the policies could be improved by providing additional guidance on the use of competition exceptions, such as seeking as much competition as practicable and limiting the duration of noncompetitive contracts to the exigency period. To better ensure that Reserve Banks do not miss opportunities to obtain competition and receive the most favorable terms for services acquired, GAO recommended that they revise their acquisition policies to provide such guidance.

FRBNY took steps to manage conflicts of interest for its employees, directors, and program vendors, but opportunities exist to strengthen its conflict policies. In particular, FRBNY expanded its guidance and monitoring for employee conflicts, but new roles assumed by FRBNY and its employees during the crisis gave rise to potential conflicts that were not specifically addressed in the Code of Conduct or other FRBNY policies. For example, FRBNY's existing restrictions on its employees' financial interests did not specifically prohibit investments in certain nonbank institutions that received emergency assistance. To manage potential conflicts related to employees' holdings of such investments, FRBNY relied on provisions in its code that incorporate requirements of a federal criminal conflict of interest statute and its regulations. Given the magnitude of the assistance and the public's heightened attention to the appearance of conflicts related to Reserve Banks' emergency actions, existing policies and procedures for managing employee conflicts may not be sufficient to avoid the appearance of a conflict in all situations. As the Federal Reserve System considers revising its conflict policies given its new authority to regulate certain nonbank institutions, GAO recommended it consider how potential conflicts from emergency lending could inform any changes. FRBNY managed vendor conflict issues through contract protections and actions to help ensure compliance with relevant contract provisions, but these efforts had limitations. For example, while FRBNY negotiated important contract protections, it lacked written guidance on protections that should be included to help ensure vendors fully identify and remediate conflicts. Further, FRBNY's on-site reviews of vendor compliance in some instances occurred as far as 12 months into a contract. FRBNY implemented a new vendor management policy but has not yet finalized another new policy with comprehensive guidance on vendor conflict issues. GAO recommended FRBNY finalize this new policy to reduce the risk that vendors may not be required to take steps to fully identify and mitigate all conflicts.

While the Federal Reserve System took steps to mitigate risk of losses on its emergency loans, opportunities exist to strengthen risk management practices for future crisis lending. The Federal Reserve Board approved program terms and conditions designed to mitigate risk of losses and one or more Reserve Banks were responsible for managing such risk for each program. Reserve Banks required borrowers under several programs to post collateral in excess of the loan amount. For programs that did not have this requirement, Reserve Banks required borrowers to pledge assets with high credit ratings as collateral. For loans to specific institutions, Reserve Banks negotiated loss protections with the private sector and hired vendors to help oversee the portfolios that collateralized loans. The emergency programs that have closed have not incurred losses and FRBNY does not project any losses on its outstanding loans. To manage risks posed by these new lending activities, Reserve Banks implemented new controls and FRBNY strengthened its risk management function. In mid-2009, FRBNY created a new risk management division and enhanced its risk analytics capabilities. But neither FRBNY nor the Federal Reserve Board tracked total exposure and stressed losses that could occur in adverse economic scenarios across all emergency programs. Further, the Federal Reserve System's procedures for managing borrower risks did not provide comprehensive guidance for how Reserve Banks should exercise discretion to restrict program access for higher-risk borrowers that were otherwise eligible for the Term Auction Facility (TAF) and emergency programs for primary dealers. To strengthen practices for managing risk of losses in the event of a future crisis, GAO recommended that the Federal Reserve System document a plan for more comprehensive risk tracking and strengthen procedures to manage program access for higher-risk borrowers.

While the Federal Reserve System took steps to promote consistent treatment of eligible program participants, it did not always document processes and decisions related to restricting access for some institutions. Reserve Banks generally offered assistance on the same terms to institutions that met announced eligibility requirements. For example, all eligible borrowers generally could borrow at the same interest rate and against the same types of eligible collateral. Because Reserve Banks lacked specific procedures that staff should follow to exercise discretion and document actions to restrict higher-risk eligible borrowers for a few programs, the Federal Reserve System lacked assurance that Reserve Banks applied such restrictions consistently. Also, the Federal Reserve Board did not

fully document its justification for extending credit on terms similar to the Primary Dealer Credit Facility (PDCF) to affiliates of a few PDCF-eligible institutions and did not provide written guidance to Reserve Banks on types of program decisions that would benefit from consultation with the Federal Reserve Board. In 2009, FRBNY allowed one entity to continue to issue to the Commercial Paper Funding Facility, even though a change in program terms by the Federal Reserve Board likely would have made it ineligible. FRBNY staff said they consulted the Federal Reserve Board regarding this situation, but did not document this consultation and did not have any formal guidance as to whether such continued use required approval by the Federal Reserve Board. To better ensure an appropriate level of transparency and accountability for decisions to extend or restrict access to emergency assistance, GAO recommended that the Federal Reserve Board set forth its process for documenting its rationale for emergency authorizations and document its guidance to Reserve Banks on program decisions that require consultation with the Federal Reserve Board.

[Testimony]

Chairman Paul, Ranking Member Clay, and Members of the Subcommittee:

Thank you for the opportunity to discuss our work on the emergency assistance the Federal Reserve System provided to certain financial markets and financial institutions during the financial crisis that began in summer 2007.³⁴¹ From late 2007 through mid-2010, Reserve Banks provided more than a trillion dollars in emergency loans to the financial sector to address strains in credit markets and to avert failures of individual institutions believed to be a threat to the stability of the financial system. The scale and nature of this assistance amounted to an unprecedented expansion of the Federal Reserve System's traditional role as lender-of-last-resort to depository institutions. In March 2008, the Federal Reserve Board cited "unusual and exigent circumstances" in invoking its emergency authority under section 13(3) of the Federal Reserve Act of 1913 to authorize a Reserve Bank to extend credit to nondepository

³⁴¹ The Federal Reserve System consists of the Board of Governors of the Federal Reserve System—a federal agency—and 12 regional Reserve Banks. For this testimony, I use Federal Reserve Board to refer to the federal agency and Federal Reserve System to refer collectively to the federal agency and one or more of the Reserve Banks.

institutions. For the first time since the Great Depression, a Reserve Bank extended credit under this authority. The Federal Reserve Board would invoke this authority on three other occasions within that month and on several occasions in late 2008 when the failure of Lehman Brothers Holdings Inc. (Lehman Brothers) triggered a severe intensification of the financial crisis.³⁴² The Federal Reserve Bank of New York (FRBNY), which operated most of these programs under authorization from the Federal Reserve Board, faced a number of unique operational challenges related to implementation and oversight for numerous emergency programs, many of which required large vendor procurements to fill gaps in Federal Reserve System expertise. To date, most of the Reserve Banks' emergency loans have been repaid, and FRBNY projects repayment on all outstanding loans.

My statement today is based on our July 2011 report.³⁴³ We completed this work in response to a mandate contained in Title XI of the Dodd-Frank Wall Street Reform and Consumer Protection Act. Table 1 [Table 5] lists all programs covered by our review, including the broad-based programs and assistance extended to individual institutions. For these emergency programs or actions, where relevant, I will discuss (1) the Reserve Banks' controls over financial reporting and accounting; (2) the Reserve Banks' policies and practices for the use, selection, and payment of vendors; (3) the effectiveness of policies and practices for identifying and managing conflicts of interest for Reserve Bank employees, Reserve Bank vendors, and members of Reserve Banks' boards of directors; (4) the effectiveness of security and collateral policies in place to mitigate risk of losses; and (5) the extent to which program implementation resulted in consistent and equitable treatment of eligible participants.

³⁴² Lehman Brothers was an investment banking institution that offered equity, fixed-income, trading, investment banking, asset management, and other financial services. According to the bankruptcy examiner appointed by the bankruptcy court, Lehman Brothers originated mortgages, securitized them, and then sold the securitized assets. Although headquartered in New York, Lehman Brothers operated globally. Lehman Brothers had \$639 billion in total assets and \$613 billion in total debts as of May 31, 2008, the date of its last audited financial statements.

³⁴³GAO, *Federal Reserve System: Opportunities Exist to Strengthen Policies and Processes for Managing Emergency Assistance*, GAO-11-696 (Washington, D.C.: July 21, 2011).

Table 1: List of Federal Reserve Emergency Programs and Assistance Covered by Our Review

Programs and Assistance	Description	Reserve Bank
Broad-based programs		
Term Auction Facility (Dec. 12, 2007)	Auctioned one-month and three-month discount window loans to eligible depository institutions	All 12 Reserve Banks
Dollar Swap Lines (Dec. 12, 2007)	Exchanged dollars with foreign central banks for foreign currency to help address disruptions in dollar funding markets abroad	FRBNY
Term Securities Lending Facility (Mar. 11, 2008)	Auctioned loans of U.S. Treasury securities to primary dealers against eligible collateral	FRBNY
Primary Dealer Credit Facility (Mar. 16, 2008)	Provided overnight cash loans to primary dealers against eligible collateral	FRBNY ^a
Asset-Backed Commercial Paper Money Market Mutual Fund Liquidity Facility (Sept. 19, 2008)	Provided loans to depository institutions and their affiliates to finance purchases of eligible asset-backed commercial paper from money market mutual funds	Federal Reserve Bank of Boston
Commercial Paper Funding Facility (Oct. 7, 2008)	Provided loans to a special-purpose vehicle to finance purchases of new issues of asset-backed commercial paper and unsecured commercial paper from eligible issuers	FRBNY
Money Market Investor Funding Facility (Oct. 21, 2008, but never used)	Created to finance the purchase of eligible short-term debt obligations held by money market mutual funds	FRBNY

Table 5

Programs and Assistance	Description	Reserve Bank
Term Asset-Backed Securities Loan Facility (Nov. 25, 2008)	Provided loans to eligible investors to finance purchases of eligible asset-backed securities	FRBNY
Assistance to individual institutions		
Bear Stearns Companies, Inc. acquisition by JP Morgan Chase & Co.		
Bridge Loan (Mar. 14, 2008)	Overnight loan provided to JP Morgan Chase & Co. bank subsidiary, with which this subsidiary made a direct loan to Bear Stearns Companies, Inc.	FRBNY
Maiden Lane (Mar. 16, 2008)	Special purpose vehicle created to purchase approximately \$30 billion of Bear Stearns's mortgage-related assets	FRBNY
American International Group, Inc. (AIG)		
Revolving Credit Facility (Sept. 16, 2008)	Revolving loan for the general corporate purposes of AIG and its subsidiaries, and to pay obligations as they came due	FRBNY
Securities Borrowing Facility (Oct. 8, 2008)	Provided collateralized cash loans to reduce pressure on AIG to liquidate residential mortgage-backed securities (RMBS) in its securities lending portfolio	FRBNY
Maiden Lane II (Nov. 10, 2008)	Special purpose vehicle created to purchase residential mortgage-backed securities from the securities lending portfolios of AIG subsidiaries	FRBNY
Maiden Lane III (Nov. 10, 2008)	Special purpose vehicle created to purchase collateralized debt obligations on which AIG Financial Products had written credit default swaps	FRBNY
Life Insurance Securitization (March 2, 2009, but never used)	Authorized to provide credit to AIG that would be repaid with cash flows from its life insurance businesses	FRBNY

Credit extensions to affiliates of some primary dealers <i>(Sept. 21, 2008)</i>	Loans provided to broker-dealer affiliates of four primary dealers on terms similar to those for Primary Dealer Credit Facility	FRBNY
Citigroup lending commitment <i>(Nov. 23, 2008)</i>	Commitment to provide nonrecourse loan to Citigroup against ring-fence assets if losses on asset pool reached \$56.2 billion	FRBNY
Bank of America lending commitment <i>(Jan. 16, 2009)</i>	Commitment to provide nonrecourse loan facility to Bank of America if losses on ring-fence assets exceeded \$18 billion (agreement never finalized)	Federal Reserve Bank of Richmond
Open market operations		
Agency Mortgage-Backed Securities Purchase Program <i>(Nov. 25, 2008)</i>	Purchased agency mortgage-backed securities to provide support to mortgage and housing markets and to foster improved conditions in the financial markets more generally	FRBNY

Source: GAO summary of Federal Reserve Board documents.

Note: Dates in parentheses are the program announcement dates. On October 3, 2008, the Federal Reserve Board authorized the Direct Money Market Mutual Fund Lending Facility (DMLF) and rescinded this authorization one week later. DMLF was not implemented.

³PDCF was administered by FRBNY with operational assistance provided by the Federal Reserve Banks of Atlanta and Chicago.

To conduct the work for our report, we reviewed documentation supporting the Federal Reserve Board's authorizations for the emergency programs, Federal Reserve System documents and press releases describing the purpose of the programs, and other relevant program documentation, including announced terms and conditions. To assess Reserve Banks' controls over financial reporting and accounting, we developed an audit strategy designed to leverage, to the extent possible, the audit work specific to the emergency programs performed by the Federal Reserve System's external and internal auditors. For example, we reviewed the external auditor's key audit documentation including audit strategy, planning, and accounting memoranda; internal control and account balance testing audit procedures and results; and summary memoranda. We evaluated the quality of this documentation against relevant auditing standards. To evaluate the Reserve Banks' policies and practices for the use, selection, and payment of vendors, we analyzed Reserve Banks' acquisition policies and guidance, vendor contracts, and vendor payment information. To evaluate the effectiveness of Reserve Bank policies and practices for managing conflicts of interest, we reviewed relevant Reserve Bank policies, including FRBNY's Code of Conduct, and relevant statutory prohibitions on conflicts of interest that apply to federal government and Federal Reserve System employees and federal government guidance for agencies' management of employee conflicts of interest. To assess the effectiveness of security and collateral policies in place to mitigate risk of losses, we reviewed relevant documentation to identify key features of security and collateral policies and determine how these policies were designed to mitigate risk of losses for each emergency program. We obtained and analyzed documentation of steps taken by the Reserve Banks to develop risk governance structures and practices needed to manage the risks associated with the emergency programs. To examine the extent to which program implementation resulted in consistent and equitable treatment of eligible participants, we reviewed and analyzed documentation of the basis for the Federal Reserve Board's decisions about which types of institutions would be eligible to participate in the emergency programs. To determine the extent to which the Reserve Banks offered the same terms and conditions to all participants, which for some programs included financial institutions affiliated with Reserve Bank directors, we reviewed documentation of program terms and conditions and obtained and analyzed program transaction data. For parts of our methodology that involved the analysis of computer-processed data, we assessed the reliability of these data and

determined that they were sufficiently reliable for our purposes. For all objectives, we interviewed staff at the Federal Reserve Board, FRBNY, the Federal Reserve Bank of Boston, and the Federal Reserve Bank of Richmond.

The work on which this statement is based was conducted from August 2010 through July 2011 in accordance with generally accepted government auditing standards. Those standards require that we plan and perform the audit to obtain sufficient, appropriate evidence to provide a reasonable basis for our findings and conclusions based on our audit objectives. We believe that the evidence obtained provides a reasonable basis for our findings and conclusions based on our audit objectives.

Background

The Federal Reserve Act of 1913 established the Federal Reserve System as the country's central bank. The Federal Reserve System consists of the Federal Reserve Board located in Washington, D.C.; 12 Reserve Banks, which have 24 branches located throughout the nation; and the Federal Open Market Committee (FOMC), which is responsible for directing open market operations to influence the total amount of money and credit available in the economy. Each Reserve Bank is a federally chartered corporation with a board of directors. The Federal Reserve Act authorizes the Reserve Banks to make discount window loans, execute monetary policy operations at the direction of the FOMC, and examine bank holding companies and member banks under rules and regulations prescribed by the Federal Reserve Board, among other things.

The Federal Reserve Board and the Reserve Banks are self-funded entities that deduct their expenses from their revenue and transfer the remaining amount to Treasury.³⁴⁴ Federal Reserve System revenues transferred to Treasury have increased substantially in recent years, chiefly as a result of interest income earned from the Federal Reserve System's large-scale emergency programs. To the extent that Reserve Banks suffer losses on emergency loans, these losses would be deducted from the excess earnings transferred to Treasury.

Between late 2007 and early 2009, the Federal Reserve Board created more than a dozen new emergency programs to stabilize financial

³⁴⁴ These excess earnings remitted to Treasury consist of Reserve Bank earnings after providing for operating expenditures, capital paid out in dividends to banks that are members of the Federal Reserve System, and an amount reserved by Reserve Banks to equate surplus with capital paid in.

markets and provided financial assistance to avert the failures of a few individual institutions. The Federal Reserve Board authorized most of this emergency assistance under emergency authority contained in section 13(3) of the Federal Reserve Act.³⁴⁵ Three of the programs covered by this review—the Term Auction Facility, the dollar swap lines with foreign central banks, and the Agency Mortgage-Backed Securities Purchase Program—were authorized under other provisions of the Federal Reserve Act that do not require a determination that emergency conditions exist, although the swap lines and the Agency MBS program did require authorization by the FOMC. In many cases, the decisions by the Federal Reserve Board, the FOMC, and the Reserve Banks about the authorization, initial terms of, or implementation of the Federal Reserve System’s emergency assistance were made over the course of only days or weeks as the Federal Reserve Board sought to act quickly to address rapidly deteriorating market conditions. FRBNY implemented most of these emergency activities under authorization from the Federal Reserve Board. In a few cases, the Federal Reserve Board authorized FRBNY to lend to a limited liability corporation (LLC) to finance the purchase of assets from a single institution. The LLCs created to assist individual institutions were Maiden Lane, Maiden Lane II, and Maiden Lane III. In 2009, FRBNY, at the direction of the FOMC, began large-scale purchases of mortgage-backed securities (MBS) issued by the housing government-sponsored enterprises, Fannie Mae and Freddie Mac, or guaranteed by Ginnie Mae.³⁴⁶ Purchases of these agency MBS were intended to provide support to the mortgage and housing markets and to foster improved conditions in financial markets more generally. Most of the Federal Reserve Board’s broad-based emergency programs closed on February 1, 2010. Figure 1 [

Figure 38] provides a timeline for the establishment, modification, and termination of Federal Reserve System emergency programs subject to this review.

³⁴⁵ At the time of these authorizations, section 13(3) allowed the Federal Reserve Board, in “unusual and exigent circumstances,” to authorize any Reserve Bank to extend credit in the form of a discount to individuals, partnerships, or corporations when the credit was indorsed or otherwise secured to the satisfaction of the Reserve Bank, after obtaining evidence that the individual, partnership, or corporation was unable to secure adequate credit accommodations from other banking institutions. As a result of amendments to section 13(3) made by the Dodd-Frank Act, the Federal Reserve Board can now authorize 13(3) lending only through programs or facilities with broad-based eligibility.

³⁴⁶ Mortgage-backed securities are securities that represent claims to the cash flows from pools of mortgage loans, such as mortgages on residential property.

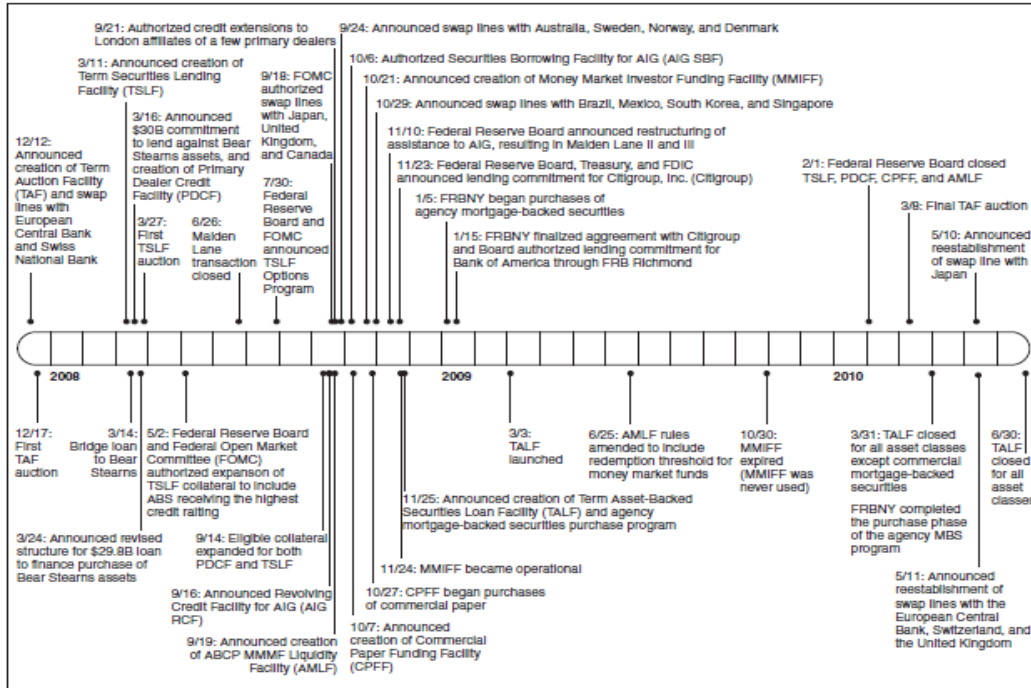

Figure 38

The Federal Reserve System and Its Emergency Activities Were Subject to Multiple Audits and Reviews

The Reserve Banks' and LLCs' financial statements, which include the emergency programs' accounts and activities, and their related financial reporting internal controls, are audited annually by an independent auditing firm. In addition, the Federal Reserve System has a number of internal entities that conduct audits and reviews of the Reserve Banks, including the emergency programs. As shown in figure 2 [Figure 39], these other audits and reviews were conducted by the Federal Reserve Board's Division of Reserve Bank Operations and Payment Systems (RBOPS), the Federal Reserve Board's Office of Inspector General, and individual Reserve Bank's internal audit function. The independent financial statement audits and other reviews did not identify significant accounting or financial reporting internal control issues concerning the emergency programs.

Figure 39

Reserve Banks Would Benefit From Strengthening Guidance for Noncompetitive Contracts Awarded in Exigent Circumstances

Reserve Banks Relied Extensively on Vendors to Establish and Operate the Emergency Programs, Particularly Those Designed to Assist Single Institutions

From 2008 through 2010, vendors were paid \$659.4 million across 103 contracts to help establish and operate the Reserve Banks' emergency programs. The 10 largest contracts accounted for 74 percent of the total amount paid to all vendors. FRBNY was responsible for creating and operating all but two emergency programs and assistance and therefore awarded nearly all of the contracts.³⁴⁷ See table 2 for the total number and value of contracts for the emergency programs and assistance.

As shown in table 2 [Table 6], the Reserve Banks relied on vendors more extensively for programs that assisted single institutions than for broad-based emergency programs. The assistance provided to individual institutions was generally secured by existing assets that either belonged to or were purchased from the institution, its subsidiaries, or counterparties.³⁴⁸ The Reserve Banks did not have sufficient expertise available to evaluate these assets and therefore used vendors to do so. For example, FRBNY used a vendor to evaluate divestiture scenarios associated with the assistance to AIG. It also hired vendors to manage assets held by the Maiden Lanes. For the broad-based emergency programs, FRBNY hired vendors primarily for transaction-based services and collateral monitoring. Under these programs, the Reserve Banks purchased assets or extended loans in accordance with each program's terms and conditions. Because of this, the services that vendors provided for these programs were focused more on assisting with transaction execution than analyzing and managing securities, as was the case for the single institution assistance.

³⁴⁷ The Federal Reserve Bank of Boston entered into a single \$25,000 contract for AMLF and the Federal Reserve Bank of Richmond entered into three contracts totaling \$22.8 million for the Bank of America ring-fencing agreement.

³⁴⁸ Any loans made under the Bank of America or Citigroup ring-fencing agreements were to be secured by specified pools of assets belonging to each institution. However, no loans were extended under the programs.

Table 2: Number of Contracts and Fees Paid, By Emergency Program, Calendar Years 2008–2010

Dollars in millions			
	Program	Number of contracts ^a	Total fees paid

	Bank of America lending commitment	3	22.8
	Citigroup lending commitment	3	21.4
	Maiden Lane (Bear Stearns)	42	158.4
	Maiden Lane II (AIG)	9	27.9
	Maiden Lane III (AIG)	12	57.0
	General ^b	4	4.5
Total		103	\$659.4

Source: GAO analysis of Reserve Bank data.

Note: Reserve Bank programs and assistance listed include only those for which the Reserve Banks used vendors. See figure 1 for abbreviations of program names.

^aBecause some contracts included work on multiple programs, the sum of the contracts for each program is greater than the 103 total contracts identified in the table. Also, 36 subvendors were paid \$3.3 million for the three Maiden Lane programs, CPFF, and TALF. The table does not include fees for subcontracts.

^bOf the four general contracts, two were for advisory services related to how FRBNY managed the emergency programs overall. The other two included work on multiple programs, but FRBNY could not separate out what proportion of the total fees was assigned to each program.

Table 6

Reserve Banks Awarded Largest Contracts Noncompetitively and Would Benefit From Additional Guidance on Seeking Competition

Most of the contracts, including 8 of the 10 highest-value contracts, were awarded noncompetitively, primarily due to exigent circumstances. These contract awards were consistent with FRBNY's existing acquisition policy, which applied to all services associated with the emergency programs and single-institution assistance.³⁴⁹ Under FRBNY policy, noncompetitive processes can be used in special circumstances, such as when a service is available from only one vendor or in exigent circumstances. FRBNY cited exigent circumstances for the majority of the noncompetitive contract awards.³⁵⁰ FRBNY officials said that the success of a program was often dependent on having vendors in place quickly to begin setting up the operating framework for the program. FRBNY's policy did not provide additional guidance on the use of competition exceptions, such as seeking as much competition as practicable and limiting the duration of noncompetitive contracts to the exigency period. To better ensure that Reserve Banks do not miss opportunities to obtain competition and receive the most favorable terms for services acquired, we recommended that they revise their acquisition policies to provide such guidance.

Vendor Fees Generally Came from Program Income or Participants

From 2008 through 2010, vendors were paid \$659.4 million through a variety of fee structures. For a significant portion of the fees, program recipients reimbursed the Reserve Banks or the fees were paid from program income. The Reserve Banks generally used traditional market conventions when determining fee structures. For example, investment managers were generally paid a percentage of the portfolio value and law firms were generally paid an hourly rate. Fees for these contracts were subject to negotiation between the Reserve Banks and vendors. For some of the large contracts that were awarded noncompetitively, FRBNY offered vendors a series of counterproposals and was able to negotiate lower fees than initially proposed.

³⁴⁹ FRBNY is a private corporation and not subject to the Federal Acquisition Regulation.

³⁵⁰ Of the noncompetitive contracts we reviewed, FRBNY awarded three under the sole-source exception, when a service was available from only one vendor.

Opportunities exist to strengthen conflict policies for employees, directors, and program vendors

During the crisis, FRBNY took steps to manage conflicts of interest related to emergency programs for its employees, program vendors, and members of its Board of Directors, but opportunities exist to strengthen its conflicts policies.

During the Crisis, FRBNY Expanded Its Efforts to Manage Employee Conflicts

Historically, FRBNY has managed potential and actual conflicts of interest for its employees primarily through enforcement of its Code of Conduct, which outlines broad principles for ethical behavior and specific restrictions on financial interests and other activities, such as restrictions on employees' investments in depository institutions and bank holding companies, and incorporates the requirements of a federal criminal statute and its regulations. During the crisis, FRBNY expanded its guidance and monitoring for employee conflicts. However, while the crisis highlighted the potential for Reserve Banks to provide emergency assistance to a broad range of institutions, FRBNY has not yet revised its conflict policies and procedures to more fully reflect potential conflicts that could arise with this expanded role. For example, specific investment restrictions in FRBNY's Code of Conduct continue to focus on traditional Reserve Bank counterparties—depository institutions or their affiliates and the primary dealers—and have not been expanded to further restrict employees' financial interests in certain nonbank institutions that have participated in FRBNY emergency programs and could become eligible for future ones, if warranted. Given the magnitude of the assistance and the public's heightened attention to the appearance of conflicts related to Reserve Banks' emergency actions, existing policies and procedures for managing employee conflicts may not be sufficient to avoid the appearance of a conflict in all situations. During our review, Federal Reserve Board and FRBNY staff told us that the Federal Reserve System plans to review and update the Reserve Banks' Codes of Conduct as needed given the Federal Reserve System's recently expanded role in regulating systemically significant financial institutions. In light of this ongoing effort, we recommended that the Federal Reserve System consider how potential conflicts from emergency lending could inform any changes.

FRBNY Primarily Used Contract Protections to Manage Risks Related to Vendor Conflicts, and the Lack of a Comprehensive Policy Created Certain Limitations

FRBNY managed risks related to vendor conflicts of interest primarily through contract protections and oversight of vendor compliance with these contracts, but these efforts have certain limitations. For example, while FRBNY's Legal Division negotiated contract provisions intended to help ensure that vendors took appropriate steps to mitigate conflicts of interest related to the services they provided for FRBNY, FRBNY lacked written guidance on protections that should be included to help ensure vendors fully identify and remediate conflicts. Rather than requiring written conflict remediation plans that were specific to the services provided for FRBNY, FRBNY generally reviewed and allowed vendors to rely on their existing enterprisewide policies for identifying conflicts. However, in some situations, FRBNY requested additional program-specific controls be developed. Further, FRBNY's on-site reviews of vendor compliance in some instances occurred as far as 12 months into a contract. In May 2010, FRBNY implemented a new vendor management policy but had not yet finalized more comprehensive guidance on vendor conflict issues. As a result, we recommended that FRBNY finalize this new policy to reduce the risk that vendors may not be required to take steps to fully identify and mitigate all conflicts.

Reserve Bank Directors Are Generally Subject to the Same Conflict Rules as Federal Employees and a Few Directors Played a Limited Role in Risk Oversight of the Programs

Individuals serving on the boards of directors of the Reserve Banks are generally subject to the same conflict-of-interest statute and regulations as federal employees. A number of Reserve Bank directors were affiliated with institutions that borrowed from the emergency programs, but Reserve Bank directors did not participate directly in making decisions about authorizing, setting the terms, or approving a borrower's participation in the emergency programs. Rather FRBNY's Board of Directors assisted the Reserve Bank in helping ensure risks were managed through FRBNY's Audit and Operational Risk Committee.³⁵¹ According to the Federal Reserve

³⁵¹ FRBNY's Audit and Operational Risk Committee, which includes directors, is appointed by its Board of Directors to assist the board in monitoring, (1) the integrity of the financial statements of the Reserve Bank, (2) the Reserve Bank's external auditor's qualifications and independence, (3) the performance of the Reserve Bank's internal audit function and external

Board officials, Reserve Banks granted access to borrowing institutions affiliated with Reserve Bank directors only if these institutions satisfied the proper criteria, regardless of potential director-affiliated outreach or whether the institution was affiliated with a director. Our review of the implementation of several program requirements did not find evidence that would indicate a systemic bias towards favoring one or more eligible institutions.

Opportunities Exist to Strengthen Risk Management Policies and Practices for Future Emergency Programs

The Federal Reserve Board approved key program terms and conditions that served to mitigate risk of losses and delegated responsibility to one or more Reserve Banks for executing each emergency lending program and managing its risk of losses. The Federal Reserve Board's early broad-based lending programs—Term Auction Facility, Term Securities Lending Facility, and Primary Dealer Credit Facility—required borrowers to pledge collateral in excess of the loan amount as well as other features intended to mitigate risk of losses.³⁵² The Federal Reserve Board's broad-based programs launched in late 2008 and early 2009 employed more novel lending structures to provide liquidity support to a broader range of key credit markets. These later broad-based liquidity programs included Asset-Backed Commercial Paper Money Market Mutual Fund Liquidity Facility, Commercial Paper Funding Facility, Money Market Investor Funding Facility, and Term Asset-Backed Securities Loan Facility. These liquidity programs, with the exception of the Term Asset-Backed Securities Loan Facility, did not require overcollateralization. To help mitigate the risk of losses, the Term Asset-Backed Securities Loan Facility, as well as the programs that did not require overcollateralization, accepted only highly-rated assets as collateral. In addition, Commercial Paper Funding Facility, Money Market Investor Funding Facility, and Term Asset-Backed Securities Loan Facility incorporated various security features, such as the accumulation of excess interest and fee income to absorb

auditors, (4) internal controls and the measurement of operational risk, and (5) the compliance by the Reserve Bank with legal and regulatory requirements. The Audit and Operational Risk Committee also assesses the effectiveness of (2), (3), (4), and (5).

³⁵² We use the term "overcollateralized" to refer to Reserve Bank lending for which borrowers were required to pledge collateral in excess of the loan amount. By using this term, we do not intend to suggest that the amount of excess collateral required was inappropriately excessive given the Federal Reserve Board's policy objectives.

losses, to provide additional loss protection. Also, for the assistance to specific institutions, the Reserve Banks negotiated loss protections with the institutions and hired vendors to help oversee the portfolios collateralizing loans. For each of the Maiden Lane transactions, FRBNY extended a senior loan to the LLC and this loan was collateralized by the portfolio of assets held by the LLC. JP Morgan Chase & Co. agreed to take a first loss position of \$1.15 billion for Maiden Lane and AIG agreed to assume a similar first loss position for Maiden Lanes II and III. As of July 2011, most of the Federal Reserve Board's emergency loan programs had closed and all of those that had closed had closed without losses. Moreover, currently, the Federal Reserve Board does not project any losses on FRBNY's outstanding loans to Term Asset-Backed Securities Loan Facility borrowers and the Maiden Lane LLCs.

Opportunities Exist for the Reserve Banks to Continue to Strengthen Policies for Future Emergency Programs

To manage risks posed by the emergency programs, Reserve Banks developed new controls and FRBNY strengthened its risk management practices over time. In particular, FRBNY expanded its risk management function and enhanced its risk reporting and risk analytics capabilities. For example, in summer 2009, FRBNY expanded its risk management capabilities by adding expertise that would come to be organized as two new functions, Structured Products and Risk Analytics. Although FRBNY has improved its ability to monitor and manage risks from emergency lending, opportunities exist for FRBNY and the Federal Reserve System as a whole to strengthen risk management procedures and practices for any future emergency lending. Specifically, neither FRBNY nor the Federal Reserve Board tracked total potential exposures in adverse economic scenarios across all emergency programs. Moreover, the Federal Reserve System's existing procedures lack specific guidance on how Reserve Banks should exercise discretion to restrict or deny program access for higher-risk borrowers that were otherwise eligible for the Term Auction Facility and emergency programs for primary dealers. To strengthen practices for managing risk of losses in the event of a future crisis, we recommended that the Federal Reserve System document a plan for more comprehensive risk tracking and strengthen procedures to manage program access for higher-risk borrowers.

While the Federal Reserve Board Took Steps to Promote Consistent Treatment of Participants, It Lacked Guidance and Documentation for Some Access Decisions

The Federal Reserve Board and the Reserve Banks took steps to promote consistent treatment of eligible program participants and generally offered assistance on the same terms and conditions to eligible institutions in the broad-based emergency programs. However, in a few programs, the Reserve Banks placed restrictions on some participants that presented higher risk but lacked specific guidance to do so. Further, certain Federal Reserve Board decisions to extend credit to certain borrowers were not fully documented.

The Federal Reserve Board Designed Program Eligibility Requirements to Target Assistance to Groups of Institutions Facing Liquidity Strains

The Federal Reserve Board created each broad-based emergency program to address liquidity strains in a particular credit market and designed program eligibility requirements primarily to target significant participants in these markets. The emergency programs extended loans both directly to institutions facing liquidity strains and through intermediary borrowers. For programs that extended credit directly, the Federal Reserve Board took steps to limit program eligibility to institutions it considered to be generally sound. For example, Term Auction Facility loans were auctioned to depository institutions eligible to borrow from the discount window and expected by their local Reserve Bank to remain primary-credit-eligible during the term the Term Auction Facility loan would be outstanding.³⁵³ For programs that provided loans to intermediary borrowers, the Federal Reserve Board based eligibility requirements in part on the ability of borrowing institutions, as a group, to channel sufficient liquidity support to eligible sellers. For example, eligible Term Asset-Backed Securities Loan Facility borrowers included a broad range of institutions ranging from depository institutions to U.S. organized investment funds. Federal Reserve Board officials told us that broad participation in Term Asset-Backed Securities Loan Facility was

³⁵³ The Reserve Banks extend discount window credit to U.S. depository institutions (including U.S. branches and agencies of foreign banks) under three programs, one of which is the primary credit program. Primary credit is available to generally sound depository institutions, typically on an overnight basis. To assess whether a depository institution is in sound financial condition, its Reserve Bank can regularly review the institution's condition, using supervisory ratings and data on adequacy of the institution's capital.

intended to facilitate the program goal of encouraging the flow of credit to consumers and small businesses.

While Reserve Banks Generally Offered the Same Terms to Eligible Participants, Some Programs Lacked Documented Procedures to Systematically Apply Special Restrictions

The Federal Reserve Board promoted consistent treatment of eligible participants in its emergency programs by generally offering assistance on the same terms and conditions to all eligible participants. For example, institutions that met the announced eligibility requirements for a particular emergency program generally could borrow at the same interest rate, against the same types of collateral, and where relevant, with the same schedule of haircuts applied to their collateral. As previously discussed, for a few programs, FRBNY's procedures did not have specific guidance to help ensure that restrictions were applied consistently to higher-risk borrowers. Moreover, the Federal Reserve Board could not readily provide documentation of all Term Auction Facility restrictions placed on individual institutions. By having written procedures to guide decision-making for restrictions and suggestions for documentation of the rationale for such decisions, the Federal Reserve Board may be able to better review such decisions and help ensure that future implementation of emergency lending programs will result in consistent treatment of higher-risk borrowers. Our review of Federal Reserve System data for selected programs found that incorrect application of certain program requirements was generally infrequent and that cases of incorrect application of criteria did not appear to indicate intentional preferential treatment of one or more program participants.

The Federal Reserve Board Did Not Fully Document the Basis for Extending Credit to a Few Affiliates of Primary Dealers

The Federal Reserve Board did not fully document the basis for its decisions to extend credit on terms similar to those available at PDCF to certain broker-dealer affiliates of four of the primary dealers. In September and November of 2008, the Federal Reserve Board invoked section 13(3) of the Federal Reserve Act to authorize FRBNY to extend credit to the London-based broker-dealer subsidiaries of Merrill Lynch, Goldman Sachs, Morgan Stanley, and Citigroup, as well as the U.S. broker-dealer subsidiaries of Merrill Lynch, Goldman Sachs, and Morgan Stanley. Federal Reserve Board officials told us that the Federal Reserve Board did not consider the extension of credit to these subsidiaries to be a legal extension of

PDCF but separate actions to specifically assist these four primary dealers by using PDCF as an operational tool. Federal Reserve Board officials told us that the Federal Reserve Board did not draft detailed memoranda to document the rationale for all uses of section 13(3) authority but that unusual and exigent circumstances existed in each of these cases as critical funding markets were in crisis. However, without more complete documentation, how assistance to these broker-dealer subsidiaries satisfied the statutory requirements for using this authority remains unclear. Moreover, without more complete public disclosure of the basis for these actions, these decisions may not be subject to an appropriate level of transparency and accountability. The Dodd-Frank Act includes new requirements for the Federal Reserve Board to report to Congress on any loan or financial assistance authorized under section 13(3), including the justification for the exercise of authority; the identity of the recipient; the date, amount, and form of the assistance; and the material terms of the assistance. To address these new reporting requirements, we recommended that the Federal Reserve Board set forth its process for documenting its rationale for emergency authorizations.

The Federal Reserve Board Generally Has Not Provided Documented Guidance to Reserve Banks on Types of Program Decisions That Require Consultation with the Federal Reserve Board

In authorizing the Reserve Banks to operate its emergency programs, the Federal Reserve Board has not provided documented guidance on the types of program policy decisions—including allowing atypical uses of broad-based assistance—that should be reviewed by the Federal Reserve Board. Standards for internal control for federal government agencies provide that transactions and other significant events should be authorized and executed only by persons acting within the scope of their authority. Outside of the established protocols for the discount window, FRBNY staff said that the Federal Reserve Board generally did not provide written guidance on expectations for types of decisions or events requiring formal Federal Reserve Board review, although program decisions that deviated from policy set by the Federal Reserve Board were generally understood to require Board staff consultation. In 2009, FRBNY allowed an AIG-sponsored entity to continue to issue to the Commercial Paper Funding Facility, even though a change in program terms by the Federal Reserve Board likely would have made it ineligible. FRBNY staff said they consulted the Federal Reserve Board regarding this situation, but did not document this consultation and did not have

any formal guidance as to whether such continued use required approval by the Federal Reserve Board. To better ensure an appropriate level of transparency and accountability for decisions to extend or restrict access to emergency assistance, we recommended that the Federal Reserve Board document its guidance to Reserve Banks on program decisions that require consultation with the Federal Reserve Board.

The Federal Reserve Board Took Steps to Prevent Use that Would Be Inconsistent with Its Policy Objectives

To assess whether program use was consistent with the Federal Reserve Board's announced policy objectives, we analyzed program transaction data to identify significant trends in borrowers' use of the programs. Our analysis showed that large global institutions were among the largest users of several programs. U.S. branches and agencies of foreign banks and U.S. subsidiaries of foreign institutions received over half of the total dollar amount of Commercial Paper Funding Facility and Term Auction Facility loans (see fig. 3) [Figure 40].

According to Federal Reserve Board staff, they designed program terms and conditions to discourage use that would have been inconsistent with program policy objectives. Program terms—such as the interest charged and haircuts applied—generally were designed to be favorable only for institutions facing liquidity strains. Use of the programs generally peaked during the height of the financial crisis and fell as market conditions recovered (see fig. 4) [Figure 41]. Within and across the programs, certain participants used the programs more frequently and were slower to exit than others. Reserve Bank officials noted that market conditions and the speed with which the participant recovered affected use of the program by individual institutions. As a result of its monitoring of program usage, the Federal Reserve Board modified terms and conditions of several programs to reinforce policy objectives and program goals.

Figure 3: Total Transaction Amount by Parent Company Country of Domicile for the Term Auction Facility and Commercial Paper Funding Facility

TAF

CPFF

Source: GAO analysis of Federal Reserve System data.

Note: For Term Auction Facility, the total dollar amount of loans are aggregated at the level of the parent company for participating depository institutions. For Commercial Paper Funding Facility, the total dollar amount of issuance is aggregated at the parent company level and includes asset-backed commercial paper issuance by entities sponsored by the parent company or one of its subsidiaries. The country of domicile for parent companies is based on SNL Financial data.

Figure 41

Concluding Observations

During the financial crisis that began in the summer of 2007, the Federal Reserve System took unprecedented steps to stabilize financial markets and support the liquidity needs of failing institutions that it considered to be systemically significant. To varying degrees, these emergency actions involved the Reserve Banks in activities that went beyond their traditional responsibilities. Over time, FRBNY and the other Reserve Banks took steps to improve program management and oversight for these emergency actions, in many cases in response to recommendations made by their external auditor, Reserve Bank internal audit functions, or the Federal

Reserve Board's RBOPS. However, the Reserve Banks have not yet fully incorporated some lessons learned from the crisis into their policies for managing use of vendors, risk of losses from emergency lending, and conflicts of interest. Such enhanced policies could offer additional insights to guide future Federal Reserve System action, should it ever be warranted. We made seven recommendations to the Chairman of the Federal Reserve Board to further strengthen Federal Reserve System policies for selecting vendors, ensuring the transparency and consistency of decision making involving implementation of any future emergency programs, and managing risks related to these programs. In its comments on our report, the Federal Reserve Board agreed to give our recommendations serious attention and to strongly consider how to respond to them.

Mr. Chairman, Ranking Member Clay, and Members of the Subcommittee, this completes my prepared statement. I am prepared to respond to any questions you or other Members of the Subcommittee may have at this time.

**WRITTEN TESTIMONY OF
ROBERT D. AUERBACH, Ph.D.**

PROFESSOR OF PUBLIC AFFAIRS
LYNDON B. JOHNSON SCHOOL OF PUBLIC AFFAIRS
UNIVERSITY OF TEXAS AT AUSTIN

Introduction

Thank you Chairman Ron Paul, Ranking Member William Lacy Clay and members of the subcommittee for this opportunity to testify on transparency at the Federal Reserve. My name is Robert Auerbach. I am a Professor of Public Policy at the Lyndon B. Johnson School of Public Affairs at the University of Texas in Austin. On two separate occasions I had the honor to serve as an economist on the staff of this Committee (1977-81 and 1992-1997) and my 2008 book, *Deception and Abuse at the Fed: Henry B. Gonzalez Battles Alan Greenspan's Bank* details the oversight investigations that I staffed while serving Committee Chairman Henry S. Reuss in the late 1970's and Committee Chairman/Ranking Member Henry B. Gonzalez in the 1990's. I have also served as an economist in the U.S. Treasury's Office of Domestic Monetary Affairs during the Reagan Administration and at the Federal Reserve System.

The Fed is the powerful central bank of the United States that controls the money supply, regulates the banking system and, since 1962, makes loans to foreign countries without Congressional authorization.³⁵⁴ The historical record summarized below, describing Federal Reserve officials blocking transparency and individual accountability, including destroying source records of its policymaking committee since 1995, leads to the following suggested remedies:

- **Independent Inspector General:** The Inspector General of the Federal Reserve should not be appointed by the chairman of the Federal Reserve Board as is currently the case. The IG should be a Presidential nominee whose credentials, abilities and independence are examined during a Senate confirmation process.
- **Preserve Transcripts:** The Federal Reserve should stop destroying the source transcripts and should stop turning off the recording system at its policy making committee, the Federal Open Market Committee (FOMC). This practice was

³⁵⁴ Auerbach, *Deception and Abuse at the Fed*, pp. 69 - 73.

approved in 1995 by an unrecorded vote of the FOMC directed by then-Chairman Alan Greenspan.³⁵⁵

- **Provide Minutes to Congress:** The minutes of the boards of directors meetings at the Federal Reserve's 12 district banks and the transcripts of the meetings of the Federal Reserve Board of Governors and of the FOMC, should be sent to the House and Senate banking committees within six months of the meetings. Trained archivists at the National Archives and Records Administration should edit those records to remove prescribed items in cooperation with the Federal Reserve.
- **Senate Confirmation of Bank Presidents:** The 12 Federal Reserve regional bank presidents who are eligible to vote on the money supply as members of the FOMC should be confirmed by the Senate. The presidents wield enormous power as members of the FOMC and they should be fully vetted in the confirmation process. I want to commend full committee Ranking Member Bernie Frank for addressing the regional bank presidents' role on the FOMC with H.R. 1512, although rather than removing them from the FOMC as proposed in the bill I would recommend Senate confirmation.

Fed Audits

Chairman Ron Paul and Senator Bernie Sanders deserve great praise for their leadership in enacting the current Government Accountability Office (GAO) audit of the Federal Reserve as part of the Dodd-Frank Act. The Senate unanimously approved, by a 90 to 0 vote, the Sanders amendment to require disclosure of the recipients of the Fed's emergency loans. Hopefully this Congressional action set a precedent for fuller continuing audits of Federal Reserve operations.

In 1976, House Committee on Banking, Finance and Urban Affairs Chairman Henry Reuss proposed a GAO audit of the Fed. The Fed orchestrated a massive lobbying campaign using the officials of private banks to lobby to stop the audit bill.

Evidence of the lobbying campaign came from minutes of the board of directors of each of the 12 district Federal Reserve Banks. Chairman Reuss requested minutes from district bank meetings from 1972, 1974, and 1975. After a six-month delay with letters back and forth and meetings between Chairman Reuss and Federal Reserve Chairman Arthur Burns, the minutes arrived at the Congress. One

³⁵⁵ Auerbach, *Deception and Abuse at the Fed*, pp. 103 - 104.

response to the Reuss request for records was given by a St. Louis Fed President, as reported on the transcript:

"I would also think that if this involves a lot of work, which it will, needless work, that someone on Mr. Reuss' Committee, a friendly individual should know what we're being called upon to do. Because I think this can be used against Reuss if we react intelligently and as I see it in the St. Louis case, it's appalling how skimpy or meaningless our minutes are, I'm sure we did this with great wisdom knowing that a man named Reuss would ask for them. The minutes are really terribly shallow. Tell nothing."³⁵⁶ (Emphasis added)

Chairman Reuss' delivered a floor speech in 1976 detailing the evidence of the Fed's orchestrated lobby against the audit bill entitled: "What the Secret Minutes of the Federal Reserve Banks Meetings Disclose". The speech led to the passage of the Federal Reserve Reform Act of 1977 which brought Fed Bank directors under the federal government conflict of interest laws.

Despite this victory, the Fed won the first round on the audit effort. Chairman Reuss's audit bill could not garner enough support to pass out of the Committee. It was shunted to the Government Operations Committee where it passed in 1978, but only after glaring no-audit barriers on any Fed operations connected to monetary policy or international transactions were added.

In the Fed's monetary policy operations billions of dollars can be made from inside information from leaks of Fed policy. It is very difficult to police these leaks of inside information. One necessary step to stop leaks is to severely limit the interest rate policy information in the Federal Reserve to a few people. This has not happened. Many hundreds of Federal Reserve employees -- over 500 employees -- are directly involved in the secret meetings or in preparing information that has been discussed at these meetings.

The House Banking Committee received information in 1997 about non-Federal Reserve employees at Federal Reserve meetings where inside information was discussed. Congressmen Gonzalez and Maurice Hinchey asked Greenspan about the apparent leak of discount rate information and the presence of these people at Federal Reserve meetings. Greenspan was forced to admit that some non-Federal Reserve people had attended Federal Reserve meetings where the Federal Reserve's future interest rate policy was discussed.³⁵⁷ Greenspan included a 23-page enclosure listing

³⁵⁶ November 16, 1976 FOMC transcript, p.17.

³⁵⁷ Greenspan letter of April 25, 1997.

hundreds of people at the Board of Governors in Washington, D.C. and in the 12 Federal Reserve Banks around the country who have access to at least some secret Federal Reserve information about non-public Federal Reserve interest rate policy.

Names of Avisiting scholars@ were listed who had attended pre-FOMC meetings at three Federal Reserve Banks. Greenspan also wrote:

At the Federal Reserve Bank of Kansas City, over the 3-year period, a total of 28 foreign central bankers have attended 16 different Board of Directors meetings, including the discussion and vote on discount rates. Those attending included Acentral bankers from Bulgaria, China, the Czech Republic, Hungry, Poland, Romania and Russia.³⁵⁸

At the December 19, 1989 FOMC meeting Greenspan warned about the ill effects of continuing leaks from the FOMC's supposedly secret meetings and said that "we're beginning to look like buffoons":

[. . .] I would like to raise again a problem that continues to confront this organization with continuous damaging and corrosive effects, and that is the issue of leaks out of this Committee. We have two extraordinary leaks, and perhaps more, in recent days: in which John Berry at The Washington Post in late November had the time and content of a telephone conference; previous to that we had The Wall Street Journal knowing about telephone conferences and knowing a number of things that could only have come out of this Committee.

As best I can judge from feedback I'm getting from friends of ours the credibility of this organization is beginning to recede and we're beginning to look like buffoons to some of them. [. . .]³⁵⁹

FOMC Records

In 1976 two threats to Fed secrecy created high anxiety at the Federal Reserve Board of Governors. First, David Merrill, a law student at Georgetown University, brought a legal action challenging the 45-day delay in releasing the "Directive" on monetary policy.³⁶⁰ It is a short report on policy actions that were authorized at the FOMC

³⁵⁸ Greenspan letter to Chairman Gonzalez, April 25, 1997, p. 2.

³⁵⁹ Chapter 9, "Valuable Secrets and the Return of Greenspan's "Prophetic Touch" in *Deception and Abuse at the Fed*.

³⁶⁰ The secret meetings at the Board of Governors in Washington D.C. revealed great alarm about transparency at the Arthur Burns Fed. This response was revealed in the FOMC transcripts Burns left upon his death in 1987 to the President R. Gerald Ford Library on the University of Michigan campus. The archivists of the National Archives and Records Administration lightly edited the transcripts.

meeting. The Federal District Court agreed with Merrill. The Fed appealed up to the Supreme Court which remanded it back to the district court. Lacking funds for further extensive adjudication Merrill could not pursue the case. The Fed has all the money it needs or can order from the Bureau of Engraving and Printing to hire private law firms and fight any legal action.

The second attack on the Fed's secrecy was Congressional consideration of the "Government in the Sunshine Act" that was signed into law September 13, 1976. That law required that: "The agency shall make promptly available to the public, in a place easily accessible to the public, the transcript, electronic recording or minutes of the meeting." The Fed frantically tried to protect itself from such transparency and individual accountability.

Fearing the new legislation and the pending legal action for the disclosure of their records, Federal Reserve Chairman Arthur Burns led the Federal Reserve Open Market Committee in a 10 to 1 vote to discontinue transcripts of its meetings in 1976. That vote began the official 17-year Fed lie asserting that no transcripts were being maintained of FOMC meetings.

In 1992 I returned to the Banking Committee staff of then-Chairman Henry B. Gonzalez. Chairman Gonzalez and I could not believe that the most powerful central bank in the world, operating in our great democracy, had no complete records of its policy making committee, the FOMC. On October 19, 1993, Chairman Gonzalez convened a Fed oversight hearing focusing on transcripts. Seventeen officials of the Fed, seven members of the Board of Governors and ten of the twelve presidents of the Federal Reserve District Banks, testified in the Banking Committee chamber. Chairman Greenspan sat in the center of the long row of Fed officials. Prior to the hearing, Chairman Gonzalez sent the witnesses specific instructions that they reveal details of what records are kept by the Fed of their meetings.

A top Fed staff person, who would become vice chairman of the Board of Governors, explained on a confidential FOMC conference call four days before their Congressional testimony that Greenspan clearly intended to mislead Congress about written records of the FOMC: "The Chairman is not highlighting these transcripts ... We're not waving red flags."³⁶¹

Jim McTague, now the Washington editor of Barron's, wrote about Greenspan's testimony: "In a performance that would have made professor Irwin Corey weep with admiration Mr. Greenspan

³⁶¹ FOMC conference call transcript, October 15, 1993, p. 20.

avoided drawing attention to the existence of transcripts ..." Corey famously performed as a double-talking comedian.³⁶²

Several days after the hearing, the Cleveland Fed broke the silence and misdirection and informed the Congress of the deception. Chairman Greenspan then sent a letter admitting that transcripts existed. He claimed to have had memory problems. I led a group of Republican and Democratic staff to the Board of Governors where Fed staff showed us 17 years of neatly typed transcripts around the corner from Chairman Greenspan's office. Under pressure from this Gonzalez investigation the Fed ended its 17-year lie by again issuing the transcripts but only with a 5-year lag, too long to establish timely individual accountability.

In 1995 Greenspan held a non-recorded vote of the FOMC – no finger prints – to destroy the source FOMC transcripts. I was informed by the Fed Vice Chairman Donald Kohn that this destruction would continue and that it was legal.³⁶³ Previously these source records had been sent to the National Archives.

That same year the shredding machines at the Fed destroyed the source FOMC records when Fed officials bypassed the Congress and voted \$5 billion to support the Mexican peso. That loan was collateralized by revenue from Mexico's oil industry. When the loan authorization was sent to the New York Federal Reserve Bank and was public information the peso stopped falling. The loan to Mexico that had been authorized was then not needed and was not made.

Investigations of Fed Operations

Congresswoman Carolyn Maloney joined Chairman Gonzalez in an investigation from 1995 to 1997 of the Fed's more than 50 contracted airplanes that were delivering paper checks across the country. The investigation found evidence of corruption in this system typified by the "backup plane" at Teterboro Airport. The Fed paid for this contracted plane that people at that Fed facility called the phantom plane because it was not present at Teterboro much of the time. We also uncovered evidence of nearly nonexistent in-house audits. Officials covered losses in the airplane fleet operations by transferring money from the Fed's employee pension fund.

³⁶² "Greenspan Has Himself to Blame for Fervid Interest in Transcripts," *American Banker*, December 1, 1993, p. 24.

³⁶³ A letter from then Vice Chairman Donald Kohn to Robert Auerbach September 1, 2001. Included in Auerbach, "Stop the Fed From Shredding Its Record," *Huffington Post*, December 9, 2001.

The Reno Justice Department refused the Gonzalez request to investigate the extensive corruption found in the management of the airplane fleet and referred the Gonzalez inquiry to the Fed's Inspector General. The IG told me he did not know if he had jurisdiction because the fleet was managed by the Boston regional Fed Bank.

That weak dodge is consistent with my prior experience and underlies the importance of changing the structure of the Fed's IG. The Fed's Report to Congress and the Dodd-Frank law grant the Chairman of the Federal Reserve the authority to appoint his own Inspector General who is charged with investigating the Fed bureaucracy and who also serves as the IG for the new Consumer Financial Protection Bureau. This is a clear conflict as Chairman Bernanke can "prohibit the Fed's Inspector General from carrying out or completing an audit or investigation or from issuing a subpoena ..."³⁶⁴

Another Gonzalez investigation began in 1997 when the Congress received information about alleged corrupt accounting at the cash section of the Los Angeles branch of the San Francisco Federal Reserve Bank that includes vaults containing cash and coins. The GAO assisted the Gonzalez's investigation. During the investigation Chairman Greenspan informed Ranking Member Gonzalez that the Federal Reserve knew that nearly \$500 thousand that had been stolen from Fed vaults by Fed employees from 1987 to 1996.³⁶⁵ The Gonzalez/GAO investigation indicated this was an understatement.

The following selections are from the September 30, 1996 published report of an excellent GAO team that investigated the cash section at the Los Angeles Branch of the Federal Reserve in coordination with a Gonzalez investigation. The report indicates how desperately the Fed operations need a complete competent audit. It is a matter of national security:

A bank had brought a deposit of \$432,000 to the Fed and Fed employees mistakenly entered the transaction as \$8,640,000. When

³⁶⁴ Section 1081 of the Dodd-Frank Wall Street Reform and Consumer Protection Act states that, "...the Chairman of the Board of Governors of the Federal Reserve System shall appoint the Inspector General of the Board of Governors of the Federal Reserve System and the Bureau of Consumer Financial Protection. The Inspector General of the Board of Governors of the Federal Reserve System and the Bureau of Consumer Financial Protection shall have all of the authorities and responsibilities provided by this Act with respect to the Bureau of Consumer Financial Protection, as if the Bureau were part of the Board of Governors of the Federal Reserve System."

³⁶⁵ Federal Reserve Board of Governors Chairman Alan Greenspan letter to Ranking Member Gonzalez, December 5, 1996.

Fed employees in the cash department counted the deposit they discovered an \$8,208,000 mistake “they overrode the system control in the cash inventory system and forwarded the money for further processing. Although this error was corrected when the problem was detected at the end of the day, this resulted in an erroneous entry being made in the L.A. Bank’s ledger for \$8,640,000 that increased the cash in the vault amount and the depository institution’s account. L.A. Bank officials had no explanation for why this occurred.”

The GAO also reported: “We found that the October, November, and December 1995 monthly currency activity reports of the L.A. Bank were prepared and reported incorrectly. We confirmed that the reported receipts from currency deposited in the L.A. Bank by depository institutions (receipts from circulation) were not taken from the L.A. Bank’s cash inventory records (in other words, independently determined) but rather ‘forced’ to ensure that the currency activity reports agreed with the daily balance sheet for the last day of the month.” “The reports were prepared incorrectly at the direction of the L.A. Bank’s management. L.A. Bank officials stated that the practice of forcing the reports to agree had been in place for some time.” “We found that problems in currency reporting are linked to the limitations in the design of the underlying cash inventory system.” “The L.A. Bank’s inability to precisely summarize currency activity from its cash inventory records raises serious questions about the integrity of its accounting and internal controls.” “We attempted to perform a comprehensive review of the L.A. Bank’s internal controls and accounting practices over the money flowing through the Bank. Our efforts to perform a comprehensive review were substantially limited by the L.A. banks inability to provide the information needed for such a review.[...] we requested that the Bank provide us with [. . .] a general ledger history of all of the activity in its general ledger cash accounts for October through December 1995” [The bank did not provide the] general ledger of cash transactions because Bank officials stated that it would take them 3 weeks.”³⁶⁶

This excellent GAO report demonstrates that the agency is capable of conducting exemplary audits of Fed operations if it is not constrained by statutory limitations and as long as experienced staff lead the investigations. The Fed vault facilities are a crucial part of

³⁶⁶ “Federal Reserve Banks, Inaccurate Reporting of Currency at the Los Angeles Branch, Report to the Ranking Minority Member [The Honorable Henry B. Gonzalez], Committee on Banking and Financial Services,” House of Representatives. GAO/AIMD-96-146, September 30, 1996. See also “EMBEZZLING FED MONEY AND FALSIFYING ACCOUNTING RECORDS,” Deception and Abuse At the Fed, pp. 55-60.

the nation's payment system and should be a national security priority with full accountability to the Congress. The Fed banks contain uncirculated currency and coin transferred from the Bureau of Engraving and Printing. They also receive cash from banks throughout the country. The cash sections and vaults of the Federal Reserve District Banks and branches need to be investigated and audited with personnel who are experienced in central bank operations, independent of Fed officials and instructed to make thorough audits.

Academic Independence

Future GAO audits should target the massive number of Fed payments to academics who are not employed at the Federal Reserve. A Gonzalez investigation found that the Federal Reserve sent money and provided other benefits to economists throughout academia who specialize in monetary and financial subjects, and who were not employees of the Federal Reserve. The Fed itself employed over 500 economists so the need to make all these outside payments is highly questionable.³⁶⁷ Some academics received checks from a number of (up to five) district Fed Banks. Reuters reported Milton Friedman's views on this problem in 1993: "the Fed's relatively enhanced standing among the public has been aided 'by the fact the Fed has always paid a great deal of attention to soothing the people in the media and buying up its most likely critics' Recognizing that the Fed employs 'probably half of the monetary economists in the U.S. and has visiting appointments for two-thirds of the rest' he [Friedman] saw few among the academic community who were prepared to criticize the Fed policy."³⁶⁸

Conclusion

The current GAO audit of the Federal Reserve is a historic step towards greater transparency at the central bank. The Fed has a long history of fighting outside audits as various Fed officials have complained that they would constitute an infringement on central bank independence. In fact, the Fed's mythical flag of independence from politics, a favorite Fed mantra to avoid individual responsibility,

³⁶⁷ After the chapter in my book, "When 500 economists are not enough," was published on *Huffington Post*, September 7, 2009, Ryan Grim followed up with an up to date article: "Priceless: How the Fed Bought the Economics Profession," September 7, 2009.

³⁶⁸ Reuters interview reported July 7, 1993.

is merely a shield intended to protect the institution from being forced to act in a more transparent fashion. Ongoing audits do not infringe on the Fed's independence which is protected in a myriad of ways, including self-funding and terms for members of the Board of Governors of 14 years. Board of Governor members can only be removed by impeachment and that has never happened.

Their long terms and very little chance of being impeached should allow independent votes. It has not prevented the fact that monetary policy has been very poor in periods such as the 1970's and since October 2008. I have been writing and speaking about the Federal Reserve's present misguided policy since 2009.³⁶⁹

Complete GAO audits and the other improvements I have described are essential for establishing a timely authentic record of policy actions and individual responsibility for the powerful unelected officials at the nation's central bank.

³⁶⁹ "The Bernanke Fed Is in a Deep Hole With a \$1.6 Trillion Time Bomb," *Huffington Post/AOL*, August 29, 2011.

WRITTEN TESTIMONY OF
MARK A. CALABRIA, Ph.D.
DIRECTOR OF FINANCIAL REGULATION STUDIES
CATO INSTITUTE

Chairman Paul, Ranking Member Clay, and distinguished members of the Subcommittee, I thank you for the invitation to appear at today's important hearing. I am Mark Calabria, Director of Financial Regulation Studies at the Cato Institute, a nonprofit, non-partisan public policy research institute located here in Washington, DC. Before I begin my testimony, I would like to make clear that my comments are solely my own and do not represent any official policy positions of the Cato Institute. In addition, outside of my interest as a citizen and taxpayer, I have no direct financial interest in the subject matter before the Committee today, nor do I represent any entities that do.

The Federal Reserve and the Financial Crisis

As the Subcommittee is well aware, the events of 2008 witnessed not only unprecedented disruptions to our financial markets, but also extraordinary responses on the part of our financial regulators and central bank. No entity was more deeply involved than the Federal Reserve System ("Fed"), particularly the Federal Reserve Bank of New York.

Yet the Fed has consistently and repeatedly resisted efforts to bring any accountability and transparency to its actions. Congress and the public were regularly warned that if the details of the Fed's actions became public, further panic would ensue in our financial markets. For instance I distinctly remember, as a staffer for the Senate Banking Committee, listening to then Fed Vice Chair Donald Kohn tell that Committee that making the names of AIG's derivatives counterparties public would severely harm our financial markets. When those names were eventually released our world did not come to an end. In short, the Fed has a long tradition and strong preference for secrecy. Despite some notable attempts by the Fed to increase its communications with the public, I believe, given its track record, the public cannot rely on the Fed to voluntarily provide us with sufficient information to monitor its activities and judge the effectiveness of its actions. And while the requirements of the Dodd-Frank Wall Street Reform and Consumer Protection Act ("Dodd-Frank"), in relation to auditing the Fed's activities are an important

advance, they fall far too short of providing sufficient oversight of the Fed.

What auditing has been conducted has so far been focused on the Fed's response to the crisis. Among economists, on both the right and the left, there remains considerable concern and debate over the Fed's role in helping to create the crisis via its easy money policies in the aftermath of the dot-com bubble and the events of 9/11. If we truly wish to end financial crises, then I believe it is absolutely essential that Congress receive a full and objective evaluation of the Fed's role in fostering the housing bubble, particularly as it relates to monetary policy decisions made between 2002 and 2005.

Federal Reserve Audit Requirements under Dodd-Frank

The primary audit requirements of Dodd-Frank, as they relate to the Fed's actions during the financial crisis, are contained in Section 1109, which directs GAO to:

conduct a onetime audit of all loans and other financial assistance provided during the period beginning on December 1, 2007 and ending on the date of enactment of this Act by the Board of Governors or a Federal reserve bank under the Asset-Backed Commercial Paper Money Market Mutual Fund Liquidity Facility, the Term Asset-Backed Securities Loan Facility, the Primary Dealer Credit Facility, the Commercial Paper Funding Facility, the Term Securities Lending Facility, the Term Auction Facility, Maiden Lane, Maiden Lane II, Maiden Lane III, the agency Mortgage-Backed Securities program, foreign currency liquidity swap lines, and any other program created as a result of section 13(3) of the Federal Reserve Act.

That audit was delivered to Congress in July. Importantly, the audit required by Dodd-Frank goes beyond a simple accounting of what was lent to whom, but also requires GAO to evaluate the effectiveness and policies of the various lending facilities. As GAO's audit makes clear, the Fed, and in particular the New York Fed, exercised considerable discretion in designing these lending programs and often did so in an extremely ad hoc manner. While it does appear that the Fed made attempts to treat all program participants fairly and equally, a lack of appropriate internal controls within these programs left open considerable potential for abuse.

In addition to the audit requirements of Section 1109, Dodd-Frank also requires under Section 1103(b) that the Fed provide:

disclosure in a timely manner consistent with the purposes of this Act of information concerning the borrowers and counterparties

participating in emergency credit facilities, discount window lending programs, and open market operations authorized or conducted by the Board or a Federal reserve bank...

The importance of Section 1103(b) is that participants in future discount window lending will eventually be identified to the public, along with the terms of such lending. Given that Dodd-Frank gives the Fed approximately two years to disclose such information in relation to discount window lending, I believe the risk that such disclosure will dissuade financial institutions from the use of the discount window has been minimized. Of course, if such disclosure encourages financial institutions to manage their operations in such a way to avoid the need for access to the discount window, then the strength of our financial system would likely be improved.

While Sections 1102, 1103 and 1109 of Dodd-Frank are without doubt improvements in Federal Reserve transparency, and some of the few positive provisions in the Act, they fall short of truly bringing the operations of the Fed into the light of day.

Although I believe it to be a grave mistake to continue to entrust the Federal Reserve with bank supervision and regulation, Congress has chosen to maintain, and extend, that situation. The requirements of Section 1108(b) of Dodd-Frank requiring the Fed's Vice Chair for Supervision to regularly appear before Congress should increase transparency and improve Congressional oversight as it relates to the Fed's bank supervision responsibilities.

The Federal Reserve Needs a Full and Continuous Audit

The non-monetary actions of the Federal Reserve in 2008 and 2009 will likely be debated for decades among economists and historians. Just as the causes of the Great Depression and the effectiveness of the New Deal remain in contention, so will recent actions. What we all can perhaps agree on, or at least hope, is that the extraordinary measures, by Congress, the Federal Reserve and the Treasury, will not be repeated soon or repeated often. Accordingly, much of the audit requirements in Dodd-Frank have something of an "historical" feel to them. However, it is not enough to just get history right, but also to insure that future mistakes are avoided. I can think of few areas requiring as much mistake-avoidance as monetary policy.

Others have already laid out the case that easy money contributed to the crisis,³⁷⁰ so I will not repeat that argument here. I do believe, however, that the role of easy money in the fostering a

³⁷⁰ See John Taylor, *Getting Off Track*. Hoover Institute Press. 2009.

housing bubble demonstrates the need for an on-going GAO audit of the Federal Reserve's monetary functions. Disagreement as to the appropriate stance of current monetary policy also demonstrates the need for objective, independent analysis.

What's GAO for?

GAO, the US Government Accountability Office, states its mission is "to support the Congress in meeting its constitutional responsibilities and to help improve the performance and ensure the accountability of the federal government for the benefit of the American people. We provide Congress with timely information that is objective, fact-based, nonpartisan, nonideological, fair, and balanced." (www.gao.gov).

Quite simply GAO is not a political organization. As someone who has interacted repeatedly and regularly with GAO over the last decade, including serving as a Congressional staff liaison for requested GAO reports, I can say they are independent, unbiased and non-political. I have not always agreed with the conclusions of GAO, but I have never felt as if such disagreements were the result of politics or bias.

Subjecting the Federal Reserve's monetary policy function to a GAO audit does not subject the Fed to "politics" – such a claim is not only insulting to GAO, it is insulting to the very concept of Congressional oversight. GAO exists for the very simple reason that no one member of Congress, or their staff, fully understand and are knowledgeable about the functioning of the various government agencies. GAO exists to inform. And there are few areas less understood by Congress than monetary policy and macroeconomics. Hence there are few areas more in need of a GAO audit than the Fed. While the impact of getting wheat support prices or fair market rents wrong is not insignificant, getting monetary policy wrong can be disastrous for an economy.

On Fed Independence

A common objection to a GAO audit of the Fed is that such would "compromise" the Fed's independence and subject its actions to political influence. Such an objection confuses the very nature of Fed independence. The Fed's authority to regulate the value of money is one delegated from Congress. As Congress can, and has, legislated changes to the Fed, it should be clear beyond a doubt that the Fed is not "independent" of Congress. It is a creature of Congress.

Setting aside the debate over the desirability and legitimacy of so-called independent agencies, it should be clear that their independence, in an operational sense, is from the Executive Branch. It should also be clear, however, that in recent years the Fed has coordinated its actions quite closely with the Treasury Department, eroding any real independence. The revolving door, both at the political and career levels, between the Fed and the Treasury Department further undermines the Fed's operational independence. A GAO audit could shine a light on this relationship, helping to insulate the Fed from continued interference by the Treasury Department.

Improving Federal Reserve Transparency

The Dodd-Frank Act made important advances in bringing transparency and accountability to the Federal Reserve. Unfortunately it falls short in allowing Congress, and the public, to truly gauge the effectiveness of the Federal Reserve.

In order to improve Federal Reserve Transparency, Congress should mandate a regular GAO audit of all Fed activities, including monetary policy. Such audits can be performed in such a manner so as to minimize their disruptions to any on-going deliberations of the Federal Open Market Committee (FOMC). For instance audits can be kept confidential for a year after each FOMC meeting.

Evaluating the effectiveness of any government agency is made all the more difficult when that agency faces a variety of competing and sometimes conflicting objectives. If the Fed feels it is free to abandon price stability in order to achieve other objectives, such as supporting the financial industry or misguided attempts to influence the labor market, then an audit will have limited value. At a minimum Congress should restrict the Federal Reserve to a single goal, that of price stability. Congress should also restrict the Fed's discretion in implementing that goal. A central bank that is free to define price stability as whatever it wants is a central bank without any meaningful constraint.

Chairman Paul, Ranking Member Clay and members of the Subcommittee, I again thank you for the invitation to appear at today's important hearing. I firmly believe our monetary system was a central driver of the financial crisis and that its deep flaws remain in place. In order to both prevent future financial crises and protect our society from the significant harm that results from inflation, a vigorous debate as to the performance of the Federal Reserve is long overdue.

*H*EARING XII.

**FEDERAL RESERVE AID TO THE EUROZONE: ITS
IMPACT ON THE U.S. AND THE DOLLAR**

TUESDAY, MARCH 27, 2012

WITNESSES

Dudley, William C., President, Federal Reserve Bank of New York
Kamin, Steven B., Director, Division of International Finance,
Board of Governors, Federal Reserve System

*B*ACKGROUND

The Subcommittee on Domestic Monetary Policy and Technology held a hearing entitled “Federal Reserve Aid to the Eurozone: Its Impact on the U.S. and the Dollar” at 10:00 a.m. on Tuesday, March 27, 2012 in Room 2128 of the Rayburn House Office Building.

The hearing examined the Federal Reserve’s assistance to the Eurozone and the effect of that assistance on the U.S. economy, the U.S. monetary system, and the dollar. In particular, this hearing explored the central bank currency swap line arrangements set up between the Federal Reserve and the central banks of England, Switzerland, Japan, Canada, and the European Central Bank (ECB). This was a one-panel hearing with the following witnesses:

- Mr. William C. Dudley, President and Chief Executive Officer, Federal Reserve Bank of New York
- Dr. Steven B. Kamin, Director, Division of International Finance, Board of Governors of the Federal Reserve System

The Eurozone Crisis

In late 2009, the revelation that the Greek government had misrepresented the extent of its indebtedness triggered a crisis that spread from Greece to other European countries as financial markets became concerned, first about the extent to which financial institutions were exposed to Greek debt, and then about the extent to which other European countries were facing budget problems similar to Greece. Concerns about the stability and solvency of the Eurozone³⁷¹ and its member nations made it more difficult and more

³⁷¹ The Eurozone comprises the 17 nations in the European Monetary Union that adopted the euro as their common currency. These nations are Austria, Belgium, Cyprus, Estonia, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, Malta, the Netherlands, Portugal, Slovakia, Slovenia, and Spain.

expensive for European nations to borrow, which has in turn resulted in a sovereign debt crisis that affected several Eurozone countries and created economic instability throughout Europe.

The underlying cause of this crisis was that some members of the Eurozone had borrowed too much. Under the 1997 Stability and Growth Pact, an agreement among the member states of the European Union to facilitate and maintain the stability of the European Monetary Union, member states were required to run budget deficits no larger than 3% of their gross domestic product (GDP) and to cap their national debts below 60% of their GDP. Without any punishment for transgressing the limits, however, these fiscal limits were largely ignored by member states, and in recent years particularly those states in the Eurozone periphery such as Greece, Ireland, and Portugal, and even larger member states such as Spain and Italy.

Under the Basel II capital adequacy standards, all Eurozone sovereign debt was treated as “risk-free,” which meant that financial institutions holding sovereign debt could earn interest on that debt without having to hold additional capital against it. (The Basel III capital adequacy standards continue to treat all sovereign debt as risk-free.) But as the extent of the budget deficits being run by countries in the Eurozone periphery became known, financial markets began charging risk premiums on the debt issued by those countries that reflected the risk that those countries might default. These premiums, in turn, dried up financing to European banks as investors became increasingly wary of lending to Europe. In the Eurozone, medium- and long-term dollar funding declined significantly as market sentiment deteriorated; unsecured dollar funding could not be obtained for terms longer than a week.

Central Bank Liquidity Swap Lines

To offset the shortfall in private dollar funding to the Eurozone and to improve dollar liquidity in global money markets, in May 2010 the Federal Reserve re-established temporary reciprocal currency agreements – known as swap lines – with the central banks of England, Japan, Switzerland, Canada, and the ECB. Under these swap lines, the Federal Reserve swapped dollars for foreign currencies for a fixed period of time and at fixed exchange rates, charging interest. Fixed exchange rates were supposed to ensure that fluctuations in the price of currencies would not affect repayments and that the Federal Reserve was repaid in dollars exactly what it had swapped. The terms of the swaps ranged from

one week to three months and the swaps were managed primarily by the Federal Reserve Bank of New York.

Originally set to expire in January 2011, the swap lines were renewed several times. In November 2011, the Federal Reserve re-authorized the swap lines until February 2013 and reduced the interest rate, which had been set at 100 basis points over the overnight index swap (OIS) rate, to 50 basis points over the OIS. Before the Federal Reserve reduced the interest rate, the swap lines were little-used and rarely reached more than \$2 billion outstanding at any one time. After the Federal Reserve reduced the interest rate on these swap lines in November 2011, use of the swap lines jumped to nearly \$55 billion, and peaked at \$109 billion in February 2012. While this is a comparatively small sum compared to swap line use at the peak of the 2008-2009 financial crisis, when they totaled \$583 billion, nonetheless the amount outstanding as of March 14, 2012 was nearly equal to the U.S.'s IMF quota of approximately \$65 billion.

The Federal Reserve explained that swap lines were “designed to improve liquidity conditions in global money markets and to minimize the risk that strains abroad could spread to U.S. markets, by providing foreign central banks with the capacity to deliver U.S. dollar funding to institutions in their jurisdictions.”³⁷² By providing liquidity to central banks rather than directly to foreign financial institutions, the Federal Reserve maintained that credit risks from the currency swaps were borne by the foreign central bank and not by the U.S. taxpayer. For example, if the Federal Reserve held euros that it received in exchange for providing dollars to the ECB then the ECB would be liable for returning those dollars once the swaps mature. It is therefore the ECB's responsibility to collect adequate collateral from the financial institutions to which it lends dollars in order to ensure that it can repay the dollars it received from Federal Reserve when the swap unwinds.

In February 2012, Federal Reserve Chairman Ben Bernanke stated in testimony before the Financial Services Committee that the Federal Reserve's swap lines were “a very safe proposition. First, our counterparty is the ECB. It is not banks. It is not Greece. It is the European Central Bank itself, which in turn is well-capitalized and has behind it the national central banks of 17 countries.”

³⁷²Federal Reserve Bank of New York, “Central Bank Liquidity Swaps,” March 19, 2012, available at http://www.newyorkfed.org/markets/liquidity_swap.html. Last accessed December 11, 2012. [should probably check all other hyperlinks in other memos to make sure they still work and add their access date.]

European Central Bank as Counterparty

The composition of the ECB's balance sheet, however, generated concern about the ECB's capitalization and the counterparty risk it posed to the Federal Reserve. The ECB significantly expanded its role in response to the Eurozone crisis. In December 2011 the ECB reduced its policy interest rate (the ECB's equivalent to the federal funds rate), reduced reserve requirements, expanded the categories of collateral it would accept for ECB refinancing operations, and began providing three-year loans to banks in the form of long-term refinancing operations (LTRO). LTRO was a significant departure from the ECB's usual practice: the ECB historically supplied short-term loans to European banks, usually for terms no longer than three months. In its first LTRO offering in December 2011, the ECB lent €489 billion (\$638 billion³⁷³) to more than 500 Eurozone banks, the largest infusion of cash into the banking system since the introduction of the euro in 1999. In its second LTRO offering in February 2012, which was advertised as the final offering, the ECB lent €530 billion (\$708 billion³⁷⁴) to 800 Eurozone banks. These large operations raised concerns about the quality of the collateral securing the loans made by the ECB as well as concerns about the ECB's leverage ratio.

Before its first LTRO offering, the ECB relaxed its rules regarding the collateral that banks could post as security for ECB loans. For the first time in its history, the ECB began accepting lower-rated securities, including lower-rated government bonds, as collateral. But subsequent to the February LTRO offering, the ECB began to use margin calls to require banks to increase the collateral posted with the ECB. These collateral increases were requested after the loans had been made and appeared on the ECB's balance sheet as "deposits related to margin calls on credit extended to counterparties." While this line item was normally around €2 billion or less, the margin calls increased to over €17.3 billion (\$22.7 billion³⁷⁵) as of March 13, 2012. The increase in margin calls led to concerns about the deteriorating value of the collateral held by the ECB, and some speculated that the deterioration was being driven by the falling value of the large amounts of Greek, Italian, and Spanish bonds held by the ECB.

³⁷³ According to the exchange rate of 12/21/11, when LTRO 1 took place.

³⁷⁴ According to the exchange rate of 2/29/12, when LTRO 2 took place.

³⁷⁵ According to the exchange rate of 3/13/12

The ECB's capital and reserves stood in March 2012 at €83 billion (\$111 billion³⁷⁶) with total assets at €3 trillion (about \$4 trillion), creating a leverage ratio of 36 to 1. By way of comparison, the Federal Reserve had a leverage ratio of about 54 to 1 (\$3 trillion in assets with \$55 billion in capital). While the ECB's may have looked better on paper, some remained concerned that that ratio was too high for it to be a safe counterparty to the Federal Reserve, particularly because the ECB's balance sheet largely consisted of sovereign debt that had a high risk of default, such as Greek bonds. Former ECB Executive Board Member Juergen Stark said that the ECB's "balance sheet is not only gigantic in its dimension but also alarming in its quality."³⁷⁷

Macroeconomic Effects of Increased Dollar Liquidity

By making it easier and cheaper for Eurozone institutions to borrow dollars, the swap lines raised concerns about the effects that increased dollar liquidity would have on the international economy. A few smaller central banks, including those of Switzerland and Israel, began investing part of their dollar reserves directly in U.S. stocks. Eurozone banks began to move out of euro assets into dollar assets because it was cheaper to borrow dollars than euros. While the provision of dollar liquidity by the Federal Reserve was intended to help mitigate the effects of the Eurozone crisis, it was not clear whether Eurozone banks' purchases of dollar-denominated assets instead of euro-denominated assets was reducing risk or increasing it. While dollar-denominated assets may have been a less-risky asset in the short term in order to help strengthen the balance sheets of Eurozone banks, the decision of Eurozone banks to opt out of euro markets and into safer dollar markets may have played a role in reducing liquidity to euro bond markets, putting an even greater financial strain on Eurozone governments, banks, and financial markets.

In addition, critics of the swap lines, such as Gerald P. O'Driscoll, Jr., former vice president of the Federal Reserve Bank of Dallas, contended that the swap lines amounted to a U.S. bailout of European banks and fostered moral hazard, distorting the economy as a result of credit allocation by the government. But the President of the Federal Reserve Bank of New York, William Dudley, pointed

³⁷⁶ According to exchange rate of 3/27/12

³⁷⁷ Andrea Thomas, "Ex-ECB Stark: Bank's balance sheet 'alarming,'" Wall Street Journal MarketWatch, March 8, 2012, accessed available at <http://www.marketwatch.com/story/ex-ecb-stark-banks-balance-sheet-alarming-2012-03-08>. Last accessed December 11, 2012.

out that the swap lines helped “support the availability of credit to U.S. households and businesses.”³⁷⁸ Because foreign financial institutions provided roughly \$900 billion in financing within the U.S., Mr. Dudley expressed concerns that an impairment of access to dollar funding could have raised the costs for borrowing and lending in the U.S.

Increases in the cost of dollar funding, however, did not necessarily mean that funding was unavailable, but rather that the cost of lending had risen to reflect more accurately the risks of lending to Eurozone institutions, given their exposure to European sovereign debt. By providing dollar liquidity at lower rates than the market was then offering, the Federal Reserve was encouraging unsound investments or impeding economic recovery by preventing the liquidation of bad investments. Given that financial institutions held \$1.6 trillion in excess reserves at the Federal Reserve, it was not clear that U.S. financial markets would have been affected if foreign financing had declined because European access to dollar funding was curtailed.

Additional Federal Reserve Assistance

Chairman Bernanke indicated to Members of Congress that the Federal Reserve had neither the authority nor the intention to bail out European governments or financial institutions. But in testimony before Congress in December 2011, Mr. Dudley said that the Federal Reserve has the authority to buy sovereign debt and that that option should not be ruled out.

Central Banks and Monetary Policy

Since the onset of the financial crisis in 2008, the world's central banks have injected large amounts of liquidity into the economy in an attempt to stave off further crisis. Accommodative monetary policy resulted in central banks moving from a focus on maintaining price stability to a policy of supporting the banking sector and providing relief from sovereign debt problems. While the actions of central banks were once perceived as necessary to stem the economic crisis, it remains to be seen how these large increases in the supply of money worldwide will affect economic activity. In the U.S. as of March 2012, price inflation appeared to be picking up in various economic sectors.

³⁷⁸ William Dudley, Federal Reserve Bank of New York, “Letter to the Editor Regarding Central Bank Liquidity Swaps,” March 19, 2012, available at http://www.newyorkfed.org/markets/statement_0105_2012.html. Last accessed December 11, 2012.

Oil and gasoline prices rose sharply over the preceding month, the consumer price index increased at an annual rate of nearly 3%, and 10-year Treasury bond yields spiked roughly 40 basis points in the first quarter of 2012.

If the accommodative monetary policies undertaken by the world's central banks prevent needed readjustments from taking place in the global economy, or if inexpensive financing misdirects resources and results in malinvestment and unsustainable booms, these policies could sow the seeds for an even greater crisis.

*T*RANSCRIPT

The subcommittee met, pursuant to notice, at 10:03 a.m., in room 2128, Rayburn House Office Building, Hon. Ron Paul (chairman of the subcommittee) presiding.

Members present: Representatives Paul, McHenry, Luetkemeyer, Huizenga, Schweikert; Clay, Maloney, and Green.

Chairman PAUL. This hearing will now come to order.

Without objection, all Members' opening statements will be made a part of the record.

I will now recognize myself for 5 minutes to make an opening statement.

First, I would like to thank Dr. Kamin and Dr. Dudley for appearing today to discuss a very important subject that the world is looking at constantly: a major debt crisis that exists around the world.

It has a great deal of significance not only for world finance, but also for the American taxpayer and the value of the U.S. dollar, and indirectly, the deficits that are run up because they are all interconnected.

The crisis we face right now is a crisis in debt and how we handle this debt. Who gets stuck with the debt? Who gets the bailout? How does the debt get defaulted on? How do you liquidate the debt?

And there are different ways of liquidating debt. When you can't pay the bills and you write them off the books, that is liquidating debt and that helps to solve the problem.

Other times, governments and central banks participate in liquidating debt by diminishing real debt, and that is by purposely devaluing the currency and, of course, that has been used historically many, many times and is one of the most common ways of liquidating debt.

So if you can devalue a currency by 50 percent, you can get rid of real debt by half if your prices go up. And there certainly seems to be

a concerted effort around the world, and even within our own country, to handle debt in that fashion.

But in the process, the question really is: Who gets stuck with it? Who gets the most penalties? And if you happen to be on the receiving end of being too-big-to-fail and you get some benefits from the system, but the debt is not liquidated, it is passed on, it is transferred from one group of individuals to another. Nevertheless, it is still a pain. But it is just a matter of picking and choosing who will receive the most harm.

The problem I see right now in dealing with this debt crisis is can the U.S. dollar and the U.S. economy and the U.S. taxpayer bear the burden? And this is the way it seems because now, the European Central Bank (ECB) is asking us to continue to do what we have done over these last few years, to use the dollar to actually bail them out.

On paper, it looks like the balance sheet is better with the Europeans. Their assets-to-capital ratio is better than our bank. And yet, the dependency is for the United States to bail them out and it seems like it is working.

Of course, we have the advantage of issuing the reserve currency of the world which has given us, in a deceptive way, some advantages over many, many decades. But the big question is: How long can that happen? Will we always have the benefits? Will other countries finally get together, as they talk about constantly, and replace the dollar? And certainly, the dollar isn't getting to be a stronger reserve currency; if anything, it is getting slightly weaker. And someday, there may be some real challenges to the dollar, so there has to be a limit to this.

We talk about the Greek crisis, which is major and significant, and we are dealing with it on a daily basis. This might just be the beginning of a much bigger crisis when you look at the different countries, whether it is Portugal or Spain or Italy. And this thing could—it is much bigger than we are willing to admit. In many, many ways, I think we are in denial of how serious this problem is.

So we have to face up to the fact that there is a cost. I see it is going to be a cost against the value of the dollar. Some people say, "This is good. We want a weaker dollar because it is going to help our trade; it is going to help our exports."

And now, there are currency wars going on. All we do is complain about the Chinese having too weak a currency. At the same time, we triple our balance sheet and triple the monetary base.

Now, that is deliberately trying to weaken a currency too. So there will be limits on that. I think we are facing that. We are up

against the wall on this. And very soon, I think we are going to have to admit that you can't solve the problem of debt with more debt.

You can't solve the problem of a weak currency by making the currency even weaker. You can't solve the problem by having the moral hazard of a guaranteed bailout that people—there is always going to be a lender of last resort, and if you are too-big-to-fail, you are going to be taken care of. Some people may suffer, but others will be taken care of.

I think there are limits. I think we are facing that. I think we are in denial. We won't admit how serious it is; but I believe that we will be forced to, not because of the politics of it as much as because of the economics.

I complain about the power of governments and central banks, but ultimately, there are economic rules and laws—economic laws probably much stronger than all of us. And you can't dictate and mandate forever. You can kid people for a long time. But right now, it is an illusion that we can trust the dollar to bail out the world. And soon, we are going to see the end of that and that is why many of us believe that the crisis is far from over and that we have to face up to those facts.

Now, I would like to recognize Mr. Clay for his opening statement.

Mr. CLAY. Thank you, Chairman Paul, and thank you for holding this hearing to examine the Federal Reserve's assistance to the Eurozone and the effect of that assistance on the U.S. economy, monetary system, and the dollar.

The focus of this hearing is to examine the Federal Reserve's Central Bank's currency swap-line arrangements with central banks of Europe, England, Switzerland, Japan, and Canada.

Also, I want to thank the witnesses for appearing before us today.

When the new Greek government came into power in late 2009, they revealed that the previous Greek government had not been reporting the budget deficit accurately. This has led to major economic challenges and concerns to other parts of Europe and the United States.

The first concern is the high levels of public debt in some Eurozone countries. Three Eurozone major governments—Greece, Ireland and Portugal—have had to borrow money from the European Central Bank and the International Monetary Fund in order to avoid defaulting on their debt.

Currently, the Greek government is negotiating losses on bonds held by private creditors. Investors have started to demand higher

interest rates for buying and holding Italian and Spanish bonds. The Italian government debt is forecast to be \$2.8 billion in 2012, which is greater than Spain, Portugal, Greece, and Ireland combined.

The second concern is the lack of growth and the high unemployment in the Eurozone. In January of this year, the IMF downgraded its growth forecast for the Eurozone from growing by 1.1 percent in 2012 to contracting by 0.5 percent.

The third concern is the weakness of the Eurozone's banking system, which holds high levels of public debt. In December of last year, the European Banking Authority estimated that European banks need about \$152 billion of additional capital in order to withstand a range of shocks and still maintain adequate capital.

The fourth concern is persistent trade imbalances within the Eurozone. The Eurozone core countries tend to run trade surpluses with the Eurozone periphery countries. And the periphery countries tend to run trade deficits with the core countries.

To help ease the financial crisis in the Eurozone, the Federal Reserve opened the currency swap line. Under a swap line with the European Central Bank, the ECB temporarily receives U.S. dollars and the Federal Reserve temporarily receives euros.

After a fixed period of time, the transaction is reversed. Interest on swaps is paid to the Federal Reserve at the rate that the foreign central bank charges to its dollar borrower. The temporary swaps are repaid at the exchange rate prevailing at the time of the original swap, meaning that there is no downside risk for the Federal Reserve if the dollar appreciates in the meantime.

All of these concerns have raised questions about the economic stability of the Eurozone countries. I look forward to the witnesses' comments regarding these concerns and actions taken by the Federal Reserve Bank to address these concerns.

And again, thank you for conducting this hearing. I yield back.

Chairman PAUL. I thank the gentleman.

Now, I will recognize Mr. Luetkemeyer for his opening statement.

Mr. LUETKEMEYER. Thank you, Mr. Chairman. Over the past several years, many of my colleagues and I have expressed serious concerns regarding U.S. exposure to the Eurozone.

Like many of my colleagues, my concerns have been met at times with cynicism and assurance of an efficient recovery with little or no contagion. Yet here we sit today, continuing to talk about the Eurozone crisis, and hearing once again that our Nation won't be dramatically impacted.

Certain scholars and fellow officials said that the crisis wouldn't spread. It has now impacted several European nations with effects ranging from default and upheaval in Greece to bank failures and increased risk in the perceived financial stalwart of France. This hasn't badly taken a toll on U.S. markets. I believe it has a potential to take a toll on our Nation's economy as a whole.

Chairman Bernanke testified recently in this committee that the two greatest threats to our economy are rising gas prices and the Eurozone problems. Secretary Geithner testified in this committee just last week, and seemed concerned as well about the possibility of a eurozone contagion, although he was optimistic things would work themselves out.

Regardless of what we hear today, we are in fact exposed. Our financial institutions, industries, and government are all exposed, and as a result, so are the taxpayers. Our economies are and always will be deeply connected. It is our responsibility to ensure that this exposure is managed thoughtfully and to ensure that the

U.S. taxpayers are not again on the hook for the failure of the financial institutions not only domestic but foreign as well.

Mr. Chairman, I look forward to an enlightened discussion with our panel. This is an important topic and one that merits great transparency and attention. I thank you, and I yield back.

Chairman PAUL. I thank the gentleman.

Now, I would like to introduce our witnesses for today. Dr. William Dudley is the President of the Federal Reserve Bank of New York. Before taking over as President of the New York Fed in 2009, Dr. Dudley had been Executive Vice President of the Markets Group at the New York Fed, where he managed the System's open market account for the Federal Open Market Committee.

Prior to joining the New York Fed in 2007, Dr. Dudley was a partner and managing director at Goldman Sachs and company, and was Goldman's chief U.S. economist for a decade. Dr. Dudley also serves as chairman of the Committee on Payments and Settlement Systems of the Bank for International Settlements and as a member of the Board of Directors of the Bank for International Settlements. Dr. Dudley received his bachelor's degree from New College of Florida and received his Ph.D. in economics from the University of California, Berkeley.

Dr. Steven Kamin is the Director of the Division of International Finance for the Board of Governors of the Federal Reserve System. He joined the Federal Reserve System Board in 1987, and was appointed to the official staff in 1999.

Prior to taking over the Division of International Finance in December of 2011, Dr. Kamin was Deputy Director of the Division. He has also served as a visiting economist at the Bank for International Settlements, a senior economist for international financial affairs at the Council of Economic Advisors, and as a consultant for the World Bank.

Dr. Kamin received his bachelor's degree from the University of California, Berkeley and received his Ph.D. in economics from the Massachusetts Institute of Technology.

Without objection, your full written statements will be made a part of the record. You will now each be recognized for a 5-minute summary of your testimony.

Dr. Dudley?

STATEMENT OF WILLIAM C. DUDLEY³⁷⁹
PRESIDENT
FEDERAL RESERVE BANK OF NEW YORK

Mr. DUDLEY. Thank you. Chairman Paul, Ranking Member Clay, and members of the subcommittee, my name is Bill Dudley and I am the President of the Federal Reserve Bank of New York. It is an honor to testify today about the economic and fiscal challenges facing Europe and the Federal Reserve's effort to support financial stability in the United States.

Let me preface these remarks by stating that the views expressed in my written and oral testimony are solely my own and do not represent the official views of the Federal Reserve Board, the Federal Open Market Committee or any other part of the Federal Reserve System.

Additionally, because I am precluded by law from discussing confidential supervisory information, I will not be able to speak about the financial condition or regulatory treatment or rating of any individual financial institution.

The economic situation in Europe has been unsettled for the better part of 2 years with pressure on sovereign debt markets and local banking systems. The strains in European markets have affected the U.S. economy.

The euro area has the capacity, including the fiscal capacity, to overcome its challenges. However, the politics are very difficult, both because the problem has many dimensions and because many different countries and institutions in the euro area have to coordi-

³⁷⁹ [The prepared statement of Dr. Dudley can be found on page 1357.]

nate their actions in order to achieve a coherent and effective policy response.

Europe's leadership has affirmed its commitment to the European Union and a single-currency union on numerous occasions. And the leadership is working harder than ever to achieve greater policy coordination in areas such as fiscal policy. A more robust and resilient European Union would be a welcome development for the United States. Three recent developments are especially encouraging in that regard.

First, liquidity concerns have eased significantly following the European Central Bank's long-term financing operations in December and February. Through this program, the ECB provides 3-year loans to European banks at low rates, accepting a wider range of collateral in return.

Second, earlier this month the Greek government worked with European leaders and its largest creditors to restructure the bulk of its 206 billion euros of outstanding privately held bonds. This not only helped reduce Greeks' total indebtedness, it also helped calm persistent worries that a disorderly Greek default could become the trigger for a global economic crisis.

Third, leaders in most euro-area countries have approved a new treaty designed to increase fiscal coordination. The new rules already appear to be making a difference. While difficult work still lies ahead, countries in the euro area have made meaningful progress towards achieving long-term fiscal sustainability.

Looking to the future, the difficult work that remains also presents special risks, both for Europe and for the United States. If Europe fails to chart an effective course forward, this could have a number of negative implications here. In particular, there are three areas of potential risk that I would like to highlight for the subcommittee today.

First, if economic conditions in Europe were to weaken significantly, the demand for U.S. exports would decrease. This would hurt domestic growth and have a negative impact on U.S. jobs. It is important to recognize that the euro area is the world's second largest economy after the United States, and it is an important trading partner for us. Also, Europe is a significant investor in the U.S. economy and vice versa.

Second, deterioration in the European economy could put pressure on U.S. banking systems. As the recent round of stress tests reveals, U.S. banks are much more robust and resilient than they were a few years ago. They have bolstered their capital significantly,

built up their loan loss reserves, and have significantly higher liquidity bumpers.

The good news in the United States means that we are better able to handle bad news from Europe. With that said, the exposures of U.S. banks climb sharply when one also considers their exposures to the core European countries and to the overall European banking system.

Third, severe stresses in European financial markets would disrupt financial markets here, which could harm the real economy. Stress in the financial markets causes banks to more carefully husband their balance sheets. When that phenomenon occurs, the availability of credit to U.S. households and businesses becomes constrained.

Such conditions could also cause equity prices to fall, impairing the value of American pension and 401(k) holdings. This would damage the U.S. recovery and result in slower output growth and less job creation. At a time when the U.S. employment rate is very high, this is a particularly unacceptable outcome.

In the extreme, U.S. financial markets could become so impaired that the flow of credit to households and businesses could dry up. In today's globally integrated economy, banks headquartered abroad play an important role in providing credit and other financial services in the United States. About \$1 trillion in worldwide dollar financing comes from foreign banks; \$700 billion in the form of loans within the United States.

For these banks to provide U.S. dollar loans, they have to maintain access to U.S. dollar funding. At a time when it is already hard enough for American families and businesses to get the credit they need, they have a strong interest in making sure these banks continue to be active in the U.S. dollar markets.

It is in our national interest to make sure that non-U.S. banks remain able to access the U.S. dollar funding that they need to be able to continue to finance their U.S. dollar assets. If access to dollar funding were to become severely impaired, this could necessitate the abrupt forward sales of dollar assets by these banks, which could seriously disrupt U.S. markets and adversely affect American businesses, consumers, and jobs.

One way we can help to support the availability of dollar funding and ensure that credit continues to flow to American households and businesses is by engaging in currency swaps with other central banks. Such swaps are a policy tool that the Federal Reserve has used to support dollar liquidity for nearly 50 years.

More recently, the Federal Reserve established dollar-swap lines with major central banks during the global financial crisis of 2008, and reactivated them in May 2010. The swaps are intended to create a credible backstop to support but not supplant private markets. Banks with surplus dollars are more likely to lend to banks in need of dollars if they know that the borrowing bank will be able to obtain the dollars it needs to repay the loan if necessary from its central bank.

Our principal aim is to protect U.S. banks, businesses, and consumers from adverse economic trends abroad. I am pleased that the swaps seem to be working. In conjunction with ECB's long-term refinancing operations, the swaps have helped European banks avoid the significant liquidity pressures we feared a few months ago. And they have reduced the risks that they would need to sell off their U.S. dollar assets abruptly.

In conclusion, I am hopeful that Europe can effectively address its current fiscal challenges. The Federal Reserve is actively and carefully assessing the situation and the potential impact on the U.S. economy.

At this time, although I do not anticipate further efforts by the Federal Reserve to address the potential spillover effect of Europe on the United States, we will continue to monitor the situation closely.

Thank you for your invitation to testify today and I look forward to answering your questions.

Chairman PAUL. Thank you, Dr. Dudley.

Dr. Kamin?

**STATEMENT OF STEVEN B. KAMIN³⁸⁰
DIRECTOR, DIVISION OF INTERNATIONAL FINANCE
BOARD OF GOVERNORS, FEDERAL RESERVE SYSTEM**

Mr. KAMIN. Thank you, Chairman Paul, and members of the subcommittee, for inviting me to talk about the economic situation in Europe and actions taken by the Federal Reserve in response to this situation.

In the past several months, European authorities have provided additional liquidity to banks, bolstered bank capital requirements, developed rules to strengthen fiscal discipline, and explored means of enlarging the euro-area financial backstop.

Stresses in financial markets have eased, but these markets remain under strain. The fiscal and financial strains in Europe have

³⁸⁰ [The prepared statement of Dr. Kamin can be found on page 1362.]

spilled over to the United States by restraining our exports, depressing confidence, and adding to the pressure on U.S. financial markets.

Of note, foreign financial institutions, especially those in Europe, have found it more difficult to borrow dollars. These institutions make loans to U.S. households and firms as well as to borrowers in other countries who use those loans to purchase U.S. goods and services.

While strains have eased somewhat of late, difficulties borrowing dollars by European institutions may make it harder for U.S. households and firms to get loans and for U.S. businesses to sell their products abroad. Moreover, these disruptions could spill over into U.S. money markets, raising the cost of funding for U.S. financial institutions.

To address these risks to the United States, on November 30th, the Federal Reserve announced, jointly with the European Central Bank or ECB, and the central banks of Canada, Japan, Switzerland, and the United Kingdom that it would revise, extend, and expand its swap lines with these institutions.

The measures were motivated by the need to ease strains in global financial markets which, if left unchecked, could impair the supply of credit to households and businesses in the United States and impede our economic recovery.

Three steps were described in the announcement.

First, we reduced the pricing of the dollar swap lines from a spread of 100 basis points over the overnight index swap rate to 50 basis points over that rate. This has enabled foreign central banks to reduce the cost of the dollar loans they provide to financial institutions in their jurisdictions. This, in turn, has helped alleviate global financial strains and put foreign institutions in a better position to maintain their supply of credit, including to U.S. residents.

Second, we extended the closing date for these lines from August 1, 2012, to February 1, 2013, demonstrating that central banks are prepared to work together for a sustained period to support global liquidity conditions.

Third, we agreed to establish swap lines in the currencies of other participating central banks. These lines would allow the Federal Reserve to draw foreign currencies and provide them to U.S. financial institutions on a secured basis. U.S. financial institutions are not experiencing any foreign currency liquidity pressures at present, but

we judged it prudent to make such arrangements should the need arise in the future.

Information on the swap lines is fully disclosed on the Web sites of the Federal Reserve Board and the Federal Reserve Bank of New York. I also want to underscore that the swap transactions are safe and secure.

First, the swap transactions present no exchange rate or interest rate risk because the terms of each drawing and repayment are set at the time the draw is initiated.

Second, each drawing on the swap lines must be approved by the Fed, providing us with control over the use of the facility.

Third, the foreign currency held by the Fed during the term of the swap provides an important safeguard.

Fourth, our counterparties are the foreign central banks, not the private institutions to which the central banks lend. The Fed's history of close interaction with these central banks provides a track record justifying a high degree of trust and cooperation.

Finally, the short tenor of the swaps means that positions could be wound down relatively quickly were it judged appropriate to do so. Notable, the Fed has not lost a penny on these swap lines since they were established in 2007. In fact, fees on these swaps have added to the earnings that the Fed remits to taxpayers.

To conclude, following the changes that we made to our swap line arrangements last November, the amount of dollar funding for the swap lines increased substantially. Subsequently, as measures of dollar funding costs declined, usage of the swap lines has fallen back.

Ultimately, however, a sustained further easing of financial strains here and abroad will require European authorities to follow through on their policy commitments in the months ahead. We are closely monitoring events in Europe and their spillovers to the U.S. economy and financial system.

Thank you, again, for inviting me to appear before you today. I would be happy to answer any questions you may have.

Chairman PAUL. Thank you, Dr. Kamin.

[QUESTIONS & ANSWERS]

I will start off with the questioning.

For Dr. Dudley, I wanted to see if we could start off by seeing if we could agree with what the problem is—in my opening statement, I emphasize that the debt is the problem; that we are in a worldwide debt crisis.

Do you generally agree with that and how serious to you think it is?

Mr. DUDLEY. I think you are certainly correct that there is a question of debt sustainability in Europe in terms of the fiscal budget deficit path for some countries—not all countries, some countries—and there is also—and that is also implicated some of the European banks to have large exposures to that sovereign debt.

And so what is important is that these countries have an opportunity to undertake the fiscal consolidations that they need to demonstrate to the market that they can actually be on a sustainable path.

ECB's long-term refinancing operations and, I think, the dollar swaps have helped create some time for this to take place, but for this to work out well, these countries still have to take the appropriate steps.

Chairman PAUL. So far, if we date the crisis back to 2008 and 2009, and if it was a debt crisis that was a problem, if you look at everybody's debt, it is exploding, including ours. How do you solve the problem of debt with exponentially increasing the debt? It seems like our problems are just compounded.

How do you get around to either stop accumulating more debt or do you believe you have to liquidate debt? Some people believe you have to get rid of the debt in order to get growth again because the debt will consume us and interest rates are bumping up already.

And as I said in my opening statement, the Fed will have some ability to manipulate interest rates in the economy, but ultimately, the economic laws are pretty powerful, so interest rates are liable to go up.

So how can we solve the problem of debt with more debt, and what is your opinion of liquidating that? Is that important?

Mr. DUDLEY. I think that you are right, obviously, more debt does not solve the problem of too much debt. I think the good news in the United States, and I will speak about the United States, is that there has actually been a significant amount of deleveraging that has taken place among U.S. households over the last few years.

Debt-to-income ratios have come down. Debt service relative to income has come down. So U.S. households, I think, are in significantly better shape than they were a few years ago.

The second area where we see a pretty big change in terms of deleveraging of the United States is in the state of health of the

U.S. banking system. U.S. banks, compared to 5 or 6 years ago, have much more capital and much bigger liquidity buffers.

So while I think it is too soon to say that the deleveraging process in the United States is over, we have made a considerable amount of progress in working our way out of the problems that we faced in 2007 and 2008.

Chairman PAUL. But isn't it true that mortgage debt is still on the books? It has been transferred; maybe the Fed owns that debt. We don't even know what the real value is of most of it.

And banks still hold some mortgage debt and it might be at a nominal value so in that sense of that debt being liquidated, maybe some individuals have straightened out their bank accounts, but there are still millions of people—if they really were improving, they could make their payments again, but debt is still the problem.

You say that some are deleveraged, but has there been any real liquidation of debt when it comes to mortgage and the derivatives because governments are involved in that—either the Central Bank or some of our programs are involved. It seems like none of that has been deleveraged. If anything, that looks like it is getting worse.

Mr. DUDLEY. On the mortgage front, there has been some deleveraging, because banks have taken mortgage losses. Also, in certain cases, especially among private holders of mortgage debt, there has been some principal forgiveness, principal reductions.

So you have actually seen, for example, last year, total household debt outstanding, according to the flow of funds, which is the broadest measure of household credit, was roughly flat last year; so nominal GDP was growing. Debt that was held by households was flat. So you are actually seeing the debt burden become less overwhelming.

Chairman PAUL. Yes. The promises that we made and the involvement we have with Europe that our finances are so good with our debt and our dollar that we have been standing and saying, "Yes, we will be there."

The Chairman of the Fed has said, "We are not ignoring this. If necessary, we have been there before, we will be back again."

What is the limit to this? What is the limit to us making these promises that we can always be available? Isn't there a limit to what the dollar will sustain?

Won't it eventually have to stop or do you think we can do this—if another crisis hits and there is a big downturn, and you have to inject trillions of dollars again, what is the limiting factor to the dollar and the United States economy bailing out the world?

Mr. DUDLEY. I think that, from my perspective, we want to make the decisions based on what is in our self-interest, what is best for

households and businesses. And, in that calculation, if we decide that intervention can help

household and businesses, at higher benefits than cost, then we want to proceed. If we don't reach that calculation, if we think that there is too much risk involved in the program or that the program is going to lead to moral hazard and is going to be counterproductive, then we don't want to undertake it.

So I don't think that the Federal Reserve has made any decisions about what future interventions we would or would not do, except that we will do interventions that are consistent with our dual mandate, as set by Congress, to achieve maximum employment and price stability, sustain financial stability in the United States, and do what is best for households and businesses here.

That is why we are doing this program; not for Europe, but for ourselves.

Chairman PAUL. Dr. Kamin, did you want to make a comment?

Mr. KAMIN. Yes, do you mind? Could I add a few words, Chairman Paul?

Just to add to the comments that President Dudley made—our purpose in the swap lines, in particular, is not to, in some sense, fully back or to make whole all the debts that have accumulated around the world. That is very far from our purpose.

Our key strategy and our key intent in this regard is to make sure that foreign financial institutions could maintain the flow of credit, both to U.S. households and firms, and to firms and households around the world that in turn buy U.S. goods and services.

So the intent was mainly to help alleviate the liquidity pressures that could lead these foreign institutions to wind down their assets too quickly, and thus injure the U.S. recovery.

Thank you.

Chairman PAUL. Thank you.

Mr. Clay?

Mr. CLAY. Thank you, Chairman Paul.

Let me follow Chairman Paul's line of questioning.

Dr. Dudley, in your opening statement you mention that severe stress in European markets will create stress in the U.S. economy. Are we that tied to the European economy and that married to that system that it would have that kind of reaction, a chain reaction?

Mr. DUDLEY. I think we live in a global economy, and what happens in the other big economies of the world definitely affects us. As I noted in my testimony, there are sort of three channels by which Europe could affect us in a negative fashion. One, if the European

economy is in recession or very weak, that is going to reduce the demand for our exports. So that has effects on U.S. production and employment here in the United States.

Two, if Europe were to be in a difficult position, and the European banking system were to worsen, that would have consequences for U.S. banks that have exposure to the European banks.

And three, if Europe were to perform badly, that would have negative effects on financial markets around the world. And that would have implications for our financial markets, and therefore, investment and growth here in the United States.

So there are definitely significant channels by how Europe can affect the United States.

Mr. CLAY. Dr. Dudley, have actions taken by the Federal Reserve regarding the currency swap line arrangements been beneficial or detrimental to the U.S. economy?

Mr. DUDLEY. We think that the swap lines have had their desired effects, because they have basically given a source of a backstop to other sources of funding to European banks. So as a consequence of them having this backstop available, if they were to need it, they don't have to be as fearful about their ability to obtain funding. And therefore, they can manage their dollar loans to U.S. businesses and households in a more orderly fashion.

We follow the activities of European banks in the United States through their U.S. branches and subsidiaries, and they are definitely reducing their exposure in the United States. But I think because of the dollar swaps, this is happening in an orderly way, rather than a disorderly way.

And so, we don't see that their reduction in the business that they are doing in the United States is having any damaging effects on the U.S. economy, which is really what our goal is; to prevent any damaging effects on the U.S. economy.

Mr. CLAY. Okay.

Dr. Kamin, would you like to add something?

Mr. KAMIN. Yes, thank you, if I could just add to those remarks.

Over the past couple of years, as the crisis in Europe has progressed, we have seen several periods when the financial situation in Europe deteriorated fairly dramatically. And during those periods, we could see some very obvious spillovers to financial markets, both in the United States and around the world.

During those periods of deterioration, investors became worried, and around the world they retreated from assets they perceived to be more risky. And what that led to, both in Europe and the United

States and elsewhere, was sharp declines in stock prices, increases in interest rates line of credits, and other developments that were associated with retreats from risk and flights to quality. So, we have seen those episodes very clearly.

Now, more recently, since we changed the pricing of our swap lines, since the ECD introduced many measures to add liquidity to banks, and since European leaders have taken other actions, we have seen financial conditions in Europe—this is more or less since December—improve quite markedly. And that has been an important contributing factor to the improvement to the tone in financial markets in the United States. So those connections are definitely there.

Mr. CLAY. Dr. Kamin, share with us the effects that the rise in gasoline prices around the world and in the United States—what effects will this rise in gas prices have on the economies of Europe and the United States?

Mr. KAMIN. The effects that higher oil prices will have on both the United States and on Europe are, in broad qualitative terms, relatively similar. Both broad economies import oil. There is a greater dependence on imported oil in Europe than in the United States, but both do.

So, when oil prices rise, that acts as a tax on consumers of oil in both countries. And as a result, that diminishes the purchasing power that consumers in those counties have to basically spend on other goods. So, it basically acts as a brake on economic recovery and all else being equal, may make it more difficult to create jobs.

In addition to the effects on unemployment and economic activity, increases in oil prices have the effect of raising at least some portion of the consumer basket of prices. As long as oil prices will continue to rise, that should lead to a temporary increase in inflation. But that also poses concerns.

So obviously, recent increases in oil and gasoline prices are something that we monitor very carefully.

Mr. CLAY. Thank you.

And my time is up.

Chairman PAUL. I thank the gentleman.

Now, I recognize Mr. Luetkemeyer from Missouri.

Mr. LUETKEMEYER. Thank you, Mr. Chairman.

Gentlemen, correct me if I am wrong, but I believe that the swap dollars that are—I guess euros—that are on the other end with the European Central Bank, they secure those, do they not, whenever they loan them back out on their other end?

And would you agree that there is a problem from the standpoint that what we have been told and what we find recently is they are taking a little more exposure, a little more risk, with some of the investments that they are taking as collateral for those? Would that be a fair statement?

Mr. DUDLEY. They have broadened out the collateral eligibility, but they also have significant haircuts for that collateral. So, they take more collateral than the value of the money that they are actually lending out.

Mr. LUETKEMEYER. Instead of one-to-one, it may be two-to-one, as they take additional collateral?

Mr. DUDLEY. They adjust for what they perceive to be the quality of the collateral.

Mr. LUETKEMEYER. Because I know that former executive board member Juergen Stark recently said that the balance sheet of the ECB is not only gigantic in dimension, but also alarming in its quality. Would you agree with that statement?

Mr. DUDLEY. I don't have enough information to assess the quality of the ECB balance sheet. But my dealings with the ECB suggest that they are quite prudent in terms of how they run their operations.

Mr. LUETKEMEYER. Yes, but aren't you one of the leading experts on swaps between the United States and Europe?

Mr. DUDLEY. But I do not conduct the daily operations of the ECB in lending money to their banks, versus collateral that they take.

Mr. LUETKEMEYER. Okay.

One of the concerns that I have is with regard to the quality of the economies over there. We keep talking saying, "They have dodged the bullet. They are getting better. They are improving."

And yet, we see, and we had Secretary Geithner here just last week, and he acknowledged that the European continent as a whole is still struggling. I think the comment was made in testimony today that it is a negative position as far as the growth of the economy yet. Greece is probably 4/10ths or 4 percent negative growth.

It is fine to sit here and go through a workout and restructure your debt, but if you don't have the ability to repay it, because you don't have an economy that grows fast enough to repay it, what do you have? I think we have to look at the revenue side.

We may be able to restructure the debt so that it can work. But if you don't have enough cash flow, enough revenue coming in, we are still in trouble. Where do you see that going?

Mr. DUDLEY. I certainly accept your observation that the European economy is very weak, and that weakness is going to persist for a while as these governments engage in further fiscal actions to get their budget deficits on a sustainable course.

But that fact I think in no way creates risk for us in terms of our swap agreements with the European Central Bank. We think we are very well secured in those transactions. We fully anticipate being fully repaid.

During the depths of the financial crisis in 2008 and 2009, a far worse economic environment than the one in which we are today, with far greater amounts of swaps outstanding, we were fully repaid. We didn't lose a penny. In fact, the total profit to the U.S. taxpayers for the swaps that were engaged in during that period was about \$4 billion of profit to the U.S. taxpayer.

Mr. LUETKEMEYER. The point I am getting to, though, is if you have weak collateral for the European Central Bank swap lines and their economy is not going anywhere, that even gets—to me, that makes the debt that is—or the collateral that is securing that line—even weaker.

And so therefore, whether we may have two-to-one or three-to-one, if you have nothing supplying—you have 2 or 3 times nothing securing the debt, that is pretty concerning to me.

Quick question for you—do you think that the swap lines enhance the dollar as the world reserve currency, or do you think it hurts it?

Mr. DUDLEY. I think—

Mr. LUETKEMEYER. I would like a comment from both of you, please.

Mr. DUDLEY. I don't think it is a major factor, but I think at the margin it probably enhances the dollar as a reserve currency. In other words, the fact that the Federal Reserve is willing to engage in dollar swaps probably makes people more comfortable to use the dollars to finance international transactions around the world.

I don't think this is a major factor though in terms of why we are engaging in swaps, or should be a major factor in terms of why we are engaging in swaps. I think the main reason why we are engaging in swaps is we don't want European banks to quickly exit their dollar lending business here in the United States, with that exit causing harm to U.S. households and businesses.

Mr. LUETKEMEYER. Dr. Kamin?

Mr. KAMIN. If I could add to that, clearly, key factors that are underpinning the dollar's status as a global reserve currency are the breadth and depth of U.S. financial markets. And in particular,

including but not limited to the status of U.S. Treasuries. All that is underpinned by the vitality of the U.S. economy and its consistent record of being able to innovate and grow.

The purpose of the swap lines is ultimately focused on continuing to preserve the vitality of the American economy and by making sure that foreign financial institutions have the funding they need to continue the flow of credit to American households and firms.

Insofar, then, as the swap lines can contribute to the continued vitality, the continued recovery of the U.S. economy, it undoubtedly is a plus as far as the dollar's reserve status. Although, as President Dudley has pointed out, it is probably one of many factors and not necessarily the most important.

Mr. LUETKEMEYER. Okay. Thank you very much. I see my time has expired.

Thank you, Mr. Chairman.

Chairman PAUL. Thank you.

I now recognize the gentlelady from New York, Mrs. Maloney.

Mrs. MALONEY. Thank you.

I want to welcome both of the panelists, particularly Dr. William Dudley, who is the President of the Federal Reserve Banks of New York. So welcome, Dr. Dudley.

And I would like to begin questioning by asking you, regarding the Federal Reserve's foreign exchange swap lines, can you tell me what your track record has been with these programs? Have they been successful? Have there been any losses to the taxpayers? Have there been any gains for the taxpayers; and if so, how much? And welcome.

Mr. DUDLEY. Thank you.

Mrs. MALONEY. Thank you for your service, both of you. Thank you.

Mr. DUDLEY. Thank you, Congressman Maloney. The track record is excellent, in two dimensions. One, the swap lines that we have engaged with have accomplished the goal that we set for them, which is basically to support U.S. financial markets and ensure the flow of credit to U.S. households and businesses.

And two, we have managed to do so in a way that has been extraordinarily safe. As I noted earlier, there have been no losses on any swap programs that we have ever engaged in, going back to 1962; and in terms of the swaps that we enacted during the financial crisis in 2008 and 2009 and ongoing, total profits for the taxpayers of about \$4 billion.

So no losses, profit for the taxpayers; has had the beneficial effect that we wanted in terms of supporting the financial system and supporting the flow of credit to U.S. households and businesses. So I think that they have worked very well. Thank you.

Mrs. MALONEY. Thank you very much.

And I would like to ask Dr. Kamin about a statement that Treasury Undersecretary Brainard has stated; that the Administration's position in Europe is not to seek additional funding for the IMF. And to quote her directly, she said, "The challenge Europe faces is within the capacity of the Europeans to manage."

Europe accounts for roughly 16 percent of our exports; in my opinion, and correct me if I am wrong, accounting for the stabilization of many jobs here in the United States, probably thousands of jobs. What occurs abroad is going to have a direct effect on the recovery here at home in the United States.

Do you believe the stabilization of European markets is critical to our economic recovery here at home, making systems like the Federal Reserve foreign exchange swap lines crucial?

Mr. KAMIN. Thank you, Congresswoman Maloney.

In response to your questions, first of all, I absolutely agree that it is critical that the Europe financial and economic situation be stabilized. As you have pointed out, Europe is a major trading partner of the United States. And as we discussed earlier, its financial conditions in Europe are highly intertwined with those in the United States.

So a stabilization of the European situation really is very important, both for the United States financial conditions as well as the continued growth of exports and the real economy, and thus jobs. Now, as regards the issue of IMF policy, the Treasury Department is our liege on that, on the issue of IMF policy, so I can't speak directly to their statements.

But I will note, as Treasury officials have noted as well, as well as Federal Reserve officials, that Europe is a very—the euro area is a very large and comparatively wealthy economy relative to many others in the world. And they do have very many substantial resources that could be brought to bear on their situation. And so it is critical for them to do so. Thank you.

Mrs. MALONEY. Thank you.

And Dr. Dudley, I would like to ask you, as countries and international markets form individual firewalls to stave off residual financial distress, are we always and likewise creating firewalls through various other areas in policies involving capital and liquidity

requirements that could have an effect on our economy here in the United States?

Mr. DUDLEY. We think it is very important to have a financial system that is resilient and robust. And towards that end, Congress, the Administration, and the regulatory community in the United States have been working hard to bolster the capital and liquidity among U.S. financial firms.

I have to say that we are in much better shape than we were a few years ago in both those regards. And I think that is good news because it means that if there are shocks emanating from abroad or emanating in the United States, that U.S. banks are in much better shape to absorb those shocks and to continue to function and supply credit to U.S. households and businesses.

Mrs. MALONEY. Could I ask for an additional 10 seconds?

Do you believe that we should do everything we can to contain the European crisis, to ensure that there is no spillover here in the United States, and to stabilize that region and our own economy? Yes or no?

Mr. DUDLEY. I think we should do everything that is prudent to stabilize the European economy. Obviously, we should do what is in our self-interest in terms of what is best for the United States; and all our policies are enacted through that prism.

Mrs. MALONEY. Okay.

Dr. Kamin?

Mr. KAMIN. Yes. That was exactly my thought. Definitely everything that is prudent and appropriate.

Mrs. MALONEY. Okay. Thank you.

I yield back. Thank you, Mr. Chairman.

Chairman PAUL. Thank you.

Did Mr. Luetkemeyer have a unanimous consent request?

Mr. LUETKEMEYER. Yes, Mr. Chairman. I would like to ask unanimous consent to place in the record the article which I referred to this morning. It is a MarketWatch article by Andrea Thomas with regards to the comment of executive board member Juergen Stark.³⁸¹

Chairman PAUL. Without objection, it is so ordered.

Mr. LUETKEMEYER. Thank you, sir.

Chairman PAUL. I now recognize Mr. Schweikert from Arizona.

³⁸¹ [The article Rep. Luetkemeyer placed in the hearing record can be found in Appendix E.]

Mr. SCHWEIKERT. Thank you, Mr. Chairman. Congressman Luetkemeyer stole one of the number-one questions I was interested in pursuing, and that was the credit quality of what is being pledged.

Can I get into something that is a little more conceptual? But this one actually really does bother me.

I am trying to get my head around the interconnectivity of euro-yen, euro's relationship to Singapore. And ultimately, as we are providing interlocking swap facilities, what happens when the debt cascade happens somewhere else in the world? Does that cascade end up tagging Europe, which tags us?

And how much ultimately is there in true net reserves in central banks around the world when you start looking at the net borrowing compared to the net savings countries? Dr. Kamin, I would love it if you would start with that one.

Mr. KAMIN. Thank you. I will be happy to.

So to start with, as we have come to recognize only too well, we have a very globalized financial system. And disturbances that occur in one part of the world are transmitted around the world through numerous channels and through numerous markets.

That was quite evident during the global financial crisis of 2008 and 2009. And we have seen it more recently with the European fiscal and financial crisis as deteriorations there—

Mr. SCHWEIKERT. Can I beg of you to pull the microphone a little closer to you?

Mr. KAMIN. Thank you. We have seen it more recently during the European financial crisis in the last couple of years. So—

Mr. SCHWEIKERT. And almost to the—what I am somewhat hunting is I have been tracking some data coming out of Japan, and there are some very worrisome signs in the net debt. How does that play into this interconnectivity?

Mr. KAMIN. What we have seen, then, is that in situations that occur like this, some dollar-funding problems, which is to say problems with banks getting funding in dollars in order to continue their flow of financing, they tend not to basically stay in one part of the world. There is a very easy capacity for those problems to spill out all over the world.

And it was in large part for that reason that we didn't just establish the swap lines with the ECB. We also established them with central banks around the world so that problems as they arose in different parts of the world could be addressed.

And as is evident from the data on the swap lines that we publish on our Web site, the take-up of these swap lines, in other words the

distribution of funds to institutions in different regions, has not been limited exclusively to the euro area, although that is where most of the money has gone.

Mr. SCHWEIKERT. Dr. Dudley?

Mr. DUDLEY. I certainly agree with Dr. Kamin's answer to that. The world is very interconnected, and problems in one part of the world can definitely have ripple effects through the other parts of the world.

That is why we did set up these swap lines with five central banks rather than just the European Central Bank. And there are some draws on those swap lines from some of these other central banks.

Mr. SCHWEIKERT. Dr. Dudley, as to that concept, help me get my head around it.

Considering the nature of our balance sheets today after the 2008 crisis, both Europe and the United States, some of our partners in Japan, around other places in the world, if today Europe—this became a very hard recession and we had something like the Tequila Crisis from 15 years ago or some sort of cascade out there, do we have enough capacity, particularly if we also had different regions of the world competing for access to those swap lines? Do you believe our balance sheets are capable of stabilizing?

Mr. DUDLEY. It is hard to know what would happen in a given scenario, so it is hard to speculate.

One thing that I think is important though is that the foreign countries around the world are a bit better protected themselves in terms of sharp changes in capital inflows to capital outflows in the sense that they have very large foreign exchange reserves compared to what they had 20 or 30 years ago.

So, the ability of countries to bear a reversal from capital inflows to capital outflows is much better generally around the world than it was 20 or 30 years ago.

And part of that is my concern over the interest-rate spike, particularly with our net debt coverage; the interest rate spike and where our WAM is on our U.S. sovereign debt. A couple of years of higher interest rates would be devastating budget-wise. So, I am fearful of a cascade somewhere else truly affecting us.

Mr. SCHWEIKERT. I talked in a recent speech about debt service problems for the United States that are not really visible yet because U.S. interest rates are so low.

And if the United States does not get its fiscal house in order over the medium term, there is a chance that U.S. interest rates will rise.

And that debt interest burden on the U.S. fiscal position will become quite significant. So, this is just another reason why the United States does need to get its fiscal house in order over the medium to longer term.

Thank you for your tolerance, Mr. Chairman. Thank you.

Chairman PAUL. I thank the gentleman.

Now, I recognize the gentleman from North Carolina, Mr. McHenry.

Mr. MCHENRY. Thank you, Mr. Chairman.

And thank you both for being here. We had a similar hearing in my subcommittee of the Committee on Oversight and Government Reform. And the times have changed slightly in the last couple of months, so I do want to touch on some of the things that I raised then, just to see if things have changed.

Dr. Dudley, can you explain under what circumstances the Fed would consider purchasing European sovereigns directly?

Mr. DUDLEY. The Federal Reserve has a small foreign exchange reserve portfolio that we manage for ourselves and for Treasury. And so we do actually own a very small amount of European sovereign debt as part of that foreign exchange reserve portfolio.

With the exception of that portfolio, which we periodically roll over maturing securities, I think the bar, as I said in our hearing a few months ago, was extraordinarily high for the Federal Reserve to actually go out and buy foreign sovereign debt for its own portfolio apart from these very small foreign exchange reserves holdings that we have.

Mr. MCHENRY. So, roughly what dollar amount do we have?

Mr. DUDLEY. I think it is on the order of \$20 billion, \$25 billion total. It consists of cash, sovereign debt of a couple countries, and then there are some reversed repurchase agreements where we basically have executed against dealers and taken—

Mr. MCHENRY. So, for context—

Mr. DUDLEY. It is a tiny—and it is based—

Mr. MCHENRY. \$25 billion to what of your total holdings, just so we have—

Mr. DUDLEY. The total portfolio is about almost \$3 trillion, not quite \$3 trillion.

Mr. MCHENRY. Okay. So, it is de minimis—

Mr. DUDLEY. It is de minimis and it hasn't changed in size or composition over—

Mr. MCHENRY. Do you have statutory authority to expand that? Could you ramp it up to \$500 billion?

Mr. DUDLEY. We have legal authority under the Federal Reserve Act to buy foreign sovereign debt. I don't see the circumstances under which we would ever be willing to do that, except with the exception of managing this foreign exchange reserve portfolio.

Mr. MCHENRY. Okay. Now, in terms of the long-term refinancing operation the European Central Bank has undertaken with the 3-year notes, in essence it looks similar in concept to TARP, doesn't it?

Mr. DUDLEY. It is a little different in the sense that TARP was money that Congress appropriated and then was used by the Treasury as capital to put into banks or put into other entities to recapitalize them.

The long-term refinancing operation is a loan from the European Central Bank to its banks against collateral that they pledged. So, it is a lending operation, not a capital investment.

Mr. MCHENRY. So, the TARP really wasn't a lending operation so you had to pay it back with fines and penalties and interest? It seems to me—

Mr. DUDLEY. TARP could be used for many purposes. It could be lent out and it could be used as capital. But if you look at how the TARP money was used and the bulk of it, the bulk of it was used for capital investments.

Mr. MCHENRY. I think we are battling semantics here because in essence they are similar in dollar amounts, similar in terms of their intent.

Now, really at the root, what is the European problem? Is it a problem of indebted countries? Is that the root of what we are contending with right now?

Mr. DUDLEY. I think that is part of it. Part of it is you have some countries in Europe that have budget deficits that are unsustainably high and debt burdens that are continuing to climb. So, that is problem number one.

But problem number two is they are doing so in a system of 17 countries with a common currency where the individual countries don't have control over their own monetary policy. They don't have their own currency and there is a lack of fiscal transfers within Europe to support countries that are in a weaker position relative to those that are in a stronger position.

So, there are some things that are very special about Europe's that are part of the European Union, the system of how the system is

arranged that are very different than anything that applies to the United States.

Mr. MCHENRY. So, what happened with much of this long-term refinancing operation, that capital; it flowed into sovereign debt of a few countries and in large part that is where much of this flowed.

But Dr. Kamin, in terms of what that actually did—we have actually bought some time and space for a few highly indebted countries. Is that basically what has happened?

Mr. KAMIN. I think that it is possible that the sect of the Long-Term Refinancing Operations (LTRO), in combination with the other measures that have been taken, basically might have some somewhat longer-term benefits.

To be specific about that, it is true, as you say, that probably some of the LTRO money did flow to the purchase of sovereign bonds. But perhaps the more important thing that the LTRO funds did was alleviate many concerns by the market about the liquidity position and the financial position more generally of European banks.

And so the way in which that may have led to reductions in the sovereign yields of some embattled European governments was not just directly—they had the funds and they could use them; but indirectly because European banks felt more solid in their financial position and more comfortable being able to buy these bonds.

In turn, that improved situation in terms of European banks in the eyes of the markets may have led investors to believe that, therefore, European governments would not in turn be called upon to support banks. So, there was sort of a virtuous circle in process here, which has so far been very beneficial in terms of improving the tenor of markets.

Now, all that said, you are absolutely right that the LTRO is the provision of liquidity by itself cannot be the only thing that will solve the European crisis. It is very important that European leaders work on a number of more lasting fundamental issues.

One of them is they need to actually make the financial backstops for European governments higher and stronger, and that is a discussion they are having. They also need, quite obviously, and this is very challenging, to actually follow through on their many commitments to improve their fiscal situation.

And finally, as we have discussed here today, improved fiscal performance must be buttressed by improved growth performance, and that is particularly challenging for the peripheral European economies. And so, they are going to have to follow through on a lot of fairly rigorous structural reforms.

Thank you.

Mr. MCHENRY. Thank you.

It sounds like psychology and economics are getting closer and closer in these current crisis times.

Mr. KAMIN. I think they always have been.

Chairman PAUL. I thank the gentleman.

I want to follow up on this issue about how it is going to help our consumers here at home when we make these loans overseas. And I think, Dr. Dudley, you indicated that you already have some evidence that it has been helpful? Or are you just saying that if we do it, it could be helpful?

Mr. DUDLEY. The evidence is—it is soft evidence rather than hard evidence. But we have been monitoring the performance of the European banks who do business in the United States quite closely because they were having trouble getting dollar funding.

Money market mutual funds which were providing dollar funding to the European banks during the summer and fall were pulling back. Other lenders, large asset managers, were also pulling back from the European banks. And this was causing those banks to start to get out of their dollar book of business. They were trying to sell off loans and pull back in terms of their willingness to provide credit.

This was going on at a pretty feverish pitch through the late fall and in through the early winter. And I wouldn't say that it stopped, but the sense we get is it is happening now in a much more orderly way and not leading to the fire sale of assets at low prices; not leading to downward pressure on financial markets; not leading to a constraint in credit availability of U.S. households and businesses.

So, from what I can tell, we are seeing that the leveraging of the European banks is continuing. But it is happening in an orderly way rather than a disorderly way, which is what our objective is.

Chairman PAUL. You don't actually have a quantity, a number that you can—

Mr. DUDLEY. No, we don't have—

Chairman PAUL. —to say that they did such and such to the consumers back here at home?

Mr. DUDLEY. We don't have the details or data on that. But we do have discussions with those banks.

Chairman PAUL. It seems like there is a conflict, at least in my mind, of the need to send more currency swaps over there when the banks—I think the top eight banks in Europe actually had a tremendous increase in their reserves, a 50 percent increase in 1

year. So, why do they need more money? Why do they need more? It is already there.

What about our banks? Our banks have \$1.5 trillion. If it is a good deal and it needs these bailouts or these purchases that you want them to do by having these currency swaps to help the banks—give the central banks to help buy some of this debt. If it is a good deal for anybody, why wouldn't some of our banks—they have \$1.5 trillion?

It seems like you are doing something that the market doesn't want you to do. And there is a reason. Maybe it is way too risky. And if we are sending money over to the European banks with the hope, but no evidence, actually, of some of this money coming back and actually stimulating our economy, why is it that just more credit and more money in the system is going to work if our banks are holding \$1.5 trillion?

There is something more to it than the lack of the ability or the lack of the willingness of the Fed to just endlessly create more and more credit. Why is it going to work better by just pumping more into, say, a European bank if the goal—see, you emphasized the help it is going to—you do it out of the interest of the American consumer.

You diminish the possibility that it might be done to just prop up the banks because they are in over their heads—that they may have credit default swaps. And the banks over there are—it is global. They have branches over there. It is just to prop up a system that is not viable.

So why is there a disconnect? There seems to be a lot of money there. Why do you feel compelled that we have to keep sending more in order that hopefully it will help our consumers here at home?

Mr. DUDLEY. I think that the U.S. banking system is a very different place than the European banking system. The U.S. banks have plenty of dollar assets that they can—monies that they can lend. They gather deposits through their retail branch networks here. So they don't have any shortage of dollar funds which they can lend.

The European banks were in a different position because they were dependent on the wholesale funding market providing them with dollars. And as the European situation deteriorated last summer and fall, U.S. investors that had been providing dollars to these European banks were pulling back.

And it was that pulling back and that difficulty for European banks to gain access to the wholesale dollar funding markets which was forcing them to pull back in terms of their willingness to lend to

U.S. households and businesses. U.S. banks don't need dollar liquidity right now, so there is no—and they are not deleveraging.

The issue is the European banks, their dollar book of business. They were having trouble funding that book of business, and that is why they were pulling back.

Chairman PAUL. But they are holding all the reserves. If it were any advantage at all, they would do it. Obviously, there is no advantage to even helping out Europe. There is no law against them loaning the money, is there? Why do you feel compelled that you have to do something that the banks that are holding all this money won't do?

Mr. DUDLEY. I think that the European situation was creating a lot of anxiety about the health of the European banking system because the health of the European banking system was tied up with the health of the individual national economies in terms of their fiscal positions. And the ECB basically has been trying to find a way to cut that tie.

I think that long-term refinancing operations and the dollar swaps have sort of calmed down the anxiety in the market. And what we have actually seen now since the long-term refinancing operations have been put in place by the ECB and the dollar swaps have been put in place by us, is we have actually seen financing pressures in Europe subside.

So the rates that the European banks have to borrow from other European banks or to borrow from U.S. banks in dollars, those rates have actually been coming down. So that is actually a beneficial consequence of the long-term refinancing operations and the dollar-swap programs. The pressure on the markets is abating, which I think is a good thing.

Chairman PAUL. I will recognize Mr. Luetkemeyer from Missouri.

Mr. LUETKEMEYER. Thank you, Mr. Chairman.

I am kind of curious. Who determines the rate for the swap lines, the interest rate?

Mr. DUDLEY. The interest rate is established by the Federal Open Market Committee in discussions with the foreign central banks. Obviously, they have to agree to the rate that we are willing to—

Mr. LUETKEMEYER. How often is it reviewed to go up or down? How often do you review that: quarterly; semi-annually; once a year?

Mr. DUDLEY. The swap lines are outstanding. For example, the current set of swap lines are outstanding until February 1, 2013. But we certainly could review them at any—

Mr. LUETKEMEYER. The rate doesn't float?

Mr. DUDLEY. —at any point in time. The rate is set essentially at the Federal funds rate plus 50 basis points. So right now, it is about 0.6 percent of the interest rate.

Mr. LUETKEMEYER. Okay, but the amount above the Fed funds rate—that stays constant for the entire length of the swap? Or do you float that or adjust that as well?

Mr. DUDLEY. It had been at 100 basis points over the Federal funds rate up until last fall. And then, we lowered that spread from 100 basis points to 50 basis points. And the reason why we lowered that rate is that European banks were reluctant to use the swaps because they felt that using the swaps at that rate would be a sign of weakness.

The swaps were actually not being very effective in containing pressure in financial markets. So a decision was made by us and the foreign central banks in which we have engaged with the swaps to lower the rate from 100 basis points over the Federal funds rate to 50 basis points over the Federal funds rate.

Mr. LUETKEMEYER. If the European banks felt it was in their own best interests not to borrow money, not to swap because the rate was too high, why would you want to entice them into this with a lower rate?

Mr. DUDLEY. They were reluctant to use the swap because they felt that if they used it, it would be a sign that they were particularly weak institutions.

Mr. LUETKEMEYER. Why are they not viewed as weak now because they are using it now?

Mr. DUDLEY. Because when the swap rate was lowered from 100 basis points over the Federal funds rate to 50 basis points over the Federal funds rate, it became broadly attractive to the rates that were then in place in markets.

Mr. LUETKEMEYER. It made them look like better investors?

Mr. DUDLEY. Pardon?

Mr. LUETKEMEYER. It made them look like better investors, better money managers?

Mr. DUDLEY. There was an economic rationale for borrowing from the swap lines at the lower rate, so lots of banks participated. And since lots of banks participated, there was very little stigma from participating in that program.

Mr. LUETKEMEYER. This whole thing is held together by confidence and the perception that everybody is doing okay, isn't it?

Mr. DUDLEY. I think we have seen both in the case of the swaps and in the case of our own discount window in the United States, that there are times that banks don't want to use liquidity facilities, backstop facilities, because they are afraid that it is going to show that they are weak relative to other institutions. And that is just a problem in terms of these type of liquidity facilities.

Mr. LUETKEMEYER. I am just kind of curious. I will follow up on Chairman Paul's line of questioning with regards to the ECB loaning it to the banks, and the banks turning around and loaning it to our American, I guess, companies and investors here.

Why would they do that? Why are they not borrowing the money from us directly, our banks here?

Mr. DUDLEY. The European banks have big books of business in the United States, especially in areas like trade finance, project finance, and reserve energy. They lend against oil-and-gas drilling, energy reserves. And they have specialized expertise in these areas. And so, that is why they undertake this business around the world.

And in the United States, when they partake in this business, they do it in terms of lending dollars because obviously that is what the currency that we do business here in the United States. And so, they have a need for dollars to be able to sustain that business.

Mr. LUETKEMEYER. So what you are saying is that there are banks in Europe that are better experts at lending in certain areas, certain fields, than we have lending institutions in this country. Is that what you just said?

Mr. DUDLEY. I am saying that there are European banks that are specialized in certain areas. Now whether they are better or worse than U.S. banks that participate in the same areas, there is some overlap in the areas of competition.

But there are certain areas where European banks historically have concentrated their lending. Project finance, trade finance, and energy reserve lending are probably three of the most predominant examples.

Mr. LUETKEMEYER. Do the American corporations or entities that borrow from them, are they buying goods and services from Europe then, or are they buying goods and services from someplace else in the world, or the United States? Or is it kind of—does it kind of work like our export-import bank here, or how does that work?

Mr. DUDLEY. I would presume that if you are borrowing in dollars, you are using those dollars to buy U.S. goods and services.

Otherwise, you wouldn't need the dollars. You would need some other form of currency.

Mr. KAMIN. Congressman, if I could add—this is a very global financial system, and we are in the middle of a very global economic system.

So, large banks operate all around the world and compete with each other. And that actually ends up being beneficial to non-financial—

Mr. LUETKEMEYER. I understand that, Dr. Kamin, but I am trying to get at—I am kind of concerned here because we have foreign banks that are apparently competing against American banks, which is what you just said, yet we are loaning money to the ECB, to those banks, to be able to loan back and compete against our banks. Is that what you just said?

Mr. KAMIN. What I said was just that both financial institutions and non-financial institutions compete with each other all around the world.

Mr. LUETKEMEYER. Yes, but my concern is that if we, through these swap lines, are funding these international banks, and they are in turn competing against our banks, I don't think we need to be doing that. Do you?

Mr. KAMIN. The primary concern of the Federal Reserve in setting up the swap lines was to maintain the flow of credit to American households and firms. That was key because that is what is needed in order to maintain the economic recovery and to move toward achieving our dual mandate of both price stability and maximum sustainable employment.

So, that was the critical factor that motivated.

Mr. DUDLEY. I think the U.S. banks also are interested in having a healthy U.S. economy, just like the European banks are. And I think that they probably broadly recognize that a forced liquidation of assets by European banks would have negative consequences for the U.S. economy and for their banks.

Mr. LUETKEMEYER. I see my time is up. Thank you, Mr. Chairman.

Chairman PAUL. I now recognize Mr. McHenry for 5 minutes.

Mr. MCHENRY. Thank you, Mr. Chairman. To follow up on the earlier question I had about the long-term refinancing operation, it is interesting to me, Dr. Kamin—you did walk through the whole thought process. And I do appreciate that, the willingness of a witness from an independent institution the Congress oversees to walk

through in sort of a very broad form; your thinking on this is rather impressive, and, dare I say, revolutionary.

But it was very much appreciated because this is really just about trying to make sure policymakers on the Hill have an awareness of what the Fed is doing. And I don't have to explain to the Fed the chairman of this subcommittee's vigorous intention of oversight of the Federal Reserve. That may be the understatement of the day.

So with this injection of funds, of low-interest-rate loans for an extended period of time, much of this capital—a large portion of this capital, I should say—of all the categories has gone to sovereign debt.

Mr. KAMIN. This is the LTROs?

Mr. MCHENRY. Yes.

Mr. KAMIN. Thank you.

Mr. MCHENRY. Yes. I am sorry.

So in that operation, money is flowed to sovereign debt. So it has had one of the intended effects from the ECB, it appears. The question is, of course, "What is our exposure to Europe?" Right? In terms of a quantifiable dollar amount, by our private sector; that is one question.

But really the bigger question here for policymakers is what is our exposure as a government, and the Federal Reserve's exposure to Europe?

Mr. KAMIN. Thank you, Congressman McHenry, for your kind remarks earlier, and for these questions.

The Federal Reserve exposure to Europe would be basically encompassed by the value of our swap lines, which is around \$50 billion or so, to the ECB, and then a very small amount to the Swiss National Bank.

As we have discussed earlier, we think that those exposures are very secure. We have provided them with dollars. In exchange, they have provided us with their currency. And we appreciate the prudent management and the strong financial position of the ECB.

The exposure of our private financial institutions to Europe is obviously much, much larger, both our banks and our money market funds. Those exposures to the most embattled so-called countries in Europe, particularly like Greece and Portugal and Ireland, are really very small; the exposures to Spain and Italy—somewhat larger. But we have had many discussions with the banks that we supervise, and those are viewed to be quite manageable. Obviously, the exposures to core European banks which are, in turn, exposed to peripheral Europe are much larger.

But we are, in terms of thinking about the channels of spillover and how this exposure really works—what is probably more of concern is not so much these direct financial exposures to European institutions, but rather the fact that if the situation in Europe took a turn for the worse, there will be these ancillary channels that we have talked about before; the disruptions of financial markets; the retreat from risk-taking that could disrupt financial markets around the world.

And that is really the matter of greater concern, and that is where we focus a lot of our efforts in working with the banks that we supervise, and other regulatory institutions taking the same standpoint that the banks—

Mr. MCHENRY. Sir, explain to me how the swap lines benefit the American economy. Just in layman's terms.

Mr. KAMIN. Sure. To begin with, many European financial institutions, as we have discussed, are engaged in direct extensions of credit to U.S. households and firms. Any situation where these European banks were unable to get the dollar funding they needed, they would be forced to pull back on lending from U.S. households and firms. They might be forced to sell assets, which would then depress asset values in the U.S. economy more generally. And both of those effects would directly affect the ability of the U.S. households and firms to grow and prosper.

On top of that, funding difficulties by these European banks would lead to their cutback on credit, in terms of dollar lending, to other firms around the world; firms which buy a lot of the U.S. exports. And so, that would be an additional channel through which a funding shortage could hurt the U.S. economy. And that is what we hope to alleviate through the provision of these funds.

Finally, in the event that the dollar funding was not available—say in the absence of our swaps lines—and European banks ran into more severe difficulties, this could be a contributing factor to a further and renewed deterioration of European financial conditions, that not only could severely impact the European economy and prolong the recession, but lead to distressed conditions around the world.

So there might be larger, more ancillary effects from dollar funding problems than, again, the dollar swap lines are intended to alleviate.

Mr. MCHENRY. Thank you, Mr. Chairman.

Chairman PAUL. Thank you.

I recognize the gentleman from Michigan, Mr. Huizenga.

Mr. HUIZENGA. Thank you, Mr. Chairman.

I appreciate the opportunity, and I thank the witnesses for coming in. I want to maybe touch on a couple of quick things and continue on the currency swaps.

How far are we going to bring this along, I guess would be part of my question? How long are we going to stick into this game and be part of it? If Europe remains dependent on currency swaps, these same swaps become increasingly risky. Are you prepared to allow these currency swaps to wind down? Or what is going to happen there?

And then, the short-term dollar funding in Europe seemed to be the discussion point; right? How would you define short term versus medium term and long term?

Mr. KAMIN. I will start. Or, why don't you go ahead?

Mr. DUDLEY. Okay.

What we would hope is that the European countries do the right thing in terms of getting their fiscal houses in order and improving their competitiveness, so that investors start to have more confidence in the sustainability of the European Union and how all these countries are going to persist.

If that happens, and at the same time, the European banks are shown to have good earnings, liquidity, and capital, then I think that the willingness of private lenders to provide dollar liquidity to the European banks will emerge very much intact.

And in that situation, our swaps will be at rates that are actually higher than the market, and the swap programs will just sort of wind down automatically.

This is what we saw during 2007, 2008, 2009, during the first big wave of swaps; that as market conditions normalized, the swap usage came down pretty automatically.

Mr. HUIZENGA. I am kind of curious about that, because I am looking at some information in front of me here that says interest rates on dollar loans from the ECB are around 0.6 percent; interest rate on ECB charges for its euro loans is 1 percent. I don't have my Ph.D. in economics, however, I can see the incentive there. Why by making dollar financing cheaper than euro financing, how are they ever going to get out of that cycle?

Mr. DUDLEY. I am not sure that I would agree with that, if that is the right comparison. The 1 percent is to borrow euros. The 0.6 percent is to borrow dollars. And the alternative is to borrow dollars from a U.S. bank when the Federal Reserve is paying 25 basis points on the interest rate that we pay on excess reserves.

There is quite a bit of room between the 25 basis points we pay on the reserves here in the United States, and the 0.6 percent on the dollar swaps. So we would expect that if the conditions in Europe were to continue to improve, that the rate at which European banks could borrow dollars would be somewhat north of 25 basis points perhaps, but below that 0.6 percent. So we would think that there is plenty of room in that difference for the European banks to obtain credit from private entities.

And, in fact, we have actually seen private suppliers of dollars to the European banks return subsequently to the large, long-term refinancing operations and the dollar swap programs. So it looks like—

Mr. HUIZENGA. But doesn't that—

Mr. DUDLEY. —the market is already starting to normalize the dollar swaps.

Mr. HUIZENGA. But doesn't that weaken the value of the euro, what they are doing?

Mr. DUDLEY. I think the euro has really basically been trading in line with how the situation in Europe looks. As the European situation worsens, the euro depreciates. As the European situation improves, the euro appreciates. So it is really based on the outlook for Europe, of course relative to the outlook in the United States.

Mr. HUIZENGA. Help me to understand how if it is a weaker euro, doesn't that mean a typically a weaker Eurozone, since we have sort of flagged this off as a European issue, and trying not to get dragged into it here from the U.S. side?

Mr. DUDLEY. You are certainly right that if the European outlook were to deteriorate, the euro would probably weaken as a consequence. The good news is that over the last 4 or 5 months, the euro has actually strengthened a bit, because Europe has actually made some progress in terms of addressing some of their issues.

Mr. HUIZENGA. Okay.

And then, my time is almost up, and I will—Dr. Kamin, do you want to say something as well?

But I am just curious: What keeps you up at night? What other countries? You specifically—I think in Dr. Kamin's testimony, he talked briefly about Greece.

And then, you just were touching on Spain and Portugal. But where are we at with Italy and Ireland? Are we on solid footing— are they on solid footing in France and Germany and some of those other countries that have been leading this?

Mr. KAMIN. Certainly, the euro crisis in general is what keeps me up at night, and what occupies much of my thinking time during the day as well.

Obviously, the situation in Greece has been very difficult. And we have been following that very closely. We also, obviously, are very focused on, basically, Ireland and Portugal, which are the recipients of IMF funds. And we think it is critically important that these problems not move further into Spain and Italy, which have also been the focus of market attention.

And we think it is absolutely critical to make sure that you don't have further contagion beyond that. So far, things have been looking on the brighter side. There have been improvement in markets. But we have continued to monitor the situation as closely as ever.

And then, while most of my thinking lately is focused on Europe, obviously I am thinking about oil prices as well, because that is another area that poses a potential threat at least down the road.

Mr. HUIZENGA. Thank you.

Chairman PAUL. Thank you.

I have a couple of additional questions I would like to ask.

I am interested in one line on the Federal Reserve sheet at each week on other assets, other Federal Reserve assets. And it has been growing a bit. It used to be a small number, but even in recent years, it has gone up. I think it is about \$160 billion now.

What does that include? Does that include anything foreign? Is there any type of a foreign asset or a swap or anything involved in there that would help me understand this international financial crisis that we are in?

Mr. KAMIN. Chairman Paul, we definitely put on our balance sheet—we list our holdings of foreign assets. I don't recall offhand if that is where the "other assets" are. I don't think so. The "other assets" have, as you point out, risen over time. And there is one main contributing factor to that, which is when we buy securities in the markets, sometimes we buy them at a value that is above their par or face value, because interest rates had declined since they were first issued. That raises the value of those securities.

So then, we place the par value of the securities in one line on our balance sheet, and then that additional part that is over the par value, the premium, that is placed in our "other assets" line. So as we have continued to purchase securities in the market, the amount of the premium part of our purchases, which has gone into the "other assets" line, has continued to rise.

Chairman PAUL. So you say you are buying securities. Would this be like mortgage securities?

Mr. DUDLEY. This would be predominantly the maturity extension program, in which we are selling short-dated Treasury securities and buying long-dated Treasury securities. We are also buying mortgage-backed securities, but with emphasis to rolling over existing maturing mortgage-backed securities, so the size of the mortgage-backed securities portfolio is pretty constant.

Chairman PAUL. So, the significant increase of \$160 billion of just saying they are “other,” it is definitely related to the international financial crisis that we are involved in right now?

Mr. DUDLEY. As Steve related, it is related to the expansion of the Fed’s balance sheet and the types of assets that we are buying in the market. The maturity extension program—we are selling short-dated Treasuries; we are buying long-dated Treasuries. To the extent that we are buying Treasuries that are selling above par because interest rates has declined, that is different than what Steve was saying is booked in the other assets category.

Chairman PAUL. What does this mean, if this were to continue to grow at the rate it is growing now?

Mr. DUDLEY. No. I would expect that once the maturity extension program or other asset purchase programs are ended, then I would expect the other assets category actually to probably come down over time as that premium was amortized over time. So, I would view this as a temporary phenomenon.

Chairman PAUL. But there is no one place in the Federal Reserve reports that would give me a full explanation of exactly what the \$160 billion is? You don’t send out a report each month and say exactly what that is made up of?

Mr. KAMIN. There is an interactive portion of our Web site that offers more analysis of the different lines. That is the first thing.

The second thing I want to follow up on is having checked, the “other assets”—I just think the “other assets” category does indeed, as you suggest, also include foreign currency denominative assets, but not the swap lines. It is the other European and the undenominated securities that we hold.

Chairman PAUL. Okay.

The other thing I have noticed since 2008 is if you look at a long-term chart of currency in circulation, it is a steady increase and very predictable. But since 2008, it has been going up much more rapidly. This is cash as currency. Where is the demand for more cash? Do you

know exactly where that goes? Does that end up overseas? Is that in circulation here? Or is it in a shoebox someplace?

Mr. DUDLEY. Probably in both places. With interest rates this low, the opportunity costs of holding more currency obviously is very low. If you hold the currency, you get a 0 percent return. But if you have gone to your bank these days, you don't get much more than that.

So, people probably are carrying around more currency in their pockets because there is less cost of holding the currency versus holding it in a bank. This may also be true internationally, although I am not familiar with how much currency is held here versus abroad. I know historically, it has been about one third here, and two thirds abroad. But I don't know how that has been changing recently.

Chairman PAUL. I have one quick question for both of you. You can probably answer this rather easily.

You are very much involved in dealing with the value of our money, the value of our dollar and our financial system. But I have trouble finding the legal definition for the unit of account that we have as a dollar. Can you tell me your definition of—what is a dollar?

Mr. DUDLEY. I view the dollar as the legal tender in the United States, so that if someone pays a dollar as payment, the shopkeeper has to accept that dollar for that transaction.

Mr. KAMIN. Also the classic definition of money, I think of it as three things. It is store value, which it is a medium of transaction.

Mr. DUDLEY. And usually has portability.

Mr. KAMIN. Yes. And then it is a medium of accounts. In other words, you measure value by using a dollar.

Chairman PAUL. But you do realize there was a more precise definition of a dollar most of our history where you could actually know what it meant. But it seems like there is no definition at all. You say it is just a unit of account. And that is probably the reason why we have lost about 98 percent of the value of that dollar since 1913, since it has been the responsibility of the Federal Reserve to protect the value of our currency.

So, I have trouble believing that we will be able to solve any of our problems financially or even fiscally if we can create money endlessly and out of thin air and accommodate the politicians who spend money, who spend money overseas, who spend money on foreign policy that indirectly you have to deal with. Look how the sanctions and the threat of war in Iran affects the finances of the world, not only perception-wise in trade and pushing up oil prices, but also the need to keep monetizing this debt.

Federal Reserve Chairmen endlessly, for all the years I have been here, have said, “If the Congress would quit spending so much money and didn’t have so much debt, we wouldn’t have such a tough problem managing the currency.” At the same time, the debt wouldn’t be there if the Federal Reserve wasn’t there willing to monetize the debt, because you are the lender of last resort.

You guarantee the moral hazard that politicians are going to spend money. And it seems like to coordinate the two and have a sound economic system instead of a financial bubble that is based on debt and a monetary standard based on debt with the world awash in an exploding amount of debt. I don’t know how we will ever get out of this unless we finally come up with a definition, once again, of what the unit of account is and what a dollar means.

This hearing is now adjourned.

The Chair notes that some Members may have additional questions for the panel, which they may wish to submit in writing. Without objection, the hearing record will remain open for 30 days for Members to submit written questions to these witnesses and to place their responses in the record.

[Whereupon, at 11:42 a.m., the hearing was adjourned.]

QUESTION
FOR THE RECORD

FROM CHAIRMAN RON PAUL TO
WILLIAM C. DUDLEY, PRESIDENT
FEDERAL RESERVE BANK OF NEW YORK

Question 1:

The Federal Reserve receives no appropriations from Congress and is completely dependent on funding itself through its own operations. During your testimony you stated that the Federal Reserve made a \$4 billion profit from the central bank liquidity swap arrangements during 2008 and 2009. Considering that the Federal Reserve's annual operating budget is roughly \$4 billion, and money is fungible, could it be said that the Fed is funded by foreign central banks rather than through returns on its portfolio of Treasuries?

Answer:

While the Federal Reserve's current operating budget and the profit to date on our liquidity swaps are roughly the same, it would not be accurate to say that the Federal Reserve is funded by foreign central banks. Profits on the liquidity swaps did not come in the regular course of the Federal Reserve's operations, and, unlike income derived from our portfolio of government securities, are not a typical source of revenue for the Federal Reserve System.

Question 2:

With respect to the swap lines with the European Central Bank (ECB), you stated during the hearing that, "We think we are very well secured in those transactions. We fully anticipate to be fully

repaid.” You also stated that you “don’t have enough information to assess the quality of the ECB balance sheet.”

As I stated in my testimony, we believe that these swap transactions are secure. First, at the initiation of each transaction, the Federal Reserve takes ownership of foreign currency that it holds for the duration of the trade. This provides an important safeguard: if a central bank failed to repay us, we could sell the currency into the market for dollars, which would limit the consequences to the Fed’s balance sheet and to the taxpayer of a failure to repay.

Second, fluctuations in exchange or interest rates between initiation and maturity do not alter the contractual repayment amounts. At the end of each swap transaction, the Federal Reserve gets back all the dollars it provided plus a fee.

Third, the Federal Reserve must agree to any request to draw on the swap lines. We are in frequent contact with our counterparts at each foreign central bank regarding developments abroad. If we became uncomfortable with our exposure at any time, we could stop further swap transactions with the central bank (or central banks) in question.

Answer:

As I stated in my testimony, we believe that these swap transactions are secure. First, at the initiation of each transaction, the Federal Reserve takes ownership of foreign currency that it holds for the duration of the trade. This provides an important safeguard: if a central bank failed to repay us, we could sell the currency into the market for dollars, which would limit the consequences to the Fed’s balance sheet and to the taxpayer of a failure to repay.

Second, fluctuations in exchange or interest rates between initiation and maturity do not alter the contractual repayment amounts. At the end of each swap transaction, the Federal Reserve gets back all the dollars it provided plus a fee.

Third, the Federal Reserve must agree to any request to draw on the swap lines. We are in frequent contact with our counterparts at each foreign central bank regarding developments abroad. If we became uncomfortable with our exposure at any time, we could stop further swap transactions with the central bank (or central banks) in question.

Fourth, with respect to the ECB, the Federal Reserve has a

long track record of conducting successful operations not only with the ECB itself, but also with the national central banks of the euro area countries. Those national central banks – and their national governments behind them – are shareholders in the ECB and would be expected to backstop the ECB's obligations in the highly unlikely event that the ECB failed to repay us.

Question 3:

Has the Federal Reserve provided any other assistance either financial or technical in nature, aside from the central bank liquidity swap lines, to help mitigate the financial crisis in Europe? If so, please provide a thorough list and explanation of such assistance.

Answer:

I respectfully refer you to the response to this question provided by Steven Kamin, Director of the Division of International Finance at the Federal Reserve Board of Governors, and my co-panelist at the March 27th hearing.

Question 4:

Does the Federal Reserve have the ability and authority to provide financial assistance to Europe, aside from the central bank liquidity swap lines? If so, under what statute(s) does the Federal Reserve have such authority and what form(s) could such assistance take?

Answer:

The Federal Reserve derives its authority exclusively from the Federal Reserve Act, and all of our operations and actions are conducted pursuant to that statute.

The Federal Open Market Committee (FOMC) established central bank liquidity swap arrangements with five foreign central banks, including the ECB, between 2007 and 2008 and reauthorized them in successive votes from May 2010 through the present. The current authorization runs through February 1, 2013. I am not aware of any additional plans or intentions within the Federal Reserve to provide financial assistance to European central banks or governments.

Question 5:

The International Monetary Fund (IMF) is not permitted to accept funds directly from the Federal Reserve. Notwithstanding the

restraint on the IMF, does the Federal Reserve have the authority to provide funding directly to the IMF? If so, please cite the legal statute(s).

Answer:

I respectfully refer you to the response to this question provided by Steven Kamin, Director of the Division of International Finance at the Federal Reserve Board of Governors, and my co-panelist at the March 27th hearing.

Question 6:

What would the ramifications be to the Federal Reserve if the ECB is unable to repay the dollars it has borrowed? Does the Federal Reserve have a contingency plan in the event the ECB does not repay the dollars? If so, what is this plan?

Answer:

The dollars involved in our swaps with the ECB are not borrowed; they are swapped in exchange for euros provided by the ECB. The ECB is bound by contract to return any dollars it draws from the swap line, and we believe it will uphold its obligation in every instance. Our expectation that the ECB will repay us the dollars we have swapped for euros is based on the financial strength of that institution and its shareholders – the national central banks of the euro area countries. As mentioned above, the Federal Reserve has a long history of conducting successful operations with the ECB and with the national central banks of the euro area countries.

Question 7:

Payment transactions in the Eurozone are settled using the TARGET 2 system, a settlement system owned and operated by the Eurosystem, which is comprised of the 17 national central banks of the European monetary union and the ECB. Under TARGET 2, the various national central banks accumulate assets and liabilities amongst themselves.

- a. Is there a credit risk between the various national central banks of Europe as a result of the TARGET system?
- b. If so, under what circumstances could a national central bank incur a write-down or loss on its TARGET 2 assets?
- c. If such losses could occur, how does the Federal Reserve assess credit risk to the Federal Reserve's loans to the ECB?

Answer:

I respectfully refer you to the response to this question provided by Steven Kamin, Director of the Division of International Finance at the Federal Reserve Board of Governors, and my co-panelist at the March 27th hearing.

FROM CHAIRMAN RON PAUL TO
STEVEN B. KAMIN, DIRECTOR
DIVISION OF INTERNATIONAL FINANCE
BOARD OF GOVERNORS OF THE FEDERAL RESERVE SYSTEM

Question 1:

Has the Federal Reserve provided any other assistance either financial or technical in nature, aside from the central bank liquidity swap lines, to help mitigate the financial crisis in Europe? If so, please provide a thorough list and explanation of such assistance.

Answer:

The Federal Reserve has no programs in place other than the central bank liquidity swaps that involve financial institutions in Europe. I would not that the main purpose of the swap lines is to protect financial markets in the United States from disruption in foreign markets and to help support the flow of credit to U.S. households and businesses.

We have of course been in continual contact with our European counterparts and have closely monitored the situation, with an eye toward minimizing the potential spillovers to the U.S. economy.

Question 2:

Does the Federal Reserve have the ability and authority to provide financial assistance to Europe, aside from the central bank liquidity swap lines? If so, under what statute(s) does the Federal Reserve have such authority and what form(s) could such assistance take?

Answer:

As noted above, the Federal Reserve has no programs in place that involve financial institutions in Europe other than the central bank liquidity swaps, and participates in these swaps in order to protect U.S. financial markets and maintain the flow of credit in the U.S. economy. The Federal Reserve operates its swpal lines under the authority of Section 14 of the

Federal Reserve Act, which permits the Federal Reserve Banks to conduct operations in foreign exchange and to open and maintain accounts in foreign currency with foreign central banks. Any other action taken in response to the situation in Europe would be the decision of the Federal Reserve Board or the FOMC and would be taken in accordance with relevant statutes.

Question 3:

The International Monetary Fund (IMF) is not permitted to accept funds directly from the Federal Reserve. Notwithstanding the restraint on the IMF, does the Federal Reserve have the authority to provide funding directly to the IMF? If so, please cite the legal statute(s).

Answer:

No, the Federal Reserve System would be prohibited by statute from extending credit to the Fund without Congressional approval.

The Bretton Woods Agreements Act (BWA) reserves for Congress the ability to authorize certain actions to be taken on behalf of the United States with respect to the IMF. Under the Act, “[u]nless Congress by law authorizes such action, neither the President nor any person or agency shall on behalf of the United States...make any loan to the Fund...”. For purposes of the BWA, a reserve bank would likely be considered a “person” and may be considered an “agency”, to the extent that it would be acting at the request of the Board or the FOMC.

Question 4:

What would the ramifications be to the Federal Reserve if the ECB is unable to repay the dollars it has borrowed? Does the Federal Reserve have a contingency plan in the event the ECB does not repay the dollars? If so, what is this plan?

Answer:

The dollars involved in our swaps with the ECB are not borrowed, they are swapped in exchange for euros provided by the ECB. The ECB is bound by contract to return any dollars it draws from the swap line, and we believe it will uphold its obligation in every instance. Our expectation that the ECB will repay us the dollars we have swapped for euros is based

on the financial strength of that institution and its history of prudent decision-making: the Federal Reserve has a long track record of conducting successful operations not only with the ECB, but also with the national central banks of the euro area countries. As shareholders of the ECB – the national central banks – and their national governments behind them – would be expected to further backstop the ECB's obligations.

Question 5:

Payment transactions in the Eurozone are settled using the TARGET 2 system, a settlement system owned and operated by the Eurosystem, which is comprised of the 17 national central banks of the European monetary Union and the ECB. Under TARGET 2, the various national central banks accumulate assets and liabilities amongst themselves.

- a. Is there a credit risk between the various national central banks of Europe as a result of the TARGET system?

Answer:

The TARGET2 system settles domestic and cross-border interbank payments in the euro area by crediting and debiting banks' reserve accounts at their respective national central banks. Any accumulation of assets and liabilities in the TARGET2 system by the various national central banks are claims on and liabilities to the ECB, not one another. The ECB and euro-area national central banks control for credit risk in their operations with monetary and financial institutions by applying haircuts in valuing the collateral they receive and by requiring their counterparties to adjust the marketable assets they post as collateral as the prices of those assets change.

- b. If so, under what circumstances could a national central bank incur a write-down or loss on its Target 2 assets?

Answer:

In the event that there is a credit loss despite these precautions, then according the Eurosystem rules, capital losses are allocated according the respective capital shares of the national central banks in the Eurosystem,

not according to TARGET2 balances.

- c. If such losses could occur, how does the Federal Reserve assess credit risk to the Federal Reserve's loans to the ECB?

Answer:

The credit standing of the ECB is of the highest caliber, it has a very strong financial position, and we continue to view our swap lines with the ECB as safe. TARGET2 losses would not diminish either the effectiveness or the safety of the Federal Reserve's swap operations with the ECB.

STATEMENTS

STATEMENT FOR THE RECORD
HON. RON PAUL
REPRESENTATIVE, 14TH DISTRICT OF TX
CHAIRMAN, SUBCOMMITTEE ON
DOMESTIC MONETARY POLICY & TECHNOLOGY
U.S. HOUSE OF REPRESENTATIVES

The Federal Reserve has recently begun to engage in an ongoing bailout of the European monetary system. Under the guise of providing dollar liquidity to strained European financial markets, the Fed is creating hundreds of billions of dollars out of thin air to prop up the euro. While still well under their 2008 peak, these latest dollar swap agreements are nonetheless a thinly-disguised bailout. Congress has been far too lenient in allowing the Fed to engage in unprecedented monetary policy operations without informing or explaining its actions to Congress. The American people need to understand the effects these actions have on the dollar so that the Fed can be held accountable. I hope that this hearing will get much-needed answers to the very important questions surrounding the Fed's involvement in bailing out Europe.

For over 40 years, the Fed has been creating money out of thin air, propping up Wall Street while destroying the value of the dollar. This excessive money creation is what caused the financial crisis, yet just as a dog returns to its vomit, the Fed thinks that continuing to print money will somehow end the crisis. The trillions of dollars the Fed has created have eviscerated the purchasing power of American consumers, as anyone who has set foot inside a grocery store can see. While the government's official inflation rate is hovering around three percent, the original method of calculating the price index indicates that price inflation is over ten percent, which is more in line with what consumers are experiencing.

Despite a world awash in dollars, the Fed continues to view the cause of every financial problem as a dearth of liquidity. When the banks say they do not have enough money, the Fed unquestionably believes them and provides them with new dollars created from nothing. But a bank saying that there is not enough money is like a broke college student saying that there are not enough Ferraris. What he really means is that there are not enough Ferraris for sale at a price that he can afford. The same is true with banks; there are plenty of dollars available for banks to borrow, but the banks don't want to pay the going interest rate on loans, so they run to the central bank for cheap money.

Much of the Fed's intervention in the U.S. has been undertaken in an attempt to reflate the housing market. Rather than allowing house prices to fall so that supply and demand will re-equilibrate, the Fed has pumped liquidity into the system in an attempt to keep prices elevated. The federal funds rate has been kept artificially low for over three years now, and according to the Fed will be kept near zero for at least three years more. Because the Federal Reserve is so used to manipulating interest rates, it fails to see that interest rates are a price, the price of money and credit. While American banks may not be willing to lend dollars short-term to ailing European banks at 0.25 or 0.50%, you can bet that there would be a lot more dollars available to loan at 2, 3, or 4%. But in order for the markets to adjust and price loans at a market-clearing rate, the Fed needs to abstain from intervening to short-circuit this price discovery process.

The Federal Reserve has pumped trillions of dollars into the American financial system, with banks now holding \$1.5 trillion of excess reserves at the Fed, money which is literally just sitting there. The Fed pays an 0.25% interest rate on those excess reserves, which lessens the incentive of the banks to loan those funds to anyone, regardless of how safe the loan might be. This leads to a lessened availability of credit both domestically and abroad, with the result that credit markets are more contracted than they otherwise might be. The Fed views this credit market contraction as having its root in insufficient liquidity, which it then attempts to counteract by creating more money.

This time around, the newly created dollars are being loaned through swap lines to the European Central Bank (ECB) in exchange for euros. The ECB loans the dollars to struggling European banks in exchange for collateral. Once those loans are repaid and the swap lines expire, the ECB returns the dollars to the Fed and takes back its euros. The interest rate on these loans is about 0.6%, so it is not

surprising that American banks are keeping their excess reserves safe at the Federal Reserve. After all, why loan dollars to weak and risky European banks at 0.6% when you can get a guaranteed 0.25% from the Federal Reserve? So the dollar markets dry up and the Fed steps in to “fix” the problem it created.

We have to question what will happen if these loans from the ECB to European banks go bad. What happens if a major bank fails? If the ECB cannot return dollars to the Fed, does the Fed keep the euros it received from the ECB? Does it receive European government bonds, perhaps Greek bonds? Does it have recourse to the ECB's gold, as Chairman Bernanke alluded to last week?

Even more importantly, what is the impact of these programs on the dollar and on the U.S. economy? While the Fed seems to think that these swap lines eventually will be drawn back down to zero, what happens in the meantime? These hundreds of billions of dollars may be created out of thin air, but their effects on the real economy are anything but ephemeral. And the Fed has failed to consider the possibility that these swap lines may rise even higher than the \$600 billion level that was reached in 2008. Given the still precarious position of European governments and the European financial system, it would not be surprising to see a few hundred billion dollars more being created to continue the bailout of the euro.

The Fed's continued intervention in financial markets creates a climate of uncertainty. For almost five years, financial institutions have had to wonder from one day to the next what the Fed will do. Will it continue with more asset purchases under its policy of quantitative easing? Will it bailout large firms in danger of collapse or allow them to fail? Will it allow markets to function or continue its intervention? In such uncertain times it is only natural for firms to sit back and wait to see what happens. And every action by the Fed, every attempt at stimulus, rather than placating that uncertainty, instead exacerbates it. The Fed's actions destroy markets, erode the earnings and savings of Americans, and sow the seeds for the next great crisis. I hope that this hearing is yet another step in holding the Fed accountable and will help both Members and the American people reconsider the necessity of a central bank.

WITNESS TESTIMONY

WRITTEN TESTIMONY OF WILLIAM C. DUDLEY PRESIDENT AND CHIEF EXECUTIVE OFFICER FEDERAL RESERVE BANK OF NEW YORK

I. Introduction

Chairman Paul, Ranking Member Clay, and members of the Subcommittee, my name is Bill Dudley, and I am President of the Federal Reserve Bank of New York. It is an honor to testify today about the economic and fiscal challenges facing Europe, and the Federal Reserve's efforts to support financial stability in the United States. Financial stability enables U.S. businesses and households to maintain their access to credit and ensures sustained economic growth. This is why promoting financial stability is an important objective of the Federal Reserve, and other central banks around the world.

Let me preface these remarks by stating that the views expressed in my written and oral testimony are solely my own and do not represent official views of the Federal Reserve Board, the Federal Open Market Committee ("FOMC") or any other part of the Federal Reserve System. Additionally, because I am precluded by law from discussing confidential supervisory information, I will not be able to speak about the financial condition or regulatory treatment or rating of any individual financial institution.

The U.S. economy is currently expanding at a moderate pace, and strains in global financial markets, although having eased recently, continue to pose significant downside risks to the economic outlook. Because developments in Europe will have an important bearing on

the prospects for growth and jobs here in the U.S., the Federal Reserve is monitoring the situation there closely. This is also why we have taken special steps in recent months, together with other central banks, to support the flow of credit to households and businesses.

II. Europe

The economic situation in Europe has been unsettled for the better part of two years, with pressure on sovereign debt markets and local banking systems. High debts, large deficits, and slow growth in several European countries have called into question the sustainability of the entire euro area. The resulting strains in European markets have affected the U.S. economy.

The euro area has the capacity, including the fiscal capacity, to overcome its challenges. However, the politics are very difficult, both because the problem has many dimensions, and because many different countries and institutions in the euro area have to coordinate their actions in order to achieve a coherent and effective policy response.

Europe's leadership has affirmed its commitment to the European Union and its single currency union on numerous occasions. And the leadership is working harder than ever to achieve greater coordination in areas such as fiscal policy. A more robust and resilient European Union would be a welcome development for the United States. Three recent developments are especially encouraging in that regard.

First, liquidity concerns have eased significantly following the European Central Bank's long-term refinancing operations in December and February. Through this program, the ECB provides three-year loans to European banks at low rates, accepting a wide array of collateral in return. Hundreds of banks accessed the program in each operation, and the ECB lent nearly €1 trillion in total. As a result, the cost of funding throughout Europe has declined since the program began, the Euro has stabilized, and the sovereign bond market has improved. Changes in the ECB's collateral rules and reserve requirements have also had a positive impact.

Second, earlier this month, the Greek government worked with European leaders and its largest creditors to restructure the bulk of its €206 billion of outstanding privately-held bonds.

This not only reduced Greece's total indebtedness, it helped calm persistent worries that a

disorderly Greek default could become the trigger for a global

economic crisis. Shortly after the debt restructuring, the EU approved a €130 billion aid package for Greece. Together, these measures will provide key support to Greek leaders as they pursue the difficult fiscal reforms that are essential over the long term.

Third, leaders in most euro area countries have approved a new treaty designed to increase fiscal coordination. The new rules already appear to be making a difference. Both Spain and Italy recently completed 2012 budgets that move their deficits closer to EU targets. Further, Spain and Italy took their fiscal actions in close consultation with finance ministers from other countries in the euro area, demonstrating a healthy ability to work together. While difficult work still lies ahead, countries in the euro area have made meaningful progress toward achieving long-term fiscal sustainability.

Looking to the future, the difficult work that remains also presents special risks – both for Europe and the United States. If Europe fails to chart an effective course forward, this could have a number of negative implications here. In particular, there are three areas of potential risk that I would like to highlight for the Subcommittee today.

First, if economic conditions in Europe were to weaken significantly, demand for U.S. exports would decrease. This would hurt domestic growth and have a negative impact on U.S. jobs. It is important to recognize that the euro area is the world's second largest economy after the U.S. and an important trading partner for us. Also, Europe is a significant investor in the

U.S. economy, and vice versa. Thus, what happens in Europe has significant implications for our economy.

Second, deterioration in the European economy could put pressure on the U.S. banking

system. As the recent round of stress tests revealed, U.S. banks are much more robust and resilient than they were a few years ago. They have bolstered their capital significantly, built up their loan loss reserves, and have significantly larger liquidity buffers. The direct net exposures of U.S. banks to the so-called “peripheral” European countries are actually quite modest. The good news in the United States means that we are better able to handle bad news from Europe.

With that said, the exposures of U.S. banks climb sharply when one also considers their exposures to the core European countries and to the overall European banking system. U.S. money market mutual funds, in particular, have significant European holdings. This means that if the crisis were to broaden further and intensify, it would put

pressure on the capital and liquidity buffers of U.S. banks and other financial institutions.

Third, severe stresses in European financial markets would disrupt financial markets here, which could harm the real economy. Stress in the financial markets causes banks to more carefully husband their balance sheets. When that phenomenon occurs, the availability of credit to U.S. households and businesses becomes constrained. Such conditions could also cause equity prices to fall, impairing the value of Americans' pension and 401(k) holdings. This would damage the U.S. recovery and result in slower output growth and less job creation. At a time when U.S. unemployment is very high, this is a particularly unacceptable outcome. In the extreme, U.S. financial markets could become so impaired that the flow of credit to households and businesses would dry up.

III. U.S. Dollar Swaps

In today's globally integrated economy, banks headquartered abroad play an important role in providing credit and other financial services in the United States. About \$1 trillion in worldwide dollar financing comes from foreign banks, \$700 billion in the form of loans within

the U.S. For these banks to provide U.S. dollar loans, they have to maintain access to U.S. dollar funding. At a time when it is already hard enough for American families and firms to get the credit they need, we have a strong interest in making sure that these banks can continue to be active in the U.S. dollar markets.

Banks headquartered outside the U.S. make extensive use of dollars in their financing activities. In part, this results from the fact that the U.S. dollar is the world's number one currency – a status that brings with it many benefits for our country. It is in our national interest to make sure that non-U.S. banks remain able to access the U.S. dollar funding they need to continue financing their U.S. dollar assets. If access to dollar funding were to become severely impaired, this could necessitate the abrupt, forced sales of dollar assets by these banks, which could seriously disrupt U.S. markets and adversely affect American businesses, consumers, and jobs.

One way we can help to support the availability of dollar funding, and ensure that credit continues to flow to American households and businesses, is by engaging in currency swaps with other central banks. Such swaps are a policy tool the Federal Reserve has used to support dollar liquidity for nearly fifty years. Most recently, the Federal Reserve established dollar swap lines with major central

banks during the global financial crisis of 2008, and reactivated them in May 2010. Last November, the FOMC, cooperating with five other central banks, reduced the rate being charged on these swaps to increase usage.

The swaps are intended to create a credible backstop to support – but not supplant – private markets. Banks with surplus dollars are more likely to lend to banks in need of dollars if they know that the borrowing bank will be able to obtain the dollars it needs to repay the loan, if necessary, from its central bank.

Ultimately, these dollar swaps are designed to support financial stability, and avoid an unnecessary tightening in financial conditions, so that economic activity and job creation in the United States can continue to recover. Our principal aim is to protect U.S. banks, businesses, and consumers from adverse economic trends abroad. I am pleased that the swaps seem to be working. In conjunction with the ECB's long-term refinancing operations, the swaps have helped European banks avoid the significant liquidity pressures we feared a few months ago and have reduced the risk that they would need to sell off their U.S. dollar assets abruptly.

IV. Conclusion

In sum, I am hopeful that Europe can effectively address its current fiscal challenges. The Federal Reserve is actively and carefully assessing this situation and the potential impact on the U.S. economy. At this time, although I do not anticipate further efforts by the Federal Reserve to address the potential spillover effects of Europe on the United States, we will continue to monitor the situation closely.

Thank you for your invitation to testify today, and I look forward to answering your questions.

**WRITTEN TESTIMONY OF
STEVEN B. KAMIN**

DIRECTOR OF THE DIVISION OF INTERNATIONAL FINANCE
BOARD OF GOVERNORS OF THE FEDERAL RESERVE SYSTEM

Thank you, Chairman Paul, Ranking Member Clay, and members of the Subcommittee for inviting me today to talk about the economic situation in Europe and actions taken by the Federal Reserve in response to this situation.

For two years now, developments in Europe have played a critical role in shaping the tenor of global financial markets. The combination of high debts, large deficits, and poor growth prospects in several European countries using the euro has raised concerns about their fiscal sustainability. Such concerns were initially focused on Greece but have since spread to a number of other euro-area countries, leading to substantial increases in their sovereign borrowing costs. Pessimism about these countries' fiscal situation, in turn, has helped to undermine confidence in the strength of European financial institutions, increasing the institutions' borrowing costs and threatening to curtail their supply of credit. These developments have strained global financial markets and weighed on global economic activity.

In the past several months, European leaders have taken a number of policy actions that have helped reduce financial market stresses. In early December, the European Central Bank (ECB) reduced its policy interest rate, cut its reserve requirement, eased collateral rules for its lending, and, perhaps most important, began providing three-year secured loans to banks. Second, euro-area leaders, the Greek government, and private-sector holders of Greek debt are taking steps to put that country on a more sustainable fiscal path. Additionally, European leaders announced and have started to implement proposals to strengthen fiscal rules and European fiscal coordination. Discussions to expand the euro-area financial backstop are on-going. These steps are positive developments and signify the commitment of European leaders to alleviate the crisis.

Since early December, borrowing costs for several vulnerable European governments have declined, funding pressures for European banks have eased, and the tone of investor sentiment has improved. However, financial markets remain under strain. Europe's authorities continue to face difficult challenges as they seek to stabilize their fiscal and financial situation, and it will be critical

for them to follow through on their policy commitments in the months ahead.

Here at home, the financial stresses in Europe have undoubtedly spilled over to the United States by restraining our exports, weighing on business and consumer confidence, and adding to pressures on U.S. financial markets and institutions. Of note, as concerns about the financial system in Europe mounted, many foreign banks, especially those in Europe, faced a rise in the cost of dollar funding and a decline in its availability. A great deal of trade and investment the world over is financed in dollars, so many foreign financial institutions have heavy borrowing needs in our currency. These institutions also borrow heavily in dollars because they are active in U.S. markets, purchasing government and corporate securities and lending to households and firms. While strains have eased somewhat of late, difficulty acquiring dollar funding by European and other financial institutions could ultimately make it harder and more costly for U.S. households and businesses to get loans. Moreover, disruptions to European access to dollar funding could spill over into the market for borrowing and lending in U.S. dollars more generally, raising the cost of funding for U.S. financial institutions. Although the breadth and size of all of these effects on the U.S. economy are difficult to gauge, it is clear that the situation in Europe poses a significant risk to U.S. economic activity and bears close watching.

Swap Lines with Other Central Banks

To address these potential risks to the United States, as described in an announcement on November 30, the Federal Reserve agreed with the ECB and the central banks of Canada, Japan, Switzerland, and the United Kingdom to revise, extend, and expand its swap lines with these institutions.³⁸² The measures were taken to ease strains in global financial markets, which, if left unchecked, could significantly impair the supply of credit to households and businesses in the United States and impede our economic recovery. Such strains were particularly evident in Europe, and these actions were designed to help prevent them from spilling over to the U.S. economy.

Three steps were described in the November 30 announcement. First, we reduced the pricing of drawings on the dollar liquidity swap lines. The previous pricing had been at a spread of 100 basis points

³⁸² See Board of Governors of the Federal Reserve System (2011), "Coordinated Central Bank Action to Address Pressures in Global Money Markets," press release, November 30, www.federalreserve.gov/newsevents/press/monetary/20111130a.htm. Similar announcements appeared on the web sites of the other participating central banks.

over the overnight index swap rate.³⁸³ We reduced that spread to 50 basis points. The lower cost to the ECB and other foreign central banks enabled them to reduce the cost of the dollar loans they provide to financial institutions in their jurisdictions. Reducing these costs has helped alleviate pressures in U.S. money markets generated by foreign financial institutions, strengthen the liquidity positions of European and other foreign institutions, and boost confidence at a time of considerable strain in international financial markets. Through all of these channels, the action should help support the continued supply of credit to U.S. households and businesses.

Second, we extended the authorization for these lines through February 1, 2013. The previous authorization had been through August 1, 2012. This extension demonstrated that central banks are prepared to work together for a sustained period, if needed, to support global liquidity conditions.

Third, we agreed to establish, as a precautionary measure, swap lines in the currencies of the other central banks participating in the announcement. (The Federal Reserve had established similar lines in April 2009, but they were not drawn upon and were allowed to expire in February 2010.) These lines would permit the Federal Reserve, if needed, to provide euros, Canadian dollars, Japanese yen, Swiss francs, or British pounds to U.S. financial institutions on a secured basis, much as the foreign central banks provide dollars to institutions in their jurisdictions now.

U.S. financial institutions are not experiencing any foreign currency liquidity pressures at present, but we judged it prudent to make arrangements to offer such liquidity should the need arise in the future.

I would like to emphasize that information on the swap lines is fully disclosed on the Federal Reserve's website--through our weekly balance sheet release and other materials--and information on swap transactions each week is provided on the website of the Federal Reserve Bank of New York.³⁸⁴

³⁸³ The dollar overnight index swap rate is the fixed rate that one party agrees to pay in exchange for the average of the overnight federal funds rates over the life of the swap. As such, it is a measure of the average federal funds rate expected over the term of the swap.

³⁸⁴ For the outstanding amount of dollar funding through the swap lines as it appears each week in the Federal Reserve balance sheet, see www.federalreserve.gov/releases/h41. For other relevant information and materials on the Federal Reserve's website, see www.federalreserve.gov/monetarypolicy/bst_liquidityswaps.htm. For weekly information on the Federal Reserve's swap transactions with other central banks, see www.newyorkfed.org/markets/fxswap/fxswap.cfm. Finally, for copies of the agreements

I also want to underscore that these swap agreements are safe from the perspective of the Federal Reserve and the U.S. taxpayer, for five main reasons:

- First, the swap transactions themselves present no exchange rate or interest rate risk to the Fed. Because the terms of each drawing and repayment are set at the time that the draw is initiated, fluctuations in exchange rates and interest rates that may occur while the swap funds are outstanding do not alter the amounts eventually to be repaid.
- Second, each drawing on the swap lines must be approved by the Federal Reserve, which provides the Federal Reserve with control over use of the facility by the foreign central banks.
- Third, the foreign currency held by the Federal Reserve during the term of the swap drawings provides added security.
- Fourth, our counterparties in these swap agreements are the foreign central banks. In turn, it is they who lend the dollars they draw from the swap lines to private institutions in their own jurisdictions. The foreign central banks assume the credit risk associated with lending to these institutions. The Federal Reserve has had long and close relationships with these central banks, and our interactions with them over the years have provided a track record that justifies a high degree of trust and cooperation.
- Finally, the short tenor of the swap drawings, which have maturities of at most three months, also offers some protection, in that positions could be wound down relatively quickly were it judged appropriate to do so.

The Federal Reserve has not lost a penny on any of the swap line transactions since these lines were established in 2007, even during the most intense period of activity at the end of 2008. Moreover, at the maturity of each swap transaction, the Federal Reserve receives the dollars it provided plus a fee. These fees add to overall earnings on Federal Reserve operations, thereby increasing the amount the Federal Reserve remits to taxpayers.

Conclusion

The changes in swap arrangements that I have discussed have had some positive effects on dollar funding markets. After the announcement of the changes at the end of November, draws on the swap lines increased considerably, peaking at \$109 billion in mid-February, and measures of the cost of dollar funding declined. In recent weeks, reflecting the improvement in market conditions, usage of the swap lines has fallen back to about \$65 billion.

That being said, many financial institutions, especially those from Europe, continue to find it difficult and costly to acquire dollar funding, in large part because investors remain uncertain about Europe's economic and financial prospects. Ultimately, the easing of strains in

U.S. and global financial markets will require concerted action on the part of European authorities as they follow through on their announced plans to address their fiscal and financial difficulties. The situation in Europe is continuously evolving. Thus, we are closely monitoring events in the region and their spillovers to the U.S. economy and financial system.

Thank you again for inviting me to appear before you today. I would be happy to answer any questions you may have.

GLOBAL FIAT CURRENCY COOPERATION

The Supremacy of the Dollar

The global fiat currency cooperation is organized by the Federal Reserve (FED) in a form of hegemonic cooperation (Mises 1998, 196). In practice, the FED is the world's central bank.

The hegemony of the FED is explained by the role of the dollar as the world reserve currency and the political power of the U.S. government. Due to the wealth created by the economic liberty³⁸⁵ that exceeds the one most other countries enjoy, the U.S. government could command enough resources to be the determining factor in two world wars. The U.S. have been maintaining the most powerful army with troops stationed in approximately 130 countries around the globe (Politifact 2011). Its defense budget is almost as high as that of all other countries combined (U.S. military spending is currently at 41% of the world military spending, Stockholm International Peace Institute 2011).

The military and political power has been used to impose a dollar based global fiat currency regime after World War II when the British

³⁸⁵ The size of the US economy is another important reason for the dollar being world reserve currency. The US has the biggest and most liquid financial markets. However, the economic factor alone does not explain why foreign central banks hold on to continuously depreciating dollar reserves.

Empire faded. Along the British political and military power the British pound, the former world reserve currency, lost its status. At the same time the U.S. emerged as world power number one (Hoppe 1990) and with it the dollar as the world reserve currency.³⁸⁶

The Bretton Woods System designed in 1944 made the dollar the backbone of the international monetary system. Currencies maintained fixed exchange rates to the dollar which was still linked to gold; and in fact, the only currency redeemable into the yellow metal. Foreign central banks did not exchange their own currencies into gold, but they could redeem dollars into gold at the FED. In this system central banks expanded their reserves on top of dollar reserves, which supposedly were as good as gold.

The Bretton Woods System allowed the U.S. to import goods and services in exchange for dollars that would accumulate in the vaults of foreign central banks or in the hands of private persons living in high inflation countries. A steady flow into the U.S. of goods and services in exchange for dollars developed. The great advantage for the U.S. government was and still is that due to the status of the dollar, part of the costs of money production could be externalized on foreigners. Foreign governments accepted the system not only due to the economic status of the U.S. as the largest economy, but mainly due to the political power and pressure by the U.S. government.

Allied governments that hoped for protections were pressured to accumulate and hold on to their dollar reserves, in the same way that Great Britain in its heydays had ensured that countries under its influence held pound reserves. In the famous Blessing letter of 1967, the President of the Bundesbank Karl Blessing assured his U.S. colleague that Germany would not redeem dollars into gold in order to “support” the U.S. with the cost of American troops occupying Germany. Indeed, the countries with the highest number of U.S. troops, Germany and Japan, were the most “loyal” to their dollar reserves and did not redeem their reserves massively against gold in the Bretton Woods System.

Despite of this loyalty the U.S. slowly lost gold reserves, as the government used the printing press to finance its expenditures such as the Vietnam War. It was French President Charles de Gaulle that gave the order to massively redeem French dollar reserves into gold. Thereby independent France, that also withdrew its troops from NATO command, contributed decisively to the end of the Bretton

³⁸⁶ On the substitution of the pound by the dollar as the world reserve currency see Schenk (2009).

Woods System. In 1971 U.S. President Richard Nixon broke the U.S.' redemption promises and the last links to gold disappeared.

Even though, the Bretton Woods System disappeared, U.S. dominance did not. Dollars that had not been redeemed into gold in time remained in the vaults of foreign central banks. Thanks to the U.S. economic and military power, the U.S. dollar still is the main world reserve currency. U.S. allies cannot be expected to massively sell its dollar reserves. Fittingly, countries that want military protection from the US, such as Japan, Taiwan and Saudi Arabia hold very high dollar reserves.³⁸⁷ As long as the U.S. hegemony lasts, the dollar is likely to remain the world reserve currency. The status of being the world reserve currency still allows the U.S. to enjoy advantages similar to the ones it enjoyed in the Bretton Woods System. By producing and exporting dollars the U.S. can partially finance its government and trade deficit.

Issuing the World Reserve Currency

The status of being the world reserve currency also implies that the central bank issuing this currency becomes the world central bank coordinating central bank cooperation. As dollars are held to a large extent outside the U.S. and are used in international transactions, international financial markets trade mainly in dollars.

One of the main businesses of banks today is maturity mismatching: Borrowing short and lending long. Banks have engaged in this practice extensively during the last 10-15 years and internationalized this practice. Indeed, banks' foreign claims increased from 2000 to 2007 from \$10 trillion to \$34 trillion (McGuire and von Peter 2009, 9). Banks borrowed dollars short term in international wholesale markets (from money market funds, in the interbank market or in the foreign exchange swap market) and invested them long term, by granting loans to companies or households. Maturity mismatching is quite risky, because if the bank cannot roll-over the short term debt, it gets into liquidity problems.³⁸⁸ It may be forced to fire sale its long term assets, incurring in losses

³⁸⁷ As an exception to the rule China, not a traditional U.S. ally, holds a lot of dollar reserves. These reserves stem from the deliberate undervaluation of the Chinese currency in order to foster export growth on cost of internal consumption. They are a result of a form of forced savings. China, in contrast, to allies as Japan, Taiwan or Saudi Arabia, could actually sell its reserves and put the dollar under enormous pressure in the future.

³⁸⁸ For an analysis of the causes and consequences of maturity mismatching see Bagus (2010a) and Bagus and Howden (2010).

and triggering solvency problems. These risks are alleviated if there exists a lender of last resort that will come to help in times of trouble. The global lender of last resort is the central bank that issues the reserve currency.

The FED as the Dollar Lender of Last Resort in the Financial Crisis

Banks world-wide played the game of maturity mismatching, because they expected that in case of emergency, a lender of last resort would come to rescue. The lender of last resort of the world reserve currency was the FED: The world central bank. During the financial crisis, the FED came to fulfill the expectations and bailed out the world financial system via two main instruments.

Dollar Liquidity Swap Lines

First, when international interbank lending showed the first signs of stress, the Fed instituted dollar liquidity swap lines with the ECB and the Swiss National Bank (SNB) in December 2007.³⁸⁹ In such a swap transaction, the FED sells dollars to the ECB or SNB and buys them back later at the same price, receiving interests. This construction resembles a dollar loan to the ECB or SNB. The ECB or SNB can then use these dollars to lend them to troubled Eurozone and Swiss banks.³⁹⁰

The institution of swap lines solved the predicament that, for instance, the ECB could not have saved European banks that were short on dollars. These banks owned long term dollar assets in dollars financed with short-term funding, i.e. they had a foreign currency funding gap. MacGuire and von Peter (2009) estimate that the short term dollar shortage of European banks in 2007 was between \$1 trillion and \$6.5 trillion.

When in 2008 investment banks Lehman Brothers collapsed, international short term liquidity dried up even more drastically, the

³⁸⁹ This is not the first incident where the Fed used swap lines to support the international banking system as it has employed this instrument already after the terrorist attacks of September 11, 2001 (Fleming and Klagge 2009, 3).

³⁹⁰ The same applies mutatis mutandis for the SNB.

FED doubled the swap lines in size, instituted new lines with additional central banks and lowered interest rates. Central bank cooperation continues also along other lines. In the beginning of October 2008 the FED, the ECB, the Bank of England, the SNB, the Bank of Japan, the Swedish Central Bank and the Bank of Canada in an unprecedented coordinated move lowered interest rates. Major central banks also lengthened maturities of their lending operations and expanded the range of collateral accepted.

By the end of 2008, the Fed had instituted swap lines with a dozen central banks: Reserve Bank of Australia, the Banco Central do Brasil, the Bank of Canada, Danmarks Nationalbank, the Bank of England, the European Central Bank, the Bank of Japan, the Bank of Korea, the Banco de Mexico, the Reserve Bank of New Zealand, Norges Bank, the Monetary Authority of Singapore, Sveriges Riksbank, and the Swiss National Bank (Federal Reserve 2011).³⁹¹ In mid October the FED opened the dollar floodgates totally and removed limits to the swap lines to the ECB, Bank of England, the Bank of Japan and SNB lending as many dollars as demanded at a fixed rate at 100 basis points over OIS. At its heights in December 2008, the Fed lent through its swap lines to foreign central banks about \$620 bn. (Goldberg, Kennedy and Miu 2011).

In sum, major central banks cooperated during the financial crisis to maintain the global fiat system afloat. If the system had broken down, their respective governments would have gotten into severe funding problems and, indeed, central banks could have lost their reasons to exist. It is all in the interest of central banks to cooperate.³⁹²

³⁹¹ While the FED provides lender of last reserve services to the world, other central banks have also lent to foreign national banks. The ECB provided euros to countries such as Hungary, Poland and Denmark via central bank swap lines. The Swiss National Bank provided swap lines to Poland and Hungary as well. The Norwegian, Danish and Swedish National Banks provided swap lines to the Central Bank of Iceland. While the dollar is the basis of the global fiat money system on which credit is expanded, there are additional layers of credit expansion on top of secondary reserve currencies such as the euro or the swiss franc.

³⁹² In practice this coordination was achieved through occasional meetings and phone calls (Bernanke 2008). The main coordination occurred between Bernanke and Trichet. One reason why the U.S. government favored and supported the introduction of the euro was that with the

Dollar Lending to U.S. Subsidiaries of Foreign Banks

Second, during the financial crisis between 2007 and 2009 (Kuntz and Ivry 2011), European banks were bailed out by the FED through secret emergency loans to their subsidiaries in the United States (Bloomberg 2011). For instance, a subsidiary of Deutsche Bank in the U.S. could take mortgage backed securities and offer them as collateral for a new dollar loan from the FED.

Of course, these bailouts were not altruistic. In a fractional reserve fiat currency system (also in its global variety), a central bank has to bail out important banks if it wants to maintain its power. Important banks are “too big to fail” in the sense that their collapse threatens through bank’s interconnectivity and general losses of confidence, the very stability of the system. The system depends on the confidence that the central bank will bailout the banking system. In other words, if the dollar based global fiat currency regime was to be maintained, and a general panic with mass bankruptcies be prevented, the FED had to bail out foreign banks in its role of the world’s central bank. A collapse of the world financial system could mean the end of the dollar as the main reserve currency, and thereby mean the end of the advantages derived from it. Without the dollar privilege, the U.S. government would have had to downsize importantly.

Another Covert Bail Out

After drowning the market with liquidity, the financial crisis was stalled in 2009 and conditions improved. In February 2010 central bank swap lines expired. However, already two months later in May 2010, the FED reestablished swap lines with the Bank of Canada, the Bank of England, the European Central Bank, the Bank of Japan, and the Swiss National Bank. This time the liquidity problem had its source in Europe.

But why did European banks need help from the FED again? European banks had continued to borrow dollars short term in international wholesale markets and lent these dollars for the long term to US companies or households. Again, the maturity mismatch

euro monetary coordination between the U.S. and Europe got easier. Bernanke only had to call Trichet instead of calling the presidents of the different central banks in today’s Eurozone.

is highly risky, because once a bank cannot renew its short-term debts it becomes illiquid.

The situation of European banks deteriorated in 2010 and 2011.³⁹³ European banks had been pressured by their governments to buy their governments' debts. Italian banks are loaded with Italian government bonds, Spanish banks with Spanish bonds and so on. As the sovereign-debt crisis increased once again in the summer of 2011 with governments short of collapsing, European banks had increasing difficulties renewing their short-term loans in wholesale markets. Quickly the ECB provided the missing short-term euro liquidity. However, as the ECB can only print euros, not dollars, European banks got nervous. While US banks did not want to lend to European banks anymore, in November 2011, the FED stepped in and reduced the swap rate from the U.S. dollar OIS rate plus 100 basis points to the OIS rate plus 50 basis points. Effectively, the FED bailed out European banks and assumed its role as the international lender of last resort again.

This time the FED abstained from the second option: emergency loans to European bank subsidiaries in the U.S. since when these FED loans to foreign banks had been made public the FED had received harsh critics for having helped foreign financial institutions. Thus this time the FED used exclusively instruments that were less direct and obvious such as liquidity swap lines with foreign central banks in a covert bailout of European banks (O'Driscoll 2011).

Interestingly, in a March 2012 meeting of the Committee of Financial Services FED officials did not deny the bailout of European banks by the FED. Rather, they claimed that the bailouts are basically a free lunch for U.S. taxpayers, as they would get an almost-risk-free benefit in the form of the interest on the swap.

Further, the FED officials maintained that the bailout was necessary because a default of European banks would cause stress in financial markets. Through the interconnectivity of financial markets, U.S. banks would get into problems; lending to US households and companies would be affected negatively.

³⁹³ For an overview of the European sovereign debt crisis see Bagus (2010).

Lastly, they made assurances that the FED would end the swap-bailout policy once it becomes imprudent and the costs and risks of such a policy exceed the benefits for the US public.

Let's have a look at these startling arguments.

First, there ain't no such a thing as a free lunch; not even for the FED, the ultimate money producer. Just remember that US banks did not want to lend to European banks, because they regarded it as too risky. Even the central-bank swap is not risk free. It is true that the FED has locked in the exchange rate and expects to get back the same amount of dollars plus interest. Yet there remains counterparty risk: what if the ECB, goes bust? Then the creditors, including the FED, will take over the ECB's assets. Creditors would receive assets such as Greek government bonds, or loans to Portuguese banks. These banks depend on ECB liquidity lines and are collateralized by bonds issued by the Portuguese government, which also depends on the ECB to support it.

In the end, the ECB balance sheet is backed to a large extent by bonds from insolvent governments that are only kept afloat thanks to the ECB's promises to keep printing money and the pledged support of German taxpayers.

While an ECB bankruptcy does not seem imminent, the ECB has increased its capital to make good for potential losses already back in 2010 (ECB 2010), and the Bundesbank increased its provisions for losses in 2011 (Mallien 2012). In the mean time, the ECB has bought even more Greek government debt. The ECB is probably one of the most highly leveraged banks in history.

Of course, the FED hopes that eurozone governments will always recapitalize the ECB if it is necessary, so that ultimately taxpayers return the dollars to the FED. But what if Germany leaves the eurozone? While this is unlikely in the short term, the possibility exists for the long run. Then southern European governments will default on their debts — and take their banks and the ECB down with them. Then who will pay back dollar swaps to the FED?

The swap is also no free lunch as opportunity costs are involved. By abstaining from producing dollars and lending them to the ECB, the US-dollar money supply would be smaller or backed by better-quality assets (not indirectly by Greek government bonds). The dollar

production also implies a redistribution toward the first receivers of the new dollars, the ECB, European banks, and their borrowers (mainly irresponsible and insolvent governments) to the detriments of the last receivers, mainly US citizens, who are confronted with a debased dollar.

There are other opportunity costs. The FED could have produced the same amount of dollars and not invested in the central-bank liquidity swap lines. These swaps earn very low interest. Instead of the swaps, the FED could have purchased other assets, like stocks of Apple or gold, which may rise more in value.

One cost of the swap operation acknowledged by the officials in the hearing is the moral hazard created. Banks and governments worldwide may expect that the FED will come to save them, too, especially if they are well connected with the US financial system. So why be prudent?

The highest cost of the swaps, though, may be something else. Through the swaps, the FED is helping the ECB to bail out European banks that finance insolvent and irresponsible governments. The FED is indirectly bailing out countries like Greece, Portugal, and Spain, debasing the dollar with unlimited swap lines. The FED has promised to print unlimited amount of dollars and lent it to insolvent European banks via the ECB. Thanks to the bailouts, the political project of the euro continues. Without the swaps, some European banks might have failed, and with them their sovereigns. Thanks to the swaps, the eurozone stays intact.

The project of the euro leads to an ever-increasing rescue fund, and gradually toward a fiscal union and more centralization. A European financial government and the European super state, which would most likely abolish tax competition in Europe, are on the horizon. The highest cost of the FED policy, therefore, may be liberty in Europe.

The FED officials also made clear that they think the swap arrangement benefits the US public by keeping stress away from US banks and financial markets. The FED does not want stock markets to fall or interest rates to increase. For them, low interest rates are the panacea for all economic ills. However, having artificially low interest rates climb back to more normal levels is no disaster.

Sustainable investments are always restricted by real savings. Lowering interest rates does not increase the amount of real savings at all. Moreover, an important feature of a market economy is that people take responsibility for their actions. If US banks have granted loans to European banks and governments, they should assume the losses from their risky behavior.

Finally, the FED claims to be prudent. But how can the FED know the point at which it is no longer prudent to bail out foreign banks? How can it know when the costs of the bailouts start to exceed the benefits to the US public? How can they know what is best for the United States? Interpersonal-utility comparisons are arbitrary. Thanks to the bailouts, some banks may win, some stock owners may win, but at the cost of liberty in Europe and to the detriment of dollar users. Moreover, bailouts produce moral hazards, crises, and losses for individuals in the future. Yet the FED claims to know what to do: social engineering at its best — or, as Hayek would put it, a fatal conceit on the part of central (banking) planners.

Conclusion

International central bank cooperation is coordinated by the FED, which issues the world reserve currency. The dollar is not only a reserve asset for central banks, it is also the currency of international financial transaction implying important advantages for the producers of dollars who can externalize part of the costs of money production on foreigners. To maintain the fragile fractional reserve fiat currency system, the FED has to act as a lender of last resort, thereby contributing to its instability encouraging risky behavior and financing indirectly government spending.

As the financial crisis and the European debt crisis illustrate, the FED cooperates with other central banks in stabilizing the global fiat currency system. To this effect, the FED provided emergency loans to European banks and installed liquidity lines for foreign central banks. In short, the FED has assumed the task of bailing out the financial industry and governments worldwide by debasing the dollar.

**INVESTIGATING THE GOLD: H.R. 1495,
THE GOLD RESERVE TRANSPARENCY
ACT OF 2011 AND THE OVERSIGHT OF
UNITED STATES GOLD HOLDINGS**

THURSDAY, JUNE 23, 2011

WITNESSES

Thorson, Hon. Eric M., Inspector General, U.S. Department of the
Treasury

Engel, Gary T., Director, Financial Management and Assurance,
U.S. Government and Accountability Office

BACKGROUND

The Subcommittee on Domestic Monetary Policy and Technology held a hearing entitled “Investigating the Gold: H.R. 1495, the Gold Reserve Transparency Act and the Oversight of United States Gold Holdings” at 2:00 p.m. on Thursday, June 23, 2011 in Room 2128 of the Rayburn House Office Building.

H.R. 1495 requires the Department of the Treasury to assay, inventory, and audit gold reserves held by the United States government. This hearing focused on previous audits of U.S. gold reserves; the methodology for conducting the audit called for by the legislation; the proposed review of that audit by the U.S. Government Accountability Office (GAO); and possible improvements to the legislation.

This was a one-panel hearing with the following witnesses:

- The Hon. Eric M. Thorson, Treasury Department Inspector General (Treasury IG)
- Gary T. Engel, Director of Financial Management and Assurance, GAO

Summary of the Legislation

H.R. 1495, the “Gold Reserve Transparency Act of 2011,” was introduced on April 12, 2011 by Subcommittee Chairman Paul and was referred to the Domestic Monetary Policy Subcommittee. The bill directs the Secretary of the Treasury to complete a full accounting of the U.S. government’s gold reserves within six months of date of enactment of the legislation. The bill requires the Treasury Department to take a full inventory of the U.S.’s gold reserves; assay the reserves; and then conduct a full audit. The Treasury Department is directed to visit all locations where gold reserves are

held, and to assess the sufficiency of measures taken to ensure the security of the reserves.

After the Treasury Department completes its audit of the U.S.'s gold reserves, the bill directs the GAO to review the Treasury Department's work and to report to Congress within nine months with any additional findings regarding the state of the gold reserve. The legislation grants the GAO access to any facility where gold reserves are held. The bill also directs the Treasury Department to give the GAO full access to any relevant material pertaining to its review of the gold reserves.

Gold in the Monetary System

Like most other countries in the eighteenth century, at its founding the United States monetary system was based on gold and silver coins. In 1933, President Franklin Roosevelt, under Executive Order 6102, criminalized the possession of gold coins, gold bullion, and gold certificates. All individuals, with very minimal exceptions, were required to surrender their gold coins, bullion, and gold certificates to the Federal Reserve Banks or member banks of the Federal Reserve System. Thereafter any privately-held gold certificates, United States Notes, Federal Reserve Notes, National Bank Notes, or gold-denominated savings bonds were no longer redeemable for gold. In 1934, all gold held by the Federal Reserve System was ordered to have its title transferred to the federal government. The overwhelming majority of the 261.5 million troy ounces of gold owned by the United States is from this transfer of gold from the people to the government in the 1930s.

From that point on, only foreign governments could redeem their dollars for gold. This practice, however, ended on August 15, 1971, when President Nixon took the U.S. entirely off the gold standard by closing the U.S. government's "gold window," thereby preventing other central banks from converting the dollar to gold directly.

In the current international monetary regime, gold no longer plays a role as money, and members of the International Monetary Fund (IMF) are even forbidden from linking their currencies to gold. As a result, gold is now primarily used as one of many assets held by national central banks. Despite the lack of an official monetary role for gold, many countries hold gold reserves in significant quantities to defend the value of their currencies and to hedge against the dollar, which forms the bulk of their liquid currency reserves. Because gold is sufficiently scarce and can be easily traded, it has served as a store of value, a unit of account, and a medium of exchange for millennia,

and does not appear to have lost this standing even in a global fiat monetary system.

Despite the demonetization of gold by President Roosevelt and subsequently President Nixon, the U.S. Mint still issues a number of gold commemorative coins and investment-grade bullion coins in gold, silver, and platinum. The U.S. gold coins issued today by the Mint bear nominal face values that are not at all indicative of the commodity value of the gold contained in the coin. Bullion coins are sold for a price that includes the spot price of the metal plus a small manufacturing fee, while commemorative and collector versions have an additional markup.

Gold Holdings of the U.S. Government

The United States government is the world's largest single holder of gold, with 261.5 million fine troy ounces³⁹⁴. The majority of the gold is held in the form of 700,000 bars, many of which were made by melting gold coins collected after President Roosevelt's gold seizure in 1933. Some of the gold is in the form of coins held for historic or exemplar purposes.

About 95 percent of the United States government's gold stock is held in three deep storage vault locations, the most famous of these storage locations being in Fort Knox, KY; The other storage facilities are the U.S. Mint's production facility in Denver, CO, and the Mint's production facility at West Point, NY. Small amounts of gold are held in the Mint's production facility in Philadelphia and in the Mint's headquarters in Washington, DC. The precise amount of gold held by the Mint varies because it uses some of its gold to produce bullion coins and collector coins, which it then sells. The gold it uses to make coins is processed, sold, and replaced. Otherwise the U.S. stock has been relatively stable since the early 1970s.

The Federal Reserve Bank of New York stores 5 percent of the United States government's gold holdings in its vault. The New York Fed also holds gold on behalf of other governments or central banks, although that amount has been steadily dropping and does not count as part of the total U.S. gold stock.

The Federal Reserve once held sizeable stocks of physical gold with which to back the Federal Reserve Notes it issued, it was forced to surrender this gold stock to the Treasury in 1934, and now owns no

³⁹⁴ Gold is weighed in troy ounces rather than the avoirdupois ounces to which most Americans are accustomed. One troy ounce is 480 grains, or roughly 31.1 grams, while a troy pound is 12 troy ounces; an avoirdupois ounce is 437.5 grains, or around 28.35 grams, while an avoirdupois pound is 16 avoirdupois ounces (7000 grains).

gold. The Federal Reserve today carries on its books gold certificates issued by the Treasury in exchange for that gold surrendered by the Federal Reserve. The certificates are valued at about \$11 billion, or \$42.22 per ounce of gold surrendered.

The gold held by the United States government is officially valued for accounting purposes at \$42.22 per ounce. Gold had been officially valued at \$35 per ounce until President Nixon closed the gold window in 1971. Thereafter the dollar was officially devalued by revaluing gold at \$38 per ounce, and then again at \$42.22 per ounce in 1973. Even at that time the official accounting price was significantly under the market price of gold. At the time this hearing was held, the market price for gold was over \$1500 per ounce. In 2012, the market price for gold peaked near \$1800 per ounce.

Storage and Custody of U.S. Gold Holdings

The U.S. Mint is the custodian of a significant portion of the United States government's gold and silver reserves. "Deep storage" is the U.S. gold and silver bullion reserve secured by the U.S. Mint in sealed vaults, which comprises the vast majority of U.S. reserves and consists primarily of gold bars. The U.S. Mint prepares the custodial schedule for the deep storage gold and silver reserves, establishes and maintains internal controls for securing the reserves, and is responsible for complying with laws and regulations applicable to its custodial responsibilities for the reserves.

In October 2010, the Treasury Department's Inspector General released a report on its audit of the U.S. Mint's deep storage gold reserves.³⁹⁵ The Treasury IG concluded that in all material respects, the balance of the deep storage gold and silver reserves in Mint custody were in conformity with U.S. generally accepted accounting principles. The Treasury IG also rendered an unqualified opinion that there were no material weaknesses related to internal control over financial reporting and no instances of reportable noncompliance with laws and regulations.

Unfortunately, these regular financial audit reports from the Treasury IG show a limited picture of the condition of the U.S. gold holdings, focusing solely on an examination and approval of financial statements. They do not detail important information such as the last

³⁹⁵ Department of the Treasury Office of Inspector General, "Audit of the United States Mint's Schedule of Custodial Deep Storage Gold and Silver Reserves as of September 30, 2010 and 2009," Oct. 21, 2010, available at <http://www.treasury.gov/about/organizational-structure/ig/Documents/oig11004.pdf>.

time it was assayed (examined for purity) or inventoried. As a result, the condition of the U.S. gold holdings has been a topic of much debate, prompting questions as to whether the gold is encumbered in financial transactions, whether its quality is accurately reflected on financial statements, and, for some, whether it is even in the vaults at all.

It was not until the preparation for this hearing that a more complete picture emerged as to the audits that have been conducted and the condition of the gold reserves. While not available in any widely distributed reports, the U.S. Mint and other Federal agencies have been performing audits of the U.S. gold holdings periodically since 1975.

Gold Audit Timeline

In preparation for this hearing, the Treasury IG reported that between 1975 and 1986 an extremely thorough audit of the gold storage vaults was conducted: the vaults were inventoried, some bars were assayed on a random basis, and those results were audited. The vaults then were sealed with tamper-proof seals, signed by representatives of the U.S. Mint, the bureau that was the predecessor of the Treasury Department's Financial Management Service, and the Federal Reserve Bank of New York, all of whom were present for the entire audit process. This audit covered roughly 92 percent of the gold in the custody of the Mint.

After 1986 gold audits and inventories continued but were conducted solely by the Mint, without independent parties present for the sealing of the vaults. In 1993, the Treasury IG began conducting inventories again, and between 1993 and 2008 the OIG examined the 8 percent of the Mint's gold holdings not audited during the 1975-1986 audits. Another 13 percent of the gold was examined during this period for a total audit of roughly 21% of the Mint's custodial gold. In the process, the vaults were inventoried, bars were assayed on a selective basis, the results audited, and the vaults sealed and signed. Seals from the 1975-1986 audits were reviewed and some of the older ones were replaced where they were found to have begun deteriorating.

According to the U.S. Mint, all of the United States' gold reserves (aside from those held at the New York Fed) have thus been audited, inventoried, and assayed, and the vaults in which the reserves are held have been sealed. The gold cannot be moved out of the vaults without breaking the seal. If a seal needs to be replaced for any reason – if, for example, a light bulb in a vault burns out and

must be replaced – the Treasury IG must witness the old seal being broken and the affixing of a new one.

In 2012, the U.S. Mint undertook an audit of the gold held at the Federal Reserve Bank of New York. As of December 2012, the results of that audit were not made available to the public.

*T*RANSCRIPT

The subcommittee met, pursuant to notice, at 9:31 a.m., in room 2128, Rayburn House Office Building, Hon. Ron Paul {chairman of the subcommittee} presiding.

Members present: Representatives Paul, Jones, Luetkemeyer, Huizenga, Schweikert; Clay, Maloney, and Green.

Chairman PAUL. This hearing will come to order. Without objection, all members' opening statements will be made a part of the record.

I will start with my opening statement and proceed to anybody else who is anxious to do the same.

For far too long, the United States Government has been less than transparent in releasing information relating to its gold holdings. Not surprisingly, this secrecy has given rise to a number of theories about the gold at Fort Knox and other depositories.

Some people speculate that the gold has been involved in gold swaps with foreign governments or bullion banks. Others believe that the gold has been secretly shipped out of Fort Knox and sold. And, still others believe that the bars at Fort Knox are actually gold-plated tungsten.

Historically, the Treasury and the Mint have dismissed these theories rather than addressing these concerns with substantive rebuttals. No one from Congress has been allowed to view the gold at Fort Knox in nearly 40 years. Recent photographs of gold holdings seem to be hard to come by. And the Mint and the Inspector General's audit statements contain only the bare minimum of information.

Because the Government has for so long refused to provide substantive information on its gold holdings, it is not surprising that so much confusion abounds, both within and without the Government.

The difference between custody and ownership, questions about the responsibility for U.S. gold held at the New York Fed, and that issue of which division at Treasury is ultimately responsible for the gold reserves are just some of the questions that have come up during the research for this hearing. In a way, it seems as though someone decided to lock up the gold, put the key in a desk somewhere, and walk off without telling anyone anything.

Only during the preparation for this hearing was my office informed that the Mint has in fact conducted assays of statistically representative samples of gold bars, and we were provided with a sample assay report.

This type of information should be reported, or at least tabulated and published, so that the public knows exactly how many bars of gold exist, what their fineness is, and whether they are encumbered in any way through loans or swaps.

While the various agencies concerned have been very accommodating to my staff in attempting to shed some light on this issue, it should not require the introduction of legislation or a congressional hearing to gain access to this information. This information should be published and available to the American people.

This gold belongs to the people, especially since much of it was forcibly taken from them in the 1930s, and the Government owes it to the people to provide them with the details of these holdings.

We would greatly benefit from a full, accurate inventory audit and assay with detailed explanations of who owns the gold and who is responsible for ownership, custody, and auditing.

While the Mint and the Inspector General trust the accuracy of the audits performed between 1975 and 1986, this still means that at least two-thirds of the gold reserves were last audited over a quarter century ago. Surely, a full audit every 25 years is not too much to ask.

I look forward to the testimony of the witnesses regarding the conditions of the gold reserves, the accounting audits that are regularly performed, and the inventories and assays that have been conducted on some of this gold over the years.

I am also very interested to hear the comments on the Gold Reserve Transparency Act, so that we may put forward a measure that provides the public with accurate and complete information on their gold.

I yield back the remaining time of my 5 minutes, and yield to Mr. Clay for his 5 minutes.

Mr. CLAY. Thank you, Mr. Chairman. And thank you for holding this hearing, entitled, "Investigating the Gold: H.R. 1495, the Gold

Reserve Transparency Act of 2011 and the Oversight of United States Gold Holdings.”

I, too, look forward to the witnesses’ testimony.

And I also noted that in the Treasury Inspector General’s written testimony, he wrote that the IG is required by law to perform an annual audit of the Mint public enterprise fund’s financial statements. And those statements include the balance of custodial deep storage gold reserve held by the Mint.

It seems as though there is already an annual audit that both the IG and the GA believe is required of them.

However, Mr. Chairman, one other suggestion is perhaps we, as a subcommittee, may consider taking a tour of Fort Knox and the other place or places that house the gold and really witness for ourselves if it is going—I don’t know if that would be enough to determine if the gold is authentic.

But, it may be something for the committee to consider. So I look forward to the witnesses’ testimony. And, again, I thank the chairman.

Chairman PAUL. I thank the gentleman. I also thank the gentleman for his suggestion. I think it is a good idea to go and at least show our interest. But I personally would feel like I would have shortcomings on looking at a bar and knowing exactly what I was looking at. But there is no reason why we can’t at least consider that as a starting point.

Would any other member like to make an opening statement?

Okay. I will proceed to the witnesses.

I would like introduce our two witnesses. Mr. Gary Engel is the Director of Financial Management and Assurance at the Government Accounting Office. He directs GAO’s annual audit of the U.S. Government’s consolidated financial statements, as well as audits of key financial statements at the Department of the Treasury.

And I want to welcome Mr. Engel, as well as the honorable Eric M. Thorson, who has been the Inspector General of the Department of the Treasury since 2008. He manages oversight of the Treasury through independent audits, investigations, and review.

And we will go ahead and proceed with the testimony of Mr. Thorson.

**STATEMENT OF THE HONORABLE ERIC M. THORSON³⁹⁶
INSPECTOR GENERAL
U.S. DEPARTMENT OF THE TREASURY**

³⁹⁶ [The prepared statement of Inspector General Thorson can be found on page 1432.]

Mr. THORSON. I thank you for the opportunity to appear before you this afternoon.

My testimony will cover the audits done by my office on the United States Mint's Schedule of Custodial Deep Storage Gold Reserves. Hereafter, I will mostly refer to them simply as the gold reserves.

Before I discuss the details of the audits that are the topic of this hearing, I want to make one point very clear: 100 percent of the

U.S. Government's gold reserves in the custody of the Mint has been inventoried and audited. Furthermore, these audits found no exceptions of any consequence.

I also want to assure you that the physical security over the gold reserves is absolute. I can say that without any hesitation, because I have observed the gold and the security of the gold reserves myself.

Accordingly, the requirements of H.R. 1495, which calls for a full assay, inventory, and audit of gold reserves of the United States, together with an analysis of the sufficiency of the measures taken for the security of such reserves, is redundant of audit work already done.

Since 1993, my office has performed annual audits of the Government's deep storage gold reserves held by the Mint. In fact, our Fiscal Year 2011 audit of the gold reserves is currently under way.

My testimony today will briefly describe what the Mint gold reserves include, and the annual audits performed by my office since 1993.

The Mint maintains its storage gold reserves in three highly secure locations: Fort Knox, Kentucky; West Point, New York; and Denver, Colorado. While it would be inappropriate for me to discuss the details of the security arrangements in place at these facilities, I can tell you that they are multilayered and include substantial physical barriers, armed guards, cameras, and metal detectors.

In all, 42 compartments at these 3 hardened facilities hold 699,515 gold bars with a fineness or purity ranging from 0.47 to 0.9999, with an average fineness of 0.9006.

As of September 30, 2010, the audited quantity of the gold reserves held by the Mint was over 245 million fine troy ounces, weighing over 9,300 tons, with a market value of \$320.6 billion. I might add that each gold bar weighs about 27 pounds and has an average value of about \$0.5 million.

In June 1975, the Treasury Secretary authorized and directed a continuing audit of U.S. Government-owned gold for which Treasury is accountable. Pursuant to that order, the Committee for Continuing

Audit of the U.S. Government-owned Gold performed annual audits of Treasury's gold reserves from 1975 to 1986, placing all inventoried gold that it observed and tested under an official joint seal.

The committee was made up of staff from Treasury, the Mint, and the Federal Reserve Bank of New York. The annual audits by the committee ended in 1986 after 97 percent of the Government-owned gold held by the Mint had been audited and placed under official joint seal.

It should be noted that during the entire period of these audits and up to today, no discrepancies of any consequence have ever been found.

This is an example of the seal—and I have put pictures of these in my testimony. This is an actual seal that came off one of the compartments.

My office began conducting annual audits of the gold reserves in Fiscal Year 1993. Since 2005, these audits have supported the annual audits of the Treasury Department's consolidated financial statements, which incorporate the balances of the gold reserves held by the Mint.

The financial statement audit is performed by KPMG under contract with my office. KPMG has relied on our audits of the gold reserves when rendering its opinions on the Mint's and Treasury's financial statements. They have assured themselves as to the independence, reputation, and qualifications of my audit staff.

In addition, they have satisfied themselves with the adequacy of the audit procedures performed. The audit work performed by both my office and KPMG is done in accordance with Government auditing standards established by the GAO.

Since 1993, when we assumed responsibility for the audit, my office has continued to directly observe the inventory and test the gold. In fact, my auditors signed the official joint seals—such as the one I showed you—placed on those compartments, inventoried and tested in their presence.

At the end of Fiscal Year of 2008, all 42 compartments had been audited by either the GAO, the Committee for Continuing Audit of the U.S. Government-owned Gold, or my office, and placed under official joint seals. There has not been any movement of inventoried gold since that time.

Furthermore, in addition to observing the inventory of the gold for all of the audit periods, we selected and tested a statistically valid random sample of gold bars using a 95 percent confidence level. We found, without fail, that any differences between the fineness

reported by the Mint and the fineness based on our independently obtained assay reports were immaterial and negligible.

For example, during our Fiscal Year 2008 audit, we sampled gold valued at \$75 million. Based on the independent assay of those samples, we projected the dollar value of the difference, based on the assay report and the Mint's inventory records, to be \$3,820, or 0.005 of 1 percent of the gold inventory.

As discussed earlier, by the end of Fiscal Year 2008, all of the gold reserves in the Mint's custody had been 100 percent inventoried and audited.

In closing, based on the work performed by my office and by my own personal observations, I can assure the subcommittee and, as you said, sir, the American people, that both the quantities and the value of the U.S. Government's deep storage gold reserves held and reported by the Mint are reliable and fully audited. I mentioned the American people because, as you said, sir, they own this gold.

The reason we go through all of the procedures that I just mentioned is to give the American people the absolute confidence that the gold reserves are as represented. Fort Knox, for instance, isn't just a huge stockpile of gold. It is also a symbol of the stability and financial soundness of their Government.

To create doubt about the value or the security or even the very presence of the gold reserves without reason contributes to the distrust in Government that seems to be a growing trend today.

It is the obligation of every Inspector General to report to the Congress, and to the public, areas of concern that need to be fixed. But I believe it is also my obligation to report to you when something is being done right, and that is the case here today.

That concludes my statement.

Chairman PAUL. I thank the gentleman, and we will proceed with Mr. Engel.

**STATEMENT OF GARY T. ENGEL³⁹⁷
DIRECTOR, FINANCIAL MANAGEMENT AND ASSURANCE,
U.S. GOVERNMENT ACCOUNTABILITY OFFICE (GAO)**

Mr. ENGEL. Thank you, Mr. Chairman, Ranking Member Clay, and other members of the subcommittee. I am pleased to be here today to discuss H.R. 1495, the Gold Reserve Transparency Act of 2011.

As of September 30, 2010, about 95 percent of the reported U.S. gold reserves were in the custody of the Mint, of which nearly all is

³⁹⁷ [The prepared statement of Mr. Engel can be found on page 1444.]

deep storage gold. The remaining U.S. gold reserves were in the custody of the Federal Reserve Bank of New York.

In 1974, in response to congressional interest and in conjunction with the Mint, GAO assisted in the planning and observed the inventory of U.S. gold reserves in the depository at Fort Knox. GAO selected and audited 3 of the 13 compartments at that depository.

As part of this audit, GAO recommended that a cyclical inventory of the gold in Mint custody be performed annually to ensure that the gold in all compartments would be inventoried over a specified period of years.

Acting on this recommendation, in 1975 Treasury established the Committee for Continuing Audit of the U.S. Government-owned Gold. Treasury OIG officials estimate that about 92 percent of the

U.S. gold reserves have been audited by either GAO or the Committee for Continuing Audit as of September 30, 1986. Of this percent, GAO's audit in 1974 represented about 13 percent.

More recently, the U.S. gold reserves have been presented in various financial reports and have therefore been subject to various audit efforts. For example, since issuing its audit report covering the Mint's custodial schedule for Fiscal Year 1993, the Treasury OIG has annually audited the deep storage gold reserves in the custody of the Mint.

For each of the fiscal years under audit, the Treasury OIG has issued a clean opinion on the Mint's custodial schedules. Also, the Treasury OIG did not report any material weaknesses in internal control over financial reporting relating to these schedules for those fiscal years.

1495 provides for the Secretary of the Treasury to conduct and complete a full assay, inventory, and audit of the U.S. gold reserves, and an analysis of the sufficiency of the measures taken for the security of such reserves. In considering the provisions of H.R. 1495, it will be important to consider the cost, benefit, and timing of actions needed to implement the proposed requirements.

1495, if enacted, may result in duplication of certain past and current efforts. Nevertheless, GAO would be capable of reviewing the results of Treasury's actions as called for in the bill, should it be enacted. GAO's review would include visits to the facilities where the gold reserves are held to selectively observe the inventorying and the auditing of the gold. We would also examine various documentation supporting the required assay, inventory, and audit.

1495 also provides for GAO to transmit to the Congress not later than 9 months after enactment of the Act a report of GAO's findings

from such review and the results of Treasury's efforts. According to Treasury officials, because of the enormous quantity of gold that would need to be inventoried and assayed, it is unclear whether Treasury can complete such actions within the 6-month period provided for in H.R. 1495.

If Treasury's efforts are not completed within this period, there would be limitations on the scope of GAO's work if GAO were still to be required to report out within the 9-month period.

GAO stands ready to work with the subcommittee on developing changes to the provisions of H.R. 1495 that would most efficiently utilize the results of past and current gold reserve assay, inventory, and audit efforts.

Mr. Chairman, and Ranking Member Clay, this concludes my prepared remarks. I would be pleased to answer any questions that you may have.

[QUESTIONS & ANSWERS]

Chairman PAUL. I thank the gentleman.

I will start off with yielding 5 minutes to myself for questions. I wanted to ask both of you this question. It has to do with what is happening in New York, because that has been a little more difficult to understand.

There is a lot of uncertainty surrounding who has responsibility of the gold reserves held at the New York Fed. You did mention it in your testimony, but conversations with the Mint and the Office of the Inspector General, the main Treasury and the New York Fed, have all resulted in one or the other of these entities saying to check with the other, so we never got a full answer.

The OIG has stated that it does receive financial statements from the New York Fed attesting to the gold held in storage there for purposes of their financial statement audits. However, there seems to be no definite answer as to who has the responsibility for the New York Fed gold, and no one seems to know the last time it was assayed or inventoried.

A common rejoinder has been that it is just a small part of the gold reserves; it is only 5 percent. But when you look at the total amount of gold we have, 5 percent is pretty significant, because it is more than 13 million ounces of gold. And at \$1,500 an ounce, we are talking about \$20 billion that seems to be floating around out there and we just really can't pin it down. I know we are used to talking in trillions, but this just seems like poor governance.

Could either of you comment on the New York Fed-held gold, whether it has been assayed or inventoried, and whether it deserves to be thoroughly examined, as the legislation calls for?

Mr. ENGEL. My understanding is that the gold reserves in the Federal Reserve Bank of New York have not been assayed. That is just based upon my reading of reports, not from work that GAO has done. But it is also my understanding from reading a Treasury OIG report from back in 1987, that pretty much 99.9 percent of the gold reserves that were in the Federal Reserve Bank of New York at that time—and I think that the amounts of fine troy ounces, when I looked, has not really changed to what it is now—were being audited over periods of time by the Federal Reserve examiners, and that those inventories had been observed by members of the Committee for Continuing Audit that we spoke of earlier.

Because it had not been assayed and because it is not under the control of that committee, they have not considered that as audited. But, there have apparently been inventories of it, and there have been observations of that inventory. The last report that I saw that said that was from back in 1986. So, I don't know what has been done since then.

Chairman PAUL. Thank you.

Mr. Thorson?

Mr. THORSON. You are correct that we don't audit that. It is done by a third-party confirmation, which is an accepted practice under audit. But it is the Treasury's gold—5 percent of it is there and it is really at this point is immaterial to the statement and the total numbers.

Chairman PAUL. It is immaterial?

Mr. THORSON. As an auditing term, I mean. It is not included in what we listed in the statements.

Chairman PAUL. But it is a relevant amount of gold, obviously?

Mr. THORSON. Right.

Chairman PAUL. Since this is held at the New York Fed, and the New York Fed is obviously very much involved in international arrangements during the financial crisis, essentially every single transaction to the tune of trillions of dollars that they transacted involved foreign central banks. And over the last decade or two, central banks have been very much involved in gold swaps and loaning gold and selling gold.

And to date, of course, we have no evidence that our Government has ever been involved. But it seems to me that if there was ever one place where they might have gotten involved, since the New York Fed

is involved in international transactions with—you probably don't have the answer on whether or not they did or did not—but could it be conceivable that they could have done it without your knowledge?

Mr. THORSON. I don't believe so, no. And as far as any encumbrances other than the gold certificates that are held by the Fed, we did ask that question before coming here. What I was told was as far as encumbrances, "Not one troy ounce is encumbered."

Chairman PAUL. Okay.

I yield back, and now I yield 5 minutes to Mr. Clay.

Mr. CLAY. Again, thank you, Mr. Chairman, for conducting this hearing. And let me thank both witnesses for your testimony today.

According to the U.S. Mint, which is the custodian of nearly 95 percent of America's gold reserves, the time required to move, weigh, assay, and re-store the bars of gold averages 6 minutes per bar with a team of 19 people. Now, the Mint points out that extrapolating that to 700,000 bars, as the legislation requires, would require nearly 1.3 million manhours of incremental labor.

Therefore, to complete the inventory of just the gold bullion bars within 6 months, as this proposal specifies, would require approximately 1,280 individuals. And we know that since this is a domestic issue that, Mr. Chairman, your leadership would require an offset, so we would have to find the money to do this since this is a domestic issue, and we have to pay for all of those things.

Would either of the witnesses view this bill as a prudent use of taxpayer funds?

Mr. Thorson?

Mr. THORSON. The numbers that you quote are probably—just on my unscientific judgment having been there—pretty accurate. It is a remarkably small area. It is really surprisingly so when you are actually standing there with the compartments. You are going to be able to use very few people in that area. I think you gave the figure of about 1,200 people? That is almost laughable when you actually see the space.

So that means it is going to take a great deal longer than what you would normally think. And if you could put 1,200 people together, have them move the bars, it is going to take a very long time.

I, obviously, as I said in my statement, don't see the benefit at any cost really. It is what we do; it is what we do every year. As I said, it almost loses its effect to stand there and actually see it all, because there is so much of it. It is there.

Mr. CLAY. Thank you for that response.

Mr. Engel, is this a good use of taxpayers' money, if this bill becomes law?

Mr. ENGEL. I think, as I said in our testimony, that we would be willing to work with the subcommittee on possibly building off of the assays, the inventories and audits that have already been done to address concerns that there may be things within these vaults that are no longer there.

I agree that they have been through an audit process. Auditors have checked these seals. But if the subcommittee wanted to have something done there, I would think we would be talking, rather than a full assay, maybe some sort of sampling, if you wanted to just get a feel that nothing has happened over the years since those vaults were sealed. But outside of that, it seems quite a bit redundant with what has already been done.

Mr. CLAY. All right.

I thank both witnesses for their responses.

And Mr. Chairman, I yield back.

Chairman PAUL. I thank the gentleman.

I yield 5 minutes to Mr. Jones from North Carolina.

Mr. JONES. Mr. Chairman, thank you very much.

And Mr. Engel, it is nice to see you. I had a very pleasant business relationship with Mr. Thorson on a number of issues. And I thank you for always being there to be helpful.

I think the reason that I wanted to be here to listen to the witnesses, and certainly my colleagues on both sides, is that as a Member of Congress, one of my biggest concerns is not so much the gold, whether it is there or not there. But it is the Americans' distrust of all of us in Congress, quite frankly.

And I was reading—my staff got for me this—I will read it. It has nothing to do with this hearing, but it will lead to something in a moment:

“The Federal Reserve Bank of New York is refusing to tell U.S. Government investigators how much money it sent to Iraq during the first years of the American invasion. The Iraqi officials suggested the missing and possibly stolen funds from that era is more than \$18 billion.”

And there is Stuart Bowen—a wonderful Inspector General who has always exposed all the lost American money—going to the New York Fed, and they won't meet with him. And I think that is the reason that maybe this bill has been introduced, and maybe not. It is for other reasons as well.

But, if the American people could just regain a little bit of confidence in Washington, whether it be an agency or the Congress itself, it would really, I think, help the environment of America.

And I was wondering, I was thinking when Mr. Clay was suggesting, and Mr. Paul, the chairman, kind of agreed, does it make any sense for there to be a congressional delegation of five people, three people, six people, that every so often when you do the audit—I think you said once a year, or I might have missed that in the testimony, you may have to correct me—but is it already in the guidelines or the statute that there would be a couple of Representatives from the Senate and the House who would be able to accompany the inspectors when they go to—or the auditors, not the inspectors, the auditors?

To me, this is about—there is so much—if I could change one thing in America and Iraq, or I—if I could control one thing, it would be the Internet. There is more misinformation on the internet than there is accurate information. And all there has to be is some person who is challenged—I am going to be careful about this—who puts on the Internet that you cannot find the gold at Fort Knox. Then all of a sudden, thousands or millions of people are seeing that. They are not hearing what you are saying.

So I just wonder, if it makes any sense, if it is in your regulations, or if it needs to be in the statute, that there would be a team of two Senators or two Representatives who would have the option of accompanying your inspectors to one of the sites?

Mr. THORSON. Actually, that has happened under a situation very similar to this one in 1974.

In September of 1974, I believe it was Congressman Rousselot took a delegation which included, I believe, one Senator, Senator Huddleston, and they went down with, I assume permission probably would have come from either the Secretary of the Treasury or the White House, and did tour the gold and there were pictures taken and there are video clips of that.

I think that is exactly what you are describing. And it was done in 1974. Obviously, I don't think either one of us have any authority to say anything about such a visit. But it certainly is something that the committee can make a request for, because there is a precedent for having done it.

Mr. JONES. I appreciate you sharing that. And I will close in just one second. But I think in the world we live in today, there is such distrust that it would be I think for at least during this deep recession that we are in, that if that could be accomplished, it would help, I think, with the public's trust.

Not so much that they should believe Members of Congress, but I think that if this was an announced group meeting and Members, then it gets some publicity, and maybe there could be a news conference after this.

I don't know. I think there is validity in why we are having this hearing today, and I just wanted to share those thoughts with the panel and you, Mr. Chairman, and my colleagues.

I yield back.

Chairman PAUL. I thank the gentleman.

I now recognize Mr. Luetkemeyer from Missouri for 5 minutes.

Mr. LUETKEMEYER. Thank you, Mr. Chairman.

In your testimony, I didn't hear any comments about the golds that we use to mint coins. Is that held separately, or is that not included in this report, or am I missing something?

Mr. THORSON. You said the Federal Reserve gold is separate?

Mr. LUETKEMEYER. Okay, the Federal Reserve has a separate— of gold they use to mint coins. Is that the same?

Mr. THORSON. Right. It is all part of Treasury's gold, but it is not reported on the Mint's financial statement. It is reported on the Treasury's consolidated financial statements.

Mr. LUETKEMEYER. Okay, so they are the ones then that will mint the coins and they don't have anything to do with the gold that we are talking about here today?

Mr. ENGEL. No, there might be a misunderstanding. In the Mint locations, they have basically two types of gold. They have the deep storage gold, and then they have working-stock gold. I believe what you are talking about is the working-stock gold. Yes, there is working-stock gold that is kept in the different Mint locations. I think at the end of last year, it was about 3 million fine troy ounces. About 1 percent of the total is working-stock gold. And that is the kind that is used for minting coins, medallions, things like that.

Mr. LUETKEMEYER. Okay, so is that audited as well, I assume, as part of—

Mr. ENGEL. Yes, that is part of the Mint's financial statements. That is not part of the custodial schedules, but it is part of the Mint's financial statements.

Mr. LUETKEMEYER. Okay, so how do you replenish that stock then? Are you just using existing stock, or do you get new gold shipments in that you use up? Or how do you continue to be able to mint new gold coins?

Mr. ENGEL. I am not involved with it. But my understanding is that they replenish that by purchasing stock, you know purchasing from the outside—

Mr. LUETKEMEYER. —just on the open market somewhere?

Mr. ENGEL. Yes.

Mr. LUETKEMEYER. Okay. That is kind of interesting. I was listening to the discussion here of my colleagues with regards to the congressional review of the actual gold. And I think it might be a good idea to do that from the standpoint of also looking at the protection and procedures—all the stuff that goes into it from the standpoint of, again, some reassurance that there are adequate procedures in place for protection of it. So it is kind of interesting to listen to that debate.

Along the same lines, with regard to the amount of gold that we have, according to testimony in the documents that I have been reading here, we are carrying it on our books at \$41, \$42.22, I believe. Is that correct?

Mr. ENGEL. That is the per fine troy ounce statutory value.

Mr. LUETKEMEYER. Okay. And you evaluated a while ago at about \$320 billion, is that right?

Mr. ENGEL. At market.

Mr. LUETKEMEYER. At the current value today?

Mr. THORSON. That was September 30th of last year. And yesterday, we pulled it up, it would be \$1,552 an ounce and \$300 and—roughly—let us see, we don't have the—roughly \$340 billion.

Mr. LUETKEMEYER. Okay. Mr. Chairman a while ago asked the question with regards to using and swapping it out with regards to other things. It is not used as collateral for anything either right now, is it, other than the gold certificates? There is no—

Mr. ENGEL. I am not aware of anything—

Mr. LUETKEMEYER. —in any other way—

Mr. ENGEL. —especially in financial statements, there is nothing—or in the Department-wide—there is nothing disclosed about—

Mr. LUETKEMEYER. So, it is just sitting there right now, right?

Mr. ENGEL. Yes, it is a reserve.

Mr. LUETKEMEYER. Right, the reserve.

Mr. THORSON. Right, it is—and I would back up his statement as far as we are not aware of anything like that.

Mr. LUETKEMEYER. Okay, what would happen—there is some discussion about going back to the gold standard. I don't know if we have a will, or if it is a good idea, a bad idea. But if we would, how would that change your operation?

Mr. ENGEL. I cannot speak to the gold standard and how it would change—

Mr. THORSON. On the gold standard issue?

Mr. LUETKEMEYER. Yes, if we went back to the gold standard, how it will it change the operation of what you do?

Mr. THORSON. I am not sure how—

Mr. LUETKEMEYER. But we have to have some more—would it be some transactions going on with regards to how you take care of it? Would it be that we would have to raise and lower the amounts that we have all the time, or things like that? Or how would we do that?

Mr. THORSON. I would have to tell you, as far as any discussion regarding returning to the gold standard, that is—you are really getting into a much more a policy issue. We are—both of us, we are auditors, we will—

Mr. LUETKEMEYER. Okay.

Mr. THORSON. We will certainly be able to look at any process or procedure or plan if that ever happened. But as far as commenting on that as a policy as to whether it is a good idea or a bad idea, that is really out of our realm.

Mr. LUETKEMEYER. Okay.

Thank you, Mr. Chairman. I appreciate the opportunity.

Chairman PAUL. I thank the gentleman, and we will go on and have a second round of questions, if you care to.

It seems that a portion of the Mint and the U.S. gold reserves were audited in an assay between 1993 and 2008, as you acknowledged. The Mint estimated that as much as one-third of the gold reserves were examined during this period. The other two-thirds, however, have not been inventoried—that is according to my understanding—or assayed since somewhere between 1975 and 1986. Do you think it would be worthwhile, at least, to inventory and assay this portion of the Mint-held gold?

Mr. THORSON. By—I forget which date it was, I believe by 1986, we—hold on just one second here, I got it.

It basically covered—by 1986, 97 percent of the Government-owned gold held by the Mint had been audited and placed under joint seal. So once you have done that, and that seal remains unbroken, then I am not sure what other benefit there would be to going back into it at that point. But by 1986, you had 97 percent was audited—

Chairman PAUL. But it just seems like, it is quite a bit different the way you described audits compared to, I think a general understanding of audits. They don't audit small portions over 20 and 30

years. An audit, I thought, was supposed to be audited as quickly as possible.

Mr. THORSON. I think it is a little different. Because what you have as opposed to, for instance, if I am auditing inventory of a company, product goes out, product comes in, it is replaced, etc., etc. In this case, there is no movement.

Those doors are not opened. There is nothing there that can happen, because once those doors are sealed—and I have given you a couple of show-and-tell examples here—it is very obvious if those seals are ever broken. And it is not like, and as I mentioned in a normal audit, where product is moved out and I replace it and I move on. That is not what happens here.

There is no movement. Those doors are not opened, if they are and a seal is broken, then those people who did—it is replaced, the seal is put in place.

So I guess, it is hard to imagine what benefit there would be, if in fact the seals that cover those doors are unbroken.

Chairman PAUL. It just seems like it doesn't conform to my idea of what an audit is all about. But let me go on to another question dealing with the audits.

There has been a lot of speculation as to the condition of the gold reserves. As I mentioned in my opening statement, it was not until legislation was introduced and a hearing scheduled that information surrounding assays and inventories conducted by the Mint and the Office of the Inspector General was forthcoming. And your offices have been very accommodating in the process.

But it seems to me that all this information about the activities of the Mint and the IG have been engaged with respect to the gold reserves and the results of these activities should be gathered together in one place and made readily available, like it was mentioned on the Internet, maybe we could have it available to the public? That is what my bill proposes, assay and inventory the gold, evaluate whether it is encumbered in any transaction by the Treasury, have the Treasury issue a report.

The GAO independently verifies that report as Congress' investigative arm. Could you comment on the reporting element of the legislation, as well as the GAO's independent review?

Could you also comment on the extent to which the information already available could be published? Can we get the information a little easier instead of dragging it out?

If, for no other reason, for reassurance, because the questions have been building over the years. And when you say, "Well, but

when was it fully audited?" My understanding, a full audit of the gold, most people give me the date 1953. So what about the facilitating of information to give the American people the absolute reassurance that they are asking for?

Mr. THORSON. I guess it would depend on what you wanted. We have published all of the audit reports on our Web site, they are public. You all asked for assay reports, which we certainly provided. We keep them for a while.

There is really no secret about it. There was one thing, I guess, on the press release for this hearing that kind of got my attention when you said we were less than forthcoming, I believe, was the term. I don't understand that, sir, to be honest with you. We don't publish our work papers on the Internet. I don't think any auditor does that.

But for the period which we have them, we keep them in the normal course of events. But this is an example of a public audit report on the gold. It is out there. And the assay reports, I believe your staff asked for, we provided them. The work papers, like I said, we don't normally do that. But I don't think any auditor in America does that.

So whatever it is that we can do reasonably and under the proper rules of auditing, we are happy to do. Because I agree, transparency is our business. That is why we do what we do. If there are any suggestions, we are happy to listen to them.

Chairman PAUL. What we were looking for was to get—we thought we would see a list of the bars or the assay details. There were gross numbers, but not a list of the bars and the precise assay results.

Mr. THORSON. Clearly, the results of them are published. I think in my statement which is there is nothing hidden were all in the statement. I mentioned the range of from the assay reports, I think it was 0.6 to 0.999, something like that. That is what the assay tells you and then we gave you an average.

So, those numbers are out there. I am not sure I understand why there is some confusion about that.

Chairman PAUL. But I think it was incomplete and there weren't total numbers. I think we have a much smaller number in a single report. Anyway, we might be able to work that out and figure it out. But there is still some confusion there.

My 5 minutes is up, and I yield to Mr. Luetkemeyer for his 5 minutes

Mr. LUETKEMEYER. Thank you, Mr. Chairman. I just have a couple of follow-up questions.

What is the annual cost to store and protect our U.S. holdings? Do you have an idea?

Mr. THORSON. The cost? I am sorry?

Mr. LUETKEMEYER. The annual cost to protect and hold these holdings?

Mr. THORSON. What it would cost to follow through on this bill?

Mr. LUETKEMEYER. No. Right now, we have the gold sitting in Fort Knox and Denver and—

Mr. THORSON. We don't really, because we do audits—we are doing many audits at the same time and that sort of thing, I don't think we have really ever broken down what it costs to do this particular—at least, what it costs my office to do this—

Mr. LUETKEMEYER. Let me ask you what it costs—what is the cost to, I guess, the Government or the Mint or whomever pays the bill to protect the gold—

Mr. THORSON. Oh, the security.

Mr. ENGEL. I think that would probably be something that the Mint would be able to tell you—what that cost is. Neither of us I think would know that, but they would probably know what it costs for them to maintain the facilities and the depositories and things.

Mr. LUETKEMEYER. That is not in your report? You don't go back and check the costs for the procedures of maintaining the—

Mr. THORSON. We are auditing the inventory of the gold, not the—that would be a separate job and it is something that if your committee or somebody asked us to do, we could certainly look at that.

Mr. LUETKEMEYER. All right.

Mr. THORSON. But as you can see, that is really a different issue than how much gold is present at the locations.

Mr. LUETKEMEYER. I would think protecting the gold would be pretty important, being able to count the gold. If you don't have it protected, you can't count what is not there if somebody takes it from you.

Mr. THORSON. Having gone there, I have never—I am former Air Force and been involved with everything from nuclear weapons—seen security like I saw in that vault.

Mr. LUETKEMEYER. That is great and wonderful on that. But my question is, what does it cost us?

Okay, move on.

The IMF has the fourth largest gold reserves in the world. And my understanding is that the members who belong to the IMF have contributed gold to it. I guess my question is, is the gold that we

contributed, does IMF hold it, or do we maintain it here and just pledge it to the IMF? Or do you know?

Mr. THORSON. State the last part, please, sir.

Mr. LUETKEMEYER. Okay. All of the people who are members of the IMF have contributed gold to their reserve. The United States is a member of the IMF.

Mr. THORSON. Right.

Mr. LUETKEMEYER. When we pledged this gold, did we take it and physically move it to the IMF, or did we just have it pledged?

Mr. THORSON. There are no encumbrances on that; there is no reason to move it. We have been assured that there is not one troy ounce that is encumbered; therefore—

Mr. LUETKEMEYER. Okay. So we have moved the gold to the IMF?

Mr. THORSON. The gold. The encumbrances that I am aware of, the only ones are to gold certificates held by the Fed. And if they were to go to the physical side of it, what you are talking about is, if they were to redeem those gold certificates, they would be paid in currency. They wouldn't be paid in gold. The gold is collateral. It wouldn't be redeemed that way.

Mr. LUETKEMEYER. Okay. According to my resources here, it says there are 261 million ounces that are reported as U.S. Treasury-owned gold that are part of the IMF reserve. And so, we don't hold it ourselves. The IMF holds it in their reserve, wherever that is at? Do we count it as ours?

Mr. THORSON. Not that I know of.

Mr. LUETKEMEYER. We don't count it as ours then? We count it as the IMF count it as theirs? Or we don't—it is just sort of an account. It is kind of like having a savings account with another bank?

Mr. THORSON. No.

Mr. LUETKEMEYER. So, it is not our gold anymore? Is it IMF's, or is part of—is it ours as well?

Mr. THORSON. I think what you are talking about is the three purposes the gold can be used for, and the third one is what you are discussing, of which we are not aware of any use in that category at all. I believe it says the third one is consistent with the obligations of the Government and the IMF on orderly exchange agreements and a stable system of exchange rates, etc., made with the approval of the President, and may deal in gold. We are not aware of any case where that is occurring.

Mr. LUETKEMEYER. You are saying we have never done this?

Mr. THORSON. It is what?

Mr. LUETKEMEYER. You are saying that we have never done this?

Mr. THORSON. Not that—

Mr. LUETKEMEYER. We have never transferred—

Mr. THORSON. I am not aware of any time we have done that and, at least, certainly not that it affects the amount or the type of gold in the reserves—no.

I think you were talking about physically moving them back and forth. That has not happened in recent history. Going back all the way to, at least, we cover the 70s and more. So, no, I don't believe it has.

Mr. LUETKEMEYER. Okay. Perhaps after the hearing today, we can get together and find out the answer to the question, because I am kind of concerned now that we don't know whether we have lost 261 million ounces. Either we gave it to, and have now an account with, the IMF, or we still have it in our possession and it is encumbered.

Mr. THORSON. We know we still have it in our possession.

Mr. LUETKEMEYER. Or we still have it in our possession, or we do not know where it is at, and it is encumbered. One or the other.

Mr. THORSON. I can say, there has been no physical removal of any of the gold during that time. I think what you are asking is, "Is there any obligation or something that would cause that?" In other words, "Who owns that gold?" is really what you are saying, and to our understanding, that has not occurred. And we can certainly get you a more definitive answer.

Mr. LUETKEMEYER. Okay. The information could be correct. But it is information that I would think would be correct. So it tells me that we would like a little more research to be done here. Thank you very much.

Mr. THORSON. I guess my answer, to be really clear, was that we do not believe that has occurred.

Mr. LUETKEMEYER. Okay. Thank you.

Thank you, Mr. Chairman.

Chairman PAUL. Thank you.

I want to follow up on that, because you may have given the answer, but I still don't think it is very clear.

Is it possible that the gold is counted twice—once in the IMF, and also on our balance sheet of the 261 ounces? Is the gold at the IMF part of the 261 ounces that we claim we own?

Mr. THORSON. I don't think it is possible that it could be counted.

Chairman PAUL. So you don't—

Mr. THORSON. Do we count it twice, is it that it would affect the statement? Is that what you are asking?

Chairman PAUL. We have pledged gold to the IMF. Every country has to put so much gold in the IMF. So, is it sitting over here in the IMF and we no longer own it, right?

Mr. THORSON. We do not audit—obviously, we do not audit the IMF so I can't make any comment on that.

Chairman PAUL. Yes, but we are trying to figure out the accounting procedures on whether when you go and audit the gold, maybe you don't know that you audit and check the gold and look at these bars, but they really have been pledged to the IMF. Is that a possibility?

Mr. THORSON. No. I don't believe—no. I am not going to comment on IMF or what they are doing, because we don't audit the IMF. But the statements that I have made regarding the gold reserves in the Mint, our Mint, our Treasury Department Mint, that is pretty absolute.

And we know where it is. We know how much it is. And we know that it is there and none of it has been removed to, and nor do we believe there are any encumbrances it, other what I mentioned by gold certificates of the Fed.

Chairman PAUL. We have the certificates, the Fed holds certificates that are called gold certificates. The Treasury holds the material in gold. What if a law was passed and we instructed Treasury to sell \$20 billion worth of gold?

Mr. THORSON. Right.

Chairman PAUL. Can we do that, or do we have to get permission from the IMF? Maybe the encumbrance is to the Federal Reserve; maybe they are in charge and not Treasury. What can we do with that gold and who really owns it?

Mr. THORSON. I think you are trying to back into the same question there, which I think if you wanted to do that, that would be a question that would go to the Secretary of the Treasury with consultation, I am sure, by the President, who could do that. I don't think they're going to have to get permission from the IMF to do that, because there is no encumbrance on that gold, other than the gold certificates held by the Fed.

Chairman PAUL. That would change the balance sheet of the Fed, because they count that. So, I don't know whether that would—the Fed is pretty secret, you know. Congress doesn't have much to say about what is going on over there. And they do a lot of hiding. So, I am not so sure the answer could be that helpful.

Mr. THORSON. I understand you are asking the question. I have tried my best to reassure you that isn't the case. But, on the other

hand, remember, if somebody did try and redeem those gold certificates—let us say, they were pledged to somebody. They brought them forward and they wanted to redeem them. They would be paid in currency at the statutory rate. They would not be paid in gold. The gold is collateral. It is not the method of payment.

So, they would receive whatever the value is of those certificates. The gold would remain in the custody of the United States and would no longer be collateral for those certificates that were redeemed.

Mr. ENGEL. I could maybe add something to that. As it relates to the gold certificates, the gold certificates do not represent that the Federal Reserve has ownership of that gold. There is a liability that is actually recorded in the financial statements for about \$11 billion that represents what Treasury owes the Federal Reserve for those gold certificates.

Now, if we were to go to sell some of that gold, my understanding is that Treasury would have to retire those gold certificates. And then I think, as Mr. Thorson was saying, there would be a reduction in the cash balance that Treasury has over at the Federal Reserve at \$42.22 per fine troy ounce for whatever amount of the gold certificates you were redeeming.

But there is an actual liability that is recorded currently and has been for years on the Government's financial statements for the amount that they owe the Federal Reserve for those gold certificates.

Mr. THORSON. Yes. And that is what I meant by the fact that if they were redeemed, obviously because it is a liability—if they presented those, there is an obligation to pay those. But it would not be paid in gold bars.

Chairman PAUL. I want to go back to asking for suggesting that we have more thorough reports in our request from you on these reports. We did get one assay report, which was given as an example. There were 86 bars involved and you showed the details on what you found. But, of course, there is a lot more.

Why can't we get this list of each compartment, how many bars, what percentage, whether it is 0.999 or 0.90, and have the entire gold reserves that we have audited in that manner? So we see this one report, but we are asking—since there is a claim that all this has been audited and checked, couldn't that be all into one report, since we only got one assay report?

Mr. THORSON. I think what you are describing is really what the Mint does as far as—remember, the Mint inventories and assays, we audit. And there is a difference there. What you are asking for, I believe, really you need to direct that to the Mint and they can

probably satisfy you as to what kind of records you are really looking for there.

Mr. ENGEL. The Mint should have records by bar and what the fineness is of each of those bars. I would think they would have records as to what has been assayed of those bars as part of the inventorying and all of that process. But, I think they are the ones that would have that type of detail.

Chairman PAUL. All right, okay.

I see Mr. Schweikert has come in.

Are you ready to ask a question at this time?

Okay. I will go back to Mr. Luetkemeyer, if he asked all of them.

Mr. LUETKEMEYER. I just have one follow up here with regard to the last line of questioning. The more I think about it, the more concerned I am, because we need to know if the gold that the United States has contributed to the IMF is still counted as the

U.S. gold reserve?

In other words, if it is, then it is an encumbered amount of gold that we have sitting there and should be reported as such. If it is not, it should be reported like a savings account for an individual on their financial statement, and should be reported then on our financial statement of our Government as an asset sitting in the IMF.

Mr. THORSON. I think what you are saying, clearly if it was encumbered or belonged to IMF or anyone else, that would need to be reflected on the statement, because we are representing that this is the Treasury's gold, and therefore, that would not be an accurate statement if it were encumbered.

We have been assured that none of that is encumbered and, therefore, that is the total amount. And so I guess there are a number of theories you could put onboard as to how—

Mr. LUETKEMEYER. As the auditors of our gold, you should know whether that gold, if it is sitting in the IMF, is reported on our balance sheet somewhere for the Government.

Mr. THORSON. And gold held by the IMF is—it would not be— like I said, we don't audit IMF, so I am not going to try and—

Mr. LUETKEMEYER. Yes, but aren't you auditing the gold?

Mr. THORSON. —guess what is going on there. But if it were— what we do represent is the Treasury's gold, the U.S. gold reserves, which we know where they are and they are not held by IMF or controlled by IMF.

Mr. LUETKEMEYER. Who owns what is in the IMF then?

Mr. THORSON. Who does?

Mr. LUETKEMEYER. Yes, who owns the gold—that is the United States Government's gold—who owns that then if it is sitting in the IMF? Do we not own that?

Mr. THORSON. I want to make sure I give you an accurate answer, so I am going to defer until I can get you the proper answer that is absolutely accurate, because I can't give you an answer on that off the top of my head.

Mr. LUETKEMEYER. Okay. We are supposed to have 17 percent of the IMF, and if we own 17 percent of the 90 million ounces, that is a whole lot of money. And we need to know where it is.

Mr. THORSON. Right.

Mr. LUETKEMEYER. But I certainly appreciate your willingness to work with us to find out, number one, is it counted among our reserves and we are not aware of it. And if we are not—out there— and if it is not, where does it appear on our balance sheet as an asset to the United States Government.

Mr. THORSON. You asked a good question and that is why I said I don't want to give you an answer off the top of my head. I want a real answer.

Mr. LUETKEMEYER. I want to work with you to find out and make sure where it is at.

Mr. THORSON. And I will get you one.

Mr. LUETKEMEYER. I appreciate it.

I yield back. Thank you, Mr. Chairman.

Chairman PAUL. I thank the gentleman.

Mrs. Maloney?

Mrs. MALONEY. Welcome.

And thank you for this hearing, Mr. Chairman.

I would like to ask both of the witnesses whether you believe this is a good use of your resources and funds, especially if it is true, as you testified, that it is duplicative of what you already have to do with respect to gold reserves.

And I am mentioning basically Bill 1495. And in this the GAO wrote, "Bill 1495, if enacted, may result in duplication of certain past and current efforts, especially with regard to inventorying and auditing the gold reserves of the United States." And the Treasury's IG wrote, "I believe that the inventory and audit requirements proposed in The Gold Reserve Transparency Act of 2011 (H.R. 1495) to be redundant of the work that my office and the Mint currently perform."

And basically, why should Congress pass legislation that both the IG and the GAO believe is not needed? That is my question.

It is good to see you both.

Mr. Thorson, would you begin first, and then Mr. Engel?

Mr. THORSON. In our statement, we did say we believe it is redundant, because the things that are called for in the Act are things we believe we are already doing, and that is a proper audit and assay. We do assay to a statistical sampling. We don't assay every bar of gold, but we do it to a 95 percent confidence level. So I am not sure what it is that you would want us to do that we aren't already doing.

Mrs. MALONEY. Mr. Engel?

Mr. ENGEL. The one area that we talked about a little bit earlier is that maybe if you wanted to have something looked at, it is the gold reserves that are over at the Federal Reserve Bank of New York.

Now, there has been some audit of work that was done years ago by the examiners of the Federal Reserve and apparently the Committee for Continuing Audit had observed some of that. But that has not been labeled as audited per se, as I understood it by the Committee for Continuing Audit.

So if you did want to have something done, I guess you could have some work done over on the Federal Reserve Bank of New York. In terms of some of the other, it would be very redundant of what has been already done.

Mrs. MALONEY. Can each of you comment on what you believe would be the cost to taxpayers of implementing H.R. 1495, since we are being very cautious about our deficit at this point?

Mr. THORSON. I think both of us would agree. I think the Mint has worked up some numbers that are somewhere above \$60 million or more. It would be in that range, but I think that is a question you should probably direct to the Mint.

Mrs. MALONEY. Mr. Engel, do you have a comment?

Mr. ENGEL. Yes. We do not know. We haven't heard from the Mint what the amounts are. It is our understanding they were working up what they would estimate it would cost.

In addition to the cost of actually doing the inventorying and moving all the bars, when you assay it, you are taking a drill and taking a part of the bar to be tested, and that is basically destroyed, whatever that piece is.

So there will be some loss of the gold from the bars through the assaying process if you do that for every single bar that is out there. So that would be a loss from that process as well.

Mrs. MALONEY. I have no further questions, so I yield back to the chairman.

Thank you.

Chairman PAUL. I would like to address the subject of the cost, because our first estimate—oh, okay.

I will yield 5 minutes to Mr. Schweikert from Arizona.

Mr. SCHWEIKERT. You are kind, Mr. Chairman.

And forgive me if this has already been discussed. I am curious, so please educate a freshman. The different places that U.S. gold assets are held, IMF, you were just saying with the New York Fed, the Treasury, any other places?

Mr. THORSON. Not that I can see. No.

Mr. SCHWEIKERT. So those three would cover it? Is any of that pledged to loan facilities that would be World Bank or anything else we also touched?

Mr. THORSON. No, and to go back to the IMF a little bit, like I said, I would like to find a direct answer for that one as well.

Mr. SCHWEIKERT. Okay. My understanding from listening for a moment, Mr. Chairman, was that it has been how long since both of the—was it the New York Fed which actually would handle a lot of international transactions so, therefore, they would not only hold our gold reserves for the United States, but a number of other member nations?

Mr. ENGEL. I believe they do hold gold for other nations in their vault.

Mr. SCHWEIKERT. Just for the fun of it, any guess what is there?

Mr. ENGEL. I don't know.

Mr. SCHWEIKERT. Any guess on the number of participating countries?

Mr. ENGEL. No.

Mr. SCHWEIKERT. Okay.

Mr. ENGEL. That would be something the Federal Reserve would obviously be able to answer, but I don't know.

Mr. SCHWEIKERT. Okay. So if we have functionally three places, two that you are telling me we already have some audit history, Treasury, we have an audit history on gold supply? Yes? No?

Mr. ENGEL. Gold reserves, yes.

Mr. SCHWEIKERT. And we are still a little fuzzy was it on IMF?

Mr. THORSON. I am—like I said, I am still a little concerned about that particular question. So, but no, that is it.

Mr. SCHWEIKERT. And in a previous question just a moment ago, didn't we just tell the gentlewoman from New York it was how much to do the audit?

Mr. THORSON. To do the audit? The Mint's figure to do—the one that this bill would call for—was in the neighborhood of \$60 million,

but that was—you need to—that is a Mint number and you need to ask them that.

And just to be clear, the ratio of money held by the Mint and held by the Fed is 95 and 5 percent, 5 percent is at the Fed. But as far as the cost of this bill to perform that, I believe your staff has already made an inquiry to the Mint on that. But that is really—we can certainly audit that as it plays out and that kind of thing. But it is their number.

Mr. SCHWEIKERT. Okay. It is just that it seems stunningly high, and it is always fun when you are having to audit the audits where we feel like we are in some of this very unusual circle. And it would be fun to find out how much of that is just counting, and how much of it is doing assay work.

And Mr. Chairman, I know you wanted to inquire more on that point, so I yield back my time.

Chairman PAUL. I thank the gentleman.

I do have a few more short questions for you.

Do you have any idea what the current audits cost? You do partial audits each year. What kind of expense does that involve?

Mr. THORSON. No. As I mentioned, we use people on different audits at the same time and that kind of thing, so we have not really broken down per audit what this costs.

Chairman PAUL. Okay. Where do you get the \$60 million?

Mr. THORSON. It was—we asked the same questions that you did as far as what would it be from the Mint when we were wondering what their statement might be. And that was a rough number that we were told that off the top of their head it would be in somewhere in that vicinity.

Chairman PAUL. Of course, we have Treasury's statement that claimed that it would be \$15 million, so we would like to—if you can enlighten us more maybe in writing about really whether it is \$60 million or \$15 million. That is a big difference.

And to suggest that I might be participating in the not being careful with the taxpayers' money, I happen to be the most conservative Member of Congress when it comes to spending. But, we don't even need to appropriate money for this. The Mint could easily take care of this. When you have a monopoly, you tend to be able to make some money, and last year they made \$400 million.

So even if the high number was correct, we don't have a problem there. One of the few legitimate functions of Government is to check our ownership and be fiscally responsible to find out just what we

own and whether it is really there. So I think the total amount is not, in comparison to other things, very much.

Also, back to this request that we get more details on the thing, and you said defer to the—maybe I should ask the Mint that. And, of course, the Mint is in transition now and we couldn't get anybody over here from the Mint. But I believe it was your staff who told my staff that you got the reports and not the Mint, that you get the detailed reports on all these audits.

Mr. THORSON. The assay reports, we do get the assay reports, sure. And I think we provided you some of those. The inventory of the bars, like you describe, as each one—that is definitely up to the Mint. As I said, we audit the work that they do and the records that they keep, so that would be under them.

Chairman PAUL. Of course, if you have an assay, but you don't know how many bars there are, you don't know where it applies to which. It seems like you have to have both, together and matched up.

But anyway, I believe we will follow up on that and ask for some more details. But if the gentleman from Arizona has no more questions, I will go ahead and adjourn the committee.

The Chair notes that some members may have additional questions for this panel, which they may wish to submit in writing. Without objection, the hearing record will remain open for 30 days for members to submit written questions to these witnesses and to place their responses in the record.

{Whereupon, at 11:27 a.m., the hearing was adjourned.}

QUESTIONS
FOR THE RECORD

FROM CHAIRMAN RON PAUL TO
THE HONORABLE ERIC M. THORSON
INSPECTOR GENERAL, DEPARTMENT OF THE TREASURY

Question 1:

As the Inspector General of the Department of the Treasury, can you get a definitive answer on when the last time the U.S. gold reserves held at the Federal Reserve Bank of New York were last assayed and inventoried? If so, what were the results of that assay and inventory?

Answer:

My office has not observed the assay and inventory of the U.S. gold reserves held at the Federal Reserve Bank of New York (FRB-NY). Members of the Committee for Continuing Audits of United States Government-owned Gold, however, did observe FRB Board of Governors examiners' audit of 13.451 million fine troy ounces of the U.S. gold reserves held at the FRB-NY as of September 30, 1985. That represented 99.9 percent of the 13.452 million fine troy ounces under the custody of the FRB. The Board of Governors examiners' audit procedures were essentially the same as those used by the Committee for Continuing Audits of United States Government-owned Gold when they performed their work at the Mint's deep storage facilities, except that assay samples were not taken.

With that as background, the following provides a broad

overview and understanding of the custodial gold services provided by FRB-NY (this information was provided to us by FRB-NY representatives). The FRB-NY holds gold deposits on behalf of a number of account-holders, including the U.S. Government. Upon depositing gold, FRB-NY matches the markings on each bar to the customer's deposit manifest, and verifies the gross weight of the bars deposited. The FRB-NY refers to this process as earmarking the gold. Once the gold is earmarked, it is physically segregated, for the most part, by account holder. Once segregated, the gold is physically safeguarded and held under what the FRB-NY calls a triple control, continuous audit process. According to the FRB-NY, its continuous audit process includes three-party certification/presence anytime a vault is opened. So, when a vault is opened, it must be done in the presence of one representative from vault custodian team one, one representative from vault custodian team two, and one representative from the internal audit staff. Furthermore, there are two separate combination locks (the combination of each known only to the respective vault custodian team representative), one audit lock, and an audit seal on every compartment containing customer gold. The FRB-NY also confirms the gold holdings of its respective customers upon request.

It should be noted that we are currently working with the Department and the FRB-NY to inventory and audit the Treasury gold that is on deposit with the FRB-NY. As part of the audit, we plan to obtain independent assays of a sample of the gold bars.

Question 2:

With regard to the issue of gold possibly being encumbered in swaps or loans, 31 U.S.C. 5302 gives the Secretary of the Treasury the authority to deal in gold. It also states that "Decisions of the Secretary are final and may not be reviewed by another officer or employee of the Government." Is it conceivable that the Secretary could be encumbering U.S. gold reserves in gold swaps without your knowledge, for instance through overnight or short-term repo agreements? Would such short-term agreements be reflected in any way in the OIG's audit report?

Answer:

In my opinion, it is not conceivable. If the deep storage gold reserves were involved in swaps or loans, it would be incumbent upon the Department to record those transactions in its accounting records and disclose them in its financial statements. The Department's financial statements are currently audited by KPMG under our supervision. Similarly, the Mint would also be obligated to disclose such encumbrances in its financial reports as well. In this regard, we are not aware of the gold reserves ever being encumbered in swaps or loans through our audits of the Department or the Mint.

Question 3:

The Treasury's Office of the Inspector General provided my office with an example of an assay report which dealt with 86 samples that were assayed during the summer of 2008. Due to the nature of the assay process, a total of nearly 1.9 ounces of gold was destroyed during the assay. However, the Treasury Department's Financial Management Service website continues to maintain that Treasury-owned gold totals 261,498,899.316 fine troy ounces. This number has remained the same, quoted to a thousandth of an ounce, since at least 2007. How can the Treasury continue to report this same number when gold is, in fact, destroyed during the assay process? Does this not throw into doubt the accuracy of the Treasury's financial statements, as well as the independent auditor's opinion? Your testimony contains an example of a Mint Bureau official joint seal, which reflects the loss of some gold due to assaying, so why would subsequent losses to assay not be reflected in the financial statements?

Answer:

When the audit verification of custodial deep storage gold involved testing for purity, assay samples were taken to verify/determine the fineness of the gold. This process did, in fact, result in a small loss of gold. However, it has been the Mint's policy that the balance of custodial deep storage gold reserves remains unchanged, including when losses resulted from the assaying process. Therefore, in order to keep the balance unchanged, the small losses of gold that occurred during the assaying process were replaced with gold from working stock material, which is charged to the Mint's Public Enterprise Fund (PEF). To accomplish this, the amount of material taken during the assay sample was concurrently

replaced with PEF working stock material, in the form of "granules." The granules were of equal fine troy ounce weight of that taken for assaying. This process was carried out in its entirety, in our presence and under our direct observation. As a result, the reported quantity of the custodial deep storage gold has properly remained unchanged.

Question 4:

When I asked you about the "precise assay results" you responded by saying "Clearly, the results of them are published." The assay results are not, in fact, published in the OIG's audit reports, or in the Mint's financial statements. Can you provide the published materials that contain the results of those assays to my office and/or the Financial Services Committee?

Answer:

You are correct, the assay results are not published in our audit reports or in the Mint's financial statements, only the balance of custodial deep storage gold reserves is reported. When requested, we did provide an example to your staff of the assay results we received for a 2008 statistically selected sample of inventoried gold bars by our office. We are also providing as Attachment 1,³⁹⁸ the assay reports obtained during our fiscal years 2004, 2005, 2006, and 2008 audits of the Mint's Schedule of Custodial Deep Storage Gold and Silver Reserves.

Question 5:

In your opening remarks, you stated that any discrepancies found by the Inspector General's office between the fineness reported by the U.S. Mint and the fineness determined by independent assay reports were "immaterial and negligible." How do you define immaterial and negligible? What is the largest discrepancy of fineness found between an independent assay and the fineness reported by the Mint? Could you provide a list of the independent assays performed comparing the fineness determined in the assay to that listed by the Mint?

Answer:

Professional auditing standards define materiality as the magnitude of an omission or misstatement of accounting

³⁹⁸ Attachment 1 can be found in Appendix F.

information in a financial report that makes it probable that the judgment of a reasonable person relying on the information would have been changed or influenced by the omitted or misstated item's inclusion or correction. With respect to our fiscal year 2010 audit of the Mint's Schedule of Custodial Deep Storage Gold and Silver Reserves, we determined, consistent with auditing standards, that the materiality level for financial reporting purposes was \$311 million. We considered differences individually or aggregated less than this amount to be immaterial for purposes of the Schedule. In other words, if audited differences were \$311 million or more, we would not render a "clean" audit opinion.

However, given the sensitive nature and the extraordinary physical security measures provided over these U.S. Government assets, we would expect discrepancies to be small. In this regard, the discrepancies in fineness identified in our audit tests over the years have been extremely small. The largest discrepancy of fineness identified between an independent assay report and the fineness reported by the Mint for a bar, in recent audits where independent assay reports were obtained (for the fiscal years 2004, 2005, 2006, and 2008 audits), was 0.0003 fine troy ounces. The market and statutory value of this difference, as of September 30, 2010, was \$0.39 and \$0.01, respectively, using the market and statutory value per fine troy ounce of gold of \$1,307 and \$42.2222, respectively. The net total of discrepancies for these years was 0.0078 fine troy ounces. The market and statutory value of the net total of these discrepancies, as of September 30, 2010, was \$10.19 and \$0.33, respectively, using a market and statutory value of gold per fine troy ounce of \$1,307 and \$42.2222, respectively. These discrepancies in my judgment are negligible.

A list of bars assayed in recent Mint custodial deep storage gold reserves audits in which assays were performed (FY 2004, 2005, 2006 and 2008 audits), including a comparison of the fineness determined by the independent assayer to the fineness included in the Mint records, is presented in Attachment 2.³⁹⁹

³⁹⁹ Attachment 2 can be found in Appendix F.

Question 6:

In your opening remarks you stated that the " ... entire period of these audits and up to today [1975-present], no discrepancies of any consequence have ever been found." According to a GAO report to the Director of the U.S. Mint in 1978, a discrepancy was found in 1977 in which two melts had to be remelted, after which the fineness was still below that listed on the inventory schedule. How do you reconcile this fact with your statement? Do you consider the need to remelt gold to be "no discrepancy of any consequence"? Could you provide a list of all the discrepancies found, whether of consequence or not?

Answer:

As you indicated, that audit was conducted by GAO who reported that the difference between the level of fineness determined by the assay and the fineness reported on the inventory records resulted in a \$158.77 adjustment to the records. Also in that same audit report, GAO determined that amount to be insignificant. I agree with GAO's assessment, only I described differences such as these as not of any consequence.

Discrepancies of fineness identified between independent assay reports and the fineness reported by the Mint of gold bars, noted in recent Mint custodial deep storage gold and silver reserves audits where assays were performed (FY 2004, 2005, 2006 and 2008 audits), are presented in Attachment 2.⁴⁰⁰

Question 7:

Could you provide a report, or an otherwise comprehensive document on the following items related to U.S. gold holdings? If such a report cannot be compiled in time for submission in the record of this hearing in response to this question, please indicate whether such a report could be generated and approximately how long it would take.

- a) A complete history of the audits, assays, and inventories conducted, at least as far back as 1975 if not earlier.

Answer:

⁴⁰⁰ Attachment 2 can be found in Appendix F.

A list of audits of U.S. gold holdings by GAO, the Committee for Continuing Audits of United States Government-owned Gold, and my office, is included in Attachment 3.⁴⁰¹ It should be noted that most workpapers associated with our reports issued prior to 2004 have been destroyed in accordance with our records retention policy.

- b) The inventory schedules of the gold in the custody of the U.S. Mint, including information regarding the fineness and quantity of the gold.

Answer:

See Attachment 4⁴⁰² for the Mint's detail inventory schedules of custodial deep storage gold reserves including fineness and quantity.

- c) The inventory schedules of the gold in the custody of the Federal Reserve Bank of New York, including information regarding the fineness and quantity of the gold.

Answer:

See Attachment 5⁴⁰³ for the Federal Reserve Bank of New York's detail inventory schedules of gold held in its vault including fineness and quantity. The Federal Reserve Banks also hold gold bars and coins for display purposes, totaling 2,371 fine troy ounces.

- d) Any assay reports related to U.S. gold holdings.

Answer:

See Attachment 1⁴⁰⁴ for independent assay reports obtained during our fiscal years 2004, 2005, 2006, and 2008 audits of the Mint's Schedule of Custodial Deep Storage Gold and Silver Reserves.

Question 8:

You claim that it would cost \$60 million to carry out a full audit and assay of the gold reserves. Can you provide my office and/or the Financial Services Committee the precise methodology and calculations used to arrive at this figure?

⁴⁰¹ Attachment 3 can be found in Appendix F.

⁴⁰² Attachment 4 can be found in Appendix F.

⁴⁰³ Attachment 5 can be found in Appendix F.

⁴⁰⁴ Attachment 1 can be found in Appendix F.

Answer:

In my testimony, I was merely recalling a figure that I had remembered the Mint estimating for performing a full inventory and assay of the gold reserves, which is what H.R. 1495 calls for (see line 1169). Since a full audit and assay of the gold reserves would be predicated on a full inventory and assay by the Mint, I indicated that the question should be directed to the Mint.

For purposes of trying best to answer your question, I have included as Attachment 6,⁴⁰⁵ a letter dated July 22, 2011 to the Honorable Ron Paul, Chairman of the Subcommittee on Domestic Monetary Policy and Technology, from Richard Peterson, Acting Director, United States Mint, where the Mint estimates that it would cost \$235 million to conduct and complete a full assay, inventory, and audit of the gold reserves it holds. The Mint estimates with a 10 percent assay, the total cost would be slightly over \$71 million. It should be noted that on the face of what the Mint has included in its letter, these estimates do not include travel or per diem costs for individuals involved in the process. Furthermore, my office has not validated the Mint's estimate.

Question 9:

Recent advances in ultrasound and X-ray technology have led to the development of hand-held devices that allegedly are able both to determine the authenticity of precious metal bars as well as their fineness. If such claims are true, one would imagine that using such devices would obviate the need for destructive assay testing and reduce the time required for assaying. This would lead to potential savings both by ending losses of gold through destructive assay testing, as well as reducing costs incurred through drilling, shipping, assaying, and returning gold samples. Has the Office of the Inspector General ever considered using non-destructive methods of assaying gold reserves? If not, would the OIG consider studying the possible use of such technologies in future?

Answer:

If, in the future, gold is moved or otherwise needs to be re-inventoried, we will work with the Mint to consider the

⁴⁰⁵ Attachment 6 can be found in Appendix F.

cost/benefit of using such technology. Of course this would only be in the event that the accuracy of such technology is determined to be reliable and accepted as an industry practice.

FROM CHAIRMAN RON PAUL AND REP. BLAINE LUETKEMEYER TO
THE HONORABLE ERIC M. THORSON, INSPECTOR GENERAL, DEPARTMENT
OF THE TREASURY

Question 1:

The IMF has the 3rd largest gold reserves in the world, most of which the IMF acknowledges as belonging to the member country who contributed it. The U.S. contributed a large portion of the IMF's gold reserves. How and where on the financial statements of the U.S. government is the portion of gold contributed by the U.S. to the IMF accounted? Is the U.S. portion of the IMF gold counted among U.S. gold reserves? Where is the gold contributed by the U.S. to the IMF held?

Answer:

The U.S. gold contributions to the IMF are not included in the U.S. gold reserves reported by the Mint or Treasury. From 1947 through 1970, the U.S. paid its initial quota subscription and subsequent increases to that quota subscription to the IMF in four separate contributions. Those contributions were in the form of gold and were each valued at the time the payments were made. Overall, the U.S. contributed 47.9 million ounces of gold, to the IMF. The total value of the U.S. gold contributions to the IMF, valued at the time the contributions were made, is \$1,675.5 million.

This amount is included as part of the line item "Reserve Position in the International Monetary Fund" on Treasury's consolidated balance sheet. The total line item reported as of September 30, 2010, was \$12,938 million. It should be noted that once the gold contribution to the IMF was made, it became the property of the IMF. In return, the U.S. received a claim on the IMF equal to the amount of its gold payment. To reiterate, this amount is not included in the U.S. gold reserves.

It is our understanding that the gold contributed by the U.S.,

as well as gold contributed by other countries, to the IMF is comingled. We have been told that the IMF holds its gold in the following Central Banks: the Federal Reserve Bank of New York, the Bank of England, the Bank of France, and the Central Bank of India.

Question 2:

What is the cost of protecting the gold in the custody of the U.S. Mint?

Answer:

It is the Mint's responsibility to protect U.S. assets stored in its facilities. However, while the protection of the gold and silver bullion reserves are significant, they represent only a portion of what the Mint is responsible for protecting; it also protects its employees, facilities, products, and equipment. The Mint's total protection cost for FY 2010, reported in its financial statements was \$41.5 million. The actual cost for protecting only the gold in the custody of the Mint, including its working stock, would be a question more appropriately addressed to the Mint.

Question 3:

What has been the cost of audits performed on U.S. gold reserves in the past?

Answer:

The cost of our recent audits (labor and travel) of the Mint's Schedule of Custodial Deep Storage Gold and Silver Reserves was approximately \$31 thousand per audit when we observed the Mint perform an inventory count (fiscal years 2004 through 2008) and approximately \$20 thousand per audit when our work was limited to inspecting the integrity of the previously placed seals (fiscal years 2009 and 2010).

STATEMENTS

STATEMENT FOR THE RECORD
HON. RON PAUL
REPRESENTATIVE, 14TH DISTRICT OF TX
CHAIRMAN, SUBCOMMITTEE ON
DOMESTIC MONETARY POLICY & TECHNOLOGY
U.S. HOUSE OF REPRESENTATIVES

For far too long, the United States government has been less than transparent in releasing information relating to its gold holdings. Not surprisingly, this secrecy has given rise to a number of theories about the gold at Fort Knox and other depositories. Some people speculate that the gold has been involved in gold swaps with foreign governments or bullion banks, others believe that the gold has secretly been shipped out of Fort Knox and sold, and still others believe that the bars at Fort Knox are actually gold-plated tungsten. Historically, the Treasury and Mint have dismissed these theories, rather than addressing these concerns with substantive rebuttals. No one from Congress has been allowed to view the gold at Fort Knox in nearly 40 years, recent photographs of the gold holdings seem to be hard to come by, and the Mint's and Inspector General's audit statements contain only the bare minimum of information.

Because the government has for so long refused to provide substantive information on its gold holdings, it is not surprising that so much confusion abounds, both within and without the government. The difference between custody and ownership, questions about responsibility for US gold held at the New York Fed, and the issue of which division at Treasury is ultimately responsible for the gold reserves are just some of the questions that have come up during the research for this hearing. In a way, it seems as though someone

decided to lock up the gold, put the key in a desk somewhere, and walk off without telling anyone anything. Only during the preparation for this hearing was my office informed that the Mint has in fact conducted assays of statistically representative samples of gold bars, and we were provided with a sample assay report. This type of information should be reported or at least tabulated and published, so that the public knows how many bars of gold exist, what their fineness is, and whether they are encumbered in any way through loans, swaps, etc.

While the various agencies concerned have been very accommodating to my staff in attempting to shed some light on this issue, it should not require the introduction of legislation or a Congressional hearing to gain access to this information. This information should be published and available to the American people. This gold belongs to the people, especially since much of it was forcibly taken from them in the 1930s, and the government owes it to the people to provide them with the details of these holdings. We would greatly benefit from a full, accurate inventory, audit, and assay, with detailed explanations of who owns the gold and who is responsible for ownership, custody, and auditing. While the Mint and the Inspector General trust the accuracy of the audits performed between 1975 and 1986, this still means that at least two-thirds of the gold reserves were last audited over a quarter century ago. Surely a full audit every 25 years is not too much to ask?

I look forward to the testimony of the witnesses regarding the condition of the gold reserves, the accounting audits that are regularly performed, and the inventories and assays that have been conducted on some of this gold over the years. I am also very interested to hear their comments on the Gold Reserve Transparency Act so that we may put forward a measure that provides the public with accurate and complete information on their gold.

Since the U.S. Mint was unable to send a representative to testify at this hearing in person, here is an excerpt of their remarks sent to me regarding H.R. 1495:

Dear Chairman Paul:

I appreciate the opportunity to provide this statement for the record and to describe the role the United States Mint might have in carrying out the requirements of H.R. 1495, the Gold Reserve Transparency Act, upon its enactment. As of July 6, 2011, H.R. 1495 proposes, among other things, that the Secretary of the Treasury conduct and complete a full assay, inventory, and audit of the gold reserves of the United States within six months of the date of enactment.

Both the United States Mint and the Federal Reserve Bank of New York have physical custody of the gold reserves of the United States. The attached table shows that the Treasury Department maintains gold reserves totaling **261,498,899.316 fine troy** ounces.¹ Almost all of these reserves are held at three United States Mint sites across the country and at the Federal Reserve Bank of New York. The United States Mint maintains custody of **248,046,115.696** ounces,² and the Federal Reserve Bank of New York maintains custody of **13,452,783.620** ounces.³ The statutory value of the gold is \$42.22 per ounce, as established in 1976.⁴ Accordingly, the aggregate statutory value of the gold in the reserves is \$11,041,058,821.09. At a prevailing market gold price of \$1500 per ounce, the value of the gold reserves is \$392,248,348,974.00.

As the legal custodian of 95 percent of America's gold reserves, the United States Mint is absolutely confident in the security, accountability, and integrity of these significant

¹ All references to "ounces" are to "fine troy ounces."

² This includes 245,262,897.040 ounces in deep storage, and 2,783,218.656 ounces available as working stock (the portion of the gold reserve that the United States Mint is authorized to use as the raw material for minting legislatively-mandated coins).

³ This figure includes gold not only held in the vault at the Federal Reserve Bank of New York, but also 2,013,515 ounces in the form of gold bars and gold coins held by Federal Reserve Banks for display purposes.

⁴ 31 U.S.C. § 5117(b) ("The amount of outstanding certificates may be not more than the value (for the purpose of issuing those certificates, of 42 and two-ninths dollars a fine troy ounce) of the gold held against gold certificates").

national financial assets. The United States Mint recognizes that the gold reserves are owned by the United States Government, and serve as collateral for gold certificates issued to the Federal Reserve Banks. Accordingly, we believe that the United States Mint's responsibility with respect to commenting on H.R. 1495 is limited to making the Committee aware of the impact it would have on the United States taxpayer and United States Mint operations.

Audit

The gold in the custody of the United States Mint is in the form of 699,515 gold bullion bars (including 94,828 unparted bars containing both gold and silver), gold coins, gold coin blanks, and gold in miscellaneous forms. Based on the United States Mint's experience in 2008 and earlier audits, inventories, and assays, we anticipate that the time required to move, weigh, obtain assay samples, and restore bars averages six minutes per bar, assuming a team of 19 people. Expanding that to 699,515 bars would require nearly 1.3 million man-hours of incremental labor. Therefore, to complete the inventory of just the gold bullion bars within the six months, as H.R. 1495 specifies, would require approximately 1,280 individuals.

It is not physically possible to accommodate 1,280 individuals inside the small vaults and balance rooms at the three United States Mint sites. However, if the United States Mint was provided with sufficient funds and staffing that the space would reasonably accommodate, it would take three to four years to complete the inventory of all 699,515 bars. Based on these assumptions, we estimate the personnel cost to move, weigh, obtain assay samples, and restore the bars would total approximately \$53 million.⁵

Assay

The cost of assaying services is about \$230 per bar;⁶ therefore, the total cost of assaying services for the 699,515 gold bars in the reserves would be about \$161 million.⁷ Moreover, the process of assaying a gold bar requires the removal and destructive testing of a portion of a one-tenth-ounce sample of the gold. Consequently, assaying all of the bars would consume about 14,000 ounces of gold at a present market value of about \$21 million (assuming a market value of \$1,500 per ounce).⁸ Based on these figures, the United States Mint estimates a total cost to conduct and complete a full

⁵ These assumptions contemplate a 100-percent inventory and assay of each gold bullion bar. An alternative approach would be to inventory 100 percent of the bars but assay only 10 percent of them. Potential savings due to reduced samples and loss in gold from assay tests would be substantial.

⁶ The cost of assaying services charged by White Sands Laboratories for the 2008 audit was \$232 per gold bar and required approximately one month to complete.

⁷ With a ten-percent assay, we estimate that the cost of assaying services would be approximately \$16 million.

⁸ With a ten-percent assay, the loss of 1400 ounces of gold to assay at the market rate of \$1500 would be approximately \$2.1 million.

assay, inventory, and audit of the gold reserves held by the United States Mint of approximately \$235 million.⁹ This figure does not include travel and per diem costs for individuals involved in the process.

Concerns over the significant cost of conducting a full assay, inventory, and audit of the gold reserves held by the United States Mint are not unprecedented. As you may be aware, in 1979, Representative Larry McDonald of Georgia introduced H.R. 555, "A bill to provide for an audit by the General Accounting Office of all gold owned by the United States." In response to Representative McDonald's proposal, the Chief of the United States Mint's Internal Audit Staff prepared the following estimate of the resources that would be needed for a 100-percent audit of the gold in the bureau's custody:

From 1974 through 1978 during which 50 percent of the gold stock was audited--an estimated 2900 direct staff days were required for the work. About three-fourths of this time was provided by Mint resources other than auditors. If the GAO was required to perform a 100 percent audit each year, I presume that the Mint would probably be called upon to provide the same support which would amount to about 4400 staff days annually.¹⁰ The Mint would still have to establish committees including security personnel, technicians experienced in taking assay samples from bars, assaying, weighing and bar handling.¹¹

Similarly, the Department of the Treasury's Fiscal Assistant Secretary at the time stated the following about a 100 percent inventory of the gold reserves:

[A]udits contemplated by the proposed legislation would be extremely disruptive of operations at the Bureau of the Mint, would be very costly, and would require extra personnel at a time when efforts are being made not to increase Federal employment.¹²

Finally, the Deputy General Counsel of the Department of the Treasury reported the following about H.R. 555 to Representative Jack Brooks, then-Chairman of the House Committee on Government Operations:

⁹ For a full inventory and audit, with a ten-percent assay, we estimate that the total cost would be slightly over \$71 million.

¹⁰ This figure was based on the Chief of the United States Mint's Internal Audit Staff's assumption that only a two-percent assay would be performed.

¹¹ Memorandum from Chief, Internal Audit Staff, United States Mint, to Counsel to the Mint, subject: Request for Input for Treasury Proposing Gold Audits by GAO (Feb. 16, 1979).

¹² Memorandum from Fiscal Assistant Secretary, Department of the Treasury, to Chief, Legislative Section, Office of the General Counsel, Department of the Treasury, subject: H.R. 555, 96th Congress, 1st Session, Requiring Audit of Gold Held by the United States (Feb. 21, 1979).

The testing and inventory requirements of the bill would overwhelm the Bureau of the Mint laboratories and staff. Further, space limitations in vault areas are restricted as they were designed for security reasons. Therefore, the number of personnel required to conduct the proposed audit could not be accommodated. Thus, an attempt to make the audits contemplated by the proposed legislation would be extremely disruptive of operations at the Bureau of the Mint. Further, at a time when efforts are being made to reduce the Federal expenditures, the proposed audits would be very costly because of the extra personnel and testing procedures that would be required.¹³

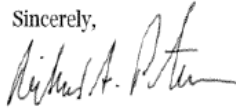

The physical requirements for such an audit at the three locations where the United States Mint holds gold reserves have not changed appreciably in the past three decades since United States Mint and Treasury officials made these statements.

Therefore, the statements made by the Chief of the United States Mint's Internal Audit Staff, the Fiscal Assistant Secretary, and the Deputy General Counsel—that such an audit would require significant additional staffing and would be extremely disruptive of operations of the United States Mint—are as accurate today as they were in 1979. Indeed, the heightened vigilance required in today's post-9/11 environment would exacerbate the significant costs involved, as well as the disruptive effect on bureau operations—particularly at the United States Mints at Denver and West Point.

The United States Mint estimates that H.R. 1495 would cost taxpayers approximately \$235 million and be of little benefit. As the Treasury Inspector General testified on June 23, 2010, "One hundred percent of the U.S. government's gold reserves in the custody of the Mint has been inventoried and audited. Furthermore, these audits found no exceptions of any consequence."

However, should the bill be enacted, you have my assurance that the United States Mint will dutifully and cooperatively facilitate the assay, inventory, and audit of the gold reserves to the best of its ability.

Sincerely,

Richard A. Peterson
Acting Director
United States Mint

WITNESS TESTIMONY

WRITTEN TESTIMONY OF HON. ERIC M. THORSON INSPECTOR GENERAL DEPARTMENT OF THE TREASURY

Chairman Paul, Ranking Member Clay, and Members of the Subcommittee, thank you for the opportunity to appear before you this afternoon for the hearing entitled “Investigating the Gold: H.R. 1495, the Gold Reserve Transparency Act of 2011 and the Oversight of United States Gold Holdings.”

My testimony will cover the audits that my office has and is conducting on the United States Mint’s Schedule of Custodial Deep Storage Gold Reserves.

Before I discuss the details of the audits that are the topic of this hearing, I would like to make one point very clear – 100 percent of the U.S. Government’s deep storage gold reserves in the custody of the Mint has been inventoried and audited. Furthermore, these audits have not found any noteworthy exceptions. I also want to make it clear that the physical security over the gold reserves is absolute. I can say that without hesitation because I have personally observed the gold myself. Accordingly, H.R. 1495, which calls for a full assay, inventory, and audit of gold reserves of the United States together with an analysis of the sufficiency of the measures taken for the security of such reserves, is redundant of audit work already done.

My office has been extensively involved in the audit of the Department’s consolidated financial statements and related entities since the enactment of the Chief Financial Officer’s Act of 1990. Since 1993, our financial statement audit work has included, and continues

to include, independent annual audits of the U.S. Government's deep storage gold reserves held by the Mint. In fact, our fiscal year 2011 audit of those deep storage gold reserves is currently underway. As background, I will briefly describe what the Mint's custodial deep storage gold reserves include, provide a short history of the audits conducted over the gold reserves from 1974 through 1986, and the annual audits performed by my office since 1993.

The Mint's Custodial Deep Storage Gold Reserves

The Mint maintains its custodial deep storage gold reserves at the United States Bullion Depository, Fort Knox, KY; the United States Mint, West Point, NY; and the United States Mint, Denver, CO. The Department's deep storage gold reserves are stored at these three locations, in 42 compartments. In all, these compartments hold 699,515 gold bars with fineness⁴⁰⁶, or purity, ranging from 0.4701 to 0.9999 with an average fineness of 0.9006. Fort Knox houses 60 percent of the fine troy ounces of the deep storage gold reserves, Denver 18 percent, and West Point 22 percent. As of September 30, 2010, the audited quantity of custodial deep storage gold reserves held by the Mint was 245,262,897 *fine* troy ounces, over 9,300 tons, with a market value of \$320.6 billion.⁴⁰⁷ Each gold bar weighs about 27 pounds and has an average value of about \$500 thousand.

All three of the deep gold storage facilities are highly secured. While it would not be appropriate for me to discuss the details of the security arrangements in place at these facilities, I can tell you that they are multi-layered and include substantial physical barriers, armed guards, cameras, and metal detectors.

Audits of the Mint's Custodial Deep Storage Gold Reserves Over the Years

In 1974, in response to public and Congressional inquiries, the General Accounting Office (GAO), known as the Government Accountability Office since July 2004, in cooperation with the Department of the Treasury, conducted an audit of about 21 percent of the gold bars stored at the United States Bullion Depository, Fort Knox, KY, and concluded that the gold stored at that facility agreed with the records of the depository. Auditors from the United States Mint, the Bureau of Government Financial Operations (BGFO),⁴⁰⁸ the

⁴⁰⁶ The fineness of a precious metal refers to the ratio of the primary metal to the total weight.

⁴⁰⁷ Market value was based on the London Gold Fixing price for gold as of September 30, 2010. On that date, gold was priced at \$1,307.00 per fine troy ounce.

⁴⁰⁸ BGFO was established in 1974 as a bureau of the Treasury. In October 1984, BGFO was renamed the Financial Management Service.

U.S. Customs Service,⁴⁰⁹ and the Department of the Treasury's Office of the Secretary and GAO were part of a special audit committee established by the Director of the Mint to maintain physical control over the gold during the conduct of the inventory. In the report, *Accountability and*

Physical Controls of the Gold Bullion Reserves, FOD-75-10, GAO also recommended that the Secretary of the Treasury request the Director of the Mint to include, as part of each depository's annual settlement of accounts, a cyclical inventory of the Mint's custodial gold holdings.

It should be noted that the audit by GAO followed a Congressional visit to the Fort Knox facility. In this regard, the House Congressional Report for September 24, 1974, included the following statement by the Honorable John H. Roussetot:

"Mr. Speaker, the Congress can now be assured that there is gold bullion at the Fort Knox Depository. Several of us went there yesterday to try to make sure that many of these rumors and counterrumors were either correct or not correct. Members of the Committee on Banking and Currency and Senator Huddleston of Kentucky actually entered the Fort Knox Depository to check the validity of claims that U.S. gold bullion had been depleted. We can be assured that our civil servants are watching the gold at Fort Knox. It is there."

On June 3, 1975, the Secretary of the Treasury issued Treasury Department Order No. 234-1 (TDO 234-1), *Audit of Gold Stock*, authorizing and directing the Fiscal Assistant Secretary, with the cooperation and assistance of the Director of the Mint, to conduct a continuing audit of U.S. Government-owned gold for which the Department is accountable.⁴¹⁰ Pursuant to TDO 234-1, the Committee for Continuing Audit of the U.S. Government-owned Gold performed annual audits of Treasury's deep storage gold reserves from 1975 to 1986, placing all inventoried gold that it observed and tested under Official Joint Seal.⁴¹¹ The Committee was made up of Internal Audit

⁴⁰⁹ The U.S. Customs Service was a bureau of the Treasury until March 2003 when it was transferred to the Department of Homeland Security.

⁴¹⁰ The Mint is directly responsible for safeguarding all of Treasury's deep storage gold reserves and working stock. Overall, the deep storage gold reserves account for about 94 percent and working stock about 1 percent of Treasury's gold holdings; the other 5 percent is held by the Federal Reserve Bank of New York. Treasury reports the value of its deep storage gold reserves held by the Mint and the Federal Reserve Bank of New York in its consolidated financial statements.

⁴¹¹ An Official Joint Seal is a pre-numbered document that includes wax seals. It is attached to an inventoried compartment door with tamperproof cloth tape. The pre-numbered document

staff from the BGFO and the Mint, and the General Auditor staff from the Federal Reserve Bank of New York. The annual audits by the Committee for Continuing Audit of the U.S. Government-owned Gold ended in 1986, after 97 percent of the U.S. Government-owned gold held by the Mint had been audited and placed under Official Joint Seal. It should be noted that during the entire period of these audits, and up to today, no significant discrepancies have ever been found.

From 1986 to 1992, the Mint continued to perform an annual inventory and verification of the gold reserves in accordance with its own policies over those compartments that had not been placed under Official Joint Seal by the Committee for Continuing Audit of the U.S. Government-owned Gold. According to Mint officials, this was done to comply with the 1975 GAO recommendation discussed earlier.

My office began conducting annual audits of the Mint's Schedule of Custodial Deep Storage Gold Reserves in fiscal year 1993. Our audits are made pursuant to 51 U.S.C. § 5136, United States Mint Public Enterprise Fund, and the Government Management Reform Act (GMRA). In this regard, we are required to perform an annual audit of the Mint Public Enterprise Fund's financial statements, and those statements include the balances of custodial deep storage gold reserves held by the Mint. Under GMRA, my office is also responsible for the annual audit of the Department of the Treasury's consolidated financial statements. Those financial statements incorporate the balances of the custodial deep storage gold reserves. It should be noted that the Mint's financial statements and the Department's consolidated financial statements are audited by a contractor under our supervision -- the independent public accounting firm, KPMG LLP. KPMG has performed the audit of the Mint's financial statements since fiscal year 2005 and the Department's consolidated financial statements since fiscal year 2004. Starting with the fiscal year 2005 audit, KPMG has taken responsibility for our work on the custodial deep storage gold reserves when rendering its opinions on the Mint's and Treasury's financial statements. In order for KPMG to do that, they must satisfy themselves as to the independence, reputation, and qualifications of my audit staff. In addition, they must also satisfy themselves with the adequacy of the audit procedures performed. This has included, among other things,

includes all relevant information of the compartment inventoried and audited, e.g., the number of gold bars, gross weight, and fine troy ounces). The document is signed by those present at the inventory of the compartment (a representative from the storage facility, a representative from the Mint headquarters, and an OIG/independent observer).

accompanying my auditors on a number of observations of the deep gold storage facilities. By doing this KPMG can express its opinion on the Mint's and Treasury's financial statements without making reference to us in their report. That also means that KPMG concurs with the amount and value of the gold as it is reported. The audit work performed by both my office and KPMG is done in accordance with government auditing standards established by GAO.

For each of the fiscal years under audit, we have rendered unqualified or "clean" opinions on the Mint's Schedule of Custodial Deep Storage Gold Reserves. In addition, for each such fiscal year under audit, we have not identified any material weaknesses in internal control over financial reporting related to these schedules, nor have we reported any instances of noncompliance with laws and regulations.

When we assumed responsibility for the audit, reliance was placed on verification procedures performed by GAO and the Committee for Continuing Audit of the U.S. Government-owned Gold. Additionally, we relied on the intact Official Joint Seals that the Committee placed on the inventoried compartments that it observed and tested. If an Official Joint Seal had been tampered with, it would have been immediately evident as the wax on the seal would have been broken and the cloth tape used to attach it would have been detached. Since we assumed responsibility for the audit, my office has continued to directly observe the inventory and test the gold.

Furthermore, my auditors sign the Official Joint Seals placed on those compartments inventoried and tested in their presence. At the end of fiscal year 2008, all 42 compartments had been audited by either GAO, the Committee for Continuing Audit of the U.S. Government-owned Gold, or Treasury OIG, and placed under Official Joint Seals. There has not been any movement of the inventoried gold since that time. Furthermore, for all of the audit periods where compartment inventories were observed by my auditors, as part of our work, in addition to observing the Mint's physical inventory of the gold, we selected and tested a statistically-valid random sample of gold bars using a 95 percent confidence level and found, without fail, that any differences between the fineness reported by the Mint in its inventory records and the fineness projected based on our independently obtained assay reports to be immaterial and negligible. For example, during our fiscal year 2008 audit, we sampled gold statistically representing inventory valued at \$75,036,352.12. Based on the independent assayer's report on those samples, we projected the dollar value of the difference between the fine troy ounces

determined by the independent assay report and the fine troy ounces recorded in the Mint's inventory records to be \$3,819.84 or 0.005 percent (five thousandths of one percent) of the gold inventoried.

The annual audit work performed by my office to verify the existence, quality, and valuation of Treasury's deep storage gold reserves⁴¹² has included two parts:

**DIRECT PHYSICAL OBSERVATION OF THE GOLD RESERVES IN THE
DEEP STORAGE IN COMPARTMENTS INVENTORIED**

This included:

- Reviewing and evaluating internal control, to include the physical controls over the deep storage gold
- Verifying the existence of the gold bars in each compartment by visually inspecting the gold bars comparing the records for each compartment inventoried to the identifying information stamped into the gold bars
- Statistically selecting and testing a sample of the gold bars from the compartments inventoried for fineness re-weighing the statistically selected bars re-assaying the statistically selected bars (the selected bars are drilled, gold fragments are removed from the drilled hole, and those gold fragments are sent by us to an independent laboratory for assaying – the independent laboratory directly provides us with its reports)
- Comparing the fineness recorded in the inventory records to the fineness reported by the independent assayer for the sample of gold bars selected from the compartments inventoried (any differences are projected to the universe of the gold bars inventoried)
- Participating in the placement of an Official Joint Seal on each compartment inventoried by the Mint and tested by my auditors
- Verifying the mathematical accuracy of the inventory records

⁴¹² For the gold reserves held by the Federal Reserve Bank of New York (which are not part of the deep storage gold reserves), my office obtains relevant evidence supporting the existence and valuation of the gold through a signed third party confirmation (confirmations are a widely accepted audit procedure for purposes of placing reliance on the item being confirmed).

VISUAL INSPECTION OF OFFICIAL JOINT SEALS ON PREVIOUSLY INVENTORIED COMPARTMENTS

This includes:

- Reviewing and evaluating internal control, to include the physical controls over the deep storage gold
- Inspecting the Official Joint Seals used to control compartments containing previously inventoried gold to determine whether the seals have been altered or compromised in any way
- Preparing an Official Joint Seal Inspection Report that includes identifying the condition of the Official Joint Seal, determining if the signatures on the Seal agree with the signatures on the copy of the original Official Joint Seal, and whether the Seal and lock had any evidence of tampering and whether the compartment door was locked

As discussed earlier, by the end of fiscal year 2008, all of the deep storage gold reserves in the Mint's custody had been 100 percent inventoried and audited. During our fiscal year 2010 and 2009 audits of the deep storage gold, our audit procedures consisted primarily of inspecting the Official Joint Seals on the previously inventoried compartments to determine whether they had been altered or compromised in any way. We found no exceptions.

More recently, the Mint decided to replace all of the previously-placed Official Joint Seals with new seals. The new seals are more durable, having a double security barrier seal that can only be removed by two cuts with a strong cable cutter.

The Mint replaced all of the previously-placed Official Joint Seals with new ones during fiscal year 2010.⁴¹³ The seal replacement process consisted of two steps:

- a) inspection of all previously-placed Official Joint Seals on all the compartments containing deep storage gold to determine whether they had been altered or compromised in any way, and
- b) placement of a new Official Joint Seal. The seal inspection and replacement process was carried out for all 42 deep storage gold compartments, in the presence of a Treasury

⁴¹³ Pictures of the old and new Official Joint Seals are provided as Exhibit 1 [Figure 42 & Figure 43] and Exhibit 2 [Figure 44], respectively.

OIG auditor, by a Mint headquarter staff person, representing the Mint Director, and a Mint storage facility staff person, representing the facility's Plant Manager. For each Official Joint Seal removed, the Mint headquarters representative, the Mint storage facility representative, and the observing Treasury OIG auditor signed an inspection report; the same parties also signed the new Official Joint Seal that replaced the one removed.

In September 2010, I took part in that process at Fort Knox. At that time, I personally saw the deep storage gold reserves located there. During my visit, I witnessed, along with officials from the Mint and one of my auditors, the replacement of all previously-placed Official Joint Seals with new Official Joint Seals. I would also like to note that shortly after my visit to the Mint's Fort Knox facility I sent a letter to you, Doctor Paul, regarding my observations. A copy of that letter is provided as Exhibit 3.

In closing, based on the work performed by my office and my own personal observations, I can assure the Subcommittee, and anyone else for that matter, that both the quantities and value the U.S. Government's deep storage gold reserves held and reported by the Mint are reliable and sufficiently audited. Therefore, I believe that the inventory and audit requirements proposed in *The Gold Reserve Transparency Act* of 2011, H.R. 1495, to be redundant of the work that my office and the Mint have and currently perform.

That concludes my prepared statement. I will be happy to answer any questions that you may have. Thank you.

INSPECTOR GENERAL

DEPARTMENT OF THE TREASURY
WASHINGTON

September 24, 2010

The Honorable Ron Paul
U.S. House of Representatives
203 Cannon House Office Building
Washington, D.C. 20515

Dear Mr. Paul:

Recent media reports have indicated that you have concerns about the United States Government's gold reserves and plan to introduce legislation to provide for an annual audit. As the Inspector General of the Department of the Treasury – with the statutory responsibility of auditing all Treasury programs except for the Internal Revenue Service, I want to assure you that the gold reserves have been independently audited by my office on an annual basis since 1993. In fact, I visited Fort Knox earlier this week as part of the Fiscal Year 2010 audit where I personally observed the gold reserves located in each of the deep storage compartments.

My office, on an annual basis, directly observes the gold inventory by reviewing and evaluating internal control and physical security surrounding the gold storage, verifying the inventory of gold bars in each compartment and placing an Official Joint Seal on the compartment inventoried. In addition, we verify the mathematical accuracy of the inventory records, compare the inventoried gold to the Mint's records and compare the quantities on the Mint's records to the accounts for gold maintained by the Financial Management Service. We also visually inspect the Official Joint Seals on previously inventoried compartments.

During my visit, I witnessed, along with U.S. Mint officials, the current operation to replace the original Official Joint Seals on all the compartments containing deep storage gold with a new seal. I can tell you unequivocally that the gold reserves do exist in the amounts reported and the controls over it ensure absolute security.

I would be happy to answer any questions that you might have and can be reached at (202) 622-1090.

Sincerely,

A handwritten signature in blue ink, appearing to read "Eric M. Thorson", written over a horizontal line.

Eric M. Thorson
Inspector General

**WRITTEN TESTIMONY OF
GARY T. ENGEL**
DIRECTOR, FINANCIAL MANAGEMENT AND ASSURANCE
GOVERNMENT ACCOUNTABILITY OFFICE

**H.R. 1495
GOLD RESERVE TRANSPARENCY ACT OF 2011**

Mr. Chairman, Ranking Member Clay, and Other Members of the Subcommittee:

I am pleased to be here today to discuss H.R. 1495,⁴¹⁴ the Gold Reserve Transparency Act of 2011. This proposed legislation, which was recently referred to your Subcommittee, provides for an audit of the gold reserves of the United States. Specifically, the bill calls for the Secretary of the Treasury to conduct and complete, not later than 6 months after passage of the act, a full assay,⁴¹⁵ inventory, and audit of gold reserves of the United States at the place or places where such reserves are kept, together with an analysis of the sufficiency of the measures taken for the security of such reserves. The bill also calls for the Government Accountability Office (GAO) to review the results of such assay, inventory, audit, and analysis and, not later than 9 months after passage of the act, prepare and transmit to the Congress a report of GAO's findings together with the results of the work performed by the Secretary of the Treasury.

My testimony today will focus on (1) the reported holdings of gold reserves of the United States as of September 30, 2010; (2) past and current audit efforts regarding gold reserves of the United States, including those of the Department of the Treasury's (Treasury) Office of Inspector General (OIG); and (3) the requirements of H.R. 1495.

We conducted our work from June 3, 2011, to June 21, 2011, in accordance with all sections of GAO's Quality Assurance Framework that are relevant to our objectives. The framework requires that we plan and perform the engagement to obtain sufficient and appropriate evidence to meet our stated objectives and to discuss any limitations in our work. We believe that the information and data obtained, and the analysis conducted, provide a reasonable basis for any findings and conclusions in this product.

⁴¹⁴ Gold Reserve Transparency Act of 2011, H.R. 1495, 112th Congress (2011).

⁴¹⁵ To verify the fineness (the percentage of gold content at the time of melting) of a gold bar, it is assayed. This involves analyzing a sample from the bar to determine the quantity of gold in it.

Gold Reserves of the United States

The holdings of gold reserves of the United States are presented in various financial reports, including the United States Mint's (Mint) Schedule of Custodial Deep Storage Gold and Silver Reserves (Mint's Custodial Schedule), the Mint's financial statements, and Treasury's departmentwide financial statements. As of September 30, 2010, most, or approximately 95 percent, of the reported gold reserves of the United States were in the custody of the Mint. The gold reserves in the custody of the Mint are comprised of deep storage and working stock gold. Deep storage gold, which consists primarily of gold bars, represented nearly all of the gold reserves in the custody of the Mint and was maintained in three locations: the United States Bullion Depository at Fort Knox, Kentucky; the Mint at Denver, Colorado; and the Mint at West Point, New York. Working stock— which consists of bars, blanks, unsold coins, and condemned coins— represented about 1 percent of the reported gold reserves in the custody of the Mint and can be used as the raw material for minting coins. The remaining reported holdings of gold reserves of the United States were in the custody of the Federal Reserve Bank of New York. Table 1 presents the reported amounts as of September 30, 2010, of fine troy ounces (FTOs)⁴¹⁶ of gold reserves of the United States by category and the financial reports in which such categories were presented. From September 30, 2006, through September 30, 2010, the reported fiscal year-end amounts of FTOs of (1) deep storage gold reserves in the custody of the Mint and (2) gold reserves in the custody of the Federal Reserve Bank of New York have not changed.

⁴¹⁶ Fine troy ounces represent the gold content of the melt (that is, the melting, pouring, and casting of metal into molds) as determined by multiplying the melt's gross weight by its fineness.

Table 1: Gold Reserves of the United States as of September 30, 2010

	FTOs	Treasury's Departmentwide Financial Statements	Mint's Financial Statements	Mint's Custodial Schedule
Gold reserves in the custody of the Mint:				
Deep storage	245,262,897		X	X
Working stock	<u>2,783,219</u>		X	
Total gold reserves in the custody of the Mint	248,046,116	X		
Gold reserves in the custody of the Federal Reserve Bank of New York				
	<u>13,452,784</u>	X		
Total gold reserves of the United States	261,498,900			

Source: GAO analysis of Treasury financial reports.

Past and Current Audit Efforts Regarding Gold Reserves of the United States

In 1974, in response to congressional interest and in conjunction with the Mint, GAO assisted in the planning and observed the inventory of gold reserves of the United States maintained by the United States Bullion Depository at Fort Knox.⁴¹⁷ GAO selected 3 of the 13 compartments at this depository to be audited. The audit procedures included observing and participating in a physical inventory of the entire contents of the three compartments. GAO did not report any differences between the gold stored in these compartments and the Fort Knox depository's records. In addition, GAO's procedures included observing the assaying of a sample of gold bars. The results of the assays indicated that the recorded finenesses were within the tolerances the Mint established.

In connection with this audit, GAO recommended that the Secretary of the Treasury request the Director of the Mint to annually perform a cyclical inventory of its gold holdings to ensure that the gold holdings in all compartments would be inventoried over a specified period of years. Acting on this recommendation, Treasury established the Committee for Continuing Audits of United States Government-owned Gold (Committee for Continuing Audits) in 1975 to oversee and provide guidelines and general direction for continuing

⁴¹⁷ See GAO, *Accountability and Physical Controls of the Gold Bullion Reserves, Department of the Treasury*, FOD-75-10 (Washington, D.C.: February 1975).

audits.⁴¹⁸ The objectives of the continuing audits were to verify the accuracy of the inventory of gold and the adequacy of related accounting records and internal controls in accordance with Treasury audit policies. A March 1982 report to the Congress by the Gold Commission⁴¹⁹ noted that the continuing audit of such gold was conducted on a cyclical basis because of the enormous quantity of gold to be handled and the related costs.⁴²⁰ In an April 1987 report on continuing audits of the United States government-owned gold,⁴²¹ the Treasury OIG stated that the continuing audits were designed to ensure that about 10 percent of the United States government-owned gold was audited annually.⁴²² Further, the Treasury OIG stated that on September 19, 1986, the Inspector General had recommended canceling Treasury Department Order No. 234-1, which had resulted in the creation of the Committee for Continuing Audits, because it was unnecessary in view of the authority of the Inspector General to conduct audits of the gold stock under other Treasury Orders. It was also stated that annual audits of government-owned gold were no longer necessary because (1) virtually all of the gold in the custody of the Mint had been audited and placed under seal and (2) there had been essentially no discrepancies found as a result of those audits. Moreover, it was noted that Treasury Department Order No. 234-1 was subsequently canceled. According to the Treasury OIG, about 92 percent of the United States government-owned gold had been

⁴¹⁸ This committee was created as a result of the June 3, 1975, Department Order No. 234-1, issued by the Secretary of the Treasury authorizing and directing the Fiscal Assistant Secretary, with the cooperation and assistance of the Director of the Mint, to conduct a continuing audit of the United States government-owned gold for which the Treasury is accountable.

⁴¹⁹ Pursuant to Public Law 96-389, 94 Stat. 1551, 1555, § 10 (Oct. 7, 1980), the members of the Gold Commission were appointed by the Secretary of the Treasury to conduct a study to assess and make recommendations with regard to the policy of the U.S. government concerning the role of gold in domestic and international systems.

⁴²⁰ *Report to the Congress of the Commission on the Role of Gold in the Domestic and International Monetary Systems, Volume II, Annex D: Continuing Audit of the United States Government-Owned Gold*, March 1982.

⁴²¹ Department of the Treasury, Office of the Inspector General, *Summary Report of Continuing Audits of United States Government-owned Gold as of September 30, 1986*, OIG-87-42, (Apr. 24, 1987).

⁴²² In this report, the Treasury OIG stated that the Committee for Continuing Audits was headed by the Chief of the Internal Audit Staff of Treasury's Bureau of Government Financial Operations and included the Chief of the Internal Audit Staff of the Mint and the Assistant General Auditor of the Federal Reserve Bank of New York. The Treasury OIG also stated that (1) effective October 1, 1982, the internal audit staffs of the Bureau of Government Financial Operations and the Mint were reorganized under the Treasury OIG, and (2) on October 10, 1984, the Bureau of Government Financial Operations became the Financial Management Service.

audited by either GAO⁴²³ or the Committee for Continuing Audits as of September 30, 1986.

More recently, the gold reserves of the United States have been presented in various financial reports and have therefore been subject to various audit efforts. For example, while the deep storage gold reserves are a primary focus of the audit of the Mint's Custodial Schedule, which is audited by the Treasury OIG, the deep storage gold reserves are also within the scope of the audit of the Mint's financial statements, which are audited by independent public accountants. Also, as a bureau within Treasury, the balances and activity of the Mint are included on Treasury's departmentwide financial statements, which are required by law to annually be prepared, audited, and submitted to the Congress and the Director of the Office of Management and Budget. Specifically, 31 U.S.C. §3515(b) requires that the financial statements of covered executive agencies, of which Treasury is one, include the overall financial position of the offices, bureaus, and activities covered by the statements, including the assets and liabilities thereof; and the results of operations of those offices, bureaus, and activities.

Treasury OIG's Audits of Gold Reserves in the Custody of the Mint

The Inspector General Act of 1978, as amended,⁴²⁴ (IG Act) created offices of inspector general at major federal departments, including the Treasury OIG,⁴²⁵ to provide independent audits and investigations; promote economy, efficiency, and effectiveness; and prevent and detect fraud, waste, and abuse in the respective department's programs and operations.⁴²⁶ The Treasury OIG performs annual audits of the Mint's Custodial Schedule,⁴²⁷ which reports the deep storage gold reserves. As shown in table 1, the deep

⁴²³ Of the about 92 percent of the United States government-owned gold that had been audited as of September 30, 1986, GAO audited approximately 13 percent in 1974.

⁴²⁴ Pub. L. No. 95-452, 92 Stat. 1101 (Oct. 12, 1978) (codified, as amended, at 5 U.S.C. App.).

⁴²⁵ The Treasury OIG was established by the Inspector General Act Amendments of 1988 (Public Law 100-504).

⁴²⁶ In accordance with the IG Act, the Treasury OIG was appointed by the President and confirmed by the Senate, which, among other provisions of the IG Act, allows the Treasury's OIG to perform audits in compliance with the independence requirements of *Government Auditing Standards* (See GAO, *Government Auditing Standards, July 2007 Revision*, [GAO-07-731G](#) (Washington, D.C.: July 2007), issued by the Comptroller General of the United States), 5 U.S.C. App. § 4(b).

⁴²⁷ Prior to fiscal year 2000, the Mint's Custodial Schedule was called a Statement of Custodial Gold and Silver Reserves. Additionally, beginning in fiscal year 2006, "deep storage" was added to the title.

storage gold reserves represent nearly all of the gold reserves in the custody of the Mint.

Since issuing its first audit report on the Mint's Custodial Schedules in 1995, which presented the results of its audit of the Mint's Custodial Schedules as of September 30, 1994, and 1993, the Treasury OIG has annually audited the deep storage gold reserves in the custody of the Mint as reported in the respective Mint's Custodial Schedules. For each of the fiscal years under audit, the Treasury OIG rendered unqualified or "clean" opinions on the Mint's Custodial Schedules. In addition, the Treasury OIG did not report any material weaknesses⁴²⁸ in internal control over financial reporting relating to the schedules for these fiscal years. The Treasury OIG's most recent audit report on the Mint's Custodial Schedules, which presented the deep storage gold reserves in the custody of the Mint as of September 30, 2010, was issued on October 21, 2010.

In connection with the Treasury OIG's annual audits of the Mint's Custodial Schedules, Treasury OIG officials told us that the Treasury OIG reviews the physical controls (e.g., security fences, armed guards, security cameras, metal detectors) at each of the three Mint locations where the deep storage gold reserves are maintained. According to Treasury OIG officials, as of September 30, 2010, there were 42 compartments of deep storage gold reserves spread among these three Mint locations. As previously noted, Treasury OIG officials estimate that about 92 percent of the United States government-owned gold was audited by either GAO or the Committee for Continuing Audits as of September 30, 1986. These officials told us that once the inventory of a compartment being audited was completed, the compartment was sealed with an official joint seal. A joint seal is intended to place the gold contained in a compartment under such control that subsequent representatives can accept the verification made by previous representatives as to the weight and count of the gold.

According to Treasury OIG officials, the official joint seals, for all of the compartments that were audited by either GAO or the committee and that had not been opened since such audits, were inspected by the Treasury OIG, as part of its audits of the Mint's

⁴²⁸ A material weakness is a deficiency, or a combination of deficiencies, in internal control such that there is a reasonable possibility that a material misstatement of the entity's financial statements will not be prevented, or detected and corrected, on a timely basis. A deficiency in internal control exists when the design or operation of a control does not allow management or employees, in the normal course of performing their assigned functions, to prevent, or detect and correct, misstatements on a timely basis.

Custodial Schedules, to verify that the seals had not been compromised. These officials also told us that over the course of the Treasury OIG's audits of the Mint's Custodial Schedules for fiscal years 1993 through 2008, the compartments containing the deep storage gold reserves not audited by either GAO or the committee, along with any previously sealed compartments that were opened, were selected and audited. These officials told us that such audits included verifying the following to the Mint's inventory records:

- (1) the number of gold bars in each melt;
- (2) the melt number for each gold bar in the melt; and
- (3) the fineness stamped on each gold bar in the melt.

In addition, as part of the audits of the selected compartments, Treasury OIG officials stated that the Treasury OIG's audit procedures have included selecting a statistical sample of gold bars from the selected compartments to be weighed and assayed and that no material differences were noted. These officials also told us that once the inventory of a selected compartment being audited was completed, the compartment was sealed with an official joint seal to control the gold reserves contained in the compartment. According to Treasury OIG officials, opening and sealing compartments require the presence of three individuals—a representative of the facility where the gold reserves are held, a representative of the Director of the Mint, and a representative of the Treasury OIG. They also told us that, as of the end of fiscal year 2008, an inventory of each of the 42 compartments had been observed either by GAO, the Committee for Continuing Audits, or the Treasury OIG and that there has been no movement of deep storage gold reserves since that time. As such, in addition to considering internal control over financial reporting related to the Mint's Custodial Schedules, Treasury OIG officials stated that the Treasury OIG's audit procedures since fiscal year 2008 have primarily focused on inspecting the official joint seals each year for all 42 compartments to verify that they had not been compromised.

Independent Public Accountants' Audits Covering Gold Reserves in the Custody of the Federal Reserve Bank of New York and the Mint

The gold reserves of the United States on Treasury's departmentwide financial statements consist of the gold reserves in the custody of the Mint and those in the custody of the Federal

Reserve Bank of New York. Since fiscal year 2004, independent public accountants have rendered clean opinions on these financial statements. According to Treasury OIG officials, these independent public accountants' primary audit procedure regarding the gold reserves in the custody of the Federal Reserve Bank of New York involves annually obtaining a confirmation from the Federal Reserve regarding the gold reserves of the United States that are in the Federal Reserve Bank of New York's custody as of fiscal year-end, including the amount of FTOs. The gold reserves in the custody of the Mint are also reported on the Mint's annual financial statements. Independent public accountants have rendered clean opinions on the Mint's financial statements for fiscal years 2005 through 2010.⁴²⁹ According to Treasury OIG officials, these independent public accountants' procedures with regard to the deep storage gold reserves in the custody of the Mint have included reviewing the Treasury OIG's audit documentation, accompanying the Treasury OIG on site visits to the Mint's storage locations, reviewing the physical controls at the locations visited, and reperforming certain of the Treasury OIG's audit procedures.

Requirements of H.R. 1495

H.R. 1495 provides for the Secretary of the Treasury to conduct and complete a full assay, inventory, and audit of gold reserves of the United States and an analysis of the sufficiency of the measures taken for the security of such reserves. In considering the provisions of H.R. 1495, it will be important to consider the cost, benefit, and timing of actions needed to implement the proposed requirements. H.R. 1495, if enacted, may result in duplication of certain past and current efforts, especially with regard to inventorying and auditing the gold reserves of the United States. Nevertheless, GAO would be capable of carrying out the required review of the results of the Secretary of the Treasury's actions called for by the bill, should it be enacted. GAO's review would include visits to the facilities at which the gold reserves of the United States are held to selectively observe the inventorying and auditing of the gold reserves and examinations of various documentation supporting the required assay, inventory, and audit.

⁴²⁹ With regard to the Mint's financial statements for fiscal years 1993 through 2004, the Mint's independent public accountants reported that they did not audit the gold reserves included in the Mint's Custodial Schedules. Their opinions on these financial statements, in so far as they related to such gold reserves, were based solely on the reports of the Treasury OIG regarding the related Mint Custodial Schedule.

H.R. 1495 also provides for GAO to prepare and transmit to the Congress, not later than 9 months after enactment of the act, a report of GAO's findings from such review together with the results of the assay, inventory, audit, and analysis conducted by the Secretary of the Treasury. According to Treasury officials, because of the enormous quantity of gold that would need to be inventoried and assayed, there is uncertainty regarding the ability of Treasury to complete such actions within the 6-month period provided in H.R. 1495. If Treasury's efforts are not completed within the 6-month period, there would be limitations on the scope of GAO's work if GAO were required to report within 9 months after enactment of the act. GAO stands ready to work with the Subcommittee on developing changes to the provisions of H.R. 1495 that would most efficiently utilize the results of past and current gold reserve assay, inventory, and audit efforts.

Mr. Chairman and Ranking Member Clay, this concludes my prepared statement. I would be pleased to respond to any questions that you or other members of the Subcommittee may have at this time.

MONETARY HISTORY EXCERPTS FROM
THE MINORITY REPORT OF THE U.S. GOLD COMMISSION

II. A HISTORY OF MONEY AND BANKING IN THE UNITED STATES BEFORE THE 20TH CENTURY

As an outpost of Great Britain, colonial America of course used British pounds, pence, and shillings as its money. Great Britain was officially on a silver standard, with the shilling defined as equal to 86 pure Troy grains of silver, and with silver as so defined legal tender for all debts (i.e., creditors were compelled to accept silver at that rate). However, Britain also coined gold and maintained a bimetallic standard by fixing the gold guinea, weighing 129.4 grains of gold, as equal in value to a certain weight of silver. In that way, gold became, in effect, legal tender as well. Unfortunately, by establishing bimetallicism, Britain became perpetually subject to the evils known as Gresham's Law, which states that when government compulsorily overvalues one money and undervalues another, the undervalued money will leave the country or disappear into hoards, while the overvalued money will flood into circulation. Hence, the popular catchphrase of Gresham's Law: "Bad money drives out good." But the important point to note is that the triumph of "bad" money is the result, *not* of perverse free-market competition, but of government using the compulsory legal tender power to privilege one money above another.

In 17th- and 18th-century Britain, the government maintained a mint ratio between gold and silver that consistently overvalued gold and undervalued silver in relation to world market prices, with the resultant disappearance and outflow of full-bodied silver coins, and an influx of gold, and the maintenance in circulation of only eroded and "lightweight" silver coins. Attempts to rectify the fixed bimetallic ratios were always too little and too late.¹

In the sparsely settled American colonies, money, as it always does, arose in the market as a useful and scarce commodity and

¹ In the late 17th and early 18th centuries, the British maintained fixed mint ratios of from 15.1:1 of silver grains in relation to gold grains, to about 15.5:1. Yet the world market ratio of weight, set by forces of supply and demand, was about 14.9:1. Thus, silver was consistently undervalued and gold overvalued. In the 18th century, the problem got even worse, for increasing gold production in Brazil and declining silver production in Peru brought the market ratio down to 14.1:1 while the mint ratios fixed by the British government continued to be the same.

began to serve as a general medium of exchange. Thus, beaver fur and wampum were used as money in the North for exchanges with the Indians, and fish and corn also served as money. Rice was used as money in South Carolina, and the most widespread use of commodity money was tobacco, which served as money in Virginia. The pound-of-tobacco was the currency unit in Virginia, with warehouse receipts in tobacco circulating as money backed 100 percent by the tobacco in the warehouse.

While commodity money continued to serve satisfactorily in rural areas, as the colonial economy grew, Americans imported gold and silver coins to serve as monetary media in urban centers and in foreign trade. English coins were imported, but so too were gold and silver coins from other European countries. Among the gold coins circulating in America were the French guinea, the Portuguese “joe,” the Spanish doubloon, and Brazilian coins, while silver coins included French crowns and livres.

It is important to realize that gold and silver are international commodities, and that therefore, when not prohibited by government decree, foreign coins are perfectly capable of serving as standard moneys. There is no need to have a national government monopolize the coinage, and indeed foreign gold and silver coins constituted much of the coinage in the United States until Congress outlawed the use of foreign coins in 1857. Thus, if a free market is allowed to prevail in a country, foreign coins will circulate naturally. Silver and gold coins will tend to be valued in proportion to their respective weights, and the ratio *between* silver and gold will be set by the market in accordance with their relative supply and demand.

Shilling/Dollar Manipulations

By far the leading specie coin circulating in America was the Spanish silver dollar, defined as consisting of 387 grains of pure silver. The dollar was divided into “pieces of eight,” or “bits,” each consisting of one-eighth of a dollar. Spanish dollars came into the North American colonies through the lucrative trade with the West Indies. The Spanish silver dollar had been the world’s outstanding coin since the early 16th century, and was spread partially by dint of the vast silver output of the Spanish colonies in Latin America. More important, however, was the fact that the Spanish dollar, from the 16th to the 19th century, was relatively the most stable and least debased coin in the Western world.²

² The name “dollar” came from the “thaler,” the name given to the coin of similar weight, the “Joachimsthaler” or “schlicken thaler,” issued since the early 16th century by the Count of Schlick in Joachimsthal in Bohemia. The Joachimsthalers weigh 451 Troy grains of silver. So

Since the Spanish silver dollar consisted of 387 grains, and the English shilling consisted of 86 grains of silver, this meant the natural, free-market ratio between the two coins would be 4 shillings 6 pence per dollar.³

Constant complaints, both by contemporaries and by some later historians, arose about an alleged “scarcity of money,” especially of specie, in the colonies, allegedly justifying numerous colonial paper money schemes to remedy that “shortage.” In reality, there was no such shortage. It is true that England, in a mercantilist attempt to hoard specie, kept minting for its own prerogative and outlawed minting in the colonies; it also prohibited the export of English coin to America. But this did not keep specie from America, for, as we have seen, Americans were able to import Spanish and other foreign coin, including English, from other countries. Indeed, as we shall see, it was precisely paper money issues that led, by Gresham’s Law, to outflows and disappearance of specie from the colonies.

In their own mercantilism, the colonial governments early tried to hoard their own specie by debasing their shilling standards in terms of Spanish dollars. Whereas their natural weights dictated a ratio of 4 shillings per 6 pence to the dollar, Massachusetts, in 1642, began a general colonial process of competitive debasement of shillings. Massachusetts arbitrarily decreed that the Spanish dollar be valued at 5 shillings; the idea was to attract an inflow of Spanish silver dollars into that colony, and to subsidize Massachusetts exports by making their prices cheaper in terms of dollars. Soon, Connecticut and other colonies followed suit, each persistently upping the ante of debasement. The result was to increase the supply of nominal units of account by debasing the shilling, inflating domestic prices and thereby bringing the temporary export stimulus to a rapid end. Finally, the English government brought a halt to this futile and inflationary practice in 1707.

But the colonial governments had already found another, and far more inflationary, arrow for their bow: the invention of government fiat paper money.

Government Paper Money

Apart from medieval China, which invented both paper and printing centuries before the West, the world had never seen

successful were these coins that similar thalers were minted in Burgundy, Holland, France; most successful of these was the Maria Theresa thaler, which began being minted in 1751, and formed a considerable portion of American currency after that date. The Spanish “pieces of eight” adopted the name “dollar” after 1690.

³ Since 20 shillings make £1, this meant that the natural ratio between the two currencies was £1 = \$4.44.

government paper money until the colonial government of Massachusetts emitted a fiat paper issue in 1690.^{4,5} Massachusetts was accustomed to launching plunder expeditions against the prosperous French colony in Quebec. Generally, the expeditions were successful, and would return to Boston, sell their booty, and pay off the soldiers with the proceeds. This time, however, the expedition was beaten back decisively, and the soldiers returned to Boston in ill-humor, grumbling for their pay. Discontented soldiers are ripe for mutiny, so the Massachusetts government looked around in concern for a way to pay the soldiers. It tried to borrow 3-4,000 pounds from Boston merchants, but evidently the Massachusetts credit rating was not the best. Finally, Massachusetts decided in December 1690 to print £7,000 in paper notes and to use them to pay the soldiers. Suspecting that the public would not accept irredeemable paper, the government made a twofold pledge when it issued the notes: that it would redeem them in gold or silver out of tax revenue in a few years and that absolutely no further paper notes would be issued. Characteristically, however, both parts of the pledge went quickly by the board: The issue limit disappeared in a few months, and all the bills continued unredeemed for nearly 40 years. As early as February 1691, the Massachusetts government proclaimed that its issue had fallen “far short” and so it proceeded to emit £40,000 of new money to repay all of its outstanding debt, again pledging falsely that this would be the absolutely final note issue.

But Massachusetts found that the increase in the supply of money, coupled with a fall in the demand for paper because of growing lack of confidence in future redemption in specie, led to a rapid depreciation of new money in relation to specie. Indeed, in a year after the initial issue, the new paper pound had depreciated on the market by 40 percent against specie.

By 1692, the government moved against this market evaluation by use of force, making the paper money compulsory legal tender for all debts at par with specie, and by granting a premium of five percent on all payment of debts to the government made in paper

⁴ Government paper redeemable in gold began in the early 9th century, and after three centuries the government escalated to irredeemable fiat paper, with the usual consequence of boom-bust cycles, and runaway inflation. See Gordon Tullock, “Paper Money—A Cycle in Cathay,” *Economic History Review*, vol. IX, no. 3 (1957), pp. 393-396.

⁵ The only exception was a curious form of paper money issued five years earlier in Quebec, to become known as Card Money. The governing *intendant* of Quebec, Monsieur Mueles, divided some playing cards into quarters, marked them with various monetary denominations, and then issued them to pay for wages and materials sold to the government. He ordered the public to accept the cards as legal tender, and this particular issue was later redeemed in specie sent from France.

notes. This legal tender law had the unwanted effect of Gresham's Law: the disappearance of specie circulation in the colony. In addition, the expanding paper issues drove up prices and hampered exports from the colony. In this way, the specie "shortage" became the creature rather than the cause of the fiat paper issues. Thus, in 1690, before the orgy of paper issues began, £200,000 of silver money was available in New England; by 1711 however, with Connecticut and Rhode Island having followed suit in paper money issue, £240,000 of paper money had been issued in New England but the silver had almost disappeared from circulation.

Ironically, then, Massachusetts' and her sister colonies' issue of paper created rather than solved any "scarcity of money." The new paper drove out the old specie. The consequent driving up of prices and depreciation of paper scarcely relieved any alleged money scarcity among the public. But since the paper was issued to finance government expenditures and pay public debts, the *government*, not the public, benefited from the fiat issue.

After Massachusetts had emitted another huge issue of £500,000 in 1711 to pay for another failed expedition against Quebec, not only was the remainder of the silver driven from circulation, but despite the legal tender law, the paper pound depreciated 30 percent against silver. Massachusetts pounds, officially seven shillings to the silver ounce, had now fallen on the market to nine shillings per ounce. Depreciation proceeded in this and other colonies despite fierce governmental attempts to outlaw it, backed by fines, imprisonment, and total confiscation of property for the high crime of not accepting the paper at par.

Faced with a further "shortage of money" due to the money issues, Massachusetts decided to press on; in 1716, it formed a government "land bank" and issued £100,000 in notes to be loaned on real estate in the various counties of the province.

Prices rose so dramatically that the tide of opinion in Massachusetts began to turn against paper, as writers pointed out that the result of the issues was a doubling of prices in the past 20 years, depreciation of paper, and the disappearance of Spanish silver through the operation of Gresham's Law. From then on, Massachusetts, pressured by the Crown, tried intermittently to reduce the bills in circulation and return to a specie currency, but was hampered by its assumed obligations to honor the paper notes at par of its sister New England colonies.

In 1744, another losing expedition against the French led Massachusetts to issue an enormous amount of paper money over the next several years. From 1744 to 1748, paper money in circulation

expanded from £300,000 to £2.5 million, and the depreciation of Massachusetts was such that silver had risen on the market to 60 shillings an ounce, 10 times the price at the beginning of an era of paper money in 1690.

By 1740, every colony but Virginia had followed suit in fiat paper money issues, and Virginia succumbed in the late 1750s in trying to finance part of the French and Indian War against the French. Similar consequences—dramatic inflation, shortage of specie, massive depreciation despite compulsory par laws—ensued in each colony. Thus, along with Massachusetts' depreciation of 11:1 of its notes against specie compared to the original par, Connecticut's notes had sunk to 9:1 and the Carolinas' at 10:1 in 1740, and the paper of virulently inflationist Rhode Island had sunk to 23:1 against specie. Even the least-inflated paper, that of Pennsylvania, had suffered an appreciation of specie to 80 percent over par.

A detailed study of the effects of paper money in New Jersey shows how it created a boom-bust economy over the colonial period. When new paper money was injected into the economy, an inflationary boom would result, to be followed by a deflationary depression when the paper money supply contracted.⁶

At the end of King George's War with France in 1748, Parliament began to pressure the colonies to retire the mass of paper money and return to a specie currency. In 1751, Great Britain prohibited all further issues of legal tender paper in New England and ordered a move toward redemption of existing issues in specie. Finally, in 1764, Parliament extended the prohibition of new issues to the remainder of the colonies and required the gradual retirement of outstanding notes.

Following the lead of Parliament, the New England colonies, apart from Rhode Island, decided to resume specie payment and retire their paper notes rapidly at the current depreciated market rate. The panicky opponents of specie resumption and monetary contraction made the usual predictions in such a situation: that the result would be a virtual absence of money in New England and the consequent ruination of all trade. Instead, however, after a brief adjustment, the resumption and retirement led to a far more prosperous trade and production—the harder money and lower prices attracting an inflow of specie. In fact, with Massachusetts on specie and Rhode Island still on depreciated paper, the result was that Newport, which had been a flourishing center for West Indian

⁶ Donald L. Kemmerer, "Paper Money in New Jersey, 1668-1775," *New Jersey Historical Society, Proceedings* 74 (April 1956): 107-144.

imports for Western Massachusetts, lost its trade to Boston and languished in the doldrums.^{7,8}

In fact, as one student of colonial Massachusetts has pointed out, the return to specie occasioned remarkably little dislocation, recession, or price deflation. Indeed, wheat prices fell by less in Boston than in Philadelphia, which saw no such return to specie in the early 1750s. Foreign exchange rates, after the resumption of specie, were highly stable, and “the restored specie system operated after 1750 with remarkable stability during the Seven Years War and during the dislocation of international payments in the last years before the Revolution.”⁹

Not being outlawed by government decree, specie remained in circulation throughout the colonial period, even during the operation of paper money. Despite the inflation, booms and busts, and shortages of specie caused by paper issues, the specie system worked well overall: “Here was a silver standard ... in the absence of institutions of the central government intervening in the silver market, and in the absence of either a public or private central bank adjusting domestic credit or managing a reserve of specie or foreign exchange with which to stabilize exchange rates. The market ... kept exchange rates remarkably close to the legislated par. ... What is most remarkable in this context is the continuity of the specie system through the seventeenth and eighteenth centuries.”¹⁰

Private Bank Notes

In contrast to government paper, private bank notes and deposits, redeemable in specie, had begun in Western Europe in Venice in the

⁷ Before Massachusetts went back to specie, it was committed to accept the notes of the other New England colonies at par. This provided an incentive for Rhode Island to inflate its currency wildly, for this small colony, with considerable purchases to make in Massachusetts, could make these purchases in inflated money at par. Thereby Rhode Island could export its inflation to the larger colony, but make its purchases with the new money before Massachusetts prices could rise in response. In short, Rhode Island could expropriate wealth from Massachusetts and impose the main cost of its inflation on the latter colony.

⁸ If Rhode Island was the most inflationary of the colonies, Maryland's monetary expansion was the most bizarre. In 1733, Maryland's public land bank issued £ 70,000 of paper notes, of which £ 30,000 was *given away* in a fixed amount to each inhabitant of the province. This was done to universalize the circulation of the new notes, and is probably the closest approximation in history of Milton Friedman's “helicopter” model, in which a magical helicopter lavishes new paper money in fixed amounts of proportions to each inhabitant. The result of the measure, of course, was rapid depreciation of new notes. However, the inflationary impact of the notes was greatly lessened by tobacco still being the major money of the new colony. Tobacco was legal tender in Maryland and the paper was not receivable for all taxes.

⁹ Roger W. Weiss, “The Colonial Monetary Standard of Massachusetts,” *Economic History Review* 27 (November 1974): 589.

¹⁰ *Ibid.*, p. 591.

14th century. Firms granting credit to consumers and businesses had existed in the ancient world and in medieval Europe, but these were “money lenders” who loaned out their own savings. “Banking” in the sense of lending out the savings of others only began in England with the “scriveners” of the early 17th century. The scriveners were clerks who wrote contracts and bonds and were therefore in a position to learn of mercantile transactions and engage in money lending and borrowing.¹¹

There were, however, no banks of deposit in England until the Civil War in the mid-17th century. Merchants had been in the habit of storing their surplus gold in the King’s Mint for safekeeping. The habit proved to be unfortunate, for when Charles I needed money in 1638, shortly before the outbreak of the Civil War, he confiscated the huge sum of £200,000 of gold, calling it a “loan” from the owners. Although the merchants finally got their gold back, they were understandably shaken by the experience, and forsook the Mint, depositing their gold instead in the coffers of private goldsmiths, who, like the Mint, were accustomed to storing the valuable metal. The warehouse receipts of the goldsmiths soon came to be used as a surrogate for the gold itself. By the end of the Civil War, in the 1660s, the goldsmiths fell prey to the temptation to print pseudo-warehouse receipts not covered by gold and lend them out; in this way fractional-reserve banking came to England.¹²

Very few private banks existed in colonial America, and they were shortlived. Most prominent was the Massachusetts Land Bank of 1740, issuing notes and lending them out on real estate. The Land Bank was launched as an inflationary alternative to government paper, which the royal governor was attempting to restrict. The land bank issued frankly irredeemable notes, and fear of its unsound issue generated a competing private silver Bank, which emitted notes redeemable in silver. The Land Bank promptly issued over £ 49,000 in irredeemable notes, which depreciated very rapidly. In six months’ time the public was almost universally refusing to accept the bank’s notes and Land Bank sympathizers vainly accepting the notes. The

¹¹ During the 16th century, before the rise of the scriveners, most English money-lending was not even conducted by specialized firms, but by wealthy merchants in the clothing and woolen industries, as outlets for their surplus-capital. See J. Milnes Holden, *The History of Negotiable Instruments in English Law* (London: The Athlone Press, 1955), pp. 205-206.

¹² Once again, ancient China pioneered in deposit banking, as well as in fractional-reserve banking. Deposit banking *per se* began in the 8th century A.D., when shops would accept valuables, in return for warehouse receipts, and receive a fee for keeping them safe. After a while, the deposit receipts of these shops began to circulate as money. Finally, after two centuries, the shops began to issue and lend out more receipts than they had on deposit; they had caught on to fractional reserve banking. (Tullock, “Paper Money,” p. 396.)

final blow came in 1741, when Parliament, acting at the request of several Massachusetts merchants and the royal governor, outlawed both the law and the silver banks.

One intriguing aspect of both the Massachusetts Land Bank and other inflationary colonial schemes is that they were advocated and lobbied for by some of the wealthiest merchants and land speculators in the respective colonies. Debtors benefit from inflation and creditors lose; realizing this fact, older historians assumed that debtors were largely poor agrarians and creditors were wealthy merchants and that therefore the former were the main sponsors of inflationary nostrums. But, of course, there are no rigid “classes” of debtors and creditors; indeed, wealthy merchants and land speculators are often the heaviest debtors. Later historians have demonstrated that members of the latter group were the major sponsors of inflationary paper money in the colonies.^{13,14}

Revolutionary War Finance

To finance the Revolutionary War, which broke out in 1775, the Continental Congress early hit on the device of issuing fiat paper money. The leader in the drive for paper money was Gouverneur Morris, the highly conservative young scion of the New York landed aristocracy. There was no pledge to redeem the paper, even in the future, but it was supposed to be retired in seven years by taxes levied pro rata by the separate states. Thus, a heavy future tax burden was supposed to be added to the inflation brought about the new paper money. The retirement pledge, however, was soon forgotten, as Congress, enchanted by this new, seemingly costless form of revenue, escalated its emissions of fiat paper. As a historian

On merchant enthusiasm for inflationary banking in Massachusetts, see Herman J. Belz, “Paper Money in Colonial Massachusetts,” Essex Institute, *Historical Collections* 101 (April 1965): 146-163; and Belz, “Currency Reform in Colonial Massachusetts, 1749-1750.” Essex Institute, *Historical Collections* 103 (January 1967): 66-84. On the forces favoring colonial inflation in general, see Bray Hammond, *Banks and Politics in America* (Princeton University Press, 1957), Chap. 1; Joseph Dorfman, *The Economic Mind in American Civilization, 1606-1865* (New York: Viking Press, 1946), p. 142.

¹⁴ For an excellent bibliographical essay on colonial money and banking, see Jeffrey Rogers Hummel, “The Monetary History of America to 1789: A Historiographical Essay,” *Journal of Libertarian Studies* 2 (Winter 1978): 373-389. For a summary of colonial monetary experience, see Murray N. Rothbard, *Conceived in Liberty, Vol. II, Salutary Neglect, The American Colonies in the First Half of the 18th Century* (New Rochelle, N.Y.: Arlington House, 1975), pp. 123-140. A particularly illuminating analysis is in the classic work by Charles Jesse Bullock, *Essays on the Monetary History of the United States* (1900, New York: Greenwood Press, 1969), pp. 1-59. Up-to-date data on the period is in Roger W. Weiss, “The Issue of Paper Money in the American Colonies, 1720-1774,” *Journal of Economic History* 30 (December 1970): 770-784.

has phrased it, “such was the beginning of the ‘federal trough,’ one of America’s most imperishable institutions.”¹⁵

The total money supply of the United States at the beginning of the Revolution has been estimated at \$12 million. Congress launched its first paper issue of \$2 million in late June 1775, and before the notes were printed it had already concluded that another \$1 million was needed. Before the end of the year, a full \$6 million in paper issues were issued or authorized, a dramatic increase of 50 percent in the money supply in one year.

The issue of this fiat “continental” paper rapidly escalated over the next few years. Congress issued \$6 million in 1775, \$19 million in 1776, \$13 million in 1777, \$64 million in 1778, and \$125 million in 1779. This was a total issue of over \$225 million in five years superimposed upon preexisting money supply of \$12 million. The result was, as could be expected, a rapid price inflation in terms of the paper notes, and a corollary accelerating depreciation of the paper in terms of specie. Thus, by the end of 1776, the Continentals were worth \$1 to \$1.25 in specie; by the fall of the following year, its value had fallen to 3 to 1; by December 1778 the value was 6.8 to 1; and by December 1779 to the negligible 42 to 1. By the spring of 1781, the Continentals were virtually worthless, exchanging on the market at 168 paper dollars to one dollar in specie. This collapse of the Continental currency gave rise to the phrase, “not worth a Continental.”

To top this calamity, the several states issued their own paper money, and each depreciated at varying rates. Virginia and the Carolinas led the inflationary move, and by the end of the war, state issues added a total of 210 million depreciated dollars to the nation’s currency.

In an attempt to stem the inflation and depreciation, various states levied maximum price controls and compulsory par laws. The result was only to create shortages and impose hardships on large sections of the public. Thus, soldiers were paid in Continentals, but farmers understandably refused to accept payment in paper money despite legal coercion. The Continental Army then moved to “impress” food and other supplies, seizing the supplies and forcing the farmers and shopkeepers to accept depreciated paper in return. By 1779, with Continental paper virtually worthless, the Continental Army stepped up its impressments, “paying” for them in newly issued paper tickets or “certificates” issued by the army quartermaster and commissary departments. The states followed suit with their own massive

¹⁵ Edmund Cody Burnett, *The Continental Congress* (New York: W.W. Norton, 1964), p. 83.

certificate issues. It understandably took little time for these certificates, federal and state, to depreciate in value to nothing; by the end of the war, federal certificate issues alone totaled \$200 million.

The one redeeming feature of this monetary calamity was that the federal and state governments at least allowed these paper issues to sink into worthlessness without insisting that taxpayers shoulder another grave burden by being forced to redeem these issues specie at par, or even to redeem them at all.¹⁶ Continentals were not redeemed at all, and state paper was only redeemed at depreciating rates, some at the greatly depreciated market value.¹⁷ By the end of the war, all the wartime state paper had been withdrawn from circulation.

Unfortunately, the same policy was not applied to another important device that Congress turned to after its Continental paper had become almost worthless in 1779: loan certificates. Technically, loan certificates were public debt, but they were scarcely genuine loans. They were simply notes issued by the government to pay for supplies and accepted by the merchants because the government would not pay anything else. Hence, the loan certificates became a form of currency, and rapidly depreciated. As early as the end of 1779, they had depreciated to 24 to 1 in specie. By the end of the war, \$600 million of loan certificates had been issued. Some of the later loan certificate issues were liquidated at a depreciated rate, but the bulk remained after the war to become the substantial core of the permanent, peacetime federal debt.

The mass of federal and state debt could have depreciated and passed out of existence by the end of the war, but the process was stopped and reversed by Robert Morris, wealthy Philadelphia merchant and virtual economic and financial czar of the Continental Congress in the last years of the war. Morris, leader of the nationalist forces in American politics, moved to make the depreciated federal debt ultimately redeemable in par and also agitated for federal assumption of the various state debts. The reason was twofold: (a) to confer a vast subsidy on speculators who had purchased the public debt at highly depreciated values, by paying interest and principal at

¹⁶ As one historian explained, "Currency and certificates were the 'common debt' of the Revolution, most of which at war's end had been sunk at its depreciated value. Public opinion ... tended to grade claims against the government according to their real validity. Paper money had the least status. ..." E. James Ferguson, *The Power of the Purse: A History of American Public Finance, 1776-1790* (Chapel Hill, N.C.: University of North Carolina Press, 1961), p. 68.

¹⁷ In Virginia and Georgia, the state paper was redeemed at the highly depreciated market rate of 1,000 to 1 in specie.

par in specie;¹⁸ and (b) to build up the agitation for taxing power in the Congress, which the Articles of Confederation refused to allow to the federal government. The decentralist policy of the states' raising taxes or issuing new paper money to pay off the pro rata federal debt as well as their own was thwarted by the adoption of the Constitution, which brought about the victory of the nationalist program, led by Morris's youthful disciple and former aide, Alexander Hamilton.

The Bank of North America

Robert Morris's nationalist vision was not confined to a strong central government, the power of the federal government to tax, and a massive public debt fastened permanently upon the taxpayers. Shortly after he assumed total economic power in Congress in the spring of 1781, Morris introduced a bill to create the first commercial bank, as well as the first central bank, in the history of the new Republic. This bank, headed by Morris himself, the Bank of North America, was not only the first fractional-reserve commercial bank in the U.S.; it was to be a privately owned central bank, modeled after the Bank of England. The money system was to be grounded upon specie, but with a controlled monetary inflation pyramiding an expansion of money and credit upon a reserve of specie.

The Bank of North America, which quickly received a federal charter and opened its doors at the beginning of 1782, received the privilege from the government of its notes being receivable in all duties and taxes to all governments, at par with specie. In addition, no other banks were to be permitted to operate in the country. In return for its monopoly license to issue paper money, the bank would graciously lend most of its newly created money to the federal government to purchase public debt and be reimbursed by the hapless taxpayer. The Bank of North America was made the depository for all congressional funds. The first central bank in America rapidly loaned \$1.2 million to the Congress, headed also by Robert Morris.¹⁹

¹⁸ As Morris candidly put it, this windfall to the public debt speculators at the expense of the taxpayers would cause wealth to flow "into those hands which could render it most productive." (Ferguson, *Power of the Purse*, p. 124).

¹⁹ When Morris failed to raise the legally required specie capital to launch the Bank of North America, Morris, in an act tantamount to embezzlement, simply appropriated specie loaned to the U.S. by France and invested it for the government in his own Bank. In this way, the bulk of specie capital for his Bank was appropriated by Morris out of government funds. A multiple of these funds was then borrowed back from Morris's bank by Morris as government financier for the pecuniary benefit of Morris as banker; and finally, Morris channeled most of the money into war contracts for his friends and business associates. Murray N. Rothbard, *Conceived in Liberty, Vol. IV, The Revolutionary War, 1775-1784* (New Rochelle, N.Y.: Arlington House, 1979), p. 392.

Despite Robert Morris's power and influence, and the monopoly privileges conferred upon his bank, it was perceived in the market that the Bank's notes were being inflated compared with specie. Despite the nominal redeemability of the Bank of North America's notes in specie, the market's lack of confidence in the inflated notes led to their depreciation outside its home base in Philadelphia. The Bank even tried to shore up the value of its notes by hiring people to urge redeemers of its notes not to ruin everything by insisting upon specie—a move scarcely calculated to improve ultimate confidence in the Bank.

After a year of operation, however, Morris, his political power slipping after the end of the war, moved quickly to end his Bank's role as a central bank and to shift it to the status of a private commercial bank chartered by the state of Pennsylvania. By the end of 1783, all of the federal government's stock in the Bank of North America, which had the previous year amounted to 5/8 of its capital, had been sold by Morris into private hands, and all the U.S. government debt to the bank had been repaid. The first experiment with a central bank in the United States had ended.²⁰

At the end of the Revolutionary War, the contraction of the swollen mass of paper money, combined with the resumption of imports from Great Britain, combined to cut prices by more than half in a few years. Vain attempts by seven state governments, in the mid-1780s, to cure the "shortage of money" and reinflate prices were a complete failure. Part of the reason for the state paper issues was a frantic attempt to pay the wartime public debt, state and *pro rata* federal, without resorting to crippling burdens of taxation. The increased paper issues merely added to the "shortage" by stimulating the export of specie and the import of commodities from abroad. Once again, Gresham's Law was at work. State paper issues—despite compulsory par laws—merely depreciated rapidly, and aggravated the shortage of specie. A historian discusses what happened to the paper issues of North Carolina:

In 1787-1788 the specie value of the paper had shrunk by more than 50 percent. Coin vanished, and since the paper had practically no value outside the state, merchants could not use it to pay debts they owed abroad; hence they suffered severe losses when they had to accept it at inflated values in the settlement of local debts. North Carolina's performance warned merchants anew of the menace of depreciating paper money which they were forced to receive at par

²⁰ See Rothbard, *The Revolutionary War*, pp. 409-410. On the Bank of North America and on Revolutionary War finance generally, see Curtis P. Nettels, *The Emergence of a National Economy, 1775-1815* (New York: Holt, Rinehart, and Winston, 1962), pp. 23-34.

from their debtors but which they could not pass on to their creditors.²¹

Neither was the situation helped by the expansion of banking following the launching of the Bank of North America in 1782. The Bank of New York and the Massachusetts Bank (Boston) followed two years later, with each institution enjoying a monopoly of banking in its region.²² Their expansion of bank notes and deposits helped to drive out specie, and in the following year the expansion was succeeded by a contraction of credit, which aggravated the problems of recession.²³

The United States: Bimetallic Coinage

Since the Spanish silver dollar was the major coin circulating in North America during the colonial and Confederation periods, it was generally agreed that the “dollar” would be the basic currency unit of the new United States of America.²⁴ Article I, section 8 of the new Constitution gave to Congress the power “to coin money, regulate the value thereof, and of foreign coin”; the power was exclusive because the state governments were prohibited, in Article I, section 10, from coining money, emitting paper money, or making anything but gold and silver coin legal tender in payment of debts. (Evidently the Founding Fathers were mindful of the bleak record of colonial and revolutionary paper issues and provincial juggling of the weights and denominations of coin.) In accordance with this power, Congress passed the Coinage Act of 1792 on the recommendation of Secretary of Treasury Alexander Hamilton’s *Report on the Establishment of a Mint* of the year before.²⁵

The Coinage Act established a bimetallic dollar standard for the United States. The dollar was defined as *both* a weight of 371.25 grains of pure silver *and/or* a weight of 24.75 grains of pure gold—a fixed ratio of 15 grains of silver to 1 grain of gold.²⁶ Anyone could bring gold and silver bullion to the Mint to be coined, and silver and gold coins were both to be legal tender at this fixed ratio of 15:1. The

²⁴ As Jefferson put it at the time: “The unit or dollar is a known coin, and the most familiar of all to the mind of the public. It is already adopted from South to North, has identified our currency, and therefore happily offers itself a unit already introduced.” Cited in J. Laurence Laughlin, *The History of Bimetallism in the United States*, 4th ed. (New York: D. Appleton and Co., 1901), p. 11n.

²⁵ The text of the Coinage Act of 1792 may be found in Laughlin, *History of Bimetallism*, pp. 300-301. Also see *ibid*; pp. 21-23; Hepburn, *History of Currency*, pp. 43-45.

²⁶ The current Spanish silver dollars in use were lighter than the earlier dollars weighing 387 grains. See Laughlin, *History of Bimetallism*, pp. 16-18.

basic silver coin was to be the silver dollar, and the basic gold coin the 10-dollar eagle, containing 247.5 grains of pure gold.²⁷

The 15:1 fixed bimetallic ratio almost precisely corresponded to the market gold/silver ration of the early 1790s,²⁸ but of course the tragedy of any bimetallic standard is that the fixed mint ratio must always come a cropper against inevitably changing market ratios, and that Gresham's Law will then come inexorably into effect. Thus, Hamilton's express desire to keep both metals in circulation in order to increase the supply of money was doomed to failure.²⁹

Unfortunately for the bimetallic goal, the 1780s saw the beginning of a steady decline in the ratio of the market values of silver to gold, largely due to the massive increases over the next three decades of silver production from the mines of Mexico. The result was that the market ratio fell to 15.5:1 by the 1790s, and after 1805 fell to approximately 15.75:1. The latter figure was enough of a gap between the market and mint ratios to set Gresham's Law into operation so that by 1810 gold coins began to disappear from the United States and silver coins to flood in. The fixed government ratio now significantly overvalued silver and undervalued gold, and so it paid people to bring in silver to exchange for gold, melt the gold coins into bullion and ship it abroad. From 1810 until 1834, only silver coin, domestic and foreign, circulated in the United States.³⁰

Originally, Congress in 1793 provided that all foreign coins circulating in the United States be legal tender. Indeed, foreign coins have been estimated to form 80 percent of American domestic specie circulation in 1800. Most of the foreign coins were Spanish silver, and while the legal tender privilege was progressively cancelled for various foreign coins by 1827, Spanish silver coins continued as legal tender and to predominate in circulation.³¹ Spanish dollars however, soon began to be heavier in weight by one to five percent over their American equivalents, even though they circulated at face value here, and so the American mint ratio overvalued American more than

²⁷ Golden half-eagles (worth \$5) and quarter-eagles (worth \$2.50) were also to be coined, of corresponding proportional weights, and, for silver coins, half-dollars, quarter-dollars, dimes, and half-dimes of corresponding weights.

²⁸ Silver had declined in market value from the 14.1:1 ratio of 1760, largely due to the declining production of gold from Russian mines in this period and therefore the rising relative value of gold.

²⁹ See Laughlin, *History of Bimetallism*, p. 14.

³⁰ For a lucid explanation of the changing silver/gold ratios and how Gresham's Law operated in this period, see Laughlin, *History of Bimetallism*, pp. 10-51. Also see Laughlin, *A New Exposition of Money, Credit and Prices* (Chicago: University of Chicago Press, 1931), pp. 93-111.

³¹ These "Spanish" coins were almost exclusively minted in the Spanish colonies of Latin America. After the Latin American nations achieved independence in the 1820s, the coins circulated freely in the United States without being legal tender.

Spanish dollars. As a result, the Spanish silver dollars were re-exported, leaving American silver dollars in circulation. On the other hand, fractional Spanish silver coins—half-dollars, quarter-dollars, climes, and half dimes—were considerably over-valued in the U.S., since they circulated at face value and yet were far lighter weight. Gresham’s Law again came into play, and the result was that American silver fractional coins were exported and disappeared, leaving Spanish silver fractional coins as the major currency. To make matters still more complicated, American silver dollars, though lighter weight than the Spanish, circulated equally by name in the West Indies. As a result, American silver dollars were exported to the Caribbean. Thus, by the complex workings of Gresham’s Law, the United States was left, especially after 1820, with no gold coins and only Spanish fractional silver coin in circulation.³²

The First Bank of the United States 1791-1811

A linchpin of the Hamiltonian financial program was a central bank, the First Bank of the United States, replacing the abortive Bank of North America experiment. Hamilton’s *Report on a National Bank* of December 1790 urged such a bank, to be owned privately with the government owning one-fifth of the shares. Hamilton argued that the alleged “scarcity” of specie currency needed to be overcome by infusions of paper, and the new Bank was to issue such paper, to be invested in the assumed federal debt and in subsidy to manufacturers. The Bank notes were to be legally redeemable in specie on demand, and its notes were to be kept at par with specie by the federal government’s accepting its notes in taxes—giving it a quasi-legal tender status. Also, the federal government would confer upon the Bank the prestige of being depository for its public funds.

In accordance with Hamilton’s wishes, Congress quickly established the First Bank of the United States in February 1791. The charter of the Bank was for 20 years, and it was assured a monopoly of the privilege of having a national charter during that period. In a significant gesture of continuity with the Bank of North America, the latter’s long-time president and former partner of Robert Morris, Thomas Willing of Philadelphia, was made president of the new Bank of the United States.

The Bank of the United States promptly fulfilled its inflationary potential by issuing millions of dollars in paper money and demand deposits, pyramiding on top of \$2 million in specie. The Bank of the

³² On the complex workings of fractional as against dollar coins in this period, see the excellent article by David A. Martin, “Bimetallism in the United States before 1850,” *Journal of Political Economy* 76 (May-June 1968): 428-434.

United States invested heavily in loans to the United States government. In addition to \$2 million invested in the assumption of preexisting long-term debt assumed by the new federal government, the Bank of the United States engaged in massive temporary lending to the government, which reached \$6.2 million by 1796.³³ The result of the outpouring of credit and paper money by the new Bank of the United States was an inflationary rise in prices. Thus, wholesale prices rose from an index of 85 in 1791 to a peak of 146 in 1796, an increase of 72 percent.³⁴ In addition, speculation boomed in government securities and real estate values were driven upward.³⁵ Pyramiding on top of the Bank of the United States expansion and aggravating the paper money expansion and the inflation was a flood of newly created commercial banks. Whereas there were only three commercial banks before the founding of the United States, and only four by the establishment of the Bank of the United States, eight new banks were founded shortly thereafter, in 1791 and 1792, and 10 more by 1796. Thus, the Bank of the United States and its monetary expansion spurred the creation of 18 new banks in five years.³⁶

The establishment of the Bank of the United States precipitated a grave constitutional argument, the Jeffersonians arguing that the Constitution gave the federal government no power to establish a bank. Hamilton, in turn, paved the way for virtually unlimited expansion of federal power by maintaining that the Constitution “implied” a grant of power for carrying out vague national goals. The Hamiltonian interpretation won out officially in the decision of

³³ Schultz and Caine are severely critical of these operations: “In indebting itself heavily to the Bank of the United States, the Federal Government was obviously misusing its privileges and seriously endangering the Bank’s stability.” They also charged that “the Federalists had saddled the government with a military and interest budget that threatened to topple the structure of federal finances. Despite the addition of tax after tax to the revenue system, the Federal Government’s receipts through the decade of the 90’s were barely able to cling to the skirts of its expenditures.” William J. Schultz and M.R. Caine, “Federalist Finance,” in G.R. Taylor, ed. *Hamilton and the National Debt* (Boston: D.C. Heath and Co., 1950), pp. 6-7.

³⁴ Similar movements occurred in wholesale prices in Philadelphia, Charleston, and the Ohio River Valley. U.S. Department of Commerce, *Historical Statistics of the United States, Colonial Times to 1957* (Washington, D.C.: Government Printing Office, 1960), pp. 116, 119-121.

Supreme Court Justice John Marshall in *McCulloch v. Maryland* (1819).³⁷

Despite the Jeffersonian hostility to commercial and central banks, the Democratic-Republicans, under the control of quasi-Federalist moderates rather than militant Old Republicans, made no move to repeal the charter of the Bank of the United States before its expiration in 1811 and happily multiplied the number of state banks and bank credit in the next two decades.³⁸ Thus, in 1800 there were 28 state banks; by 1811, the number had escalated to 117, a fourfold increase. In 1804, there were 64 state banks, of which we have data on 13, or 20 percent of the banks. These reporting banks had \$0.98 million in specie, as against notes and demand deposits outstanding of \$2.82 million, a reserve ratio of .35 (or, a notes + deposits pyramiding on top of specie of 2.88:1). By 1811, 26 percent of the 117 banks reported a total of \$2.57 million; but the two-and-a-half fold increase in specie was more than matched by an emission of \$10.95 million of notes and deposits, a nearly fourfold increase. This constituted a pyramiding of 4.26:1 on top of specie, or a reserve ratio of these banks of .23.³⁹

As for the Bank of the United States, which acted in conjunction with the federal government and with the state banks, in January 1811 it had specie assets of \$5.01 million, and notes and deposits outstanding of \$12.87 million, a pyramid ratio of 2.57:1, or a reserve ratio of .39.⁴⁰

Finally, when the time for rechartering the Bank of the United States came in 1811, the recharter bill was defeated by one vote each in the House and Senate. Recharter was fought for by the Madison

³⁷ Marshall, a disciple of Hamilton, repeated some of Hamilton's arguments virtually word for word in the decision. See Gerald T. Dunne, *Monetary Decisions of the Supreme Court* (New Brunswick, N.J.: Rutgers University Press, 1960), p. 30.

³⁸ On the quasi-Federalists as opposed to the Old Republicans, on banking and on other issues, see Richard E. Ellis, *The Jeffersonian Crisis: Courts and Politics in the Young Republic* (New York: Oxford University Press, 1971), p. 277 and *passim*.

³⁹ Van Fenstermaker notes that there has been a tendency of historians to believe that virtually all bank emissions were in the form of notes, but that actually a large portion was in the form of demand deposits. Thus, in 1804, bank liabilities were \$1.70 million in notes and \$1.12 million in deposits; in 1811 they were \$5.68 million and \$5.27 respectively. He points out that deposits exceeded notes in the large cities such as Boston and Philadelphia, sometimes by two or threefold, whereas bank notes were used far more widely in rural areas for hand-to-hand transactions. Van Fenstermaker, "Statistics," pp. 406-411.

⁴⁰ Of Bank of the United States liabilities, bank notes totaled \$5.04 million and demand deposits \$7.83 million. John Jay Knox, *A History of Banking in the United States* (New York: Bradford Rhodes & Co., 1900), p. 39. There are no other reports for the Bank of the United States extant except for 1809. The others were destroyed by fire. John Thorn Holdsworth, *The First Bank of the United States* (Washington, D.C.: National Monetary Commission, 1910), pp. 111ff., 138-144.

administration aided by nearly all the Federalists in Congress, but was narrowly defeated by the bulk of the Democratic-Republicans, including the hard-money Old Republican forces. In view of the widely held misconception among historians that Central Banks serve, and are looked upon, as restraints upon state or private bank inflation, it is instructive to note that the major forces in favor of recharter were merchants, chambers of commerce, and most of the state banks. Merchants found that the Bank had expended credit at cheap rates and had eased the eternal complaint about a “scarcity of money.” Even more suggestive is the support of the state banks, which hailed the Bank as “advantageous” and worried about the contraction of credit if the Bank were forced to liquidate. The Bank of New York, which had been founded by Alexander Hamilton, in fact lauded the Bank of the United States because it had been able “in case of any sudden pressure upon the merchants to step forward to their aid in a degree which the state institutions were unable to do.”⁴¹

The War of 1812 and Its Aftermath

War has generally had grave and fateful consequences for the American monetary and financial system. We have seen that the Revolutionary War occasioned a mass of depreciated fiat paper, worthless Continentals, a huge public debt, and the beginnings of central banking in the Bank of North America. The Hamiltonian financial system, and even the Constitution itself, was in large part shaped by the Federalist desire to fund the federal and state public debt via federal taxation, and a major reason for the establishment of the First Bank of the United States was to contribute to the funding of the newly assumed federal debt. The Constitutional prohibition against state paper money, and the implicit rebuff to all fiat paper were certainly influenced by the Revolutionary War experience.

The War of 1812-15 had momentous consequences for the monetary system. An enormous expansion in the number of banks and in bank notes and deposits was spurred by the dictates of war finance. New England banks were more conservative than in other regions, and the region was strongly opposed to the war with England, so little public debt was purchased in New England. Yet imported goods, textile manufactures, and munitions had to be purchased in that region by the federal government. The government

⁴¹ Holdsworth, *First Bank*, p. 83. Also see *ibid.*, pp. 83-90. Holdsworth, the premier historian of the First Bank of the United States, saw the overwhelming support by the state banks, but still inconsistently clung to the myth that the Bank of the United States functioned as a restraint on their expansion: “The state banks, *though their note issues and discounts had been kept in check by the superior resources and power of the Bank of the United States*, favored the extension of the charter, and memorialized Congress to that effect.” (italics added) *Ibid.*, p. 90.

therefore encouraged the formation of new and recklessly inflationary banks in the Mid-Atlantic, Southern, and Western states, which printed huge quantities of new notes to purchase government bonds. The federal government thereupon used these notes to purchase manufactured goods in New England.

Thus, from 1811 to 1815 the number of banks in the country increased from 117 to 212; in addition, there had sprung up 35 private unincorporated banks, which were illegal in most states but were allowed to function under war conditions. Specie in the 30 reporting banks, 26 percent of the total number of 1811, amounted to \$2.57 million in 1811; this figure had risen to \$5.40 million in the 98 reporting banks in 1815, or 40 percent of the total. Notes and deposits, on the other hand, were \$10.95 million in 1811 and had increased to \$31.6 million in 1815 among the reporting banks.

If we make the heroic assumption that we can estimate the money supply for the country by multiplying by the proportion of unreported banks and we then add in the BUS totals for 1811, specie in all banks would total \$14.9 million in 1811 and \$13.5 million in 1815, or a 9.4 percent decrease. On the other hand, total bank notes and deposits aggregated to \$42.2 million in 1811, and \$79.0 million four years later, so that an increase of 87.2 percent, pyramided on top of a 9.4 percent decline in specie. If we factor in the Bank of the United States, then, the bank pyramid ratio was 3.70:1 and the reserve ratio .27 in 1811; while the pyramid ratio four years later was 5.85:1 and the reserve ratio .17.

But the aggregates scarcely tell the whole story since, as we have seen, the expansion took place solely outside of New England, while New England banks continued on their relatively sound basis and did not inflate their credit. The record expansion of the number of banks was in Pennsylvania, which incorporated no less than 41 new banks in the month of March 1814, contrasting to only four banks which had existed in that state—all in Philadelphia—until that date. It is instructive to compare the pyramid ratios of banks in various reporting states in 1815: only 1.96:1 in Massachusetts, 2.7:1 in New Hampshire, and 2.42:1 in Rhode Island, as contrasted to 19.2:1 in Pennsylvania, 18.46:1 in South Carolina, and 18.73:1 in Virginia.⁴²

This monetary situation meant that the United States government was paying for New England manufactured goods with a mass of inflated bank paper outside the region. Soon, as the New

⁴² Van Fenstermaker, "Statistics," pp. 401-409. For the list of individual incorporated banks, see Van Fenstermaker, "Development," pp. 112-183, with Pennsylvania on pp. 169-173.

England banks called upon the other banks to redeem their notes in specie, the mass of inflating banks faced imminent insolvency.

It was at this point that a fateful decision was made by the U.S. government and concurred in by the governments of the states outside New England. As the banks all faced failure, the governments, in August 1814, permitted all of them to suspend specie payments—that is to stop all redemption of notes and deposits in gold or silver—and yet to continue in operation. In short, in one of the most flagrant violations of property rights in American history, the banks were permitted to waive their contractual obligations to pay in specie while they themselves could expand their loans and operations and force their own debtors to repay their loans as usual.

Indeed, the number of banks, and bank credit, expanded rapidly during 1815 as a result of this governmental *carte blanche*. It was precisely during 1815 when virtually all the private banks sprang up, the number of banks increasing in one year from 208 to 246. Reporting banks increased their pyramid ratios from 3.17:1 in 1814 to 5.85:1 the following year, a drop of reserve ratios from .32 to .17. Thus, if we measure bank expansion by pyramiding and reserve ratios, we see that a major inflationary impetus during the War of 1812 came during the year 1815 after specie payments had been suspended throughout the country by government action.

Historians dedicated to the notion that central banks restrain state or private bank inflation have placed the blame for the multiplicity of banks and bank credit inflation during the War of 1812 on the absence of a central bank. But as we have seen, both the number of banks and bank credit grew apace during the period of the First BUS, pyramiding on top of the latter's expansion, and would continue to do so under the Second Bank, and, for that matter, the Federal Reserve System in later years. And the federal government, not the state banks themselves, is largely to blame for encouraging new, inflated banks to monetize the war debt. Then, in particular, it allowed them to suspend specie payment in August 1814, and to continue that suspension for two years after the war was over, until February 1817. Thus, for two and a half years banks were permitted to operate and expand while issuing what was tantamount to fiat paper and bank deposits.

Another neglected responsibility of the U.S. government for the wartime inflation was its massive issue of treasury notes to help finance the war effort. While this treasury paper was interest-bearing and was redeemable in specie in one year, the cumulative amount outstanding functioned as money, as they were used in transactions among the public and were also employed as reserves or "high-

powered money” by the expanding banks. The fact that the government received the treasury notes for all debts and taxes gave the notes a quasi-legal tender status. Most of the treasury notes were issued in 1814 and 1815, when their outstanding total reached \$10.65 million and \$15.46 million respectively. Not only did the treasury notes fuel the bank inflation, but their quasi-legal tender status brought Gresham’s Law into operation and specie flowed out of the banks and public circulation outside of New England, and into New England and out of the country.⁴³

The expansion of bank money and treasury notes during the war drove up prices in the United States. Wholesale price increases from 1811 to 1815 averaged 35 percent, with different cities experiencing a price inflation ranging from 28 percent to 55 percent. Since foreign trade was cut off by the war, prices of imported commodities rose far more, averaging 70 percent.⁴⁴ But more important than this inflation, and at least as important as the wreckage of the monetary system during and after the war, was the precedent that the two-and-a-half year-long suspension of specie payment set for the banking system for the future. From then on, every time there was a banking crisis brought on by inflationary expansion and demands for redemption in specie, state and federal governments looked the other way and permitted general suspension of specie payments while bank operations continued to flourish. It thus became clear to the banks that in a general crisis they would not be required to meet the ordinary obligations of contract law or of respect for property rights, so their inflationary expansion was permanently encouraged by this massive failure of government to fulfill its obligation to enforce contracts and defend the rights of property.

Suspensions of specie payments informally or officially permeated the economy outside of New England during the Panic of 1819, occurred everywhere outside of New England in 1837, and in all states south and west of New Jersey in 1839. A general suspension of specie payments occurred throughout the country once again in the panic of 1857.⁴⁵

⁴³ For a perceptive discussion of the nature and consequences of treasury note issue in this period, see Richard H. Timberlake, Jr., *The Origins of Central Banking in the United States* (Cambridge: Harvard University Press, 1978), pp. 13-18. The Gresham Law effect probably accounts for the startling decline of specie held by the reporting banks, from \$9.3 million to \$5.4 million, from 1814 to 1815. Van Fenstermaker, “Statistics,” p. 405.

⁴⁴ *Historical Statistics*, pp. 115-124; Murray N. Rothbard, *The Panic of 1819: Reactions and Policies* (New York: Columbia University Press, 1962), p. 4.

⁴⁵ On the suspensions of specie payments, and on their importance before the Civil War, see Vera C. Smith, *The Rationale of Central Banking* (London: P.S. King & Son, 1936), pp. 38—46. Also see Dunne, *Monetary Decisions*, p. 26.

It is important to realize, then, in evaluating the American banking system before the Civil War, that even in the later years when there was no central bank, the system was not “free” in any proper economic sense. “Free” banking can only refer to a system in which banks are treated as any other business, and that therefore failure to obey contractual obligations—in this case, prompt redemption of notes and deposits in specie—must incur immediate insolvency and liquidation. Burdened by the tradition of allowing general suspensions that arose in the United States in 1814, the pre-Civil War banking system, despite strong elements of competition when not saddled with a central bank, must rather be termed in the phrase of one economist, as “Decentralization without Freedom.”⁴⁶

From the 1814-17 experience on, the notes of state banks circulated at varying rates of depreciation, depending on public expectations of how long they would be able to keep redeeming their obligations in specie. These expectations, in turn, were heavily influenced by the amount of notes and deposits issued by the bank as compared with the amount of specie held in its vaults.

In that era of poor communications and high transportation cost, the tendency for a bank note was to depreciate in proportion to its distance from the home office. One effective, if time-consuming, method of enforcing redemption on nominally specie-paying banks was the emergence of a class of professional “money brokers.” These brokers would buy up a mass of depreciated notes of nominally specie-paying banks, and then travel to the home office of the bank to demand redemption in specie. Merchants, money brokers, bankers, and the general public were aided in evaluating the various state bank notes by the development of monthly journals known as “bank note detectors.” These “detectors” were published by money brokers

⁴⁶ Smith, *Rationale*, p. 36. Smith properly defines “free banking” as “a regime where note-issuing banks are allowed to set up in the same way as any other type of business enterprise, so long as they comply with the general company law. The requirement for their establishment is not special conditional authorization from a government authority, but the ability to raise sufficient capital, and public confidence, to gain acceptance for their notes and ensure the profitability of the undertaking. Under such a system all banks would not only be allowed the same rights, but would also be subjected to the same responsibilities as other business enterprises. If they failed to meet their obligations they would be declared bankrupt and put into liquidation, and their assets used to meet the claims of their creditors, in which case the shareholders would lose the whole or part of their capital, and the penalty for failure would be paid, at least for the most part, by those responsible for the policy of the bank. Notes issued under this system would be ‘promises to pay,’ and such obligations must be met on demand in the generally accepted medium which we will assume to be gold. No bank would have the right to call on the government or on any other institution for special help in time of need. ... A general abandonment of the gold standard is inconceivable under these conditions, and with a strict interpretation of the bankruptcy laws any bank suspending payments would at once be put into the hands of a receiver.” *Ibid.*, pp. 148-149.

and periodically evaluated the market rate of various bank notes in relation to specie.⁴⁷

“Wildcat” banks were so named because in that age of poor transportation, banks hoping to inflate and not worry about redemption attempted to locate in “wildcat” country where money brokers would find it difficult to travel. It should be noted that if it were not for periodic suspension, there would have been no room for wildcat banks or for varying degrees of lack of confidence in the genuineness of specie redemption at any given time.

It can be imagined that the advent of the money broker was not precisely welcomed in the town of an errant bank, and it was easy for the townspeople to blame the resulting collapse of bank credit on the sinister stranger rather than on the friendly neighborhood banker. During the panic of 1819, when banks collapsed after an inflationary boom lasting until 1817, obstacles and intimidation were often the lot of those who attempted to press the banks to fulfill their contractual obligation to pay in specie.

Thus, Maryland and Pennsylvania, during the panic of 1819, engaged in almost bizarre inconsistency in this area. Maryland, on February 15, 1819, enacted a law “to compel ... banks to pay specie for their notes, or forfeit their charters.” Yet two days after this seemingly tough action, it passed another law relieving banks of any obligation to redeem notes held by money brokers, “the major force ensuring the people of this state from the evil arising from the demands made on the banks of this state for gold and silver by brokers.” Pennsylvania followed suit a month later. In this way, these states could claim to maintain the virtue of enforcing contract and property rights while moving to prevent the most effective method of ensuring such enforcement.

During the 1814-1817 general suspension, noteholders who sued for specie payment seldom gained satisfaction in the courts. Thus, Isaac Bronson, a prominent Connecticut banker in a specie-paying region, sued various New York banks for payment of notes in specie. He failed to get satisfaction, and for his pains received only abuse in the New York press as an agent of “misery and ruin.”⁴⁸

The banks south of Virginia largely went off specie payment during the panic of 1819, and in Georgia at least general suspension

⁴⁷ See Richard H. Timberlake, Jr., *Money, Banking and Central Banking* (New York: Harper & Row, 1965), p. 94.

⁴⁸ Hammond, *Banks and Politics*, p. 179-180. Even before the suspension, in 1808, a Bostonian named Hireh Durkee who attempted to demand specie for \$9,000 in notes of the state-owned Vermont State Bank, was met by an indictment for an attempt by this “evil-disposed person” to “realize a filthy gain” at the expense of the resources of the state of Vermont and the ability of “good citizens thereof to obtain money.” *Ibid.*, p. 179. Also see Gouge, *Short History*, p. 84.

continued almost continuously down to the 1830s. One customer complained during 1819 that in order to collect in specie from the largely state-owned Bank of Darien, Georgia, he was forced to swear before a justice of the peace in the bank that each and every note he presented to the bank was his own and that he was not a money broker or an agent for anyone else; he was forced to swear to the oath in the presence of at least five bank directors and the bank's cashier; and he was forced to pay a fee of \$1.36 on each note in order to acquire specie on demand. Two years later, when a noteholder demanded \$30,000 in specie at the Planters' Bank of Georgia, he was told he would be paid in pennies only, while another customer was forced to accept pennies handed out to him at the rate of \$60 a day.⁴⁹

During the panic, North Carolina and Maryland in particular moved against the money brokers in a vain attempt to prop up the depreciated notes of their states' banks. In North Carolina, banks were not penalized by the legislature for suspending specie payments to "brokers," while maintaining them to others. Backed by government, the three leading banks of the state met and agreed, in June 1819, not to pay specie to brokers or their agents. Their notes immediately fell to a 15 percent discount outside the state. However, the banks continued to require—ignoring the inconsistency—that their own debtors pay them at par in specie. Maryland, during the same year, moved to require a license of \$500 per year for money brokers, in addition to an enormous \$20,000 bond to establish the business.

Maryland tried to bolster the defense of banks and the attack on brokers by passing a compulsory par law in 1819, prohibiting the exchange of specie for Maryland bank notes at less than par. The law was readily evaded, however, the penalty merely adding to the discount as compensation for the added risk. Specie furthermore was driven out of the state by the operation of Gresham's Law.⁵⁰

In Kentucky, Tennessee, and Missouri, stay laws were passed requiring creditors to accept depreciated and inconvertible bank paper in payment of debts, else suffer a stay of execution of the debt. In this way, quasi-legal tender status was conferred on the paper.⁵¹

⁴⁹ Gouge, *Short History*, pp. 141-142. Secretary of the Treasury William H. Crawford, a Georgia politician, tried in vain to save the Bank of Darien from failure by depositing Treasury funds there during the panic. Rothbard, *The Panic of 1819*, p. 62.

⁵⁰ Rothbard, *Panic of 1819*, pp. 64-68. Other compulsory par laws were passed by Ohio and Delaware.

⁵¹ The most extreme proposal was that of Tennessee politician Felix Grundy's scheme, never adopted, to compel creditors to accept bank notes of the state bank or forfeit the debt: that would have conferred full legal tender status on the bank. Rothbard, *Panic of 1819*, p. 91;

Many states permitted banks to suspend specie payment, and four Western states—Tennessee, Kentucky, Missouri, and Illinois—established state-owned banks to try to overcome the depression by issuing large issues of inconvertible paper money. In all states trying to prop up inconvertible bank paper, a quasi-legal status was also conferred on the paper by agreeing to receive the notes in taxes or debts due to the state. The result of all the inconvertible paper schemes was rapid and massive depreciation, disappearance of specie, succeeded by speedy liquidation of the new state-owned banks.⁵²

An amusing footnote on the problem of banks being protected against their contractual obligations to pay in specie occurred in the course of correspondence between one of the earliest economists in America, the young Philadelphia State Senator Condé Raguey, and the eminent English economist David Ricardo. Ricardo had evidently been bewildered by Raguey's statement that banks technically required to pay in specie were often not called upon to do so. On April 18, 1821, Raguey replied, explaining the power of banks in the United States:

You state in your letter that you find it difficult to comprehend, why persons who had a right to demand coin from the Banks in payment of their notes, so long forebore to exercise it. This no doubt appears paradoxical to one who resides in a country where an act of parliament was necessary to protect a bank, but the difficulty is easily solved. The whole of our population are either stockholders of banks or in debt to them. It is not the *interest* of the first to press the banks and the rest are *afraid*. This is the whole secret. An independent man who was neither a stockholder or debtor, who would have ventured to compel the banks to do justice, would have been persecuted as an enemy of society. ...⁵³

The Second Bank of the United States, 1816-1833

The United States emerged from the War of 1812 in a chaotic monetary state, with banks multiplying and inflating ad lib, checked only by the varying rates of depreciation of their notes. With banks freed from redeeming their obligations in specie, the number of

Joseph H. Parks, "Felix Grundy and the Depression of 1819 in Tennessee," *Publications of the East Tennessee Historical Society* X (1938): 22.

⁵² Only New England, New York, New Jersey, Virginia, Mississippi, and Louisiana were comparatively untouched by the inconvertible paper contagion, either in the form of suspended specie banks continuing in operation or new state-owned banks emitting more paper. For an analysis of the events and controversies in each state, see Rothbard, *Panic of 1819*, pp. 57-111.

⁵³ Raguey to Ricardo, April 18, 1821, in David Ricardo, *Minor Papers on the Currency Question, 1809-23*, J. Hollander, ed. (Baltimore: Johns Hopkins Press, 1932), pp. 199-201; Rothbard, *Panic of 1819*, pp. 10-11. Also see Hammond, *Banks and Politics*, p. 242.

incorporated banks increased during 1816, from 212 to 232.⁵⁴ Clearly, the nation could not continue indefinitely with the issue of fiat money in the hands of discordant sets of individual banks. It was apparent that there were two ways out of the problem: one was the hard-money path, advocated by the Old Republicans and, for their own purposes, the Federalists. The federal and state governments would have sternly compelled the rollicking banks to redeem promptly in specie, and, when most of the banks outside of New England could not, to force them to liquidate. In that way, the mass of depreciated and inflated notes and deposits would have been swiftly liquidated, and specie would have poured back out of hoards and into the country to supply a circulating medium. The inflationary experience would have been over.

Instead, the Democratic-Republican establishment in 1816 turned to the old Federalist path: a new central bank, a Second Bank of the United States. Modeled closely after the First Bank, the Second Bank, a private corporation with one-fifth of the shares owned by the federal government, was to create a national paper currency, purchase a large chunk of the public debt, and receive deposits of Treasury funds. The BUS notes and deposits were to be redeemable in specie, and they were given quasi-legal tender status by the federal government's receiving them in payment of taxes.

That the purpose of establishing the BUS was to support the state banks in their inflationary course rather than crack down on them is seen by the shameful deal that the BUS made with the state banks as soon as it opened its doors in January 1817. At the same time it was establishing the BUS in April 1816, Congress passed the resolution of Daniel Webster, at that time a Federalist champion of hard money, requiring that after February 20, 1817, the United States should accept in payments for debts or taxes only specie, Treasury notes, BUS notes, or state bank notes redeemable in specie on demand. In short, no irredeemable state bank notes would be accepted after that date. Instead of using the opportunity to compel the banks to redeem, however, the BUS, in a meeting with representatives from the leading urban banks, excluding Boston, agreed to issue \$6 million worth of credit in New York, Philadelphia, Baltimore, and Virginia before insisting on specie payments from debts due to it from the state banks. In return for that agreed-upon massive inflation, the state banks graciously consented to resume

⁵⁴ New note issue series by banks reached a heavy peak in 1815 and 1816 in New York and Pennsylvania. D.C. Wismar, *Pennsylvania Descriptive List of Obsolete State Bank Notes, 1782-1866* (Frederick, Md.: J.W. Stovell Printing Co., 1933); and idem, *New York Descriptive List of Obsolete Paper Money* (Frederick, Md.: J.W. Stovell Printing Co., 1931).

specie payments.⁵⁵ Moreover, the BUS and the state banks agreed to mutually support each other in any emergency, which of course meant in practice that the far stronger BUS was committed to the propping up of the weaker state banks.

The BUS was pushed through Congress by the Madison administration and particularly by Secretary of the Treasury Alexander J. Dallas, whose appointment was lobbied for, for that purpose. Dallas, a wealthy Philadelphia lawyer, was a close friend, counsel, and financial associate of Philadelphia merchant and banker Stephen Girard, reputedly one of the two wealthiest men in the country. Toward the end of its term, Girard was the largest stockholder of the first BUS, and during the War of 1812 Girard became a very heavy investor in the war debt of the federal government. Both as a prospective large stockholder and as a way to unload his public debt, Girard began to agitate for a new BUS. Dallas's appointment as Secretary of Treasury in 1814 was successfully engineered by Dallas and his close friend, wealthy New York merchant and fur trader John Jacob Astor, also a heavy investor in the war debt. When the BUS was established, Stephen Girard purchased the \$3 million of the \$28 million that remained unsubscribed, and he and Dallas managed to secure for the post of president of the new bank their good friend William Jones, former Philadelphia merchant.⁵⁶

Much of the opposition to the founding of the BUS seems keenly prophetic. Thus, Senator William H. Wells, Federalist from Delaware, in arguing against the Bank bill, said that it was "ostensibly for the purpose of correcting the diseased state of our paper currency by restraining and curtailing the overissue of bank paper, and yet it came prepared to inflict upon us the same evil, being itself nothing more than simply a paper-making machine."⁵⁷ In fact, the result of the deal with the state banks was that their resumption of specie payments after 1817 was more nominal than real, thereby setting the

⁵⁵ On the establishment of the BUS and on the deal with the state banks, see Ralph C.H. Catterall, *The Second Bank of the United States* (Chicago: University of Chicago Press, 1902), pp. 9-26, 479-490. Also see Hammond, *Banks and Politics*, pp. 230-248; David R. Dewey, *The Second United States Bank* (Washington, D.C.: National Monetary Commission, 1910), pp. 148-176.

⁵⁶ On the Girard-Dallas connection, see Hammond, *Banks and Politics*, pp. 231-246, 252; Philip H. Burch, Jr., *Elites in American History, Vol. I The Federalist Years to the Civil War* (New York: Holmes & Meier, 1981), pp. 88, 97, 116-117, 119-121; Kenneth L. Brown, "Stephen Girard, Promoter of the Second Bank of the United States." *Journal of Economic History*, November 1942, pp. 125-132.

⁵⁷ *Annals of Congress*, 14 Cong., 1 sess., April 1, 1816, pp. 267-270. Also see *ibid.*, pp. 1066, 1091, 1110ff. Cited in Murray N. Rothbard, *The Case for a 100 Percent Gold Dollar* (Washington, D.C.: Libertarian Review Press, 1974), p. 18n. Also see Gouge, *Short History*, pp. 79-83.

stage for the widespread suspensions of the 1819-21 depression. As Bray Hammond writes:

...specie payments were resumed, with substantial shortcomings. Apparently the situation was better than it had been, and a pretense was maintained of its being better than it was. But redemption was not certain and universal; there was still a premium on specie and still a discount on bank notes, with considerable variation in both from place to place. Three years later, February 1820, Secretary [of the Treasury] Crawford reported to Congress that during the greater part of the time that had elapsed since the resumption of specie payments, the convertibility of bank notes into specie had been nominal rather than real in the largest portion of the Union.⁵⁸

One problem is that the BUS lacked the courage to insist on payment of its notes from the state banks. As a result, state banks had large balances piled up against them at the BUS, totaling over \$2.4 million during 1817 and 1818, remaining on the books as virtual interest-free loans. As Catterall points out, “so many influential people were interested in the [state banks] as stockholders that it was not advisable to give offense by demanding payment in specie, and borrowers were anxious to keep the banks in the humor to lend.” When the BUS did try to collect on state bank notes in specie, President Jones reported, “the banks, our debtors, plead inability, require unreasonable indulgence, or treat our reiterated claims and expostulations with settled indifference.”⁵⁹

From its inception, the Second BUS launched a spectacular inflation of money and credit. Lax about insisting on the required payment of its capital in specie, the Bank failed to raise the \$7 million legally supposed to have been subscribed in specie; instead, during 1817 and 1818, its specie held never rose above \$2.5 million. At the peak of its initial expansion, in July 1818, BUS specie totaled \$2.36 million, and its aggregate notes and deposits totaled \$21.8 million. Thus, in a scant year-and-a-half of operation, the BUS had added a net of \$19.2 million to the nation's money supply, for a pyramid ratio of 9.24, or a reserve ratio of .11.

⁵⁸ Hammond, *Banks and Politics*, p. 248. Also see Condé Raguet, *A Treatise on Currency and Banking* (2nd ed., 1840, New York: Augustus M. Kelley, 1967), pp. 302-303; Catterall, *Second Bank*, pp. 37-39; Walter Buckingham Smith, *Economic Aspects of the Second Bank of the United States* (Cambridge: Harvard University Press, 1953), p. 104.

⁵⁹ Catterall, *Second Bank*, p. 36.

Outright fraud abounded at the BUS, especially at the Philadelphia and Baltimore branches, particularly the latter. It is no accident that three-fifths of all of the BUS loans were made at these two branches.⁶⁰ Also, the BUS attempt to provide a uniform currency throughout the nation floundered on the fact that the western and southern branches could inflate credit and bank notes and that the inflated notes would wend their way to the more conservative branches in New York and Boston, which would be obligated to redeem the inflated notes at par. In this way, the conservative branches were stripped of specie while the western branches could continue to inflate unchecked.⁶¹

The expansionary operations of the BUS, coupled with its laxity toward insisting on specie payment by the state banks, impelled a further inflationary expansion of state banks on top of the spectacular enlargement of the central bank. Thus, the number of incorporated state banks rose from 232 in 1816 to 338 in 1818. Kentucky alone chartered 40 new banks in the 1817-18 legislative session. The estimated total money supply in the nation rose from \$67.3 million in 1816 to \$94.7 million in 1818, a rise of 40.7% in two years. Most of this increase was supplied by the BUS.⁶²

The huge expansion of money and credit impelled a full-scale inflationary boom throughout the country. Import prices had fallen in 1815, with the renewal of foreign trade after the war, but domestic prices were another story. Thus, the index of export staples in Charleston rose from 102 in 1815 to 160 in 1818; the prices of Louisiana staples at New Orleans rose from 178 to 224 in the same period. Other parts of the economy boomed; exports rose from \$81 million in 1815 to a peak of \$116 million in 1818. Prices rose greatly in real estate, land, farm improvement projects, and slaves, much of it fueled by the use of bank credit for speculation in urban and rural real estate. There was a boom in turnpike construction, furthered by

⁶⁰ On the expansion and fraud at the BUS, see Catterall, *Second Bank*, pp. 28-50, 503. The main culprits were James A. Buchanan, president of the Baltimore mercantile firm of Smith & Buchanan, and the Baltimore BUS cashier James W. McCulloch, who was simply an impoverished clerk at the mercantile house. Smith, an ex-Federalist, was a senator from Maryland and a powerful member of the national Democrat-Republican establishment.

⁶¹ As a result of the contractionary influence on the Boston branch of the BUS, the notes of the Massachusetts banks actually declined in this period, from \$1 million in June 1815 to \$850,000 in June 1818. See Rothbard, *Panic of 1819*, p. 8.

⁶² Total notes and deposits of 39 percent of the nation's reporting state banks was \$26.3 million in 1816, while 38 percent of the banks had total notes and deposits of \$27.7 million two years later. Converting this pro rata to 100 percent of the banks gives an estimated \$67.3 million in 1816, and \$72.9 million in 1818. Add to the latter figure \$21.8 million for BUS notes and deposits, and this yields \$94.7 million in 1818, or a 40.7 percent increase. Adapted from tables in Van Fenstermaker, "Statistics," pp. 401, 405, 406.

vast federal expenditures on turnpikes. Freight rates rose on steamboats, and shipbuilding shared in the general prosperity. Also, general boom conditions expanded stock trading so rapidly that traders, who had been buying and selling stocks on the curbs on Wall Street for nearly a century, found it necessary to open the first indoor stock exchange in the country, the New York Stock Exchange, in March 1817. Also, investment banking began in the United States during this boom period.⁶³

Starting in July 1818, the government and the BUS began to see what dire straits they were in; the enormous inflation of money and credit, aggravated by the massive fraud, had put the BUS in real danger of going under and illegally failing to sustain specie payments. Over the next year, the BUS began a series of heroic contractions, forced curtailment of loans, contractions of credit in the south and west, refusal to provide uniform national currency by redeeming its shaky branch notes at par, and seriously enforcing the requirement that its debtor banks redeem in specie. In addition, it purchased millions of dollars of specie from abroad. These heroic actions, along with the ouster of President William Jones, managed to save the BUS, but the massive contraction of money and credit swiftly brought the United States its first widespread economic and financial depression. The first nationwide “boom-bust” cycle had arrived in the United States, impelled by rapid and massive inflation, quickly succeeded by contraction of money and credit. Banks failed, and private banks curtailed their credits and liabilities and suspended specie payments in most parts of the country.

Contraction of money and credit by the BUS was almost unbelievable, total notes and deposits falling from \$21.9 million in June 1818 to \$11.5 million only a year later. The money supply contributed by the BUS was thereby contracted by no less than 47.2 percent in one year. The number of incorporated banks at first remained the same, and then fell rapidly from 1819 to 1822, falling from 341 in mid-1819 to 267 three years later. Total notes and deposits of state banks fell from an estimated \$72.0 million in mid-1818 to \$62.7 million a year later, a drop of 14.0 percent in one year. If we add in the fact that the U.S. Treasury contracted total treasury notes from \$8.81 million to zero during this period, we get the

⁶³ Rothbard, *Panic of 1819*, pp. 6-10; *Historical Statistics*, pp. 120, 122, 563. Also see George Rogers Taylor, *The Transportation Revolution, 1815-1860* (New York: Rinehart & Co., 1951), pp. 334-336.

following estimated total money supply: in 1818, \$103.5 million; in 1819, \$74.2 million, a contraction in one year of 28.3 percent.⁶⁴

The result of the contraction was a massive rash of defaults, bankruptcies of business and manufacturers, and liquidation of unsound investments during the boom. There was a vast drop in real estate values and rents and in the prices of freight rates and of slaves. Public land sales dropped greatly as a result of the contraction, declining from \$13.6 million in 1818 to \$1.7 million in 1820.⁶⁵ Prices in general plummeted: The index of export staples fell from 158 in November 1818 to 77 in June 1819, an annualized drop of 87.9 percent during those seven months. South Carolina export staples dropped from 160 to 96 from 1818 to 1819, and commodity prices in New Orleans dropped from 200 in 1818 to 119 two years later.

Falling money incomes led to a precipitous drop in imports, which fell from \$122 million in 1818 to \$87 million the year later. Imports from Great Britain fell from \$43 million in 1818 to \$14 million in 1820, and cotton and woolen imports from Britain fell from over \$14 million each in the former year to about \$5 million in the latter. The great fall in prices aggravated the burden of money debts, reinforced by the contraction of credit. Bankruptcies abounded, and one observer estimated that \$100 million of mercantile debts to Europe were liquidated by bankruptcy during the crisis. Western areas, shorn of money by the collapse of the previously swollen paper and debt, often returned to barter conditions, and grain and whiskey were used as media of exchange.⁶⁶

In the dramatic summing up of the hard-money economist and historian William Gouge, by its precipitous and dramatic contraction “the Bank was saved, and the people were ruined.”⁶⁷

The Jacksonian Movement and the Bank War

Out of the bitter experiences of the Panic of 1819 emerged the beginnings of the Jacksonian movement, dedicated to hard money, the eradication of fractional-reserve banking in general, and of the Bank of the United States in particular. Andrew Jackson himself, Senator Thomas Hart (“Old Bullion”) Benton of Missouri, future President James K. Polk of Tennessee, and Jacksonian economists

⁶⁴ These estimates are adapted from the tables in Van Fenstermaker, “Statistics,” pp. 401-406; Van Fenstermaker, *Development*, pp. 66-68. The data for 38 percent of incorporated banks in 1818, and for 54 percent in 1819, are converted pro rata to 100 percent figures. BUS figures are in Catterall, *Second Bank*, p. 502. On the contraction by the BUS see *ibid.*, pp. 51-72.

⁶⁵ On Treasury note contraction in this period, see Timberlake, *Origins*, pp. 21-26.

⁶⁶ See Rothbard, *Panic of 1819*, pp. 11-16.

⁶⁷ Gouge, *Short History*, p. 110.

Amos Kendall of Kentucky and Condy Raguet of Philadelphia, were all converted to hard money and 100 percent reserve banking by the experience of the Panic of 1819.⁶⁸ The Jacksonians adopted, or in some cases pioneered in, the Currency School analysis, which pinned the blame for boom-bust cycles on inflationary expansions followed by contractions of bank credit. Far from being the ignorant bumpkins that most historians have depicted, the Jacksonians were steeped in the knowledge of sound economics, particularly of the Ricardian Currency School.

Indeed, no movement in American politics has been as flagrantly misunderstood by historians as the Jacksonians. They were emphatically not, as historians until recently have depicted, either “ignorant anti-capitalist agrarians,” or “representatives of the rising entrepreneurial class,” or “tools of the inflationary state banks,” or embodiments of an early proletarian anti-capitalist movement or a non-ideological power group or “electoral machine.” The Jacksonians were libertarians, plain and simple. Their program and ideology were libertarian; they strongly favored free enterprise and free markets, but they just as strongly opposed special subsidies and monopoly privileges conveyed by government to business or to any other group. They favored absolutely minimal government, certainly at the federal level, but also at the state level. They believed that government should be confined to upholding the rights of private property. In the monetary sphere, this meant the separation of government from the banking system and a shift from inflationary paper money and fractional-reserve banking to pure specie and banks confined to 100 percent reserves.

In order to put this program into effect, however, the Jacksonians faced the grueling task of creating a new party out of what had become a one-party system after the War of 1812, in which the Democrat-Republicans had ended up adopting the Federalist program, including the reestablishing of the Bank of the United States. The new party, the Democratic Party, was largely forged in the mid-1820s by New York political leader, Martin Van Buren, newly converted by the aging Thomas Jefferson to the laissez-faire cause. Van Buren cemented an alliance with Thomas Hart Benton of Missouri and the Old Republicans of Virginia, but he needed a charismatic leader to take the Presidency away from Adams and what was becoming known as the National Republican Party. He found that leader in Andrew Jackson, who was elected President under the new Democratic banner in 1828.

⁶⁸ Rothbard, *Panic of 1819*, p. 188.

The Jacksonians eventually managed to put into effect various parts of their free-market and minimal-government economic program, including a drastic lowering of tariffs, and for the first and probably the last time in American history, paying off the federal debt. But their major concentration was on the issue of money and banking. Here they had a coherent program, which they proceeded to install in rapidly succeeding stages.

The first important step was to abolish central banking, in the Jacksonian view the major inflationary culprit. The object was not to eliminate the BUS in order to free the state banks for inflationary expansion, but, on the contrary, to eliminate the major source of inflation before proceeding, on the state level, to get rid of fractional reserve banking. The BUS charter was up for renewal in 1836, but Jackson denounced the Bank in his first annual message, in 1829. The imperious Nicholas Biddle,⁶⁹ head of the BUS, decided to precipitate a showdown with Jackson before his reelection effort, so Biddle filed for renewal early, in 1831. The host of National Republicans and non-Jacksonian Democrats proceeded to pass the recharter bill, but Jackson, in a dramatic message, vetoed the bill, and Congress failed to pass it over his veto.

Triumphantly reelected on the Bank issue in 1832, President Jackson lost no time in disestablishing the BUS as a central bank. The critical action came in 1833, when Jackson removed the public Treasury deposits from the BUS and placed them in a number of state banks (soon labeled as “pet banks”) throughout the country. The original number of pet banks was seven, but the Jacksonians were not interested in creating a privileged bank oligarchy to replace the previous monopoly; so the number of pet banks had increased to 91 by the end of 1836.⁷⁰ In that year, Biddle managed to secure a Pennsylvania charter for his bank, and the new United States Bank of Pennsylvania functioned as a much reduced but still influential state bank for a few years thereafter.

Orthodox historians have long maintained that by his reckless act of destroying the BUS and shifting government funds to the numerous pet banks, Andrew Jackson freed the state banks from the restraints imposed on them by a central bank. Thus, the banks were supposedly allowed to pyramid notes and deposits rashly on top of

⁶⁹ Biddle continued the chain of control over both BUSs by the Philadelphia financial elite, from Robert Morris and William Bingham, to Stephen Girard and William Jones. See Burch, *Elites*, p. 147. Also see Thomas P. Govan, *Nicholas Biddle: Nationalist and Public Banker, 1786-1844* (Chicago: University of Chicago Press, 1959), pp. 45, 74-75, 79.

⁷⁰ Hammond, *Banks and Politics*, p. 420.

existing specie and precipitate a wild inflation that was later succeeded by two bank panics and a disastrous deflation.

Recent historians, however, have totally reversed this conventional picture.⁷¹ In the first place, the record of bank inflation under the regime of the BUS was scarcely ideal. From the depth of the post-1819 depression in January 1820 to January 1823, under the regime of the conservative Langdon Cheves, the BUS increased its notes and deposits at an annual rate of 5.9 percent. The nation's total money supply remained about the same in that period. Under the far more inflationist regime of Nicholas Biddle, however, BUS notes and deposits rose, after January 1823, from \$12 million to \$42.1 million, an annual rate increase of 27.9 percent. As a consequence of this base of the banking pyramid inflating so sharply, the total money supply during this period vaulted from \$81 million to \$155 million, an annual increase of 10.2 percent. It is clear that the driving force for monetary expansion was the BUS, which acted as an inflationary rather than restraining force upon the state banks. Looking at the figures another way, the 1823 data represented a pyramid ratio of money liabilities to specie of 3.86:1 on the part of the BUS and 4:1 of the banking system as a whole, or respective reserve ratios of .26 and .25. By 1832, in contrast, the BUS reserve ratio had fallen to .17 and the country as a whole to .15. Both sets of institutions had inflated almost precisely proportionately on top of specie.⁷²

The fact that wholesale prices remained about the same over this period is no indication that the monetary inflation was not improper and dangerous. As "Austrian" business cycle theory has pointed out, any bank credit inflation sets up conditions for boom-and-bust; there is no need for prices actually to rise. The reason that prices did not rise was that the increased production of goods and services sufficed to offset the monetary expansion during this period. But similar conditions of the 1920s precipitated the great crash of 1929, an event which shocked most economists, who had adopted the proto-monetarist position of Irving Fisher and other economists of the day that a stable wholesale price level cannot, by definition, be inflationary. In reality, the unhampered free-market economy will usually increase the supply of goods and services and thereby bring about a gently falling price level, as happened in most of the 19th century except during wartime.

⁷¹ For an excellent bibliographical essay and critique of historical interpretations of Jacksonism and the Bank War, see Jeffrey Rogers Hummel, "The Jacksonians, Banking, and Economic Theory: A Reinterpretation," *Journal of Libertarian Studies* 2 (Summer 1978): 151-165.

⁷² For the BUS data, see Catterall, *Second Bank*, p. 503; for total money supply, see Peter Temin, *The Jacksonian Economy* (New York: W.W. Norton, 1969), p. 71.

What, then, of the consequences of Jackson's removal of the deposits? What of the fact that wholesale prices rose from 84 in April 1834, to 131 in February 1837, a remarkable increase of 52 percent in a little less than three years? Wasn't that boom due to the abolition of central banking?

An excellent reversal of the orthodox explanation of the boom of the 1830s, and indeed of the ensuing panic, has been provided by Professor Temin.⁷³ First, he points out that the price inflation really began earlier, when wholesale prices reached a trough of 82 in July 1830 and then rose by 20.7 percent in three years to reach 99 in the fall of 1833. The reason for the price rise is simple: The total money supply had risen from \$109 million in 1830 to \$159 million in 1833, an increase of 45.9 percent or an annual rise of 15.3 percent. Breaking the figures down further, the total money supply had risen from \$109 million in 1830 to \$155 million a year and a half later, a spectacular expansion of 35 percent. Unquestionably, this monetary expansion was spurred by the still flourishing BUS, which increased its notes and deposits from January 1830 to January 1832, from a total of \$29 million to \$42.1 million, a rise of 45.2 percent.

Thus, the price and money inflation in the first few years of the 1830s were again sparked by the expansion of the still dominant central bank. But what of the notable inflation after 1833? There is no doubt that the cause of the price inflation was the remarkable monetary inflation during the same period. For the total money supply rose from \$150 million at the beginning of 1833 to \$267 million at the beginning of 1837, an astonishing rise of 84 percent, or 21 percent per annum.

But as Temin points out, this monetary inflation was not caused by the liberated state banks expanding to a fare-thee-well. If it were true that the state banks used their freedom and their new federal government deposits to pyramid wildly on the top of specie, then their pyramid ratio would have risen a great deal, or, conversely, their reserve ratio of specie to notes and deposits would have fallen sharply. Yet the banks' reserve ratio was .16 at the beginning of 1837. During the intervening years, the reserve ratio was never below this figure. But this means that the state banks did no more pyramiding after the demise of the BUS as a central bank than they had done before.⁷⁴

⁷³ Temin, *Jacksonian Economy*, passim. Also see Hugh Rockoff, "Money, Prices, and Banks in the Jacksonian Era," in R. Fogel and S. Engerman, eds., *The Reinterpretation of American Economic History* (New York: Harper & Row, 1971), pp. 448-458.

⁷⁴ Temin, *Jacksonian Economy*, pp. 68-74.

Conventional historians, believing that the BUS *must* have restrained the expansion of state banks, naturally assumed that they were hostile to the central bank. But now Jean Wilburn has discovered that the state banks overwhelmingly supported the BUS:

We have found that Nicholas Biddle was correct when he said, "state banks in the main are friendly." Specifically, only in Georgia, Connecticut, and New York was there positive evidence of hostility. A majority of state banks in some states of the South, such as North Carolina and Alabama, gave strong support to the Bank as did both the Southwest states of Louisiana and Mississippi. Since Virginia gave some support, we can claim that state banks in the South and Southwest for the most part supported the Bank. New England, contrary to expectations, showed the banks of Vermont and New Hampshire behind the Bank, but support of Massachusetts was both qualitatively and quantitatively weak. The banks of the Middle states all supported the Second Bank except for those of New York.⁷⁵

What, then, was the cause of the enormous monetary expansion of the 1830s? It was a tremendous and unusual expansion of the stock of specie in the nation's banks. The supply of specie in the country had remained virtually constant at about \$32 million, from the beginning of 1823 until the beginning of 1833. But the proportion of specie to bank notes, held by the public as money, dropped during this period from 23 percent to 5 percent, so that more specie flowed from the public into the banks to fuel the relatively moderate monetary expansion of the 1820s. But starting at the beginning of 1833, the total specie in the country rose swiftly from \$31 million to \$73 million at the beginning of 1837, for a rise of 141.9 percent or 35.5 percent per annum. Hence, even though increasing distrust of banks led the public to withdraw some specie from them, so that the public now held 13 percent of its money in specie instead of 5 percent, the banks were able to increase their notes and deposits at precisely the same rate as the expansion of specie flowing into their coffers.

Thus, the Jackson administration is absolved from blame for the 1833-37 inflation. In a sense, the state banks are as well; certainly, they scarcely acted as if being "freed" by the demise of the BUS. Instead, they simply increased their money issues proportionately with the huge increase of specie. Of course, the basic fractional reserve banking system is scarcely absolved from responsibility, since

⁷⁵ Jean Alexander Wilburn, *Biddle's Bank: The Crucial Years* (New York: Columbia University Press, 1970), pp. 118-119, Quoted in Hummel, "Jacksonians," p. 155.

otherwise the monetary expansion in absolute terms would not have been as great.⁷⁶

The enormous increase in specie was the result of two factors: first and foremost, a large influx of silver coin from Mexico, and secondly, the sharp cut in the usual export of silver to the Orient. The latter was due to the substantial increases in China's purchase of opium instead of silver from abroad. The influx of silver was the result of paper money inflation by the Mexican government, which drove Mexican silver coins into the United States, where they circulated as legal tender. The influx of Mexican coin has been attributed to a possible increase in the productivity of the Mexican mines, but this makes little sense, since the inflow stopped permanently as soon as 1837. The actual cause was an inflation of the Mexican currency by the Santa Anna regime, which financed its deficits during this period by minting highly debased copper coins. Since the debased copper grossly overvalued copper and undervalued gold and silver, both of the later metals proceeded to flow rapidly out of Mexico until they virtually disappeared. Silver, of course, and not gold, was flowing into the United States during this period. Indeed, the Mexican government was forced to rescind its actions in 1837 by shifting the copper coinage to its proper ratio. The influx of Mexican silver into the U.S. promptly ceased.⁷⁷

A bank credit inflation of the magnitude of the 1830s is bound to run into shoals that cause the banks to stop the expansion and begin to contract. As the banks expand, and prices rise, specie is bound to flow out of the country and into the hands of the domestic public, and the pressure on the banks to redeem in specie will intensify, forcing cessation of the boom and even monetary contraction. In a sense, the immediate precipitating cause is of minor importance. Even so, the Jackson administration has been unfairly blamed for precipitating the Panic of 1837 by issuing the Specie Circular in 1836.

In 1836 the Jackson administration decided to stop the enormous speculation in Western public lands that had been fueled during the past two years by the inflation of bank credit. Hence, Jackson decreed that public land payments would have to be made in specie. This had the healthy effect of stopping public land speculation, but recent studies have shown that the Specie Circular had very little impact in

⁷⁶ Moreover, if the Jacksonians had been able to move more rapidly in returning the banking system to a 100 percent specie basis, they could have used the increase in specie to ease the monetary contraction required by a return to a pure specie money.

⁷⁷ Mexico was pinpointed as the source of the inflow of specie by Temin, *Jacksonian Economy*, p. 80, while the disclosure of the cause in Mexican copper inflation came in Rockoff, "Money, Prices, and Banks," p. 454.

putting pressure on the banks to pay specie.⁷⁸ From the point of view of the Jacksonian program, however, it was as important as moving toward putting the U.S. government finances on a purely specie basis.

Another measure advancing the Jacksonian program was also taken in 1836. Jackson, embarrassed at the government having amassed a huge budget surplus during his eight years in office, ordered the Treasury to distribute the surplus proportionately to the states. The distribution was made in notes presumably payable in specie. But again, Temin has shown that the distribution had little impact on movements of specie between banks and therefore in exerting contractionist pressure upon them.⁷⁹

What, then, was the precipitating factor in triggering the Panic of 1837? Temin plausibly argues that the Bank of England, worried about inflation in Britain, and the consequent outflow of gold, tightened the money supply and raised interest rates in the latter half of 1836. As a result, credit contraction severely restricted the American cotton export trade in London, exports declined, cotton prices fell, capital flowed into England, and contractionist pressure was put upon American trade and the American banks. Banks throughout the United States—including the BUS—promptly suspended specie payments in May 1837, their notes depreciated at varying rates, and interregional trade within the country was crippled.

While banks were able to evade specie payments and continue operations, they were still obliged to contract credit in order to go back on specie eventually, since they could not hope to be creating fiat money indefinitely and be allowed to remain in business. Finally, the New York banks were compelled by law to resume paying their contractual obligations, and the other banks followed in the fall of 1838. During the year 1837, the money supply fell from \$276 million to \$232 million, a large drop of 15.6 percent in one year. Total specie in the country continued to increase in 1837, up to \$88 million, but increased public distrust of the banks (reflected in an increased proportion of money held as specie from 13 to 23 percent) put enough

⁷⁸ Public land sales by the federal government, which had been going steadily at approximately \$4-6 million per year, suddenly spurted upward in 1835 and 1836, to \$16.2 million and \$24.9 million respectively. The latter was the largest sale of public lands in American history, and the 1835 figure was the second largest. Temin, *Jacksonian Economy*, p. 124.

The first demonstration of the negligible impact of the Specie Circular on the position of the banks was Richard H. Timberlake, Jr., "The Specie Circular and Distribution of the Surplus," *Journal of Political Economy* 68 (April 1960): 109-117, reprinted in Timberlake, *Origins*, pp. 50-62. Timberlake defended his thesis in idem, "The Specie Circular and the Sale of Public Lands: A Comment," *Journal of Economic History* 25 (September 1965): 414-416.

⁷⁹ Temin, *Jacksonian Economy*, pp. 128-136.

pressure upon the banks to force the contraction. The banks' reserve ratio rose from .16 to .20. In response to the monetary contraction, wholesale prices fell precipitately, by over 30 percent in seven months, declining from 131 in February 1837 to 98 in September of that year.

In 1838 the economy revived. Britain resumed easy credit that year, cotton prices rose, and a short-lived boomlet began. Public confidence in the banks unwisely returned as they resumed specie payment, and as a result, the money supply rose slightly during the year, and prices rose by 25 percent, increasing from 98 in September 1837 to 125 in February 1839.

Leading the boom of 1838 were state governments, who, finding themselves with the unexpected windfall of a distributed surplus from the federal government, proceeded to spend the money wildly and borrow even more extravagantly on public works and other uneconomic forms of "investment." But the state governments engaged in rashly optimistic plans that their public works would be financed heavily from Britain and other countries, and the cotton boom on which these hopes depended again collapsed in 1839. The states had to abandon their projects en masse. Cotton prices declined, and severe contractionist pressure was put on trade. Furthermore, the Philadelphia-based BUS had heavily invested in cotton speculation, and the falling price of cotton forced the BUS, once again, to suspend payments in October 1839. This touched off a wave of general bank suspensions in the South and West, but this time the banks of New York and New England continued to redeem their obligations in specie. Finally, the Bank of the United States, having for the last time played a leading role in generating a recession and monetary crisis, was forced to close its doors two years later.

With the crisis of 1839 there ensued four years of massive monetary and price deflation. Unsound banks were finally eliminated; unsound investments generated in the boom were liquidated. The number of banks during these four years fell by 23 percent. The money supply fell from \$240 million at the beginning of 1839 to \$158 million in 1843, a seemingly cataclysmic drop of 34 percent, or 8.5 percent per annum. Prices fell even further, from 125 in February 1839 to 67 in March 1843, a tremendous drop of 42 percent or 10.5 percent per year.

During the boom, as we have indicated, state governments went heavily into debt, issuing bonds to pay for wasteful public works. In 1820, the total indebtedness of American states was a modest \$12.8 million; by 1830, it rose to \$26.5 million. But then it started to escalate, reaching \$66.5 million in 1835 and skyrocketing to \$170

million by 1839. The collapse of money, credit banking, and prices after 1839 brought these state debts into jeopardy. At this point, the Whigs, taking a leaf from their forebearers, the Federalists, agitated for the federal government to bail out the states and assume their debts.⁸⁰ After the crisis of 1839 arrived, some of the southern and western states were clearly in danger of default, their plight made worse by the fact that the bulk of the debt was held by British and Dutch capitalists and that specie would have to be sent abroad to meet the heavy interest payments. The Whigs pressed further for federal assumption of the debt, with the federal government to issue \$200 million worth of bonds in payment. Furthermore, British bankers put severe pressure on the United States to assume the state debts if it expected to float further loans abroad.

The American people, however, spurned federal aid, including even the citizens of the states in difficulty, and the advent of the Polk administration ended any prospects for federal assumption. The British noted in wonder that the average American was far more concerned about his personal debts to other individuals and banks than about the debts of his state. In fact, the people were quite willing to have the states repudiate their debts outright. Demonstrating an astute perception of the reckless course the states had taken, the typical American response to the problem: "Suppose foreign capitalists did not lend any more to the states?" was the sharp retort: "Well who cares if they don't? We are now as a community heels over head in debt and can scarcely pay the interest."⁸¹ The implication was that the disappearance of foreign credit to the states would have the healthy effect of cutting off their wasteful spending—as well as avoiding the imposition of a crippling tax burden to pay for the interest and principal. There was in this response an awareness by the public that they and their government were separate and sometimes even hostile entities rather than one and the same organism.⁸²

By 1847, four western and southern states (Mississippi, Arkansas, Michigan, and Florida) had repudiated all or part of their debts. Six other states (Maryland, Illinois, Indiana, Louisiana,

⁸⁰ See Reginald C. McGrane, *Foreign Bondholders and American State Debts* (New York: Macmillan, 1935), pp. 6-7, 24ff.

⁸¹ McGrane, *Foreign Bondholders*, pp. 39-40.

⁸² The Americans also pointed out that the banks, including the Bank of the United States, who were presuming to denounce repudiation of state debt, had already suspended specie payments and were largely responsible for the contraction. "Let the bondholders look to the United States Bank and to the other banks for their payment declared the people." McGrane, *Foreign Bondholders*, p. 48.

Arkansas, and Pennsylvania) had defaulted from three to six years before resuming payment.

It is evident, then, that the 1839-43 contraction was healthful for the economy in liquidating unsound investments, debts and banks, including the pernicious Bank of the United States. But didn't the massive deflation have catastrophic effects—on production, trade, and employment, as we have been led to believe? In a fascinating analysis and comparison with the deflation of 1929-33 a century later, Professor Temin shows that the percentage of deflation over the comparable four years (1839-43, and 1929-33) was almost the same.⁸³ Yet the effects on real production of the two deflations were very different. Whereas in 1929-33 real gross investment fell catastrophically by 91 percent, real consumption by 19 percent, and real GNP by 30 percent; in 1839-43, investment fell by 23 percent, but real consumption increased by 21 percent and real GNP also rose by 16 percent. The interesting problem is to account for the enormous fall in production and consumption in the 1930s, as contrasted to the rise in production and consumption in the 1840s. It seems that only the initial months of the contraction worked a hardship on the American public and that most of the earlier deflation was a period of economic growth. Temin properly suggests that the reason can be found in the downward flexibility of prices in the 19th century, so that massive monetary contraction would lower prices but not particularly cripple the world of real production or standards of living. In contrast, in the 1930s government placed massive roadblocks on the downward fall of prices and wage rates and hence brought about severe and continuing depression of production and living standards.

The Jacksonians had no intention of leaving a permanent system of pet banks, and so after the retirement of Jackson, his successor, Martin Van Buren, fought to establish the Independent Treasury System, in which the federal government conferred no special privilege or inflationary prop on any bank; instead of a central bank or pet banks, the government was to keep its funds purely in specie, in its own treasury vaults—or its “subtreasury” branches—and simply take in and spend funds from there. Van Buren finally managed to establish the Independent Treasury System, which would last until the Civil War. At long last, the Jacksonians had achieved their dream of severing the federal government totally from the

⁸³ From 1839-43, the money supply, as we have seen, fell by 34 percent, wholesale prices by 42 percent, and the number of banks by 23 percent. In 1929-33, the money supply fell by 27 percent, prices by 31 percent, and the number of banks by 42 percent. Temin, *Jacksonian Economy*, pp. 155ff.

banking system and placing its finances on a purely hard-money, specie basis.

The Jacksonians and the Coinage Legislation of 1834

We have seen that the Coinage Act of 1792 established a bimetallic system in which the dollar was defined as equaling both 371.25 grains of pure silver and 24.75 grains of pure gold—a fixed weight ratio of 15 grains of silver to 1 grain of gold. But bimetallism foundered on Gresham's Law. After 1805, the world market value of silver fell to approximately 15.75 to 1, so that the U.S. fixed mint ratio greatly undervalued gold and overvalued silver. As a result gold flowed out of the country and silver flowed in, so that after 1810 only silver coin, largely overvalued Spanish-American fractional silver coin, circulated within the United States. The rest of the currency was inflated bank paper in various stages of depreciation.

The Jacksonians, as we have seen, were determined to eliminate inflationary paper money and substitute a hard money consisting of specie—or, at the most—of paper 100 percent-backed by gold or silver. On the federal level, this meant abolishing the Bank of the United States and establishing the Independent Treasury. The rest of the fight would have to be conducted, during the 1840s and later, at the state level where the banks were chartered. But one thing the federal government could do was readjust the specie coinage. In particular, the Jacksonians were anxious to eliminate small denomination bank notes (\$20 and under) and substitute gold and silver coins for them. They reasoned that the average American largely used these coins, and they were the ones bilked by inflated paper money. For a standard to be really gold and silver, it was vital that gold or silver coins circulate and be used as a medium of exchange by the average American.

To accomplish this goal, the Jacksonians set about to establish a comprehensive program. As one vital step, one of the Coinage Acts of 1834 readjusted the old mint ratio of 15:1 that had undervalued gold and driven it out of circulation. The Coinage Act devalued the definition of the gold dollar from the original 24.75 grains to 23.2 grains, a debasement of gold by 6.26 percent. The silver dollar was left at the old weight of 371.25 grains, so that the mint ratio between silver and gold was now fixed at a ratio of 16:1, replacing the old 15:1. It was unfortunate that the Jacksonians did not appreciate silver (to

396 grains) instead of debasing gold, for this set a precedent for debasement that was to plague America in 1933 and after.⁸⁴

The new ratio of 16:1, however, now undervalued silver and overvalued gold, since the world market ratio had been approximately 15.79:1 in the years before 1834. Until recently, historians have assumed that the Jacksonians deliberately tried to bring in gold and expel silver and establish a monometallic gold standard by the back door. Recent study has shown, however, that the Jacksonians only wanted to give gold inflow a little push through a slight undervaluation and that they anticipated a full coin circulation of both gold and silver.⁸⁵ In 1833, for example, the world market ratio was as high as 15.93:1. Indeed, it turns out that for two decades the Jacksonians were right, and that the slight one percent premium of silver over gold was not enough to drive the former coins out of circulation.⁸⁶ Both silver and gold were imported from then on, and silver and gold coins both circulated successfully side-by-side until the early 1850s. Lightweight Spanish fractional silver remained overvalued even at the mint ratio, so it flourished in circulation, replacing depreciated small notes. Even American silver dollars were now retained in circulation since they were “shielded” and kept circulating by the presence of new, heavyweight Mexican silver dollars, which were exported instead.⁸⁷

In order to stimulate the circulation of both gold and silver coin instead of paper notes, the Jacksonians also passed two companion Coinage Acts in 1834. The Jacksonians were not monetary nationalists; specie was specie, and they saw that there was no reason that foreign gold or silver coins should not circulate with the same full privileges as American-minted coins. Hence, the Jacksonians, in two separate measures, legalized the circulation of all

⁸⁴ Probably the Jacksonians did so in order to preserve the illusion that the original silver dollar, the “dollar of our fathers” and the standard currency of the day, remained fixed in value. Laughlin, *History of Bimetallism*, p. 70.

⁸⁵ For the illuminating discovery that the Jacksonians were interested in purging small bank notes by bringing in gold, see Paul M. O’Leary, “The Coinage Legislation of 1834,” *Journal of Political Economy* 45 (February 1937): 80-94. For the development of this insight by Martin, who shows that the Jacksonians anticipated a coinage of both gold and silver, and reveals the comprehensive Jacksonian coinage program, see David A. Martin, “Metallism, Small Notes, and Jackson’s War with the B.U.S.,” *Explorations in Economic History*, 11 (Spring 1974): 227-247.

⁸⁶ For the next 16 years, from 1835-1850, the market ratio averaged 15.8:1, a silver premium of only 1 percent over the 16:1 mint ratio. For the data, see Laughlin, *History of Bimetallism*, p. 291.

⁸⁷ Martin, “Bimetallism,” pp. 435-437. Spanish fractional silver coins were from 5 to 15 percent underweight, and so their circulation in the U.S. at par by name (or “tale”) meant that they were still considerably overvalued.

foreign silver and gold coins, and they flourished in circulation until the 1850s.^{88,89}

A third plank in the Jacksonian coinage platform was to establish branch U.S. mints so as to coin the gold found in newly-discovered mines in Georgia and North Carolina. The Jackson administration finally succeeded in getting Congress to do so in 1835 when it set up branch mints to coin gold in North Carolina and Georgia, and silver and gold at New Orleans.⁹⁰

Finally, on the federal level, the Jacksonians sought to levy a tax on small bank notes and to prevent the federal government from keeping its deposits in state banks, issuing small notes, or from accepting small bank notes in taxes. They were not successful, but the Independent Treasury eliminated public deposit in state banks and the Specie Circular, as we have seen, stopped the receipt of bank notes for public land sales. From 1840 on, the hard-money battle would be waged at the state level.

In the early 1850s, Gresham's Law finally caught up with the bimetalist idyll that the Jacksonians had forged in the 1830s, replacing the earlier de facto silver monometallism. The sudden discovery of extensive gold mines in California, Russia, and Australia greatly increased gold production, reaching a peak in the early 1850s. From the 1720s through the 1830s, annual world gold production averaged \$12.8 million, never straying very far from that norm. Then, world gold production increased to an annual average of \$38.2 million in the 1840s, and spurted upward to a peak of \$155 million in 1853. World gold production then fell steadily from that peak to an annual average of \$139.9 million in the 1850s and to \$114.7 million from 1876-1890. It was not to surpass this peak until the 1890s.⁹¹

⁸⁸ As Jackson's Secretary of the Treasury Levi Woodbury explained the purpose of this broad legalization of foreign coins: "to provide a full supply and variety of coins, instead of bills below five and ten dollars," for this would be "particularly conducive to the security of the poor and middling classes, who, as they own but little in, and profit but little by, banks, should be subjected to as small risk as practicable by their bills." Quoted in Martin, "Metallism," p.242.

⁸⁹ In 1837 another Coinage Act made a very slight adjustment in the mint ratios. In order to raise the alloy composition of gold coins to have them similar to silver, the definition of the gold dollar was raised slightly from 23.2 to 23.22 grains. With the weight of the silver dollar remaining the same, the silver/gold ratio was now very slightly lowered from 16.002:1 to 15.998:1. Further slight adjustments in valuations of foreign coins in another Coinage Act of 1843 resulted in the undervaluation of many foreign coins and their gradual disappearance. The major ones—Spanish fractional silver—continued, however, to circulate widely. Martin, "Bimetallism," p. 436.

⁹⁰ Martin, "Metallism," p. 240.

⁹¹ On gold production, see Laughlin, *History of Bimetallism*, pp. 283-286; David A. Martin, "1853: The End of Bimetallism in the United States," *Journal of Economic History* 33 (December 1973): 830.

The consequence of the burst in gold production was, of course, a fall in the price of gold relative to silver in the world market. The silver/gold ratio declined from 15.97 in January 1849 to an average of 15.70 in 1850 to 15.46 in 1851 and to an average of 15.32:1 in the eight years from 1853 to 1860.⁹² As a result, the market premium of American silver dollars over gold quickly rose above the one-percent margin, which was the estimated cost of shipping silver coin abroad. That premium, which had hovered around one percent since the mid-1830s, suddenly rose to 4.5 percent at the beginning of 1851, and after falling back to about 2 percent at the turn of 1852, bounced back up and remained at the 4-5 percent level.

The result was a rapid disappearance of silver from the country, the heaviest and therefore most undervalued coins vanishing first. Spanish-milled dollars, which contained 1 percent to 5 percent more silver than American dollars, commanded a premium of 7 percent and went first. Then went the full-weight American silver dollars and after that, American fractional silver coins, which were commanding a 4 percent premium by the fall of 1852. The last coins left were the worn Spanish and Mexican fractions, which were depreciated by 10 to 15 percent. By the beginning of 1851, however, even these worn foreign silver fractions had gone to a one-percent premium, and were beginning to go.

It was clear that America was undergoing a severe small coin crisis. Gold coins were flowing into the country, but they were too valuable to be technically usable for small denomination coins. The Democratic Pierce administration saw with horror a flood of millions of dollars of unauthorized private small notes flood into circulation in early 1853 for the first time since the 1830s. The Jacksonians were in grave danger of losing the fight for hard-money coinage, at least for the smaller and medium denominations. Something had to be done quickly.⁹³

The ultimate breakdown of bimetallism had never been clearer. If bimetallism is in the long run not viable, this leaves two free-market, hard-money alternatives: (a) silver monometallism with the dollar defined as a weight of silver only, and gold circulating freely by weight at freely-fluctuating market rates; or (b) gold monometallism with the dollar defined only as a weight of gold, with silver circulating by weight. Each of these is an example of what has been called "parallel standards" or "free metallism," in which two or more metal coins are allowed to fluctuate freely within the same area and

⁹² The silver/gold ratio began to slide sharply in October and November 1850. Laughlin, *History of Bimetallism*, pp. 194, 291.

⁹³ Martin, "Metallism," p. 240

exchange at free-market prices. As we have seen, colonial America was an example of such parallel standards, since foreign gold and silver coins circulated freely and at fluctuating market prices.⁹⁴

The United States could have taken this opportunity of monetary crisis to go on either version of a parallel standard.⁹⁵ Apparently, however, few thought of doing so. Another viable though inferior solution to the problem of bimetallism was to establish a monometallic system, either de facto or de jure, with the other metal circulating in the form of lightweight, and therefore overvalued, or “token” coinage. Silver monometallism was immediately unfeasible since it was rapidly flowing out of the country, and because gold, being far more valuable than silver, could not technically function easily as a lightweight, subsidiary coin. The only feasible solution, then, within a monometallic framework, was to make gold the basic standard and let highly overvalued, essentially token, silver coins function as subsidiary small coinage. Certainly if a parallel standard was not to be adopted, the latter solution would be far better than allowing depreciated paper notes to function as small currency.

Under pressure of the crisis, Congress decided, in February 1853, to keep the de jure bimetallic standard but to adopt a de facto gold

⁹⁴ For an account of how parallel standards worked in Europe from the medieval period through the 18th century, see Luigi Einaudi, “The Theory of Imaginary Money from Charlemagne to the French Revolution,” in F. Lane and J. Riemersma, eds., *Enterprise and Secular Change* (Homewood, 111.: Irwin, 1953), pp. 229-261. Robert Lopez contrasts the ways in which Florence and Genoa each returned to gold coinage in the mid-13th century, after a gap of half a millennium: “Florence, like most medieval states, made bimetallism and trimetallism a base of its monetary policy ... it committed the government to the Sisyphian labor of readjusting the relations between different coins as the ratio between the different metals changes, or as one or another coin was debased ... Genoa on the contrary, *in conformity with the principle of restricting state intervention as much as possible* [italics ours], did not try to enforce a fixed relation between coins of different metals ... Basically, the gold coinage of Genoa was not meant to integrate the silver and bullion coinages but to form an independent system.” Robert Sabatino Lopez, “Back to Gold, 1252,” *Economic History Review*, April 1956, p.224. Also see James Rolph Edwards, “Monopoly and Competition in Money,” *Journal of Libertarian Studies* IV (Winter 1980): 116. For an analysis of parallel standards, see Ludwig von Mises, *The Theory of Money and Credit* 3rd ed. (Indianapolis: Liberty Classics, 1980), pp. 87, 89-91, 205-207.

⁹⁵ Given parallel standards, the ultimate, admittedly remote solution would be to eliminate the term “dollar” altogether, and simply have both gold and silver coins circulate by regular units of weight: “Grain,” “Ounce,” or “Gram.” If that were done, all problems of bimetallism, debasement, Gresham’s Law, etc., would at last disappear. While such a pure free-market solution seems remote today, the late 19th century saw a series of important international monetary conferences trying to move toward a universal gold or silver gram, with each national currency beginning as a simple multiple of each other, and eventually only units of weight being used. Before the conferences foundered on the gold/silver problem, such a result was not as remote or Utopian as we might now believe. See the fascinating account of these conferences in Henry B. Russell, *International Monetary Conferences* (New York: Harper & Bros., 1898).

monometallic standard, with fractional silver coins circulating as a deliberately overvalued subsidiary coinage, legal tender up to a maximum of only five dollars. The fractional silver coins were debased by 6.91 percent. With silver commanding about a 4 percent market premium over gold, this meant that fractional silver was debased 3 percent below gold. At that depreciated rate, fractional silver was not overvalued in relation to gold, and remained in circulation. By April, the new subsidiary quarter dollars proved to be popular and by early 1854 the problem of the shortage of small coins in America was over.

In rejecting proposals either to go over completely to de jure gold monometallism, or to keep the existing bimetallic system, Congress was choosing a gold standard temporarily, but keeping its options open. The fact that it continued the old full-bodied silver dollar, the “dollar of our fathers,” demonstrates that an eventual return to de facto bimetalism was by no means being ruled out—albeit Gresham’s Law could not then maintain the American silver dollar in circulation.⁹⁶

In 1857, an important part of the Jacksonian coinage program was repealed, as Congress, in an exercise of monetary nationalism, eliminated all legal tender power of foreign coins.⁹⁷

Decentralized Banking from the 1830s to the Civil War

After the central bank was eliminated in the 1830s, the battle for hard money largely shifted to the state governmental arena. During the 1830s, the major thrust was to prohibit the issue of small notes, which was accomplished for notes under five dollars in 10 states by 1832, and subsequently, five others restricted or prohibited such notes.⁹⁸

The Democratic Party became ardently hard-money in the various states after the shock of the financial crisis of 1837 and 1839. The Democratic drive was toward the outlawry of all fractional reserve bank paper. Battles were fought, also, in the late 1840s, at constitutional conventions of many states, particularly in the West. In some western states the Jacksonians won temporary success, but soon the Whigs would return and repeal the bank prohibition. The Whigs, trying to find some way to overcome the general revulsion against banks after the crisis of the late 1830s, adopted the concept of

⁹⁶ For an excellent portrayal of the congressional choice in 1853, see Martin, “1853,” pp. 825-844.

⁹⁷ Only Spanish-American fractional silver coins were to remain legal tender, and they were to be received quickly at government offices and immediately reminted into American coins. Hepburn, *History of Currency*, pp. 66-67.

⁹⁸ See Martin, “Metallism,” pp. 242-243.

“free” banking, which had been enacted by New York and Michigan in the late 1830s. From New York, the idea spread outward to the rest of the country and triumphed in 15 states by the early 1850s. On the eve of the Civil War, 18 out of the 33 states in the Union had adopted “free” banking laws.⁹⁹

It must be realized that “free” banking, as it came to be known in the United States before the Civil War, was unrelated to the philosophic concept of free banking analyzed by economists. As we have seen earlier, genuine free banking is a system where entry into banking is totally free, the banks are neither subsidized nor regulated, and at the first sign of failure to redeem in specie payments, the bank is forced to declare insolvency and close its doors.

“Free” banking before the Civil War, on the other hand, was very different.¹⁰⁰ As we have pointed out, the government allowed periodic general suspensions of specie payments whenever the banks over-expanded and got into trouble—the latest episode was in the Panic of 1857. It is true that bank incorporation was now more liberal since any bank which met the legal regulations could become incorporated automatically without lobbying for special legislative charters, as had been the case before. But the banks were not subject to a myriad of regulations, including edicts by state banking commissioners and high minimum capital requirements which greatly restricted entry into the banking business. But the most pernicious aspect of “free” banking was that the expansion of bank notes and deposits was directly tied to the amount of state government securities which the bank had invested in and posted as bond with the state. In effect, then, state government bonds became the reserve base upon which the banks were allowed to pyramid a multiple expansion of bank notes and deposits. Not only did this system provide explicitly or implicitly for fractional reserve banking; but the pyramid was tied rigidly to the amount of government bonds purchased by the banks. This provision deliberately tied banks and bank credit expansion to the public debt; it meant that the more public debt the banks purchased, the more they could create and lend out new money. Banks, in short, were encouraged to monetize the public debt, state governments were thereby encouraged to go into debt, and hence, government and bank inflation were intimately linked.

⁹⁹ Hugh Rockoff, *The Free Banking Era: A Re-Examination* (New York: Arno Press, 1975), pp. 3-4.

¹⁰⁰ Rockoff goes so far as to call free banking the “antithesis of *laissez-faire* banking laws.” Hugh Rockoff, “Varieties of Banking and Regional Economic Development in the United States, 1840-1860,” *Journal of Economic History* 35 (March 1975): 162. Quoted in Hummel, “Jacksonians,” p. 157.

In addition to allowing periodic suspension of specie payments, federal and state governments conferred upon the banks the privilege of their notes being accepted in taxes. Moreover, the general prohibition of interstate branch banking—and often of intrastate branches as well—greatly inhibited the speed by which one bank could demand payment from other banks in specie. In addition, state usury laws, pushed by the Whigs and opposed by the Democrats, made credit excessively cheap for the riskiest borrowers and encouraged inflation and speculative expansion of bank lending.

Furthermore, the desire of state governments to finance internal improvements was an important factor in subsidizing and propelling expansion of bank credit. As Hammond admits: “The wildcats lent no money to farmers and served no farmer interest. They arose to meet the credit demands not of farmers (who were too economically astute to accept wildcat money) but of states engaged in public improvements.”¹⁰¹

Despite the flaws and problems, the decentralized nature of the pre-Civil War banking system meant that banks were free to experiment on their own with improving the banking system. The most successful such device was the creation of the Suffolk system.

A Free-Market “Central Bank”

It is a fact, almost never recalled, that there once existed an American private bank that brought order and convenience to a myriad of privately issued banknotes. Further, the Suffolk Bank restrained the over-issuance of these notes. In short, it was a private central bank that kept the other banks honest. As such, it made New England an island of monetary stability in an America contending with currency chaos.

Chaos was, in fact, that condition in which New England found herself just before the Suffolk Bank was established. There were a myriad of banknotes circulating in the area’s largest financial center, Boston. Some were issued by Boston banks which all in Boston knew

¹⁰¹ Hammond, *Banks and Politics*, p. 627. On free banking, see Hummel, “Jacksonians,” pp. 154-160; Smith, *Rationale*, pp. 44-45; and Hugh Rockoff, “American Free Banking Before the Civil War: A Reexamination,” *Journal of Economic History* 32 (March 1972): 417-420. On the effect of usury laws, see William Graham Sumner, *A History of American Currency* (New York: Henry Holt & Co., 1876), p. 125. On the Jacksonians versus their opponents on the state level after 1839, see William G. Shade, *Banks or No Banks: The Money Issue in Western Politics, 1832-1865* (Detroit: Wayne State University Press, 1972); Herbert Ershkowitz and William Shade, “Consensus or Conflict? Political Behavior in the State Legislatures During the Jacksonian Era,” *Journal of American History* 58 (December 1971): 591-621; and James Roger Sharp, *Jacksonians versus the Banks: Politics in the States After the Panic of 1837* (New York: Columbia University Press, 1970).

to be solvent. But others were issued by state-chartered banks. These could be quite far away, and in those days such distance impeded both general knowledge about their solvency and easy access in bringing the banks' notes in for redemption into gold or silver. Thus, while at the beginning these country notes were accepted in Boston at par value, this just encouraged some far-away banks to issue far more notes than they had gold to back them. So country bank notes began to be generally traded at discounts to par, of from 1 percent to 5 percent.

City banks finally refused to accept country bank notes altogether. This gave rise to the money brokers mentioned earlier in this chapter. But it also caused hardship for Boston merchants, who had to accept country notes whose real value they could not be certain of. When they exchanged the notes with the brokers, they ended up assuming the full cost of discounting the bills they had accepted at par.

A False Start

Matters began to change in 1814. The New England Bank of Boston announced it too would go into the money broker business, accepting country notes from holders and turning them over to the issuing bank for redemption. The note holders, though, still had to pay the cost. In 1818, a group of prominent merchants formed the Suffolk Bank to do the same thing. This enlarged competition brought the basic rate of country note discount down from three percent in 1814 to one percent in 1818 and finally to a bare one-half of one percent in 1820. But this did not necessarily mean that country banks were behaving more responsibly in their note creation. By the end of 1820 the business had become clearly unprofitable, and both banks stopped competing with the private money brokers. The Suffolk became just another Boston bank.

Operation Begins

During the next several years city banks found their notes representing an ever smaller part of the total New England money supply. Country banks were simply issuing far more notes in proportion to their capital (i.e., gold and silver) than were the Boston banks.

Concerned about this influx of paper money of lesser worth, both Suffolk and New England Bank began again in 1824 to purchase country notes. But this time they did so not to make a profit on redemption, but simply to reduce the number of country notes in circulation in Boston. They had the foolish hope that this would

increase the use of their (better) notes, thus increasing their own loans and profits.

But the more they purchased country notes, the more notes of even worse quality (particularly from far-away Maine banks) would replace them. Buying these latter involved more risk, so the Suffolk proposed to six other city banks a joint fund to purchase and send these notes back to the issuing bank for redemption. These seven banks, known as the Associated Banks, raised \$300,000 for this purpose. With the Suffolk acting as agent and buying country notes from the other six, operations began March 24, 1824. The volume of country notes bought in this way increased greatly, to \$2 million per month by the end of 1825. By then, Suffolk felt strong enough to go it alone. Further, it now had the leverage to pressure country banks into depositing gold and silver with the Suffolk, to make note redemption easier. By 1838, almost every bank in New England did so, and were redeeming their notes through the Suffolk Bank.

The Suffolk ground rules from beginning (1825) to end (1858) were as follows: Each country bank had to maintain a permanent deposit of specie of at least \$2,000 for the smallest bank, plus enough to redeem all its notes that Suffolk received. These gold and silver deposits did not have to be at Suffolk, so long as they were at some place convenient to Suffolk, so that the notes would not have to be sent home for redemption. But in practice, nearly all reserves were at Suffolk. (City banks had only to deposit a fixed amount, which decreased to \$5,000 by 1835.) No interest was paid on any of these deposits. But, in exchange, the Suffolk began performing an invaluable service: It agreed to accept at par all the notes it received as deposits from other New England banks in the system, and credit the depositor banks' accounts on the following day.

With the Suffolk acting as a "clearing bank," accepting, sorting, and crediting bank notes, it was now possible for any New England bank to accept the notes of any other bank, however far away, and at face value. This drastically cut down on the time and inconvenience of applying to each bank separately for specie redemption. Moreover, the certainty spread that the notes of the Suffolk member banks would be valued at par: It spread at first among other bankers and then to the general public.

The Country Banks Resist

How did the inflationist country banks react to this? Not very well, for as one can see the Suffolk system put limits on the amount of notes they could issue. They resented par redemption and detested systematic specie redemption because that forced them to stay honest. But the country banks knew that any bank that did not play

by the rules would be shunned by the banks that did (or at least see their notes accepted only at discount, and not in a very wide area, at that). All legal means to stop Suffolk failed: The Massachusetts Supreme Court upheld in 1827 Suffolk's right to demand gold or silver for country bank notes, and the state legislature refused to charter a clearing bank run by country banks; probably rightly assuming that these banks would run much less strict operations. Stung by these setbacks, the country banks played by the rules, bided their time, and awaited their revenge.

Suffolk's Stabilizing Effects

Even though Suffolk's initial objective had been to increase the circulation of city banks, this did not happen. In fact, by having their notes redeemed at par, country banks gained a new respectability. This came, naturally, at the expense of the number of notes issued by the worst former inflationists. But at least in Massachusetts, the percentage of city bank notes in circulation fell from 48.5 percent in 1826 to 35.8 percent in 1833.

Circulation of the Notes of Massachusetts Banks (in Thousands)

Date	All Banks	Boston Banks	Boston Percentage
1823	\$3,129	\$1,354	43.3
1824	3,843	1,797	46.8
1825	4,091	1,918	46.9
1826	4,550	2,206	48.5
1827	4,936	2,103	42.6
1828	4,885	2,067	42.3
1829	4,748	2,078	43.8
1830	5,124	2,171	42.3
1831	7,139	3,464	44.8
1832	7,123	3,060	43.0
1833	7,889	2,824	35.8

Source: Wilfred S. Lake, *The End of the Suffolk System*, p. 188.

The biggest, most powerful weapon Suffolk had to keep stability was the power to grant membership into the system. It accepted only banks whose notes were sound. While Suffolk could not prevent a bad bank from inflating, denying it membership ensured that the notes would not enjoy wide circulation. And the member banks which were

mismanaged could be stricken from the list of Suffolk-approved New England banks in good standing. This caused the offending banks' notes to trade at a discount at once, even though the bank itself might be still redeeming its notes in specie.

In another way, Suffolk exercised a stabilizing influence on the New England economy. It controlled the use of overdrafts in the system. When a member bank needed money, it could apply for an overdraft, that is, a portion of the excess reserves in the banking system. If Suffolk decided that a member bank's loan policy was not conservative enough, it could refuse to sanction that bank's application to borrow reserves at Suffolk. The denial of overdrafts to profligate banks thus forced those banks to keep their assets more liquid. (Few government central banks today have succeeded in that.) This is all the more remarkable when one considers that Suffolk—or any central bank—could have earned extra interest income by issuing overdrafts irresponsibly.

But Dr. George Trivoli, whose excellent monograph, *The Suffolk Bank*, we rely on in this study, states that by providing stability to the New England banking system “it should not be inferred that the Suffolk bank was operating purely as public benefactor.” Suffolk, in fact, made handsome profits. At its peak in 1858, the last year of existence, it was redeeming \$400 million in notes, with a total annual salary cost of only \$40,000. The healthy profits were derived primarily from loaning out those reserve deposits which Suffolk itself, remember, did not pay interest on. These amounted to over \$1 million in 1858. The interest charged on overdrafts augmented that. Not surprisingly, Suffolk stock was the highest priced bank stock in Boston, and by 1850, regular dividends were 10 percent.

The Suffolk Difference

That the Suffolk system was able to provide note redemption much more cheaply than the U.S. government was stated by a U.S. Comptroller of the Currency. John Jay Knox compared the two systems from a vantage point of half a century: “...in 1857 the redemption of notes by the Suffolk Bank was almost \$400,000,000 as against \$137,697,696 in 1875, the highest amount ever reported under the National Banking system. The redemptions in 1898 were only \$66,683,476 at a cost of \$1.29 per thousand. The cost of redemption under the Suffolk system was ten cents per \$1,000, which does not appear to include transportation. If this item is deducted from the cost of redeeming National Bank notes, it would reduce it to about ninety-four cents. This difference is accounted for by the relatively small amount of redemptions by the Treasury, and the increased expense incident to the necessity of official checks by the

Government, and by the higher salaries paid. But allowing for these differences, the fact is established that private enterprise could be entrusted with the work of redeeming the circulating notes of the banks, and it could thus be done as safely and much more economically than the same services can be performed by the Government.”¹⁰²

The volume of redemptions was much larger under Suffolk than under the National Banking system. During Suffolk's existence (1825-57) they averaged \$229 million per year. The average of the National system from its start in 1863 to about 1898 is put by Mr. Knox at only \$54 million. Further, at its peak in 1858, \$400 million was redeemed. But the New England money supply was only \$40 million. This meant that, astoundingly, the average note was redeemed 10 times per year, or once every five weeks.

Bank capital, note circulation, and deposits, considered together as “banking power,” grew in New England on a per capita basis much faster than in any other region of the country from 1803 to 1850. And there is some evidence that New England banks were not as susceptible to disaster during the several banking panics during that time. In the Panic of 1837 not one Connecticut bank failed, nor did any suspend specie payments. All remained in the Suffolk system. And when in 1857 specie payment was suspended in Maine, all but three banks remained in business. As the Bank Commission of Maine stated, “The Suffolk system, though not recognized in banking law, has proved to be a great safeguard to the public; whatever objections may exist to the system in theory, its practical operation is to keep the circulation of our banks within the bounds of safety.”

The Suffolk's Demise

The extraordinary profits—and power—that the Suffolk had by 1858 attained spawned competitors. The only one to become established was a Bank for Mutual Redemption in 1858. This bank was partially a response to the somewhat arrogant behavior of the Suffolk by this time, after 35 years of unprecedented success. But further, and more importantly, the balance of power in the state legislature had shifted outside of Boston, to the country bank areas. The politicians were more amenable to the desires of the overexpanding country banks. Still, it must be said that Suffolk acted toward the Bank of Mutual Redemption with spite where conciliation would have helped. Trying to force Mutual Redemption out of business, Suffolk, starting October 9, 1858, refused to honor notes of

¹⁰² John Jay Knox, *A History of Banking in the United States* (New York: Augustus M. Kelley, 1969 [1900]), pp. 368-69.

banks having deposits in the newcomer. Further, Suffolk in effect threatened any bank withdrawing deposits from it. But country banks rallied to the newcomer, and on October 16, Suffolk announced that it would stop clearing any country bank notes, thus becoming just another bank.

Only the Bank for Mutual Redemption was left, and though it soon had half the New England banks as members, it was much more lax toward overissuance by country banks. Perhaps the Suffolk would have returned amid dissatisfaction with its successor, but in 1861, just over two years after Suffolk stopped clearing, the Civil War began and all specie payments were stopped. As a final nail in the coffin, the National Banking System Act of 1863 forbade the issuance of any state bank notes, giving a monopoly to the government that has continued ever since.

While it lasted, though, the Suffolk banking system showed that it is possible in a free-market system to have private banks competing to establish themselves as efficient, safe, and inexpensive clearing houses limiting overissue of paper money.

The Civil War

The Civil War exerted an even more fateful impact on the American monetary and banking system than had the War of 1812. It set the United States, for the first time except for 1814-17, on an irredeemable fiat currency that lasted for two decades and led to reckless inflation of prices. This “greenback” currency set a momentous precedent for the post-1933 United States, and even more particularly for the post-1971 experiment in fiat money.

Perhaps an even more important consequence of the Civil War was the permanent change wrought in the American banking system. The federal government in effect outlawed the issue of state bank notes, and created a new, quasi-centralized, fractional reserve national banking system which paved the way for the return of outright central banking in the Federal Reserve System. The Civil War, in short, ended the separation of the federal government from banking, and brought the two institutions together in an increasingly close and permanent symbiosis. In that way, the Republican Party, which inherited the Whig admiration for paper money and governmental control and sponsorship of inflationary banking, was able to implant the soft-money tradition permanently in the American system.

Greenbacks

The Civil War led to an enormous ballooning of federal expenditures, which skyrocketed from \$66 million in 1861 to \$1.30 billion four years later. To pay for these swollen expenditures, the Treasury initially attempted, in the fall of 1861, to float a massive \$150 million bond issue, to be purchased by the nation's leading banks. However, Secretary of the Treasury Salmon P. Chase, a former Jacksonian, tried to require the banks to pay for the loan in specie that they did not have. This massive pressure on their specie, as well as an increased public demand for specie due to a well-deserved lack of confidence in the banks, brought about a general suspension of specie payments a few months later, at the end of December 1861. This suspension was followed swiftly by the Treasury itself, which suspended specie payments on its Treasury notes.

The U.S. government quickly took advantage of being on an inconvertible fiat standard. In the Legal Tender Act of February 1862, Congress authorized the printing of \$150 million in new "United States Notes" (soon to be known as "greenbacks") to pay for the growing war deficits. The greenbacks were made legal tender for all debts, public and private, except that the Treasury continued its legal obligation of paying the interest on its outstanding public debt in specie.¹⁰³ The greenbacks were also made convertible at par into U.S. bonds, which remained a generally unused option for the public, and was repealed a year later.

In creating greenbacks in February, Congress resolved that this would be the first and last emergency issue. But printing money is a heady wine, and a second \$150 million issue was authorized in July, and still a third \$150 million in early 1863. Greenbacks outstanding reached a peak in 1864 of \$415.1 million.

Greenbacks began to depreciate in terms of specie almost as soon as they were issued. In an attempt to drive up the price of government bonds, Secretary Chase eliminated the convertibility of greenbacks in July 1863, an act which simply drove down their value further. Chase and the Treasury officials, instead of acknowledging their own premier responsibility for the continued depreciation of the greenbacks, conveniently placed the blame on anonymous "gold speculators." In March 1863, Chase began a determined campaign, which would last until he was driven from office, to stop the depreciation by controlling, assaulting, and eventually eliminating

¹⁰³ To be able to keep paying interest in specie, Congress provided that customs duties, at least, had to be paid in gold or silver. For a comprehensive account and analysis of the issue of greenbacks in the Civil War, see Wesley Clair Mitchell, *A History of the Greenbacks* (Chicago: University of Chicago Press, 1903). For a summary, see Paul Studenski and Herman E. Kross, *Financial History of the United States* (New York: McGraw-Hill, 1952), pp. 141-149.

the gold market. In early March, he had Congress levy a stamp tax on gold sales and to forbid loans on a collateral of coin above its par value. This restriction on the gold market had little effect, and when depreciation resumed its march at the end of the year, Chase decided to de facto repeal the requirement that customs duties be paid in gold. In late March 1864, Chase declared that importers would be allowed to deposit greenbacks at the Treasury and receive gold in return at a premium below the market. Importers could then use the gold to pay the customs duties. This was supposed to reduce greatly the necessity for importers to buy gold coin on the market and therefore to reduce the depreciation. The outcome, however, was that the greenback, at 59 cents in gold when Chase began the experiment, had fallen to 57 cents by mid-April. Chase was then forced to repeal his customs duties scheme. With the failure of this attempt to regulate the gold market, Chase promptly escalated his intervention. In mid-April, he sold the massive amount of \$11 million in gold in order to drive down the gold premium of greenbacks. But the impact was trifling, and the Treasury could not continue this policy indefinitely, because it had to keep enough gold in its vaults to pay interest on its bonds. At the end of the month, the greenback was lower than ever, having sunk to below 56 cents in gold.

Indefatigably, Chase tried yet again. In mid-May 1864, he sold foreign exchange in London at below-market rates in order to drive down pounds in relation to dollars, and, more specifically, to replace some of the U.S. export demand for gold in England. But this, too, was a failure, and Chase ended this experiment before the end of the month.

Finally, Secretary Chase decided to take off the gloves. He had failed to regulate the gold market; he would therefore end the depreciation of greenbacks by destroying the gold market completely. By mid-June, he had driven through Congress a truly despotic measure to prohibit under pain of severe penalties all futures contracts in gold, as well as all sales of gold by a broker outside his own office.

The result was disaster. The gold market was in chaos, with wide ranges of prices due to the absence of an organized market. Businessmen clamored for repeal of the “gold bill,” and, worst of all, the object of the law—to lower the depreciation of the paper dollar—had scarcely been achieved. Instead, public confidence in the greenback plummeted, and its depreciation in terms of gold got far worse. At the beginning of June, the greenback dollar was worth over 52 cents in gold. Apprehensions about the emerging gold bill drove the greenback down slightly to 51 cents in mid-June. Then, after the

passage of the bill, the greenback plummeted, reaching 40 cents at the end of the month.

The disastrous gold bill was hastily repealed at the end of June, and perhaps not coincidentally, Secretary Chase was ousted from office at the same time. The war against the speculators was over.^{104,105}

As soon as greenbacks depreciated to less than 97 cents in gold, fractional silver coins became undervalued and so were exported to be exchanged for gold. By July 1862, in consequence, no coin higher than the copper/nickel penny remained in circulation. The U.S. government then leaped in to fill the gap with small tickets, first issuing postage stamps for the purpose, then bits of unglued paper, and finally, after the spring of 1863, fractional paper notes.¹⁰⁶ A total of \$28 million in postage currency and fractional notes was issued by the middle of 1864. Even the nickel/copper pennies began to disappear from circulation, as greenbacks depreciated, and the nickel/copper coin began to move toward being undervalued. The expectation and finally the reality of undervaluation drove the coins into hoards and then into exports. Postage and fractional notes did not help matters, because their lowest denominations were 5 cents and 3 cents respectively. The penny shortage was finally alleviated when a debased and lighter weight penny was issued in the spring of 1864, consisting of bronze instead of nickel and copper.¹⁰⁷

As soon as the nation's banks and the Treasury itself suspended specie payments at the end of 1861, Gresham's Law went into operation and gold coin virtually disappeared from circulation, except for the government's interest payments and importers' customs

¹⁰⁴ Chase and the administration should have heeded the advice of Sen. Jacob Collamer (R-Vt): "Gold does not fluctuate in price ... because they gamble in it; but they gamble in it because it fluctuates ... But the fluctuation is not in the gold; the fluctuation is in the currency, and it is a fluctuation utterly beyond the control of individuals." Mitchell, *History of Greenbacks*, pp. 229-230.

¹⁰⁵ On the war against the gold speculators, see Mitchell, *History of Greenbacks*, pp. 223-235. The greenbacks fell further to 35 cents in mid-July on news of military defeats for the North. Military victories, and consequently rising prospects of possible future gold redemption of the greenbacks, caused a rise in greenbacks in terms of gold, particularly after the beginning of 1865. At war's end the greenback dollar was worth 69 cents in gold. *Ibid.*, pp. 232-238, 423-428.

¹⁰⁶ Some of the greenbacks had been decorated with portraits of President Lincoln (\$5) and Secretary Chase (\$1). However, when Spencer Clark, chief clerk of the Treasury's National Currency Division, put his own portrait on 5-cent fractional notes, the indignant Rep. Martin R. Thayer (R-Pa.) put through a law, still in force, making it illegal to put the picture of any living American on any coin or paper money. See Gary North, "Greenback Dollars and Federal Sovereignty, 1861-1865," in H. Sennholz, ed., *Gold Is Money* (Westport, Conn.: Greenwood Press, 1975), pp. 124,150.

¹⁰⁷ See Mitchell, *History of Greenbacks*, pp. 156-163.

duties. The swift issuance of legal tender greenbacks, which the government forced creditors to accept at par, insured the continued disappearance of gold from then on.

The fascinating exception was California. There were very few banks during this period west of Nebraska, and in California the absence of banks was insured by the fact that note-issuing banks, at least, were prohibited by the California constitution of 1849.¹⁰⁸ The California gold discoveries of the late 1840s insured a plentiful supply for coinage.

Used to a currency of gold coin only, with no intrusion of bank notes, California businessmen took steps to maintain gold circulation and avoid coerced payment in greenbacks. At first, the merchants of San Francisco, in November 1862, jointly agreed to refrain from accepting or paying out greenbacks at any but the (depreciated) market value, and to keep gold as the monetary standard. Any firms that refused to abide by the agreement would be blacklisted and required to pay gold in cash for any goods which they might purchase in the future.

Voluntary efforts did not suffice to overthrow the federal power standing behind legal tender, however, and so California merchants obtained the passage in the California legislature of a “specific contracts act” at the end of April 1863. The specific contract provided that contracts for the payment of specific kinds of money would be enforceable in the courts. After passage of that law, California businessmen were able to protect themselves against tenders of greenbacks by inserting gold coin payment clauses in all their contracts. Would that the other states, and even the federal government, had done the same!¹⁰⁹ Furthermore, the private banks of deposit in California refused to accept greenbacks on deposit, newspapers used their influence to warn citizens about the dangers of greenbacks, and the state government refused to accept greenbacks in payment of taxes. In that way, all the major institutions in California joined in refusing to accept or give their imprimatur to federal inconvertible paper.

Judicial institutions also helped maintain the gold standard and repel the depreciated U.S. paper. Not only did the California courts

¹⁰⁸ Banks of deposit existed in California, but of course they could not supply the public's demand for cash. See John Jay Knox, *A History of Banking in the United States* (New York: Bradford Rhodes & Co., 1900), pp. 843-845.

¹⁰⁹ This experience illustrates a continuing problem in contract law: It is not sufficient for government to allow contracts to be made in gold or gold coin. It is necessary for government to enforce specific performance of the contracts so that debtors must pay in the weight or value of the gold (or anything else) required in the contract, and not in some paper dollar equivalent decided by law or the courts.

uphold the constitutionality of the specific contracts act, but the California Supreme Court ruled in 1862 that greenbacks could not be accepted in state or county taxes, since the state constitution prohibited any acceptance of paper money for taxes.

The state of Oregon was quick to follow California's lead. Oregon's constitution had also outlawed banks of issue, and gold had for years been the exclusive currency. Two weeks after the agreement of the San Francisco merchants, the merchants of Salem, Oregon, unanimously backed gold as the monetary standard and refused to accept greenbacks at par. Two months later, the leading merchants of Portland agreed to accept greenbacks only at rates current in San Francisco; the merchants in the rest of the state were quick to follow suit. The Portland merchants issued a circular warning of a blacklist of all customers who insisted on settling their debts in greenbacks, and they would be quickly boycotted, and dealings with them would only be in cash.

Oregon deposit banks also refused to accept greenbacks, and the Oregon legislature followed California a year and a half later in passing a specific performance law. Oregon, too, refused to accept greenbacks in taxes and strengthened the law in 1864 by requiring that "all taxes levied by state, counties, or municipal corporations therein, shall be collected and paid in gold and silver coin of the United States and not otherwise."¹¹⁰

In the same year, the Oregon Supreme Court followed California in ruling that greenbacks could not constitutionally be received in payment of taxes.

The banking story during the Civil War is greatly complicated by the advent of the national banking system in the latter part of the war. But it is clear that the state banks, being able to suspend specie and to pyramid money and credit on top of the federal greenbacks, profited greatly by being able to expand during this period. Thus, total state bank notes and deposits were \$510 million in 1860, and by 1863 the amount rose to \$743 million, an increase in state bank demand liabilities in those three years of 15.2 percent per year.¹¹¹

It is no wonder, then, that contrary to older historical opinion, many state banks were enthusiastic about the greenbacks, which provided them with legal tender that could function as a reserve base

On California, see Bernard Moses, "Legal Tender Notes in California," *Quarterly Journal of Economics*, (October 1892): 1-25; Mitchell, *History of Greenbacks*, pp. 142-144. On Oregon, see James H. Gilbert, *Trade and Currency in Early Oregon* (New York: Columbia University Press, 1907), pp. 101-122.

¹¹¹ *Historical Statistics*, pp. 625, 648-649.

upon which they could expand. As Hammond puts it, “Instead of being curbed (as some people supposed later), the powers of the banks were augmented by the legal tender issues. As the issues increased, the deposits of the banks would increase.”¹¹² Indeed, Sen. Sherman (R-Ohio) noted that the state banks favored greenbacks. And the principal author of the greenback legislation, Rep. Elbridge G. Spaulding (R-N.Y.), the chairman of the House Ways and Means subcommittee that introduced the bill, was himself a Buffalo banker.

The total money supply of the country (including gold coin, state bank notes, subsidiary silver, U.S. currency including fractional and greenbacks) amounted to \$745.4 million in 1860. By 1863, the money supply had skyrocketed to \$1,435 billion, an increase of 92.5 percent in three years, or 30.8 percent per annum. By the end of the war, the money supply, which now included national bank notes and deposits, totalled \$1,773 billion, an increase in two years of 23.6 percent or 11.8 percent per year. Over the entire war, the money supply rose from \$45.4 million to \$1,773 billion, an increase of 137.9 percent, or 27.69 percent per annum.¹¹³

The response to this severe monetary inflation was a massive inflation of prices. It is no wonder that the greenbacks, depreciating rapidly in terms of gold, depreciated in terms of goods as well. Wholesale prices rose from 100 in 1860, to 210.9 at the end of the war, a rise of 110.9 percent or 22.2 percent per year.¹¹⁴

The Republican administration argued that their issue of greenbacks was required by stern wartime “necessity.” The spuriousness of this argument is seen by the fact that greenbacks were virtually not issued after the middle of 1863. There were three alternatives to the issuance of legal tender fiat money. 1) The government could have issued paper money but not made it legal tender; it would have depreciated even more rapidly. At any rate, they would have had quasi-legal tender status by being receivable in federal dues and taxes. 2) It could have increased taxes to pay for the war expenditures. 3) It could have issued bonds and other securities and sold the debt to banks and non-bank institutions. In fact, the

¹¹² Bray Hammond, *Sovereignty and an Empty Purse: Banks and Politics in the Civil War* (Princeton: Princeton University Press, 1970), pp. 246, 249-250. Also see North, “Greenback Dollars,” pp. 143-148.

¹¹³ *Historical Statistics*, pp. 625, 648-649. In a careful analysis North estimates the total money supply at approximately \$2 billion, and also points out that counterfeit notes in the Civil War have been estimated to amount to no less than one-third of the total currency in circulation. North, “Greenback Dollars,” p. 134. The counterfeiting estimates are in William P. Donlon, *United States Large Size Paper Money, 1861 to 1923*, 2nd ed. (Iola, Wis.: Krause, 1970), p. 15.

¹¹⁴ Ralph Andreano, ed., *The Economic Impact of the American Civil War* (Cambridge, Mass: Schenckman, 1961), p. 178.

government employed both the latter alternatives, and after 1863 stopped issuing greenbacks and relied on them exclusively, especially a rise in the public debt. The accumulated deficit piled up during the war was \$2,614 billion, of which the printing of greenbacks only financed \$431.7 million. Of the federal deficits during the war, greenbacks financed 22.8 percent in fiscal 1862, 48.5 percent in 1863, 6.3 percent in 1864, and none in 1865.¹¹⁵ This is particularly striking if we consider that the peak deficit came in 1865, totaling \$963.8 million. All the rest was financed by increased public debt. Taxes also increased greatly, revenues rising from \$52 million in 1862 to \$333.7 million in 1865. Tax revenues as a percentage of the budget rose from the miniscule 10.7 percent in fiscal 1862 to over 26 percent in 1864 and 1865.

It is clear, then, that the argument from “necessity” in the printing of greenbacks was specious, and indeed the greenback advocates conceded that it was perfectly possible to issue public debt, provided that the administration was willing to see the prices of its bonds rise and its interest payments rise considerably. At least for most of the war, they were not willing to take their chances in the competitive bond market.¹¹⁶

The Public Debt and the National Banking System

The public debt of the Civil War brought into American financial history the important advent of one Jay Cooke. The Ohio-born Cooke had joined the moderately successful Philadelphia investment banking firm of Clark and Dodge as a clerk at the age of 18. In a few years, Cooke worked himself up to the status of junior partner, and, in 1857, he left the firm to branch out on his own in canal and railroad promotion and other business ventures. There he doubtless would have remained, except for the lucky fact that he and his

¹¹⁵ The Confederacy, on the other hand, financed virtually all of its expenditures through mammoth printing of fiat paper, the Southern version of the greenback. Confederate notes, which were first issued in June 1861 to a sum of \$1.1 million, skyrocketed until the total supply of confederate notes in January 1864 was no less than \$826.8 million, an increase of 750.6 percent for three and a half years, or 214.5 percent per year. Bank notes and deposits in the Confederacy rose from \$119.3 million to \$268.1 million in this period, so that the total money supply rose from \$120.4 million to \$1,095 billion, or an increase of 1,060 percent—302.9 percent per year. Prices in the Eastern Confederacy rose from 100 in early 1861 to no less than over 4,000 in 1864, and 9,211 at the end of the war in April 1865. Thus, in four year, prices rose by 9,100 percent or an average of 2,275 percent per annum. See Eugene M. Lerner, “Inflation in the Confederacy, 1862-65,” in M. Friedman, ed., *Studies in the Quantity Theory of Money* (Chicago: University of Chicago Press, 1956), pp. 163-175; Lerner, “Money, Prices and Wages in the Confederacy, 1861-65,” in Andreano, *Economic Impact*, pp. 11-40.

¹¹⁶ Mitchell, *History of the Greenbacks*, pp. 61-74; 119f., 128-131. Also see Don C. Barrett, *The Greenbacks and Resumption of Specie Payments, 1862-1879* (Cambridge: Harvard University Press, 1931), pp. 25-57.

brother Henry, editor of the leading Republican newspaper in Ohio, the *Ohio State Journal*, were close friends of U.S. Sen. Salmon P. Chase. Chase, a veteran leader of the anti-slavery movement, fought for and lost the Republican Presidential nomination in 1860 to Abraham Lincoln. At that point, the Cookes determined that they would feather their nest by lobbying to make Salmon Chase Secretary of the Treasury. After heavy lobbying by the Cookes, the Chase appointment was secured, so Jay Cooke quickly set up his own investment banking house of Jay Cooke & Co.

Everything was in place; it now remained to seize the opportunity. As the Cookes' father wrote of Henry: "I took up my pen principally to say that H.S.'s [Henry's] plan in getting Chase into the Cabinet and [John] Sherman into the Senate is accomplished, and that now is the time for making money, by honest contracts out of the government."¹¹⁷

Now indeed was their time for making money, and Cooke lost no time in doing so. It did not take much persuasion, including wining and dining, for Cooke to induce his friend Chase to take an unprecedented step in the fall of 1862: granting the House of Cooke a monopoly on the underwriting of the public debt. With enormous energy, Cooke hurled himself into the task of persuading the mass of public to buy U.S. government bonds. In doing so, Cooke perhaps invented the art of public relations and of mass propaganda; certainly, he did so in the realm of selling bonds. As Kirkland writes:

With characteristic optimism, he [Cooke] flung himself into a bond crusade. He recruited a small army of 2,500 subagents among bankers, insurance men, and community leaders and kept them inspired and informed by mail and telegraph. He taught the American people to buy bonds, using lavish advertising in newspapers, broadsides, and posters. God, destiny, duty, courage, patriotism—all summoned "Farmers, Mechanics, and Capitalists" to invest in loans...¹¹⁸

—loans which of course they had to purchase from Jay Cooke.

And purchase the loans they did, for Cooke's bond sales soon reached the enormous figure of one to two million dollars a day. Perhaps \$2 billion in bonds were bought and underwritten by Jay Cooke during the war. Cooke lost his monopoly in 1864, under pressure of rival bankers; but a year later he was reappointed to keep that highly lucrative post until the House of Cooke crashed in the Panic of 1873.

¹¹⁸ Kirkland, *Industry*, pp. 20-21.

In the Civil War, Jay Cooke began as a moderately successful promoter; he emerged at war's end a millionaire, a man who had spawned the popular motto, "as rich as Jay Cooke." Surely he must have counted the \$100,000 he had poured into Salmon Chase's political fortunes by 1864 one of the most lucrative investments he had ever made. It is not surprising that Jay Cooke acquired enormous political influence in the Republican administration of the Civil War and after. Hugh McCulloch, Secretary of the Treasury from 1865 to 1869, was a close friend of Cooke's and when McCulloch left office he assumed the post of head of Cooke's London office. The Cooke brothers were also good friends of General Grant, so they wielded great influence during the Grant administration.

No sooner had Cooke secured the monopoly of government bond underwriting than he teamed up with his associates, Secretary of the Treasury Chase and Ohio's Senator John Sherman, to drive through a measure which was destined to have far more fateful effects than greenbacks on the American monetary system: the National Banking Acts. The National Banking Acts destroyed the previously decentralized and fairly successful state banking system, and substituted a new, centralized, and far more inflationary banking system under the aegis of Washington and a handful of Wall Street banks. Whereas the effects of the greenbacks were finally eliminated by the resumption of specie payments in 1879, the effects of the National Banking System are still with us. Not only was this system in place until 1913, but it paved the way for the Federal Reserve System by instituting a quasi-central banking type of monetary system. The "inner contradictions" of the National Banking System were such that the nation was driven either to go onward to a frankly central bank or else to scrap centralized banking altogether and go back to decentralized state banking. Given the inner dynamic of state intervention to keep intensifying, coupled with the almost universal adoption of statist ideology after the turn of the 20th century, which course the nation would take was unfortunately inevitable.

Chase and Sherman drove the new system through under cover of war necessity, but it was designed to alter the banking system permanently. The wartime ground was to set up national banks, which were so structured as to necessarily purchase large amounts of U.S. government bonds. Patterned after the "free" banking systems, this tied in the nation's banks with the federal government and the public debt in a close symbiotic relationship. The Jacksonian embarrassment of the independent treasury was de facto swept away, and the Treasury would now keep its deposits in a new series of "pets": the national banks, chartered directly by the federal

government. In this way, the Republican Party was able to use the wartime emergency to fulfill the Whig-Republican dream of a federally-controlled centralized banking system able to inflate the supply of money and credit in a uniform manner. Meshing with this was a profound political goal: As Sherman expressly pointed out, a vital object of the National Banking System was to eradicate the embarrassing doctrine of state's rights and to nationalize American politics.¹¹⁹

As established in the Bank Acts of 1863 and 1864, the National Banking System provided for the chartering of national banks by the Comptroller of the Currency in Washington, D.C. The banks were "free" in the sense that any institution meeting the requirements could obtain a charter, but the requirements were so high (from \$50,000 for rural banks to \$200,000 in the bigger cities) that small national banks were ruled out, particularly in the large cities.¹²⁰

The National Banking System created three sets of national banks: *central reserve city*, which was only New York; *reserve city*, other cities with over 500,000 population; and *country*, which included all other national banks.

Central reserve city banks were required to keep 25 percent of their notes and deposits in reserve of vault cash or "lawful money," which included gold, silver, and greenbacks. This provision incorporated the "reserve requirement" concept which had been a feature of the "free" banking system. Reserve city banks, on the other hand, were allowed to keep one-half of their required reserves in vault cash, while the other half could be kept as demand deposits (checking deposits) in central reserve city banks. Finally, country banks only had to keep a minimum reserve ratio of 15 percent to their notes and deposits; and only 40 percent of these reserves had to be in the form of vault cash. The other 60 percent of the country banks'

¹¹⁹ In his important work on Northern intellectuals and the Civil War, George Frederickson discusses an influential article by one Samuel Fowler written at the end of the war: "The Civil War which has changed the current of our ideas, and crowded into a few years the emotions of a lifetime,' Fowler wrote, 'has in measure given to the preceding period of our history the character of a remote state of political existence.' Fowler described the way in which the war, a triumph of nationalism and a demonstration of 'the universal tendency to combination,' had provided the *coup de grace* for the Jefferson philosophy of government with its emphasis on decentralization and the protection of local and individual liberties." George Frederickson, *The Inner Civil War: Northern Intellectuals and the Crisis of the Union* (New York: Harper & Row, 1965), p. 184. Also see Merrill D. Peterson, *The Jeffersonian Image in the American Mind* (New York: Oxford University Press, 1960), pp. 217-218.

¹²⁰ For a particularly lucid exposition of the structure of the national banking system, see John J. Klein, *Money and the Economy*, 2nd ed. (New York: Harcourt, Brace and World, 1970), pp. 140-147.

reserves could be in the form of demand deposits either at the reserve city or central reserve city banks.

The upshot of this system was to replace the individualized structure of the pre-Civil War state banking system by an inverted pyramid of country banks expanding on top of reserve city banks, which in turn expanded on top of New York City banks. Before the Civil War, every bank had to keep its own specie reserves, and any pyramiding of notes and deposits on top of that was severely limited by calls for redemption in specie by other, competing banks as well as by the general public. But now, reserve city banks could keep half of their reserves as deposits in New York City banks, and country banks could keep most of theirs in one or the other, so that as a result, all the national banks in the country could pyramid in two layers on top of the relatively small base of reserves in the New York banks. And furthermore, those reserves could consist of inflated greenbacks as well as specie.

A simplified schematic diagram can portray the essence of this revolution in American banking:

Figure 1 shows state banks in the decentralized system before the Civil War. Every bank must stand or fall on its bottom. It can pyramid notes and deposits on top of specie, but its room for such inflationary expansion is limited, because any bank's expansion will cause increased spending by its clients on the goods or services of other banks. Notes or checks on the expanding bank will go into the coffers of other banks, which will call on the expanding bank for redemption. This will put severe pressure on the expanding bank, which cannot redeem all of its liabilities as it is, and whose reserve ratio has declined, and so it will be forced to contract its loans and liabilities or else go under.

Figure 2

Figure 2 depicts the inverted pyramid of the National Banking System. New York City banks pyramid notes and deposits on top of specie and greenbacks; reserve city banks pyramid their notes and deposits on top of specie, greenbacks *and* deposits at New York City; and country banks pyramid on top of both. This means that, for example, if New York City banks inflate and expand their notes and deposits, they will not be checked by other banks calling upon them for redemption. Instead, reserve city banks will be able to expand their own loans and liabilities by pyramiding on top of their own increased deposits at New York banks. In turn, the country banks will be able to inflate their credit by pyramiding on top of their increased deposits at both reserve city and New York banks. The whole nation is able to inflate uniformly and relatively unchecked by pyramiding on top of a few New York City banks.

The national banks were not compelled to keep part of their reserves as deposits in larger banks, but they tended to do so—in the long run, so that they could expand uniformly on top of the larger banks, and in the short run because of the advantages of having a line of credit with a larger “correspondent” bank as well as earning interest on demand deposits at that bank.¹²¹

Let us illustrate in another way how the National Banking System pyramided by centralizing reserves. Let us consider the hypothetical balance sheets of the various banks.¹²² Suppose that the country banks begin with \$1 million in vault cash as their reserves. With the National Banking System in place, the country banks can

¹²¹ Banks generally paid interest on demand deposits until the practice was outlawed in 1934.

¹²² Adapted from Klein, *Money and the Economy*, pp. 144-145.

now deposit three-fifths, or \$600,000 of their cash in reserve city banks, in return for interest-paying demand deposits at those banks.

The balance-sheet changes are now as follows:

Country Banks	
Assets	Liabilities + Equity
Reserves	
Vault cash	-\$600,000
Deposits at reserve city banks	+\$600,000

Reserve City Banks	
Assets	Liabilities + Equity
Reserves	
Vault cash	+\$600,000
	Demand deposits due country banks
	+\$600,000

Total reserves for the two sets of banks have not changed. But now because the country banks can use as their reserves deposits in reserve city banks, the same total reserves can now be used by the banks to expand far more of their credit. For now \$400,000 in cash supports the same total of notes and deposits that the country banks had previously backed by \$1 million, and the reserve city banks can now expand \$2.4 million on top of the new \$600,000 in cash—or rather, \$1.8 million in addition to the \$600,000 due to the city banks. In short, country bank reserves have remained the same, but reserve city bank reserves have increased by \$600,000, and they can engage in 4:1 pyramiding of credit on top of that.

But that is not all. For the reserve city banks can deposit half of their reserves at the New York banks. When they do that, the balance sheets of the respective banks change as follows:

Reserve City Banks	
Assets	Liabilities + Equity
Reserves	
Vault cash	+\$300,000

Deposits at central reserve city banks	+ \$300,000	Demand deposits due country banks	+ \$600,000
--	-------------	---	-------------

Central Reserve City Banks

Assets		Liabilities + Equity	
Vault cash	+ \$300,000	Demand deposits due reserve city banks	+ \$300,000

Note that since the reserve city banks are allowed to keep half of their reserves in the central reserve city banks, the former can still pyramid \$2.4 million on top of their new \$600,000, and yet deposit \$300,000 in cash at the New York banks. The latter, then, can expand another 4:1 on top of the new cash of \$300,000, or increase their total notes and deposits to \$1.2 million.

In short, not only did the national banking system allow pyramiding of the entire banking structure on top of a few large Wall Street banks, the very initiating of the system allowed a multiple expansion of all bank liabilities by centralizing a large part of the nation's cash reserves from the individual state banks into the hands of the larger, and especially the New York, banks. For the expansion of \$1.2 million on top of the new \$300,000 at New York banks served to expand the liabilities going to the smaller banks, which in turn could pyramid on top of their increased deposits. But even without that further expansion, \$1 million which, we will assume, originally supported \$6 million in notes and deposits, will now support, in addition to that \$6 million, \$2.4 million issued by the reserve city banks, and \$1.2 million by the New York banks—to say nothing of further expansion by the latter two sets of banks which will allow country banks to pyramid more liabilities.

In June 1874, the fundamental structure of the National Banking System was changed when Congress, as part of an inflationist move after the Panic of 1873, eliminated all reserve requirements on notes, keeping them only on deposits. This released over \$20 million of lawful money from bank reserves, and allowed a further pyramiding of demand liabilities.¹²³ In the long run, it severed the treatment of notes from deposits, with notes tied rigidly to bank holdings of government debt, and demand deposits pyramiding on top of reserve ratios in specie and greenbacks.

¹²³ See Hepburn, *History of Currency*, pp. 317-318.

But this centralized inverse pyramiding of bank credit was not all. For, in a way modeled by the “free” banking system, every national bank’s expansion of notes was tied intimately to its ownership of U.S. government bonds. Every bank could only issue notes if it deposited an equivalent of U.S. securities as collateral at the U.S. Treasury,¹²⁴ so that national banks could only expand their notes to the extent that they purchased U.S. government bonds. This provision tied the National Banking System intimately to the federal government, and more particularly, to its expansion of public debt. The federal government had an assured, built-in market for its debt, and the more the banks purchased that debt, the more the banking system could inflate. Monetizing the public debt was not only inflationary per se, it provided the basis—when done by the larger city banks—of other banks pyramiding on top of their own monetary expansion.

The tie-in and the pyramiding process were cemented by several other provisions. Every national bank was obliged to redeem the obligations of every other national bank at par. Thus, the severe market limitation on the circulation of inflated notes and deposits—depreciation as the distance from the bank increases—was abolished. And while the federal government could not exactly make the notes of a private bank legal tender, it conferred quasi-legal tender status on every national bank by agreeing to receive all its notes and deposits at par for dues and taxes.¹²⁵ It is interesting and even heartening to discover that despite these enormous advantages conferred by the federal government, national bank notes fell below par with greenbacks in the financial crisis of 1867, and a number of national banks failed the next year.¹²⁶

Genuine redeemability, furthermore, was made very difficult under the National Banking System. Laxity was insured by the fact that national banks were required to redeem the notes and deposits of every other national bank at par, and yet it was made difficult for them to actually redeem those liabilities in specie; for one of the problems with the pre-Civil War state banking system is that interstate or even intrastate branches were illegal, thereby hobbling the clearing system for swiftly redeeming another bank’s notes and deposits. One might think that a national banking system would at least eliminate this problem, but on the contrary, branch banking

¹²⁴ Originally, national banks could only issue notes to the value 90 percent of their U.S. government bonds. This limitation was changed to 100 percent in 1900.

¹²⁵ Except, of course, as we have seen with the greenbacks, for payment of customs duties, which had to be paid in gold, to build up a fund to pay interest on the government debt in gold.

¹²⁶ See Smith, *Rationale*, p. 48.

continued to be prohibited, and interstate branch banking is illegal to this day.¹²⁷ A bank would only have to redeem its notes at its own counter in its home office. Furthermore, the redemption of notes was crippled by the fact that the federal government imposed a maximum limit of \$3 million a month by which national bank notes could be contracted.¹²⁸

Reserve requirements are now considered a sound and precise way to limit bank credit expansion, but the precision can work two ways. Just as government safety codes can decrease safety by setting a lower limit for safety measures and inducing private firms to reduce safety downward to that common level, so reserve requirements can and ordinarily do serve as lowest common denominators for bank reserve ratios. Free competition can and generally will result in banks voluntarily keeping higher reserve ratios. But a uniform legal requirement will tend to push all the banks down to that minimum ratio. And indeed we can see this now in the universal propensity of all banks to be “fully loaned up,” that is, to expand as much as is legally possible up to the limits imposed by the legal reserve ratio. Reserve requirements of less than 100 percent are more an inflationary than a restrictive monetary device.

The National Banking System was intended to replace the state banks, but many state banks continued aloof and refused to join, despite the special privileges accorded to the national banks. The reserve and capital requirements were more onerous, and at that period, national banks were prohibited from making loans on real estate. With the state banks refusing to come to heel voluntarily, Congress, in March 1865, completed the Civil War revolution of the banking system by placing a prohibitive 10 percent tax on all bank notes—which had the desired effect of virtually outlawing all note issues by the state banks. From 1865 on, the national banks had a legal monopoly on the issue of bank notes.

At first, the state banks contracted and disappeared under the shock, and it looked as if the United States would only have national banks. The number of state banks fell from 1,466 in 1863 to 297 in 1866, and total notes and deposits in state banks fell from \$733 million in 1863 to only \$101 million in 1866. After several years, however, the state banks readily took their place as an expanding element in the banking system, albeit subordinated to the national banks. In order to survive, the state banks had to keep deposit accounts at national banks, from whom they could “buy” national bank notes in order to redeem their deposits. In short, the state banks

¹²⁷ [Interstate branch banking was legalized in the late 1990s.]

¹²⁸ See Smith, *Rationale*, p. 132.

now became the fourth layer of the national pyramid of money and credit, on top of the country and other banks, for the reserves of the state banks became, in addition to vault cash, demand deposits at national banks, which they could redeem in cash. The multi-layered structure of bank inflation under the National Banking System was intensified.

In this new structure, the state banks began to flourish. By 1873, the total number of state banks had increased to 1,330, and their total deposits were \$789 million.¹²⁹

The Cooke-Chase connection with the new National Banking System was simple. As Secretary of the Treasury, Chase wanted an assured market for the government bonds that were being issued so heavily during the Civil War. And as the monopoly underwriter of U.S. government bonds for every year except one from 1862 to 1873, Jay Cooke was even more directly interested in an assured and expanding market for his bonds. What better method of obtaining such a market than creating an entirely new banking system, the expansion of which was directly tied to the banks' purchase of government bonds—from Jay Cooke?

The Cooke brothers played a major role in driving the National Banking Act of 1863 through a reluctant Congress. The Democrats, devoted to hard-money, opposed the legislation almost to a man. Only a majority of Republicans could be induced to agree on the bill. After John Sherman's decisive speech in the Senate for the measure, Henry Cooke—now head of the Washington Office of the House of Cooke—wrote jubilantly to his brother: "It will be a great triumph, Jay, and one to which we have contributed more than any other living man. The bank had been repudiated by the House, and was without a sponsor in the Senate, and was thus virtually dead and buried when I induced Sherman to take hold of it, and we went to work with the newspapers."¹³⁰

Going to work with the newspapers meant something more than mere persuasion for the Cooke brothers; as monopoly underwriter of government bonds, Cooke was paying the newspapers large sums for advertising, and so the Cookes thought—as it turned out correctly—that they could induce the newspapers to grant them an enormous amount of free space "in which to set forth the merits of the new national banking system." Such space meant not only publicity and articles, but even more important, the fervent editorial support of most of the nation's press. And so the press, implicitly bought for the

¹²⁹ *Historical Statistics*, pp. 628-629.

¹³⁰ Quoted in Robert P. Sharkey, *Money, Class and Party: An Economic Study of Civil War and Reconstruction* (Baltimore: Johns Hopkins Press, 1959), p. 245.

occasion, kept up a drumfire of propaganda for the new National Banking System. As Cooke himself related: “For six weeks or more nearly all the newspapers in the country were filled with our editorials [written by the Cooke brothers] condemning the state bank system and explaining the great benefits to be derived from the national banking system now proposed.” And every day the indefatigable Cookes put on the desks of every Congressman the relevant editorials from newspapers in their respective districts.¹³¹

While many state bankers, especially the conservative old-line New York bankers, opposed the National Banking System, Jay Cooke, once the system was in place, plunged in with a will. Not only did he sell the national banks their required bonds, he also set up new national banks which would have to buy his government securities. His agents formed national banks in the smaller towns of the South and West. Furthermore, he set up his own two large national banks, the First National Bank of Philadelphia and the First National Bank of Washington, D.C.

But the National Banking System was in great need of a mighty bank in New York City to serve as the base of the inflationary pyramid for a host of country and reserve city banks. Shortly after the inception of the system, three national banks had been organized in New York, but none of them was large or prestigious enough to serve as the key fulcrum of the new banking structure. Jay Cooke, however, was happy to oblige, and he quickly established the Fourth National Bank of New York, capitalized at a huge \$5 million. After the war, Jay Cooke favored resumption of specie payments, but only if greenbacks could be replaced one-to-one by new national bank notes. In his unbounded enthusiasm for national bank notes and their dependence on the federal debt, Cooke urged repeal of the \$300 million legal limit on national bank note issue. In 1865, he published a pamphlet proclaiming that in less than 20 years national bank note circulation would total \$1 billion.¹³² The title of the pamphlet Cooke published is revealing: *How Our National Debt May Be A National Blessing. The Debt is Public Wealth, Political Union, Protection of Industry, Secure Basis for National Currency.*¹³³

By 1866, it was clear that the National Banking System had replaced the state as the center of the monetary system of the United States. Only a year earlier, in 1865, state bank notes had totaled \$142.9 million; by 1866 they had collapsed to \$20 million. On the

¹³¹ See Hammond, *Sovereignty*, pp. 289-290.

¹³² Actually, Cooke erred, and national bank notes never reached that total. Instead, it was demand deposits that expanded, and reached the billion-dollar mark by 1879.

¹³³ See Sharkey, *Money, Class, and Party*, p. 247.

other hand, national bank notes grew from a mere \$31.2 million in 1864, their first year of existence, to \$276 million in 1866. And while, as we have seen, the number of state banks in existence was falling drastically from 1,466 to 297, the number of national banks grew from 66 in 1863 to 1,634 three years later.

The Post-Civil War Era: 1865-1879

The United States ended the war with a depreciated inconvertible greenback currency, and a heavy burden of public debt. The first question on the monetary agenda was what to do about the greenbacks. A powerful group of industrialists calling for continuation of greenbacks, opposing resumption and, of course, any contraction of money to prepare for specie resumption, was headed by the Pennsylvania iron and steel manufacturers. The Pennsylvania ironmasters, who had been in the forefront of the organized protective tariff movement since its beginnings in 1820,¹³⁴ were led here and instructed by their intellectual mentor—himself a Pennsylvania ironmaster—the elderly economist Henry C. Carey. Carey and his fellow iron manufacturers realized that during an inflation, since the foreign exchange market anticipates further inflation, domestic currency tends to depreciate faster than domestic prices are rising. A falling dollar and rising price of gold, they realized, make domestic prices cheaper and imported prices higher, and hence functions as a surrogate tariff. A cheap money, inflationist policy, then, could not only provide easy credit for manufacturing, it could also function as an extra tariff because of the depreciation of the dollar and the rise in the gold premium.

Imbibers of the Carey gospel of high tariffs and soft money were a host of attendees at the famous “Carey Vespers”—evenings of discussion of economics and politics. Influential Carey disciples included economist and Pennsylvania ironmaster Stephen Colwell; Eber Ward, president of the Iron and Steel Association; John A. Williams, editor of the Association’s journal *Iron Age*; Rep. Daniel Morrell, Pennsylvania iron manufacturer; I. Smith Homans, Jr., editor of the *Bankers’ Magazine*; and the powerful Rep. William D. Kelley of Pennsylvania, whose lifelong devotion to the interest of the ironmasters earned him the proud sobriquet of “Old Pig Iron.” The Carey circle also dominated the American Industrial League and its successor, the Pennsylvania Industrial League, which spread the Carey doctrines of protection and paper money. Influential allies in Congress, if not precisely Carey followers, were the radical leader

¹³⁴ The leader of the protectionists in Congress in 1820 was Rep. Henry Baldwin, a leading iron manufacturer from Pittsburgh. Rothbard, *Panic of 1819*, pp. 164ff.

Rep. Thaddeus Stevens, himself a Pennsylvania ironmaster, and Rep. John A. Griswold, an ironmaster from New York.

Also sympathetic to greenbacks were many manufacturers who desired cheap credit, gold speculators who were betting on higher gold prices, and railroads, who as heavy debtors to their bondholders, realized that inflation benefits debtors by cheapening the dollar whereas it also tends to expropriate creditors by the same token. One of the influential Carey disciples, for example, was the leading railroad promoter, the Pennsylvanian Thomas A. Scott, leading entrepreneur of the Pennsylvania and Texas & Pacific Railroads.¹³⁵

One of the most flamboyant advocates of greenback inflation in the post-war era was the Wall Street stock speculator Richard Schell. In 1874, Schell became a member of Congress, where he proposed an outrageous pre-Keynesian scheme in the spirit of Keynes' later dictum that so long as money is *spent*, it doesn't matter what the money is spent on, be it pyramid-building or digging holes in the ground.¹³⁶ Schell seriously urged the federal government to dig a canal from New York to San Francisco, financed wholly by the issue of greenbacks. Schell's enthusiasm was perhaps matched only by the notorious railroad speculator and economic adventurer George Francis Train, who called repeatedly for immense issues of greenbacks. "Give us greenbacks we say," Train thundered in 1867, "and build cities, plant corn, open coal mines, control railways, launch ships, grow cotton, establish factories, open gold and silver mines, erect rolling mills. ... Carry my resolution and there is sunshine in the sky."¹³⁷

The Panic of 1873 was a severe blow to many overbuilt railroads, and it was railroad men who led in calling for more greenbacks to stem the tide. Thomas Scott, Collis P. Huntington, leader of the Central Pacific Railroad, Russel Sage, and other railroad men joined in the call for greenbacks. So strong was their influence that the *Louisville Courier-Journal*, in April 1874, declared: "The strongest

¹³⁵ On the Carey circle and its influence, see Irwin Unger, *The Greenback Era: A Social and Political History of American Finance, 1865-1879* (Princeton: Princeton University Press, 1964), pp. 53-59; and Joseph Dorfman, *The Economic Mind in American Civilization, Vol. III, 1864-1918* (New York: Viking Press, 1949), pp. 7-8. Dorfman notes that Kelley dedicated his collected *Speeches, Addresses and Letters* of 1872 to "The Great Master of Economic Science, the Profound Thinker, and the Careful Observer of Social Phenomena, My Venerable Friend and Teacher, Henry C. Carey." *Ibid.*, p. 8. On the link between high tariffs and greenbacks for the Pennsylvania ironmasters, see Sharkey, *Money, Class and Party*, chap. 4.

¹³⁶ Thus, Keynes wrote: " 'To dig holes in the ground,' paid for out of savings will increase, not only employment, but the real national dividend of useful goods and services." John Maynard Keynes, *The General Theory of Employment Interest and Money* (New York: Harcourt, Brace, 1936), p. 220. On pyramid-building, see *ibid.*, pp. 220 and 131.

¹³⁷ Unger, *Greenback Era*, pp. 45-48.

influence at work in Washington upon the currency proceeded from the railroads. ... The great inflationists after all, are the great trunk railroads.”¹³⁸

The greenback problem after the Civil War was greatly complicated by the massive public debt that lay over the heads of the American people. A federal debt, which had tallied only \$64.7 million in 1860, amounted to the huge amount of \$2.32 billion in 1866. Many ex-Jacksonian Democrats, led by Sen. George H. Pendleton of Ohio, began to agitate for further issue of greenbacks *solely* for the purpose of redeeming the principal of federal debts contracted in greenbacks during the war.¹³⁹ In a sense, then, hard-money hostility to both inflation and the public debt were now at odds. In a sense, the Pendletonians were motivated by a sense of poetic justice, of paying inflated debts in inflated paper, but in doing so they lost sight of the broader hard money goal.¹⁴⁰ This program confused the party struggles of the post-Civil War period, but ultimately it is safe to say that the Democrats had a far greater proportion of congressmen devoted to hard money and to resumption than did the Republicans. Thus, Secretary of the Treasury Hugh McCulloch's "Loan Bill" of March 1866, which provided for contraction of greenbacks in preparation for resumption of specie payments, was passed in the House by a Republican vote of 56-52, and a Democratic vote of 27-1. And in April 1874, the "Inflation Bill," admittedly vetoed later by President Grant, which provided for expansion of greenbacks and of national bank notes, was passed in the House by a Republican vote of 105 to 64, while the Democrats voted against by the narrow margin of 35 to 37.¹⁴¹

In the meantime, despite repeated resolutions for resumption of specie payments in 1865 and 1869, the dominant Republican Party continued to do nothing for actual resumption. The Pendleton Plan was adopted by the Democrats in their 1868 platform, and the Republican victory in the presidential race that year was generally taken as a conclusive defeat for that idea. Finally, however, the Democratic sweep in the congressional elections of 1874 forced the Republicans into a semblance of unity on monetary matters, and, in

¹³⁸ *Ibid.*, p. 222.

¹³⁹ The federal government had contracted to redeem the *interest* on the wartime public debt in gold, but nothing was contracted about the repayment of the principal.

¹⁴⁰ Similar motivations had impelled many hard-money anti-Federalists during the 1780s to advocate the issue of state paper money for the sole purpose of redeeming swollen wartime public debts.

¹⁴¹ On the McCulloch Loan Bill, see Sharkey, *Money, Class, and Party*, p. 75; on the Inflation Bill, see Unger, *Greenback Era*, p. 410.

the lame-duck congressional session led by Sen. John Sherman, they came up with the Resumption Act of January 1875.

Despite the fact that the Resumption Act ultimately resulted in specie resumption, it was not considered a hard-money victory by contemporaries. Sherman had forged a compromise between hard and soft money forces. It is true that the U.S. government was supposed to buy gold with government bonds to prepare for resumption on January 1, 1879. But this resumption was four years off, and Congress had expressed intent to resume several times before. And in the meantime, the soft-money men were appeased by the fact that the bill immediately eliminated the \$300 million limit on national bank notes, in a provision known as “free banking.” The only hard-money compensation was an 80 percent pro-rata contraction of greenbacks to partially offset any new national bank notes.¹⁴² The bulk of the opposition to the Resumption Act was by hard-money congressmen, who, in addition to pointing out its biased ambiguities, charged that the contracted greenbacks could be reissued instead of retired. Hard-money forces throughout the country had an equally scornful view of the Resumption Act. In a few years, however, they rallied as resumption drew near.

That the Republicans were generally less than enthusiastic about specie resumption was revealed by the Grant administration’s reaction to the Supreme Court’s decision in the first legal tender case. After the end of the war, the question of the constitutionality of legal tender came before the courts (we have seen that the California and Oregon courts decided irredeemable paper to be unconstitutional). In the large number of state court decisions on greenbacks before 1870, every Republican judge but one upheld their constitutionality, whereas every Democratic judge but two declared them unconstitutional.¹⁴³

The greenback question reached the U.S. Supreme Court in 1867, and was decided in February 1870, in the case of *Hepburn v. Griswold*. The Court held, by a vote of 5 to 3, with all the Democratic judges voting with the majority and the Republicans in the minority. Chief Justice Salmon P. Chase, who delivered the decision denouncing his own action as Secretary of the Treasury as unnecessary and unconstitutional, had swung back to the Democratic

¹⁴² This political and compromise interpretation of the Resumption Act successfully revises the previous hard-money view of this measure. See Unger, *Greenback Era*, pp. 249-263.

¹⁴³ See Charles Fairman, “Mr. Justice Bradley’s Appointment to the Supreme Court and the Legal Tender Cases,” *Harvard Law Review* (May 1941), p. 1131; cited in Unger, *Greenback Era*, p. 174.

Party and had actually been a candidate for the presidential nomination at the 1868 convention.

The Grant administration was upset by *Hepburn v. Griswold*, as were the railroads, who had accumulated a heavy long-term debt, which would now be payable in more valuable gold. As luck would have it, however, there were two vacancies on the Court, one of which was created by the retirement of one of the majority judges. Grant appointed not only two Republican judges, but two railroad lawyers whose views on the subject were already known.¹⁴⁴ The new 5-4 majority dutifully and quickly reconsidered the question, and, in May 1871, reversed the previous Court in the fateful decision of *Knox v. Lee*. From then on, paper money would be held consonant with the U.S. Constitution.

The National Banking System was ensconced after the Civil War. The number of banks, national bank notes, and deposits all pyramided upward, and after 1870 state banks began to boom as deposit-creating institutions. With lower requirements and fewer restrictions than the national banks, they could pyramid on top of national banks. The number of national banks increased from 1,294 in 1865 to 1,968 in 1873, while the number of state banks rose from 349 to 1,330 in the same period. Total state and national bank notes and deposits rose from \$835 million in 1865 to \$1,964 billion in 1873, an increase of 135.2 percent or an increase of 16.9 percent per year. The following year, the supply of bank money leveled off as the Panic of 1873 struck and caused numerous bankruptcies. As a general overview of the national banking period, we can agree with Klein that “The financial panics of 1873, 1884, 1893, and 1907 were in large part an outgrowth of ... reserve pyramiding and excessive deposit creation by reserve city and central reserve city banks. These panics were triggered by the currency drains that took place in periods of relative prosperity when banks were loaned up.”¹⁴⁵ And yet it must be pointed out that the total money supply, even merely the supply of bank money, did not decrease after the Panic, but merely leveled off.

¹⁴⁴ The first new justice, William Strong of Pennsylvania, had been a top attorney for the Philadelphia and Reading Railroad, and a director of the Lebanon Valley Railroad. The second jurist, Joseph P. Bradley, was a director of the Camden and Amboy Railroad and of the Morris and Essex Railroad, in New Jersey. On the railroad ties of Strong and Bradley, see Philip H. Burch, Jr., *Elites in American History, Vol. II, The Civil War to the New Deal* (New York: Holmes & Meier, 1981), pp. 44-45. On the reaction of the Grant administration, see Unger, *Greenback Era*, pp. 172-178. For a legal analysis of the decisions, see Hepburn, *History of Currency*, pp. 254-264; and Henry Mark Holzer, ed., *Government's Money Monopoly* (New York: Books in Focus, 1981), pp. 99-168.

¹⁴⁵ Klein, *Money and the Economy*, pp. 145-146.

Orthodox economic historians have long complained about the “Great Depression” that is supposed to have struck the United States in the Panic of 1873 and lasted for an unprecedented six years in 1879. Much of this stagnation is supposed to have been caused by a monetary contraction leading to the resumption of specie payments in 1879. Yet what sort of “depression” is it which saw an extraordinarily large expansion of industry, of railroads, of physical output, of net national product, or real per capita income? As Friedman and Schwartz admit, the decade 1869 to 1879 saw a 3.0 percent per annum increase in money national product, an outstanding real national product growth of 6.8 percent per year in this period, and a phenomenal rise of 4.5 percent per year in real product per capita. Even the alleged “monetary contraction” never took place, the money supply increasing by 2.7 percent per year in this period. From 1873-1878, before another spurt of monetary expansion, the total supply of bank money rose from \$1,964 billion to \$2,221 billion—a rise of 13.1 percent or 2.6 percent per year. In short, a modest but definite rise, and scarcely a *contraction*.

It should be clear, then, that the Great Depression of the 1870s is merely a myth—a myth brought about by the misinterpretation of the fact that prices in general fell sharply during the entire period. Indeed they fell from the end of the Civil War until 1879. Friedman and Schwartz estimated that prices in general fell from 1869 to 1879 by 3.8 percent per annum. Unfortunately, most historians and economists are conditioned to believe that steadily and sharply falling prices *must* result in depression: hence their amazement at the obvious prosperity and economic growth during this era. For they have overlooked the fact that in the natural course of events, when government and the banking system do not increase the money supply very rapidly, free-market capitalism will result in an increase of production and economic growth so great as to swamp the increase of money supply. Prices will fall, and the consequences will be not depression or stagnation, but prosperity (since costs are falling, too) economic growth, and the spread of the increased living standard to all the consumers.¹⁴⁶

Indeed, recent research has discovered that the analogous “Great Depression” in England in this period was also a myth, and due to a confusion between a contraction of prices and its alleged inevitable

¹⁴⁶ For the bemusement of Friedman and Schwartz, see Milton Friedman and Anna Jacobson Schwartz, *A Monetary History of the United States, 1867-1960* (New York: National Bureau of Economic Research, 1963), pp. 33-44. On totals of bank money, see *Historical Statistics*, pp. 624-625.

effect on a depression of prices and its alleged inevitable effect on a depression of business activity.¹⁴⁷

It might well be that the major effect of the Panic of 1873 was, not to initiate a Great Depression, but to cause bankruptcies in overinflated banks and in railroads riding on the tide of vast government subsidy and bank speculation. In particular, we may note Jay Cooke, one of the creators of the National Banking System and paladin of the public debt. In 1866, he favored contraction of the greenbacks and early resumption because he feared that inflation would destroy the value of government bonds. By the late 1860s, however, the House of Cooke was expanding everywhere, and in particular, had gotten control of the new Northern Pacific Railroad. Northern Pacific had been the recipient of the biggest federal largesse to railroads during the 1860s: a land grant of no less than 47 million acres. Cooke sold Northern Pacific bonds as he had learned to sell government securities: hiring pamphleteers to write propaganda about the alleged Mediterranean climate of the Northwest. Many leading government officials and politicians were on the Cooke/Northern Pacific payroll, including President Grant's private secretary, Gen. Horace Porter.

In 1869, Cooke expressed his monetary philosophy in keeping with his enlarged sphere of activity: "Why," he asked, "should this Grand and Glorious Country be stunted and dwarfed—its activities chilled and its very life blood curdled by these miserable 'hard coin' theories—the musty theories of a bygone age—These men who are urging on premature resumption know nothing of the great and growing west which would grow twice as fast if it was not cramped for the means necessary to build railroads and improve farms and convey the produce to market." But in 1873, a remarkable example of poetic justice struck Jay Cooke. The overbuilt Northern Pacific was crumbling, and a Cooke government bond operation provided a failure. So the mighty House of Cooke—"stunted and dwarfed" by the market economy—crashed and went bankrupt, touching off the Panic of 1873.¹⁴⁸

After passing the Resumption Act in 1875, the Republicans finally stumbled their way into resumption in 1879, fully 14 years after the end of the Civil War. The money supply did not contract in the late 1870s because the Republicans did not have the will to contract in order to pave the way for resumption. Resumption was finally achieved after substantial sales of U.S. bonds for gold in Europe by Secretary of the Treasury Sherman.

¹⁴⁸ Unger, *Greenback Era*, pp. 46-47, 221.

Return to the gold standard in 1879 was almost blocked, in the last three years before resumption, by the emergence of a tremendous agitation, heavily in the West but also throughout the country, for the free coinage of silver. The United States mint ratios had been undervaluing silver since 1834, and in 1853 de facto gold monometallism was established because silver was so far undervalued as to drive fractional silver coins out of the country. Since 1853, the United States, while de jure on a bimetallic standard at 16:1, with the silver dollar still technically in circulation though nonexistent, was actually on a gold monometallic standard with lightweight subsidiary silver coins for fractional use.

In 1872, it became apparent to a few knowledgeable men at the U.S. Treasury that silver, which had held at about 15.5 to 1 since the early 1860s, was about to suffer a huge decline in value. The major reason was the realization that European nations were shifting from a silver to a gold standard, thereby decreasing their demand for silver. A subsidiary reason was the discovery of silver mines in Nevada and other states in the West. Working rapidly, these Treasury men, along with Sen. Sherman, slipped through Congress in February 1873 a seemingly innocuous bill which in effect discontinued the minting of any further silver dollars. This was followed by an act of June 1874, which completed the demonetization of silver by ending the legal tender quality of all silver dollars above the sum of \$5. The timing was perfect, since it was in 1874 that the market value of silver fell to greater than 16:1 to gold for the first time. From then on, the market price of silver fell steadily, declining to nearly 18:1 in 1876, over 18:1 in 1879, and reaching the phenomenal level of 32:1 in 1894.

In short, after 1874 silver was no longer undervalued but overvalued, and increasingly so, in terms of gold, at 16:1. Except for the acts of 1873 and 1874, labeled by the pro-silver forces as “The Crime of 1873,” silver would have flowed into the United States, and the country would have been once again on a de facto monometallic silver standard. The champions of greenbacks, the champions of inflation, saw a “hard-money” way to increase greatly the amount of American currency: the remonetization of a flood of new overvalued silver. The agitation was to remonetize silver by “the free and unlimited coinage of silver at 16 to 1.”

It should be recognized that the silverites had a case. The demonetization of silver was a “crime” in the sense that it was done shiftily, deceptively, by men who knew that they wanted to demonetize silver before it was too late and have silver replace gold. The case for gold over silver was a strong one, particularly in an era

of rapidly falling value of silver, but it should have been made openly and honestly. The furtive method of demonetizing silver, the “crime against silver,” was in part responsible for the vehemence of the silver agitation for the remainder of the century.¹⁴⁹

Ultimately, the administration was able to secure the resumption of payments in gold, but at the expense of submitting to the Bland-Allison Act of 1878, which mandated that the Treasury purchase \$2-\$4 million of silver per month from then on.

It should be noted that this first silver agitation of the late 1870s, at least, cannot be considered an “agrarian” or a particularly Southern and Western movement. The silver agitation was broadly based throughout the nation, except in New England, and was, moreover, an urban movement. As Weinstein points out:

Silver began as an urban movement, furthermore, not an agrarian crusade. Its original strongholds were the large towns and cities of the Midwest and middle Atlantic states, not the country's farming communities. The first batch of bimetallist leaders were a loosely knit collection of hard money newspaper editors, businessmen, academic reformers, bankers, and commercial groups.¹⁵⁰

With the passage of the Silver Purchase Act of 1878, silver agitation died out in America, to spring out again in the 1890s.

The Gold Standard Era with the National Banking System, 1879-1913

The record of 1879-1896 is very similar to the first stage of the alleged Great Depression from 1873 to 1879. Once again, we have a phenomenal expansion of American industry, production, and real output per head. Real reproducible, tangible wealth per capita rose at the decadal peak in American history in the 1880s, at 3.8 percent per annum. Real net national product rose at the rate of 3.7 percent per year from 1879 to 1897, while per capita net national product increased by 1.5 percent per year.

Once again, orthodox economic historians are bewildered, for there should have been a Great Depression, since prices fell at a rate of over 1 percent per year in this period. Just as in the previous period, the money supply grew, but not fast enough to overcome the great increase in productivity and the supply of products. The major difference in the two periods is that money supply rose more rapidly from 1879-1897, by 6 percent per year, compared with the 2.7 percent

¹⁴⁹ For the best discussion of the crime against silver, see Allen Weinstein, *Prelude to Populism: Origins of the Silver Issue, 1867-1878* (New Haven: Yale University Press, 1970), pp. 8-32. Also see Paul M. O'Leary, “The Scene of the Crime of 1873 Revisited: A Note,” *Journal of Political Economy* 68 (1960): 388-392.

¹⁵⁰ Weinstein, *Prelude to Populism*, p. 356.

per year in the earlier era. As a result, prices fell by less, by over 1 percent per annum as contrasted to 3.8 percent. Total bank money, notes and deposits, rose from \$2.45 billion to \$6.06 billion in this period, a rise of 10.45 percent per annum—surely enough to satisfy all but the most ardent inflationists.¹⁵¹

For those who persist in associating a gold standard with deflation, it should be pointed out that price deflation in the gold standard 1879-1897 period was considerably less than price deflation from 1873 to 1879, when the United States was still on a fiat greenback standard.

After specie resumption occurred successfully in 1879, the gold premium to greenbacks fell to par and the appreciated greenback promoted confidence in the gold-backed dollar. More foreigners willing to hold dollars meant an inflow of gold into the United States and greater American exports. Some historians have attributed the boom of 1879-1882, culminating in a financial crisis in the latter year, to the inflow of gold coin in the U.S., which rose from \$110.5 million in 1879 to \$358.3 million in 1882.¹⁵² In a sense this is true, but the boom would never have taken on considerable proportions without the pyramiding of the national banking system, the deposits of which increased from \$2,149 billion in 1879 to \$2,777 billion in 1882, a rise of 29.2 percent, or 9.7 percent per annum. Wholesale prices were driven up from 90 in 1879 to 108 three years later, a 22.5 percent increase, before resuming their long-run downward path.

A financial panic in 1884, coming during a mild contraction after 1882, lowered the supply of bank money in 1884. Total bank notes and deposits dropped slightly, from \$3.19 billion in 1883 to \$3.15 billion the following year. The panic was triggered by an overflow of gold abroad, as foreigners began to lose confidence in the willingness of the United States to remain on the gold standard. This understandable loss of confidence resulted from the inflationary sop to the pro-silver forces in the Bland-Allison Silver Purchase Act of 1878. The shift in Treasury balances from gold to silver struck a disquieting note in foreign financial circles.¹⁵³

Before examining the critical decade of the 1890s, it is well to point out in some detail the excellent record of the first decade after the return to gold, 1879-1889.

America went off the gold standard in 1861 and remained off after the war's end. Arguments between hard-money advocates who

¹⁵¹ Friedman and Schwartz, *Monetary History*, pp. 91-93; *Historical Statistics*, p. 625.

¹⁵² Friedman and Schwartz, *Monetary History*, pp. 98-99.

¹⁵³ See Rendigs Fels, *American Business Cycle, 1865-1897* (Chapel Hill, N.C.: University of North Carolina Press, 1959), pp. 130-131.

wanted to eliminate unbacked greenbacks and soft-money men who wanted to increase them raged through the 1870s until the Grant administration decided in 1875 to resume redemption of paper dollars into gold at pre-war value on the first day of 1879. At the time (1875) greenbacks were trading at a discount of roughly 17 percent against the pre-war gold dollar. A combination of outright paper-money deflation and increase in official gold holdings enabled a return to gold four years later, which set the scene for a decade of tremendous economic growth.

Economic recordkeeping a century ago was not nearly as well developed as today, but a clear picture comes through nonetheless. The *Encyclopedia of American Economic History* calls the period under review “one of the most expansive in American history. Capital investment was high; ... there was little unemployment; and the real costs of production declined rapidly.”

Prices, Wages, and Real Wages

This is shown most graphically with a look at wages and prices during the decade before and after convertibility. While prices fell during the 1870s and 1880s, wages fell only during the greenback period, and rose from 1879 to 1889.

Wholesale Price Index

(1910-1914 = 100)

Year	Index	% change
1869	151	—
1879	90	-40.4%
1889	81	-10.0%

Consumer Price Index

1869	138	—
1879	97	-28.8%
1889	93	-4.2%

Wages

(1900-1914 = 100)

	Urban Labor	Farm Labor	Combined
1869	77	96	87
1879	61	61	61
1889	72	78	75

These figures tell a remarkable story. Both consumer prices and nominal wages fell about 30 percent during the last decade of greenbacks. But from 1879-1889, while prices kept falling, wages rose 23 percent. So real wages, after taking inflation—or the lack of it—into effect, soared.

No decade before or since produced such a sustainable rise in real wages. Two possible exceptions are the period from 1909-1919 (when the index rose from 99 to 140) and 1929-1939 (134-194). But during the first decade real wages plummeted the next year—to 129 in 1920, and did not reach 1919's level until 1934. And during the 1930s real wages also soared, for those fortunate enough to have jobs.

In any event, the contrast to this past decade is astonishing. And while there are many reasons why real wages increase, three necessary conditions must be present. Foremost, an absence of sustained inflation. This contributes to the second condition, a rise in savings and capital formation.

People will not save if they believe their money will be worth less in the future. Finally, technological advancement is obviously important. But it is not enough. The 1970s saw this third factor present, but the absence of the first two caused real wages to fall.

Interest Rates

Sidney Homer writes in his monumental *History of Interest Rates, 2000 B.C. to the Present* that “during the last two decades of the nineteenth century (1880-1900), long-term bond yields in the United States declined almost steadily. The nation entered its first period of low long-term interest rates” finally experiencing the 3-3½ long-term rates which had characterized Holland in the 17th century and Britain in the 18th and 19th: in short, the economic giants of their day.

To gauge long-term rates of the day, it is best not to use the long-term government bonds we would use today as a measure. The National Banking Acts of 1863-1864 stipulated that these bonds had to be used to secure bank notes. This created such a demand for them that, as Homer says, “by the mid 1870's [it] put government bond prices up to levels where their yields were far below acceptable rates of long-term interest.” But the Commerce Department tracks the unadjusted index of yields of American railroad bonds. We list the yields for 1878, the year before gold, 1879, and 1889.

Railroad Bond Yields

1878	6.45%
1879	5.98%

1889 4.43%

We stress that with consumer prices about 7 percent lower in 1889 than they had been the decade before, the real rate of return by decade's end was well into double-digit range, a bonanza for savers and lenders.

Short-term rates during the last century were considerably more skittish than long-term rates. But even here the decennial averages of annual averages of both three-to six-month commercial paper rates and (overnight) call money during the 1880s declined from what it had been the previous decades:

	Commercial Paper	Call Money
1870-1879	6.46%	5.73%
1880-1889	5.14%	3.98%

A Burst in Productivity

By some measures the 1880s was the most productive decade in our history. In their *A Monetary History of the United States, 1867-1960*, Professors Friedman and Schwartz quote R.W. Goldsmith on the subject: “ ‘The highest decadal rate [of growth of real reproducible, tangible wealth per head from 1805 to 1950] for periods of about ten years was apparently reached in the eighties with approximately 3.8%.’ ” The statistics give proof to this outpouring of new wealth.

Gross National Product		
(1958 prices)		
	Total (billions of dollars)	Per capita (in dollars)
Decade average 1869-78	\$23.1	\$531
” 1879-88	\$42.4	\$774
” 1889-98	\$49.1	\$795

This dollar growth was occurring, remember, in the face of general price declines.

Gross Domestic Product	
(1929 prices in billions of dollars)	

1869-1878	\$11.6 (average per year)
1879-1888	\$21.2 (average per year)

Gross domestic product almost doubled from the decade before, a far larger percentage jump decade-on-decade than any time since.

Labor Productivity
Manufacturing Output per Man-Hour

(1958 = 100)

1869	14.7
1879	16.2
1889	20.5

The 26.5 percent increase here ranks among the best in our history. Labor productivity reflects increased capital investment.

Capital Formation

From 1869 to 1879 the total number of business establishments barely rose, but the next decade saw a 39.4 percent increase. Not surprisingly, a decade of falling prices, rising real income, and lucrative interest returns made for tremendous capital investment, insuring future gains in productivity.

Purchase of Structures and Equipment

(total, in 1958 prices, in billions of dollars)

1870	\$.4
1880	\$.4
1890	\$2.0

This massive 500 percent decade-on-decade increase has never since been even closely rivaled. It stands in particular contrast to the virtual stagnation witnessed by the 1970s.

Private and Public Capital Formation

(total gross, in billions, 1929 prices)

Average	1872-1876	\$2.6
"	1877-1881	\$3.7
"	1882-1886	\$4.5
"	1887-1891	\$5.9

These five-year averages are not as “clean” as some other figures, but still show a rough doubling of total capital formation from the '70s to the '80s.

It has repeatedly been alleged that the late 19th century, the “golden age of the gold standard” in the United States, was a period especially harmful to farmers. The facts, however, tell a different story. While manufacturing in the 1880s grew more rapidly than did agriculture (“The Census of 1890,” report Friedman and Schwartz, “was the first in which the net value added by manufacturing exceeded the value of agricultural output”), farmers had an excellent decade.

Number of Farms

(in thousands)

1880 4,009

1890 4,565

Farm Land

(in millions of acres)

1880 536,182

1890 623,219

Farm Productivity

(persons supplied by farm worker)

1880 5.1

1890 5.6

Value of Farm Gross Output and Product

(1910-1914 dollars, in millions)

1880 \$4,129

1890 \$4,990

So farms, farmland, productivity, and production all increased in the 1880s, even while commodities prices were falling. And as we see below, farm wage rates, even in nominal terms, rose during this time.

Farm Wage Rates

(per month, with board and room, in 1879, 1889 dollars)

1879 or 1880 \$11.50

1889 or 1890 \$13.50

This phenomenal economic growth during the decade immediately after the return to gold convertibility cannot be attributed solely to the gold standard. Indeed all during this time there was never a completely free-market monetary system. The National Banking Acts of 1863-1864 had semicartelized the banking system.

Only certain banks could issue money, but all other banks had to have accounts at these. The financial panics throughout the late 19th century were a result of the arbitrary credit-creation powers of the banking system. While not as harmful as today's inflation mechanism, it was still a storm in an otherwise fairly healthy economic climate.

The fateful decade of the 1890s saw the return of the agitation for free silver, which had lain dormant for a decade. The Republican Party intensified its longtime flirtation with inflation, by passing the Sherman Silver Purchase Act of 1890, which roughly doubled the Treasury purchase requirement of silver. The Treasury was not mandated to buy 4.5 million ounces of silver per month. Furthermore, payment was to be made in a new issue of redeemable greenback currency, Treasury Notes of 1890, which were to be a full legal tender, redeemable in either gold or silver at the discretion of the Treasury. Not only was this an increased commitment to silver, it was a significant step on the road to bimetallism which—at the depreciated market rates—would mean inflationary silver monometallism. In the same year, the Republicans passed the high McKinley Tariff Act of 1890, which reaffirmed their commitment to high tariffs and soft money.

Another unsettling inflationary move made in the same year was that the New York Subtreasury altered its longstanding practice of settling its clearing house balances in gold coin. Instead, in August 1890, it began using the old greenbacks and the new Treasury notes of 1890. As a result, these paper currencies largely replaced gold paid in customs receipts in New York.¹⁵⁴

Uneasiness about the shift from gold to silver and the continuing free-silver agitation caused foreigners to lose further confidence in the U.S. gold standard, and to cause a drop in capital imports and severe gold outflows from the country. This loss of confidence exerted contractionist pressure on the American economy and reduced potential economic growth during the early 1890s.

¹⁵⁴ See Friedman and Schwartz, *Monetary History*, pp. 106, 106n.

Fears about the American gold standard were intensified in March 1891, when the Treasury suddenly imposed a stiff fee on the export of gold bars taken from its vaults so that most gold exported from then on was American gold coin rather than bars. A shock went through the financial community, in the U.S. and abroad, when the United States Senate passed a free-silver coinage bill in July 1892; the fact that the bill went no further was not enough to restore confidence in the gold standard. Banks began to insert clauses in loans and mortgages requiring payment in gold coin; clearly the dollar was no longer trusted. Gold exports intensified in 1892, the Treasury's gold reserve declined, and a run ensued on the U.S. Treasury. In February 1893, the Treasury persuaded New York banks, which had drawn down \$6 million on gold from the Treasury by presenting treasury notes for redemption, to return the gold and re-acquire the paper. This act of desperation was scarcely calculated to restore confidence in the paper dollar. The Treasury was paying the price for specie resumption without bothering to contract the paper notes in circulation. The gold standard was therefore inherently shaky, resting only on public confidence, and that was giving way under the silver agitation and under desperate acts by the Treasury.

Poor Grover Cleveland, a hard-money Democrat, assumed the Presidency in the middle of this monetary crisis. Two months later, the stock market collapsed, and a month afterwards, in June 1893, distrust of the fractional-reserve banks led to massive bank runs and bank failures throughout the country. Once again, however, many banks, national and state, especially in the West and South, were allowed to suspend specie payments. The Panic of 1893 was on. In a few months, Eastern bank suspension occurred, beginning with New York City. The total money supply—gold coin, treasury paper, national bank notes, and national and state bank deposits—fell by 6.3 percent in one year, from June 1892 to June 1893. Suspension of specie payments resulted in deposits—which were no longer immediately redeemable in cash—going to a discount in relation to currency during the month of August. As a result, deposits became less useful, and the public tried its best to intensify its exchange of deposits for currency.

By the end of 1893, the panic was over as foreign confidence rose with the Cleveland administration's successful repeal of the Sherman Silver Purchase Act in November of that year. Further silver agitation of 1895 endangered the Treasury's gold reserve, but heroic acts of the Treasury, including buying gold from a syndicate of bankers headed by J. P. Morgan and August Belmont, restored

confidence in the continuance of the gold standard.¹⁵⁵ The victory of the free-silver Bryanite forces at the 1896 Democratic convention caused further problems for gold, but the victory of the pro-gold Republicans put an end to the problem of domestic and foreign confidence in the gold standard.

1896: The Transformation of the American Party System

Orthodox economic historians attribute the triumph of William Jennings Bryan in the Democratic Convention of 1896, and his later renominations for President, as a righteous rising up of the “people” demanding inflation over the “interests” holding out for gold. Friedman and Schwartz attribute the rise of Bryanism to the price contraction of the last three decades of the 19th century, and the triumph of gold and disappearance of the “money” issue to the price rise after 1896.¹⁵⁶

This conventional analysis overlooks several problems. First, if Bryan represented the “people” versus the “interests,” why did Bryan lose and lose soundly, not once but three times? Why did gold triumph long before any price inflation became obvious, in fact at the depths of price contraction in 1896?

But the main neglect of the conventional analysis is the disregard of the highly illuminating insights provided in the past 15 years by the “new political history” of 19th-century American politics and its political culture. The new political history began by going beyond national political issues (largely economic) and investigating state and local political contests.¹⁵⁷ It also dug into the actual voting records of individual parishes, wards, and counties, and discovered how people voted and why they voted the way they did. The work of the new political history is truly interdisciplinary, for its methods range from sophisticated techniques for voting analysis to illuminating insights into American ethnic religious history.

¹⁵⁵ On silver agitation, the gold reserves, and the Panic of 1893, see Friedman and Schwartz, *Monetary History*, pp. 104-133, 705.

¹⁵⁶ Friedman and Schwartz, *Monetary History*, pp. 113-119.

¹⁵⁷ The *locus classicus* of the new political history in late 19th-century politics is Paul Kleppner, *The Cross of Culture: A Social Analysis of Midwestern Politics, 1850-1900* (New York: The Free Press, 1970). Also see other writings of the prolific Kleppner, especially his magnum opus, *The Third Electoral System, 1853-1892: Parties, Voters, and Political Cultures* (Chapel Hill, N.C.: University of North Carolina, 1979). On the late 19th century, see also Richard J. Jensen, *The Winning of the Midwest: Social and Political Conflict, 1888-1896* (Chicago: University of Chicago Press, 1971). On the Civil War period and earlier, see the works of Ronald Formisano, Joel Sibley, and William Shade. For Eastern confirmation on the Kleppner and Jensen findings on the Middle West, see Samuel T. McSeveney, *The Politics of Depression: Political Behavior in the Northeast, 1893-1896* (Oxford: Oxford University Press, 1972).

In the following pages, we shall present a summary of the findings of the new political history on the American party structure of the late 19th century and after, and on the transformation of 1896 in particular.

First, the history of American political parties is one of successive “party systems.” Each “party system” lasts several decades, with each particular party having a certain central character; in many cases, the name of the party can remain the same but its essential character can drastically change—in the so-called “critical elections.” In the 19th century the second party system (Whigs v. Democrats), lasting from about 1832 to 1854, was succeeded by the third party system (Republicans v. Democrats), lasting from 1854 to 1896.

Characteristic of both party systems was that each party was committed to a distinctive ideology clashing with the other, and these conflicting worldviews made for fierce and close contests. Elections were particularly hard fought. Interest was high since the parties offered a “choice not an echo,” and so the turnout rate was remarkably high, often reaching 80 to 90 percent of eligible voters. More remarkably, candidates did not, as we are used to in the 20th century, fuzz their ideology during campaigns in order to appeal to a floating, ideologically indifferent, “independent voter.” There were very few independent voters. The way to win elections, therefore, was to bring out your vote, and the way to do that was to intensify and strengthen your ideology during campaigns. Any fuzzing over would lead the Republican or Democratic constituents to stay home in disgust, and the election would be lost. Very rarely would there be a crossover to the other, hated party.

One problem that strikes anyone interested in 19th-century political history is: How come the average person exhibited such great and intense interest in such arcane economic topics as banking, gold and silver, and tariffs? Thousands of half-literate people wrote embattled tracts on these topics, and voters were intensely interested. Attributing the answer to inflation or depression, to seemingly evident economic interests, as do Marxists and other economic determinists, simply won't do. The far greater depressions and inflations of the 20th century have not educed nearly as much mass interest in economics as did the milder economic crises of the past century.

Only the findings of the new political historians have cleared up this puzzle. It turns out that the mass of the public was not necessarily interested in what the elites, or national politicians, were talking about. The most intense and direct interest of the voters was applied to local and state issues, and on these local levels the two

parties waged an intense and furious political struggle that lasted from the 1830s to the 1890s.

The beginning of this century-long struggle began with the profound transformation of American Protestantism in the 1830s. This transformation swept like wildfire across the Northern states, particularly Yankee territory, during the 1830s, leaving the South virtually untouched. The transformation found particular root among Yankee culture, with its aggressive and domineering spirit.¹⁵⁸

This new Protestantism—called “pietist”—was born in the fires of Charles Finney and the great revival movement of the 1830s. Its credo was roughly as follows: Each individual is responsible for his own salvation, and it must come in an emotional moment of being “born again.” Each person can achieve salvation; each person must do his best to save everyone else. This compulsion to save others was more than simple missionary work; it meant that one would go to hell unless he did his best to save others. But since each person is alone and facing the temptation to sin, this role can only be done by the use of the State. The role of the State is to stamp out sin and create a new Jerusalem on Earth.^{159,160}

The pietists defined sin very broadly. In particular, the most important politically was “Demon rum,” which clouded men’s minds and therefore robbed them of their theological free will. In the 1830s, the evangelical pietists launched a determined and indefatigable prohibitionist crusade on the state and local level which lasted a century. Second was any activity on Sunday except going to church, which led to a drive for Sabbatarian blue laws. Drinking on Sunday was of course a double sin, and hence particularly heinous. Another vital thrust of the new Yankee pietism was to try to extirpate Roman Catholicism, which robs communicants of their theological free will by subjecting them to the dictates of priests who are agents of the Vatican. If Roman Catholics could not be prohibited per se, their immigration could be slowed down or stopped. And since their adults were irrevocably steeped in sin, it became vital for crusading pietists

¹⁵⁸ “Yankees” originated in rural New England and then emigrated westward in the early 19th century, settling in upstate (particularly western) New York, northern Ohio, northern Indiana, and northern Illinois.

¹⁵⁹ These pietists have been called “evangelical pietists” to contrast them with the new Southern pietists, called “salvational pietists,” who did not include the compulsion to save everyone else in their doctrine.

¹⁶⁰ These pietists are distinguished from contemporary “fundamentalists” because the former were “post-millennialists” who believe that the world must be shaped up and Christianized for a millennium before Jesus will return. In contrast, contemporary fundamentalists are “pre-millennials” who believe that the Second Coming of Jesus will usher in the millennium. Obviously, if everyone must be shaped up before Jesus can return, there is a much greater incentive to wield State power to stamp out sin.

to try to establish public schools as compulsory forces for Protestantizing society or, as the pietists liked to put it, to “Christianize the Catholics.” If the adults are hopeless, the children must be saved by the public school and compulsory attendance laws.

Such was the political program of Yankee pietism. Not all immigrants were scorned. British, Norwegian, or other immigrants who belonged to pietist churches (whether nominally Calvinist or Lutheran or not) were welcomed as “true Americans.” The Northern pietists found their home, almost to a man, first in the Whig Party, and then in the Republican Party. And they did so, too, among the Greenback and Populist parties, as we shall see further below.

There came to this country during the century an increasing number of Catholic and Lutheran immigrants, especially from Ireland and Germany. The Catholics and High Lutherans, who have been called “ritualists” or “liturgicals,” had a very different kind of religious culture. Each person is not responsible for his own salvation directly; if he is to be saved, he joins the church and obeys its liturgy and sacraments. In a profound sense, then, the church is responsible for one’s salvation, and there is no need for the State to stamp out temptation. These churches, then, especially the Lutheran, had a *laissez-faire* attitude toward the State and morality. Furthermore, their definitions of “sin” were not nearly as broad as the pietists. Liquor is fine in moderation; drinking beer with the family in beer parlors on Sunday after church was a cherished German (Catholic and Lutheran) tradition; and parochial schools were vital in transmitting religious values to their children in a country where they were in a minority.

Virtually to a man, Catholics and High Lutherans¹⁶¹ found their home during the 19th century in the Democratic Party. It is no wonder that the Republicans gloried in calling themselves throughout this period “the party of great moral ideas,” while the Democrats declared themselves to be “the party of personal liberty.” For nearly a century, the bemused liturgical Democrats fought a defensive struggle against people whom they considered “pietist-fanatics” constantly swooping down trying to outlaw their liquor, their Sunday beer parlors, and their parochial schools.

How did all this relate to the economic issues of the day? Simply that the leaders of each party went to their voting constituents and “raised their consciousness” to get them vitally interested in national

¹⁶¹ Lutherans, then as now, were split into many different synods, some highly liturgical, others highly pietist, and still others in between. Paul Kleppner has shown a one-to-one correlation between the degree of liturgicalness and the percentage of Democratic Party votes among the different synods.

economic questions. Thus, the Republican leaders would go to their rank-and-file and say: “Just as we need Big Paternalistic Government on the local and state level to stamp out sin and compel morality, so we need Big Government on the national level to increase everyone’s purchasing power through inflation, keeping out cheap foreign goods (tariffs), or keeping out cheap foreign labor (immigration restrictions).”

And for their part, the Democratic leaders would go to their constituents and say: “Just as the Republican fanatics are trying to take away your liquor, your beer parlors, and your parochial schools, so the same people are trying to keep out cheap foreign goods (tariffs), and trying to destroy the value of your savings through inflation. Paternalistic government on the federal level is just as evil as it is at home.”

So statism and libertarianism were expanded to other issues and other levels. Each side infused its economic issues with a moral fervor and passion stemming from their deeply held religious values. The mystery of the passionate interest of Americans in economic issues in the epoch is solved.

Both in the second party and third party systems, however, the Whigs and then the Republicans had a grave problem. Partly because of demographics—greater immigration and higher birth rates—the Democratic/liturgicals were slowly but surely becoming the majority party in the country. The Democrats were split asunder by the slavery question in the 1840s and ’50s. But now, by 1890, the Republicans saw the handwriting on the wall. The Democratic victory in the congressional races in 1890, followed by the unprecedented landslide victory of Grover Cleveland carrying both houses of Congress in 1892, indicated to the Republicans that they were becoming doomed to be a permanent minority.

To remedy the problem, the Republicans, in the early 1890s, led by Ohio Republicans William McKinley and Marc Hanna, launched a shrewd campaign of reconstruction. In particular, in state after state, they ditched the prohibitionists, who were becoming an embarrassment and losing the Republicans large numbers of German Lutheran votes. Also, they modified their hostility to immigration. By the mid-1890s, the Republicans had moved rapidly toward the center, toward fuzzing over their political pietism.

In the meanwhile, an upheaval was beginning to occur in the Democratic Party. The South, by now a one-party Democratic region, was having its own pietism transformed by the 1890s. Quiet pietists were now becoming evangelical, and Southern Protestant organizations began to call for prohibition. Then the new, sparsely

settled Mountain states, many of them with silver mines, were also largely pietist. Moreover, a power vacuum, which would ordinarily have been temporary, had been created in the national Democratic Party. Poor Grover Cleveland, a hard-money laissez-faire Democrat, was blamed for the Panic of 1893, and many leading Cleveland Democrats lost their gubernatorial and senatorial posts in the 1894 elections. The Cleveland Democrats were temporarily weak, and the Southern-Mountain coalition was ready to hand. Seizing his opportunity, William Jennings Bryan and his pietist coalition seized control of the Democratic Party at the momentous convention of 1896. The Democratic Party was never to be the same again.¹⁶²

The Catholics, Lutherans, and the laissez-faire Cleveland Democrats were in mortal shock. The “party of our fathers” was lost. The Republicans, who had been moderating their stance anyway, saw the opportunity of a lifetime. At the Republican convention, Rep. Henry Cabot Lodge, representing the Morgans and the pro-gold standard Boston financial interests, told McKinley and Hanna: Pledge yourself to the gold standard—the basic Cleveland economic issue—and drop your silverite and greenback tendencies, and we will all back you. Refuse, and we will support Bryan or a third party. McKinley struck the deal, and from then on, the Republicans, in 19th-century terms, were a centrist party. Their principles were now high tariffs and the gold standard, and prohibition was quietly forgotten.

What would the poor liturgicals do? Many of them stayed home in droves, and indeed the election of 1896 marks the beginning of the great slide downward in voter turnout rates that continues to the present day. Some of them, in anguish at the pietist, inflationist, and prohibitionist Bryanites, actually conquered their anguish and voted Republican for the first time in their lives. The Republicans, after all, had dropped the hated prohibitionists and adopted gold.

The election of 1896 inaugurated the fourth party system in America. From a third party system of closely fought, seesawing races between a pietist/statist Republican vs. a liturgical/libertarian Democratic Party, the fourth party system consisted of a majority centrist Republican party as against a minority pietist Democratic party. After a few years, the Democrats lost their pietist nature, and they too became a centrist, though usually minority party, with a moderately statist ideology scarcely distinguishable from the Republicans. So the fourth party system went until 1932.

¹⁶² Grover Cleveland himself, of course, was neither a Roman Catholic nor a Lutheran. But he was a Calvinist Presbyterian who detested the takeover of the Presbyterian Church by the pietists.

A charming anecdote, told us by Richard Jensen, sums up much of the 1896 election. The heavily German city of Milwaukee had been mainly Democratic for years. The German Lutherans and Catholics in America were devoted, in particular, to the gold standard and were bitter enemies of inflation. The Democratic nomination for Congress in Milwaukee had been obtained by a Populist-Democrat, Richard Schilling. Sounding for all the world like modern monetarists or Keynesians, Schilling tried to explain to the assembled Germans of Milwaukee in a campaign speech that it didn't really matter what commodity was chosen as money, that "gold, silver, copper, paper, sauerkraut or sausages" would do equally well as money. At that point, the German masses of Milwaukee laughed Schilling off the stage, and the shrewdly opportunistic Republicans adopted as their campaign slogan "Schilling and Sauerkraut" and swept Milwaukee.¹⁶³

The Greenbackers and later the pro-silver, inflationist, Bryanite Populist Party were not "agrarian parties"; they were collections of pietists aiming to stamp out personal and political sin. Thus, as Kleppner points out, "The Greenback Party was less an amalgamation of economic pressure groups than an ad hoc coalition of 'True Believers,' 'ideologues,' who launched their party as a 'quasi-religious' movement that bore the indelible hallmark of 'a transfiguring faith.'" The Greenbackers perceived their movement as the "religion of the Master in motion among men." And the Populists described their 1890 free-silver contest in Kansas not as a "political campaign," but as "a religious revival, a crusade, a pentecost of politics in which a tongue of flame sat upon every man, and each spake as the spirit gave him utterance..." The people had "heard the word and could preach the gospel of Populism." It was no accident, we see now, that the Greenbackers almost invariably endorsed prohibition, compulsory public schooling, and crushing of parochial schools. Or that Populists in many states "declared unequivocally for prohibition" or entered various forms of fusion with the Prohibition Party.¹⁶⁴

The Transformation of 1896 and the death of the third party system meant the end of America's great laissez-faire, hard-money libertarian party. The Democratic Party was no longer the party of Jefferson, Jackson, and Cleveland. With no further political embodiment for laissez-faire in existence, and with both parties

¹⁶³ So intense was the German-American devotion to gold and hard money that even German communist-anarchist Johann Most, leader of a movement that sought the abolition of money itself, actually came out for the gold standard during the 1896 campaign! See Jensen, *Winning of the Midwest*, pp. 293-295.

¹⁶⁴ Kleppner, *Third Electoral System*, pp. 291-296.

offering an echo not a choice, public interest in politics steadily declined. A power vacuum was left in American politics for the new corporate statist ideology of progressivism, which swept both parties (and created a short-lived Progressive Party) in America after 1900. The Progressive Era of 1900-1918 fastened a welfare-warfare state on America which has set the mold for the rest of the 20th century. Statism arrived after 1900 not because of inflation or deflation, but because a unique set of conditions had destroyed the Democrats as a laissez-faire party and left a power vacuum for the triumph of the new ideology of compulsory cartelization through a partnership of big government, business, unions, technocrats, and intellectuals.

III. MONEY AND BANKING IN THE UNITED STATES IN THE 20TH CENTURY

After 1896 and 1900, then, America entered a progressive and predominantly Republican era. Compulsory cartelization in the name of “progressivism” began to invade every aspect of American economic life. The railroads had begun the parade with the formation of the ICC in the 1880s, but now field after field was being centralized and cartelized in the name of “efficiency,” “stability,” “progress,” and the general welfare. Theodore Roosevelt, Taft, and Wilson were each in his way progressives, and each advanced the cause of cartelization, with the process culminating in the Presidency of Woodrow Wilson. In particular, various big business groups, led by the J. P. Morgan interests often gathered in the National Civic Federation and other think tanks and pressure organizations, saw that the voluntary cartels and the industrial merger movements of the late 1890s had failed to achieve monopoly prices in industry. Therefore, they decided to turn to governments, state and federal, to curb the winds of competition and to establish forms of compulsory cartels, in the name, of course, of “curbing big business monopoly” and advancing the general welfare.¹⁶⁵

America’s bankers had long chafed to cartelize the banking industry still further. The National Banking System was a long step forward, from their point of view, but it was still only quasi-centralized. Bank credit and money pyramided on top of New York (and after 1887, also Chicago and St. Louis) banks. But this system was, to use a universally adopted term, “inelastic”—that is, it could not assure the pumping in of more money during contractions or runs on banks. “Inelastic” was a code word for not enough assured inflation of the money supply.¹⁶⁶ The growing consensus, then, was to redirect the banking system by establishing, at long last, a central bank. The central bank would have an absolute monopoly of the note issue, and reserve requirements would then ensure a multilayered pyramiding on top of these central bank notes, which could bail out banks in

¹⁶⁵ See in particular, Gabriel Kolko, *The Triumph of Conservatism: A Reinterpretation of American History, 1900-1916* (Glencoe, Ill.: The Free Press, 1963.) While in less harsh a form, variants of this interpretation have now swept the field in Progressive Era historiography. Thus, see the works of Samuel Hays, James Weinstein, Arthur Ekrich, Louis Galambos, William Graebner, Jordan Schwarz, Ellis Hawley, Joan Hoff Wilson, and many others.

¹⁶⁶ National banks also had a particular form of “inelasticity.” Their issue of notes was limited by their deposit of government bonds at the Treasury. Yet government bonds were generally 40 percent over par, which imposed a penalty on further issue. See Robert Craig West, *Banking Reform and the Federal Reserve, 1863-1923*. (Ithaca: Cornell University Press, 1977).

trouble, and, moreover, could inflate the currency in a smooth, controlled, and uniform manner throughout the nation.

In addition to this chronic problem, the large banks, particularly on Wall Street, saw financial control slipping away from them. The state banks and other non-national banks began to grow instead and outstrip the nationals. Thus, while in the 1870s and the 1880s, most banks were national, by 1896 non-national banks comprised 61 percent of the total number of banks, and by 1913, 71 percent. By 1896, these non-national banks had 54 percent of the total banking resources of the country, and 57 percent in 1913. The inclusion of Chicago and St. Louis as central reserve city banks after 1887 diluted Wall Street's power. With Wall Street no longer able to cope, it was time to turn to the United States government to do the centralizing, cartelizing, and controlling instead.¹⁶⁷

It often takes a crisis to focus one's mind, and it takes a financial crisis or notable event to move men to institutional reform. The Civil War was the previous occasion for overhaul of the nation's money and banking system. The Panic of 1907 provided the spark for a return to central banking.

The Republicans fulfilled their promise, and, in March 1900, finally placed the United States officially on a monometallic gold standard. All paper was to be redeemable in gold, and silver continued as a subsidiary metal.

An unusual increase in gold production from discoveries in South Africa and Alaska doubled the world's gold stock from 1890 to 1914, causing a rise of U.S. prices of nearly 50 percent from 1897 to 1914, or two and one-half percent per year. Until after World War II, this was the largest sustained rise in prices in peacetime, but still the rise only returned to approximately 1882 levels. In the United States, the gold supply rose at a rate of seven and one-half percent per year in this period. But despite this impact, the bulk of the increase in the supply of money in the period came from bank deposits pyramiding on top of the increase in gold. Thus, from June 1896 to June 1914, total bank deposits rose from \$3.43 billion to \$14.32 billion, or an increase of 317.5 percent or an annual rise of 17.6 percent—a substantially greater percentage than the seven and one-half percent per year increase of the gold stock. Once again, fractional reserve banking under the National Banking System was far more to blame for price rises than international movements in gold.

There were several mini-panics, averted or stopped by infusions of Treasury money, after 1900; but the Panic of 1907 frightened the

¹⁶⁷ See Kolko, *Triumph*, p. 140.

banks into calling for a new central banking system. Wall Street and the Morgans could not save the New York banks themselves. There was general speculation of specie payment throughout the country, and premiums of currency over deposits. Again, the Treasury was called upon to intervene. The Wall Street banks now knew that they could not cope, and federal government cartelization and support for fractional reserve banking would be necessary.¹⁶⁸

All banks, and both parties, now agreed on some form of central banking, and the rest of the story is jockeying for minor advantage. The Wilson administration finally established central banking with the creation of the Federal Reserve System in 1913—the symbolic end of the Jacksonian hard-money heritage in the Democratic Party. From 1913 until 1933, the United States would be formally under a gold standard, but actually governed by a Federal Reserve System designed to inflate uniformly and bail out banks in trouble. The banking systems would now be pyramiding on the U.S. issue of paper money.

By establishing the Federal Reserve System, the federal government changed the base of the banking pyramid to the Federal Reserve Banks. Only the Federal Reserve could now print cash, and all member banks could now multiply their deposits on top of Federal Reserve deposits. All national banks were required to join the Federal Reserve, and their gold and other lawful money reserves had to be transferred to the Federal Reserve. The Federal Reserve, in turn, could pyramid its deposits by three-to-one on top of gold. This centralization created an enormous potential for inflationary expansion of bank deposits. Not only that, reserve requirements for the nation's banks were deliberately cut in half in the course of establishing the Federal Reserve System, thereby inviting the rapid doubling of the money supply. Average reserve requirements for all banks prior to the Federal Reserve Act is estimated to be 21 percent. In the original Act of 1913, these were cut to 11.6 percent and three years later to 9.8 percent. It is clear then that the Federal Reserve was designed from the very beginning to be an instrument for a uniform and coordinated inflation of bank money.¹⁶⁹

Indeed, total bank deposits were \$14.0 billion at the beginning of the Federal Reserve System in January 1914; after six years, in January 1920, total bank deposits had reached \$29.4 billion, an enormous increase of 110 percent or 18.3 percent per year. The creation of the Federal Reserve had made that expansion possible.

¹⁶⁸ See Kolko, *Triumph*, pp. 153-158; Friedman and Schwartz, *Monetary History*, pp. 156ff.

¹⁶⁹ See the illuminating discussion in C. A. Phillips, T. F. McManus, and R. W. Nelson, *Banking and the Business Cycle* (New York: Macmillan, 1937), pp. 23-29.

The Gold-Exchange Standard

Faced with a global inflation of unprecedented volume and destruction both during World War I and immediately after it, the world attempted to restore monetary stability. But while most officials wanted gold to re-appear as the monetary anchor, they also wanted to be able to keep inflating. Put another way, they wanted to have their cake and eat it too.

Preeminent victims of this delusion were the British; with a burgeoning welfare state in the early 1920s, and especially with rigid wage rates, it was difficult politically to end inflation. Further, Britain wanted to return to gold, but for reasons of national “prestige” she wanted to go back at the pre-war, pre-inflation rate of \$4.86 per pound. In effect, she wanted to pretend that the inflation had never happened. There was only one way Britain could get away with enthroning an artificially overvalued pound: by making other countries play along. Other nations had to be persuaded (or forced) into either likewise returning to gold at an unrealistic rate or inflating their monies so as not to cripple Britain’s exports (also priced artificially high).

Britain accomplished this at the Genoa Conference of 1922. Emerging from that first post-war economic meeting was not a gold standard, but a more slippery “gold-exchange” standard. Here’s how it worked: Only the United States stayed on the old gold-coin standard, where anyone could present notes totaling \$20.67 to the Treasury and receive an ounce of gold in return. But Britain began redeeming pounds not just in gold, but in Federal Reserve notes or dollars. Further, the other nations began predominantly using British pounds as their backing. And importantly, when they did pay gold they only paid in large bullion bars, not coins, so the average citizen was not able to redeem his currency. The Genoa Accord made the pound as well as the dollar as good as gold, even though sterling was not in fact a sound currency. Britain now printed its “gold” with American support—the U.S. agreed to inflate enough to keep Britain’s reserves of dollars or gold from flowing to America.

This inflationary charade was played to buttress Britain’s fading dreams as an imperialist world power. But also involved was the rise of the new doctrines of John Maynard Keynes, who by the early 1920s had become a foe of the “barbarous relic” gold and extolled instead the alleged virtues of a politically managed paper currency. That these ideas became so influential so fast in London banking circles was due in no small part to the catastrophic loss suffered during World War I of truly the finest minds of a generation. These would have normally become leaders during the 1920s. This left a gap which affected

Britain as it did few other countries. For at the risk of broad-brush painting, the British are a people that have always put more stock in practical knowledge than the more philosophical French or Germans. But pragmatism depends less on book knowledge than on skills handed down orally. The annihilation of a generation thus created a gap in the continuity of knowledge those more bookish nations escaped. So as one contemporary observer of London financial circles perceptively explained, by the mid-1920s, there would be few remaining grandfathers who remembered the virtues of sound money. And there would be their grandsons “miseducated by Keynes.” Between them was a gap, which created such “a barrier in ideas that it was not easy for tradition and practical knowledge to pass.”¹⁷⁰

American Inflation 1922-28

With the “discovery” of open-market operations around 1922, the Federal Reserve thought it had found a way to smooth out business cycles. In practice, it caused a substantial six-year bank credit inflation by buying securities on the open market and printing the money to pay for them. This money—bank reserves—was pyramided several-fold by means of the fractional reserve banking system. This policy of stabilizing the price level was deliberately engineered by the leader of the Federal Reserve System, Benjamin Strong, to follow the proto-monetarist theory of Yale economist Irving Fisher.

The 1920s are not often seen as an inflationary period because prices did not rise. But the money supply can rise even without prices rising in absolute terms. The 1920s saw such a burst of American technological advancement and cheaper ways of producing things that the natural tendency was for prices to *fall* (i.e., more goods chasing the same number of dollars). But the inflation caused prices to rise *relative* to what they would have done. So a “stable” price level was masking the fact that inflation was going on and creating distortions throughout the economy.

Between mid-1922 and April 1928, bank credit expanded by over twice as much as it did to help finance World War I. As with all inflations, this caused speculative excess; in this case, new money poured into the stock market and real estate. The cooling of this speculative fever in 1928 by officials who tightened the money supply because they were finally afraid of the overheated economy led to the Depression, which in turn led to the world’s abandonment of the gold standard. We would do well to examine this period closer.

¹⁷⁰ Benjamin Anderson, *Economics and the Public Welfare* (Indianapolis: Liberty Press, 1979), p. 174.

Bailing Out Britain

Britain during this time used her power to treat the pound like gold, as one might expect, keeping interest rates artificially low and inflating recklessly, thus piling up billions of pounds at the Bank of France, which finally began asking for gold. Panicked, the Bank of England in mid-1927 induced the New York Federal Reserve Bank to lower its interest rates and step up open-market purchases of securities, thus fueling inflation further. (This move to make unnecessary the payment of British gold obligations to France and to keep England inflating by causing America to inflate was disguised as “helping the farmer.” It was the Kansas City Federal Reserve Bank which first lowered its discount rate, the others following.)

A major reason for the inflationary pro-British policies of the 1920s was the close personal connection formed between Benjamin Strong, the dominant leader of the Federal Reserve System, and Montagu Norman, head of the Bank of England. In several secret conferences with Norman, unknown to the rest of the Federal Reserve or the American government, Strong agreed to inflate money and credit in order to bail out England. The ties between Norman and Strong were not only personal; both were intimately allied with the House of Morgan. Before he became the first leader of the Federal Reserve, Strong was head of the Morgan-created Bankers Trust Company in New York. He was urged to accept the post by his two closest personal friends, Henry P. Davison and Dwight Morrow, both partners at the Morgan Bank. The Morgan connection with Britain was very close; J. P. Morgan and Company was the fiscal agent for the Bank of England and underwrote the massive sale of British bonds in the United States during World War I. Montagu Norman himself had close personal connections with the United States investment banks and had worked in the offices of Brown Brothers in New York. Only the death of Strong in 1928 ended the inflationary Federal Reserve policy designed to help Britain.

By April of 1928, the new Governors of both the Federal Reserve Board and the New York Federal Reserve Bank, made an effort to hold down bank credit expansion. But those efforts were stymied by following two conflicting goals. Federal Reserve officials wanted both to reduce credit going into stock market speculation yet at the same time not to tighten money either at home or abroad (this latter for fear of pulling gold out of Britain).

And while the anti-inflationist policy predominated, it is not easy to reduce inflation in an economy grown accustomed to it, which by 1928 America had. Further, 1928 was a presidential election year, with great pressure to inflate. It therefore took about a year before

the money supply was under control. But as the tables below show, the long money-supply inflation was over by the end of 1928. At mid-1929 money-supply growth was creeping at an annual rate of only 0.7 percent, a marked deceleration from previous years. The depression caused by years of inflation was about to begin, and with it would come the end of the American gold standard.

Total Money Supply of the United States, 1921-29

(in billions of dollars)

Date	Total Money Supply	Percent Annual Change From Previous
1921 – June 30	45.30
1922 – June 30	47.16	4.1

The International Crisis: 1931

The stock market collapse in late 1929 was only a harbinger of things to come. It was not until 1931 that international bank collapses caused abandonment of gold. The first to go was Austria.

Kredit-Anstalt, Austria's largest bank, supported by the Austrian government, had for years been making bad loans on a meager reserve base. Austria had been part of the "sterling bloc," buttressed by Britain—a development resented by France, heavy with gold claims on Britain. The formation of an Austrian customs union with Germany in late March 1931 was feared by France, who saw it as a step to political union. The French central bank now insisted upon immediate repayment of her short-term debts from Austria and Germany. Austrian banks clearly could not meet their liabilities, and in late May, Kredit-Anstalt went bankrupt, taking Austria off the gold standard. A run on German banks now started. That country had been quickly affected by the tightened American credit conditions in mid-1928 and was quite vulnerable. Runs continued, and even though President Hoover declared on June 20 a moratorium on German debt, France was not immediately inclined to go along. She delayed too long; and on July 15 Germany declared national bankruptcy by going off the gold standard.

It must be said that both these nations fought desperately to maintain gold redemption, and when the end came, each regarded the act with shame. Not so with Britain. The country that had caused the others to inflate for her and did more than any other to bring on the crisis went off the gold standard without a fight.

As runs on British gold increased through the summer, Britain refused to defend the pound by raising interest rates. Instead, as gold flowed out of the banks, the Bank of England created new money to replenish the banks' reserves. The Bank of France cooperated loyally and didn't present many claims. The French bank held sterling claims worth fully seven times its capital, and thus feared for a Britain off the gold standard. Indeed, France joined America in offering massive loans to Britain. But the Bank of England didn't even take full advantage of these credit lines, and two days after assuring the Netherlands Bank (with all its capital in sterling) that England would not go off the gold standard, that is exactly what happened. The announcement was made on September 20, 1931, thus capping 17 years of gradual monetary disintegration.

Britain had for centuries been the world's premier financial power, so that announcement left the world stunned. Moreover, other governments had been deliberately deceived. The capital of the central banks of France and Holland had been made worthless in one day. Governments could no longer trust each other's financial promises, and the stage was set for perhaps the most treacherous decade in international economic relations, a decade from which we have not yet recovered. As Chase economist and contemporary eyewitness Benjamin Anderson recalled, "An immense world asset was destroyed when the Bank of England and the British government broke faith with the world. Years later after we in the United States had also broken faith with the world, the head of the national bank of one of the Scandinavian countries said, 'I have lost money in sterling. I have lost money in dollars. I have never lost money by holding gold.'"¹⁷¹

America Breaks Faith

If sterling was not good, the world asked itself, what was? It looked nervously at America, and had presented claims for \$728 million of our gold by the end of October 1931. But Americans thought any such fears were silly. After all, we had continued to pay gold to foreigners even in the crisis of 1895, with a low point of only \$41 million of gold in the Treasury. Alone among belligerents, we had not gone off gold in World War I, although we had stopped the export

¹⁷¹ Anderson, *Economics and the Public Welfare*, p. 254.

of gold. Certainly few Americans cashed in notes for gold in late 1931. They may have doubted the solvency of some banks, but few if any doubted the good faith of the American government's promise to redeem notes for gold. The platforms of both parties in 1932 contained vows that the gold standard would be maintained. The Democratic platform was largely written by Sen. Carter Glass of Virginia and Cordell Hull, later Secretary of State. As events proved, both these men were sincere.

The first sign of shakiness in the American position was a foolish and false statement by President Hoover one month before the November election. He charged that the Federal Reserve had been within two weeks of going off the gold standard earlier that year. The statement was soon proved untrue, but it aroused doubts for the first time in people's minds.

These grew into rumors beginning in late December that President-elect Roosevelt was going to take the country off the gold standard. Roosevelt would not deny them, and American hoarding of gold started for the first time on a grand scale.

The feelings of disquietude were made worse by a paralyzed government. The new President was not to take office until March 4 (the old Inauguration date) and a lame-duck Congress had many members due to retire. In the cabinet departments, anyone whose job was not protected by civil-service rules was preparing to find a new job in the midst of a terrible depression.

Runs on banks by depositors anxious to get cash, and runs on the Federal Reserve Banks by cash holders eager to turn their paper into gold, accelerated. It should not have come as a surprise when on February 14 Michigan became the first state to declare a bank "holiday," i.e., to close the banks to depositors. Michigan had been the home of some of the more reckless lending by banks during the boom. Nine days later Indiana followed, and then a score of states in a cluster. Late on the night of March 3, the big New York banks reluctantly agreed to close; though they were not in trouble, smaller upstate banks were. Roosevelt became President the next day with almost every bank in America closed. He kept them all closed until March 13, when the Federal Reserve banks opened, with others a day or two later. The public, assuaged by FDR's promise that the reopened banks would be good, poured both gold and cash back into the banks. But on March 9 Congress passed, at Roosevelt's request, a bill "to provide relief in the existing national emergency in banking, and other purposes." It gave him the power to do all he pleased regarding money and banking, including authority to seize the American people's gold coins, bullion, and gold certificates.

America Off the Gold Standard

Within a month this power was used. On April 5, it became illegal to own or hold any form of monetary gold, either coins, bullion, or certificates. (Industrial users of gold were not affected.) The banking crisis had been brought on by past inflation. But that crisis, ironically, was made the excuse to abandon the gold standard.

At first, it was stressed that these measures were temporary, only to be used as long as the crisis lasted. But on May 12 a law was passed (the Thomas Amendment to the Agriculture Adjustment Act) which gave the President the ability to increase vastly the money supply and to reduce by up to half the weight of gold dollar. Democratic Senator Glass called it “dishonor. ... This great government, strong in gold, is breaking its promises to pay gold to widows and orphans to whom it has sold government bonds with a pledge to pay gold coin of the present standard value. It is breaking its promise to redeem its paper money in gold coin of the present standard of value. It’s dishonor, sir.”¹⁷² Another Democratic Senator, Thomas Gore of Oklahoma, was asked by the President for his opinion about another law (signed on June 5) abolishing the gold clause in all past debt obligations: “Why, that’s just plain stealing, isn’t it, Mr. President?” Later in Senate debate, Gore also added that “Henry VIII approached total depravity but the vilest thing he ever did was to debase the coin of the realm.”¹⁷³

One final step remained. Using the Gold Reserve Act of January 30, 1934, President Roosevelt arbitrarily reduced the weight of gold that would define each dollar. The “old” dollar had been defined as 25.8 grains of gold, nine-tenths fine. The new devalued dollar would only be worth 15 $\frac{5}{21}$ grains, nine-tenths fine. So even the act of abandoning gold was done with the implicit admission that the dollar was still defined in terms of it.

The London Conference

Just as he had taken America off gold, Roosevelt took steps to ensure that there would be no international return to gold. The Gold Bloc of remaining gold standard nations, France, Belgium, Switzerland, Holland, and Italy, had called the London Conference for June 1933 to persuade Great Britain and the United States that “gold should be reestablished as the international measure of exchange value”—and that non-gold countries should agree that their ultimate objective was to restore the gold standard. Even the official

¹⁷² *Ibid.*, p. 315.

¹⁷³ *Ibid.*, p. 317.

American delegation, which included Secretary of State Cordell Hull, approved this declaration, and all were shocked when Roosevelt's reply rejected the proposals. Said he, "The sound internal economic system of a nation is a greater factor in its prosperity than the price of its currency in changing terms of other nations." He thus missed the point of a gold standard, which defines all currencies as an unchanging weight of gold. Incredibly, the President stated that the new order would mean currency stability: "Let me be frank in saying that the United States seeks the kind of dollar which a generation hence will have the same purchasing and debt-paying power as the dollar value we hope to maintain in the near future." Seven months later, the dollar was devalued by 40.9 percent. And we of "a generation hence" know what has happened to the purchase power of the dollar.

Gold Remains the World's Money

Finding no support, all the remaining Gold Bloc countries stopped redeeming their paper for gold, Holland and Switzerland being the last in 1936. But gold was far from banished. The deteriorating European political situation after 1936 caused everyone from homeless Jews to central bankers to trust gold over any paper currency and to transfer gold to the United States, the safest haven. Further, the stabilization funds set up by governments to stabilize now floating currencies settled their differences in gold. Remembering British and American actions to change arbitrarily the value of their currencies, no one would trust anything else.

Nor was there reason to. Beggar-thy-neighbor policies were the order of the day. International economic peace was shattered during the 1930s by economic nationalism, competitive devaluation, high tariffs, and exchange controls. Moreover, this poisoned atmosphere played its part in causing World War II.

The Coming of Bretton Woods

Try as they might, countries just before World War II were unable to carry on unsound currency and fiscal policies without seeing their currencies depreciate in terms of gold, their capital flee, or their credit markets crippled. The only pre-war exception was Nazi Germany, which achieved those goals at the cost of a complete and unprecedented economic regimentation. With the coming of war, other nations as well achieved far-reaching control over internal and foreign exchange. The end of war found government officials wishing they could retain those controls, which allowed them to inflate and run budget deficits as they pleased while still having access to easy

credit, stable foreign exchange rates, and an absence of international “flight capital.”

This was the root idea behind the international monetary conference in mid-1944 at Bretton Woods, New Hampshire, which set up the monetary order that would break down 25 years later. For while the new Bretton Woods system was supposed to restore the currency stability of the gold standard, it was designed to do so without gold. The system placed its trust, not in the workings of the marketplace, but in the judicious restraint of the American government. It therefore contained within itself the seeds of its own destruction.

The Rules of the Game

While the dollar would be convertible into gold at \$35 an ounce, it would be so only to foreigners, and after 1962 only to foreign governments. All other currencies were defined in terms of the dollar, which itself was defined as 1/35 of an ounce of gold. But the upshot of the arrangement gave America the power to have the dollar treated as gold. The Bretton Woods rules called for stable currency values: No currency was allowed to either rise or fall more than one percent. The Swiss franc, for example, was, at the time of the agreement (1944), fixed at 22.9 cents; it could go no lower than 22.7 cents and no higher than 23.1 cents. If the franc threatened to break these limits, the Swiss central bank was obliged to enter the exchange market and either buy or sell francs to hold its currency within the narrow margin. As the franc was usually bumping against the upper limits of this margin, Swiss authorities were usually selling francs and buying dollars. Most other governments were doing the same, especially those whose currencies were not inflating as much as the dollar was. But all of these nations were soothed with the promise that the dollar was indeed “as good as gold,” and that any foreign holder of dollars, individual or government, could present American currency to the U.S. Treasury at any time to collect one ounce of gold for 35 of their paper dollars. Many, of course, took advantage of this opportunity. The U.S. government continued inflating the dollar, and our gold supply plummeted from a peak of 701 million ounces in 1949 to 296 million ounces in March 1968.

No government in history had held the kind of power handed to the United States in 1944: having its paper money treated like gold. But this action overlooked the stark reality that paper is not gold, that gold cannot be printed wildly, as paper can. Another effect of the Bretton Woods regime was to subsidize American consumers at the expense of foreigners. For a long time, America prospered at the expense of her trading partners. For years, the dollar’s value was

artificially high, and therefore actually bought more than it should have been able to buy. This meant that foreign products were available to Americans at bargain prices. This left foreign consumers less to enjoy. Moreover, the foreigners had to pay more for their own goods, thanks to American “exporting” of inflation by, in effect, forcing foreign central banks to print more of their own currency to absorb the unwanted, overvalued dollars they accepted.

Predictably, those nations who had managed their own monetary affairs most conservatively were the ones hardest hit by the American action. Switzerland, that paragon of monetary restraint, now madly printed francs to pay for all dollars shunned by Swiss commercial banks. Switzerland’s money supply soared 22 percent in 1971 alone. (Ironically, Switzerland had never signed the Bretton Woods agreement, but chose nevertheless to continue to adhere to the strictures—to its own great detriment—long after the system’s founder and chief beneficiary, the United States, had broken its commitment.) Switzerland could not be expected to continue this suicidal policy forever; as we will see later, it was Swiss action which finally brought the injustice of the post-war system to an abrupt end.

The London Gold Pool

Dollars flooded the world through the 1950s, and few worried about the gold reserves leaving the U.S. Treasury. But sometime in the early 1960s the market price of gold threatened to rise above the official \$35 per ounce figure. For many years, the \$35 figure was above the market price, making holding dollars attractive. In response to this rise in gold’s price, the West’s major central banks in 1961 established the London Gold Pool. With the U.S. in the lead, the banks agreed to sell gold whenever the price threatened to rise above \$35. But this was successful only as long as world inflation fears abated. However, by the late 1960s the world had paused to assess the effects of a massive dollar inflation to pay for both the Great Society programs and the Vietnam War. The U.S. dollar had now dearly become overvalued, gold’s price undervalued.

Britain was the first major nation to violate the fixed-exchange regime by devaluing in November of 1967. This caused a massive flight into gold, the first of the post-war era. Billions of dollars were spent by central banks in the next four months trying to force the market gold price down. Finally in March, governments threw in the towel and gave up suppressing the market’s wishes.

The Approaching Crisis

From March 1968 to August 1971, during the period of the “two-tier” gold market, the political world pretended that the dollar was

still convertible, and for most of that time, the monetary scene was placid. This was due in part to the moderate lessening of American inflation during the recession of 1969-1970. But after that brief respite, the printing presses again went into high gear. The results were predictable. By early 1971, astute financial observers began to sense the imminent collapse of the dollar. One of the signs they saw was the lowering of American interest rates compared with European ones. When any nation inflates, money usually becomes cheaper, if only in the beginning, and therefore easier to borrow. The interest rate charged by banks to borrowers of money declines, and the interest rate paid by banks to depositors of money also declines. Money then flows out of those low-interest rate countries into countries where it can enjoy higher returns. During the beginning months of 1971, the outflow of funds from New York to European money markets accelerated. This forced most European currencies hard against their upper ceiling. Because Germany in particular had maintained a very tight credit stance—a low inflation rate—the mark was besieged with an unprecedented flood of buyers. Events now began to move swiftly.

In early May, on the heels of a joint report by major German economic institutes that the mark should be inflated or revalued upward, massive speculation hit that currency. Dollars poured into Germany and the Bundesbank was forced to buy them in mounting volume—more than \$1 billion on May 3-4 and a further \$1 billion during the first 40 minutes of trading on May 5. At that point, the German central bank gave up the struggle, withdrew from the market, and let the mark float. Neighboring countries, afraid of seeing now-homeless dollars careen across their own borders, were quick to join Germany.

The following weekend the central banks of the Netherlands, Switzerland, Belgium, and Austria likewise ceased support operations and set their currencies afloat. In the cases of Austria and Switzerland, revaluations of 5 to 7 percent were also realized. Not surprisingly, the newly-floated currencies continued appreciating, most of them rather sharply. There were rumblings inside the Nixon administration—especially in the Treasury Department—that the gold “window” ought to be slammed unequivocally shut.

It is important to realize that while other governments theoretically could redeem their dollars for gold, most handled the U.S. Treasury with kid gloves: Only a golden trickle left Washington. Some nations, such as Germany, did this because they were obliquely threatened with U.S. troop pullbacks, but there were others who

sincerely believed that their sacrifices were going toward the maintenance of the world monetary order.

As in any unnatural economic imbalance, speculators had jumped into the fray and began betting against the dollar. The reasons for their position were justified by every piece of economic news emerging from the United States by mid-1971. Each monthly figure was worse than its predecessor; the nation had slipped into severe trade and payments deficits. But the allies were patient; only a relatively paltry \$300 million in gold left the U.S. from January to early August 1971. Rumors spread among foreign central banks that the gold window was about to be shut. Rumbblings from the Bank of England suggested that they were preparing to turn in dollars for gold in huge amounts. As Treasury Secretary Connally said (privately) at the time, "We're completely exposed. Anybody can topple us anytime they want to."

On August 6, a congressional subcommittee report concluded that the dollar had become overvalued and called outright for an exchange rate realignment. That same day more than \$1 billion in gold or other reserve assets were drained from the Treasury, and over that next week almost \$4 billion fled the country.

During the week ending Friday, August 13, the U.S. Treasury borrowed almost \$3 billion in foreign currency to try to halt the dollar's decline (by buying dollars with that currency). But it soon became obvious that the anti-dollar forces had too much strength.

President Nixon responded by declaring international bankruptcy. In a televised address on Sunday, August 15, 1971, he announced that no more gold would be given in exchange for dollars. There were now absolutely no checks on the ability of the United States to inflate.

Nixon's speech to the world that night was a cunning attempt to lay the burden of guilt for this assault upon the shoulders of America's trading partners, who had maintained, Nixon astonishingly asserted, "unfair exchange rates." The cause of the problem had indeed been inequitable exchange rates, but not in the way that Nixon meant. The injustice of this statement is unsettling even 10 years after it was made.

"Unfair" Japan

It is interesting to trace the immediate reactions of one of those "unfair" partners, Japan. Unlike Western Europe, whose exchanges were closed when news of the announcement came, it was Monday morning in the Far East. Trading was already underway when Nixon stepped before the cameras. Paralyzed by the news, the Japanese

nevertheless kept their foreign exchange market open—not only for the rest of the day, but for two weeks afterward. As the European markets had sensibly remained closed, Tokyo became the dumping ground for anyone who wanted to get rid of dollars. During those two weeks the Bank of Japan absorbed \$4.5 billion. Finally, on August 28, they threw in the towel and joined the other currencies in floating.

The European markets had remained closed, stunned and confused by the president's action. But they could not remain shut forever, and after efforts to decide upon a common course of action failed, they opened on August 23 on an uncoordinated basis. Even though they all continued to adhere officially to their pre-August 15 parities with the dollar, virtually all of them stopped defending the upper limits of their exchange rates.

In the months that followed, the spotlight turned on the United States as other nations waited for an American move. Their view was the understandable one that since the United States had thrown the monetary system out of kilter, it was up to America to make the first move.

American officials finally revealed a plan whereby most other currencies would be revalued upward against the dollar; no mention at all was made of the United States devaluing its dollar by raising the official price of gold. This overture naturally struck America's trading partners as still one more affront. When the director of the IMF, Pierre-Paul Schmitzer, suggested that the United States might share in this realignment by a minor increase in the gold price, he was immediately moved onto the "most wanted" column of the Nixon administration's enemy list. But the Europeans were intransigent; the American plan made no headway.

The "Greatest Agreement"

Massive runs continued on the dollar, belying Nixon's August 15 claim that a dollar cut from gold would "never again be subject to international speculation." By mid-December—four months later—the dollar had declined by 12.5 percent against the mark, 12.3 percent against the yen, and had even lost ground to the lire and the pound, falling by 5.4 percent and 4.1 percent respectively. The world monetary situation not only continued in disarray, it seemed to be getting worse.

On December 18, 1971, the Smithsonian agreement was announced. For the first time in the post-war era, the dollar was devalued by raising the official gold price from \$35 to \$38 an ounce (8.6 percent). But gold convertibility was not restored, so the devaluation meant little.

Nixon's aim was to recreate an international order with fixed exchange rates—but without gold. He referred to this as “the greatest monetary agreement in the history of the world,” but it was clear that no system would break down faster than a system of fixed rates fixed to nothing, neither to gold nor to anything else.

Nixon's “greatest monetary agreement” was smashed on the shoals of economic reality barely 14 months later, because the dollar and pound sterling continued to be drastically overvalued in terms of the other industrialized nations' currencies and, most importantly, in terms of gold. The lack of confidence in the dollar sent gold prices soaring to \$90 an ounce, almost tripling the formerly sacred \$35 figure. There continued to be periodic flights from the dollar.

Finally, on January 24, 1973, the Swiss government stopped supporting the dollar. Other governments quickly followed: They had all had enough. One month later, the entire fixed-rate order collapsed. The actual story of how it happened would be a dreary repetition of the tales recounted about billions of unwanted dollars reluctantly bought; another frantic but fundamentally ineffective dollar devaluation in an unsuccessful attempt to restore tranquility and, ultimately, a closure of the world exchange markets. When those markets reopened, they did so without fixed rates. And the absence of fixed rates meant, logically, *de facto* floating rates. Floating rates had not really been adopted; rather, fixed rates had been abandoned.

Floating and Sinking

Since 1973 we haven't had the former condition of “public crises” where inflationist governments would be forced to spend millions in the foreign exchange markets defending their currencies until finally giving up and devaluing their currencies. For all its messiness, that system at least called people's attention to the fact that offending governments were in effect publicly confessing their sins. What we have had since is rather a quiet but constant withering away of values of those currencies, which are inflated more than others, and a large drop in the value of all currencies in terms of gold. While the dollar—and even the Swiss franc—is not today what it was in 1973, an ounce of gold remains an ounce of gold.

Even under the flawed Bretton Woods fixed rates, there were limits to how far governments could inflate. Granted, it took a quarter-century, but the United States eventually inflated to such a degree it lost too much gold.

The floating rate system has given, however, complete control of the value of each currency to the respective governments. They need not worry about gold flowing into other central banks. There are thus

no institutional limits to inflate, and it should come as no surprise that the past decade has seen a marked jump in average annual world inflation.

The only effect of internal inflation now is a drop in the currency exchange rate, a currency falling in value. But in each country there are special interests who desire just that. These include domestic businessmen who can't compete with the better-made or lower-cost products of other lands. If these inefficient firms' goods are priced in a currency becoming cheaper, consumers of stronger-currency countries can more easily buy those goods. But the reverse of this is that goods from those stronger currency countries, priced as they are in currencies rising in value, become more expensive for the consumers of the nation whose currency is falling. Their living standards thus fall as they are in effect forced to subsidize inefficient domestic producers. Also, gainers in a depreciating currency country are *all* export firms, inefficient or otherwise. They can exert powerful pressure in favor of international inflation.

But as one can guess, this system does not exactly promote international harmony. Temptations are great for the "competitive" devaluations which so upset world economic peace in the 1930s. As we enter the 1980s, unpleasant rumblings in favor of protectionism and high tariff barriers are being heard on a grand scale for the first time in half a century. The world economy is being pulled apart. It is no coincidence that world trade wars are threatened more now than at any time since the last regime of floating exchange rates, during the depression-ridden 1930s.

Islands of Calm in a Churning Sea

There have been attempts to operate localized fixed rate systems amidst the generalized floating. Foremost among these attempts have been the two efforts of that most cohesive and interdependent group of countries, the European Common Market.

Being linked by culture, geography, and the need for trade, they realize more than America does what havoc floating rates have wreaked, and it is a hopeful sign that these nations are more and more including gold in their dealings.

The first of these stabilizing attempts was the Common Market "snake," so-called because all the currencies moving up or down within predetermined limits called to mind the undulations of a moving snake. Begun in 1972, it was over by 1976 simply because several different governments, each with its own inflation rate, from the start moved away from each other, flinging accusations of bad faith at each other while they did.

Having more flexible limits, Western Europe tried again and in March 1979 inaugurated the European Monetary System (EMS). While the EMS enables countries to revalue more easily, each time a member does, it strains the very cohesion the system was meant to foster. It was nonetheless successful during its first two and a half years of operation. Traditionally strong currencies like the German mark weakened while perpetually weak ones like the French franc and Italian lira were strong.

There was therefore only one major realignment until October 1981. Since then, though, there have been two (the most recent on February 21, 1982) and signs point to European currencies falling back into their usual patterns. But while EMS is likely in for a hard time, in the background of this latest attempt at monetary union has been a gradual but clear remonetization of gold, the only stable unifying force among currencies.

Even before EMS's 1979 birth, both Italy and Portugal borrowed billions of dollars from other European nations and used as collateral part of their gold holdings. But in those cases in the mid-'70s, the gold was valued at around 20 percent below the prevailing free-market price.

With EMS's founding, things took a turn. In exchange for member gold deposits, nations received a new currency called the European Currency Unit (ECU). The hope is that one day ECU will be the European currency. This currency not only represents deposits in gold, but the gold is valued at the free-market rate. Further, under EMS rules, gold can act as a means of settlement between members. So gold now fulfills in the EMS two of three functions of money: It is both a reserve instrument and an instrument of payment. Gold only lacks the final prerequisite for money, a standard of value. This is so because current IMF rules (effective April 1, 1978) forbid all reference to gold in defining currency values. This has led to the absurd situation where currency A is defined in terms of B, C, and D; B in terms of A, C, and D, and so on. Each currency is thus defined in terms of others which themselves depend for definition upon it.

The market has not been fooled by any of this. It knows how to value currencies—in terms of gold. And that valuation has been since 1971 embarrassing for every currency. One-tenth of an ounce of gold will today buy as many dollars as one ounce did 10 years ago. The market has delivered its verdict on the battle between gold and the dollar waged throughout the 1970s by the American government; first the 1971 suspension of any remaining convertibility, and then two devaluations in rapid succession. At the Jamaica Conference of 1976, the IMF approved the U.S. wish to demonetize gold by abolishing the

official price and selling over 600 tons, one-sixth of all IMF holdings (returning another one-sixth to member nations). The U.S. Treasury itself announced in January 1978 that it would sell gold beginning that May. But all during the time of the sales (which totaled about 500 tons) gold's price rose. Finally realizing it was throwing away a precious resource, Treasury ceased its gold sales after November 1979. The Treasury thus implicitly backed up the enhanced roles which Europeans had given gold earlier that year.

Indeed, as pointed out by Yves Laulan, chief economist of Société Générale (one of France's largest banks), the U.S. Treasury, in an attempt to demonetize gold, authorized its sale to end circulation among individual Americans. Paradoxically, that act caused people to value it even more.

This subjective revaluation of gold has since spread to the Treasury, which now realizes that it holds far more gold reserves than any other country. Those who wish to reestablish American dominance in the world are not blind to the fact that gold is a powerful weapon. It is thus unlikely that Washington will wage last decade's war on gold again.

Conclusion

Our historical experience illustrates the overwhelmingly superior case for the gold standard as against any form of paper standard. There has never, in peacetime American history, been any sustained rate of inflation to match the inflation since 1941. The same, in fact, is true of wartime, which at least has never lasted more than a few years. And it is not an accident that the highest, most accelerated rate of inflation has taken place since 1971, when the United States went off the international aspects of the gold standard and went over completely to fiat paper.

The same conclusion is true if we consider price stability. Even deflation has been more acute under the fiat standard than under gold, as happened in the fiat standard war of 1873-79 as contrasted to the gold standard period from 1879-1896.

Bimetallism doesn't work either, as America learned painfully from a century's experience. Gresham's Law, driving out undervalued moneys, works there as it does whenever the government overvalues one money and undervalues another. The dollar must be defined once again as a fixed weight of gold, with coinage and paper dollars always redeemable one into another at that weight. Ideally, full-bodied silver would fluctuate freely alongside the gold dollar; short of that, fractional, subsidiary silver, as well as other metals such as copper, would circulate in minor capacity along with gold.

The dollar must be redefined as a unit of weight of gold again, and gold coins should be encouraged to actually circulate among the public, to be used not simply as long-range investment but as a medium of exchange functioning as money. As Mises' "regression theorem" showed in 1912, new currency units cannot be imposed *de novo* from above, by politicians or economists.¹⁷⁴ They must emerge out of the experience and the valuations of the public on the market. The public is now long used to the "dollar" as the money unit, and therefore the "gold gram" or "gold ounce" cannot be simply adopted by the public as a money out of the clear blue sky. The eventual adoption of a gold gram or gold ounce is basically a two-phase process: First, the "dollar," now of course the common currency unit, must be firmly and permanently tied to gold at a fixed weight; the public must become accustomed to this concept; and then finally, the currency unit can become that fixed weight directly.

What weight we choose to define the dollar is a matter of convenience, since any *initial* definition is arbitrary, and we can pick the most useful one. This is no more "fixing the price of gold" and violating the free market than defining that two nickels as equal to one dime "fixes the prices" of these two entities, or any more than defining that one pound as equal to 16 ounces "fixes the price" of ounces and pounds. What the definition should be depends on the preferred use and what the remainder of the monetary and banking system will look like.

Eventually, too, we must abolish the central government's monopoly of the minting business. Surely the idea that the sovereignty of the king must be expressed through stamping his face on a coin can now be discarded as a relic of a bygone age. There is no reason why private firms cannot mint coins as well, or better, than the national mint. Free competition should come, at long last, to the minting business. The cost would be far cheaper and the quality of the coins much improved.

From our historical analysis, it becomes clear that the problems of money and the business cycle under the gold standard, of inflation and contraction in the 1818-36 era, of World War I inflation, of the boom of the 1920s and the disasters of the Great Depression of 1929-33, stemmed not from the gold standard but from the inflationary fractional-reserve banking system within it. This inflationary banking system was made possible by the government's imposition of a central bank: the Federal Reserve, the Bank of the United States, or by the quasi-centralized system of the national banking era after

¹⁷⁴ See Ludwig Mises, *The Theory of Money and Credit* (Irvington-on-Hudson, New York: The Foundation for Economic Education, 1971).

the Civil War. These booms and busts would not have occurred under “free banking,” i.e., the system in which banks are decentralized, able to issue either notes or deposits, cannot be bailed out by a lender of last resort, and are forced to close their doors permanently if they fail to redeem their liabilities in specie. The quasi-free banking period from the 1830s to the Civil War was far sounder and more stable than any period before or since in American history—as historians are now coming to recognize. It would have been far better but for the periodic suspensions of specie payment that governments continued to permit. The legalization of branch banking would have made it far easier to call upon banks for redemption.

Once again, it was the intervention of government that caused the difficulty, not the market. *Laissez faire* has not been consistently applied to banking. The historical evidence shows that monetary freedom does not fail, intervention by the government does.

JOINT ECONOMIC COMMITTEE
REPUBLICAN STAFF COMMENTARY
“UNITED STATES MONETARY HISTORY IN BRIEF
PART 1: THE FIRST & SECOND BANKS OF THE UNITED STATES—
RISE AND FALL”

Monetary policy and the Federal Reserve are often perceived to be shrouded in mystery or incomprehensible to all but central bankers. This three-part monetary history series attempts to remove that veil of mystery by offering an historical vantage point that sheds light upon and makes monetary policy more comprehensible.

Central Banks: Definition & Constitutional Foundation

Central banks are chartered by national governments to have a legal monopoly over a nation's currency and bank reserves. To manage a nation's money supply, they use monetary policy tools, such as open market operations (e.g., buying/selling gold, silver, government debt securities, etc.); setting reserve requirements (i.e., deposits of currency, gold or silver that must be held at the central bank) for commercial banks and financial institutions; and acting as lender of last resort for solvent but illiquid commercial banks and financial institutions during a financial crisis. Central banks also supervise commercial banks and financial institutions.

The United States Constitution provides the legal foundation for a central bank in Article I, Section 8, Clauses 5 and 6, which give Congress the power “to coin money [and] regulate the value thereof,” and Clause 18 to make laws “necessary and proper for carrying [out] the foregoing powers.” America's first central bank was established in 1791 by the 1st Congress.

First Bank of the United States

Secretary of the Treasury Alexander Hamilton issued his “Report on a National Bank” on December 14, 1790, and in 1791—based on his report—Congress chartered the **First Bank of the United States** (1791-1811).

Congressional debate over the First Bank foreshadowed the cataclysmic event to envelope the nation 70 years later with a general north-south divide and fierce exchanges over the role of federal and state governments. Echoes of the early opposition to the First Bank have run throughout our nation's history, even down to some of the populist arguments of the present day. Nevertheless, America's need for a central bank was acute, as the country had to manage the

significant Revolutionary War debt incurred by the states; and the country needed a stable currency to facilitate commerce and trade within the fledgling United States and with countries abroad.

Yet, as economist Richard Timberlake argues, the First Bank was not meant to be a modern central bank. Rather, the bank Hamilton envisioned would be a public bank to help the federal government secure loans, “aid in the sales of public lands ... and eventually provide a uniform paper currency.”¹⁷⁵

After supporters of the First Bank won the debate, the next major development in U.S. monetary policy was Congress’s adoption of the **Coinage Act of 1792**, which placed the United States on a “**bimetallic standard**” of gold and silver (see Appendix for a discussion of the gold standard, the silver standard, and bimetallic standard and how they operated). Confusing as such a bimetallic standard may be in the 21st century, it made sense in the late 18th century when the United Kingdom—the world’s dominant economic power—operated on a gold standard, while France—America’s Revolutionary War ally—operated on a silver standard.

The Coinage Act fixed the mint prices of gold and silver at a ratio of 15:1 (i.e., \$19.39 per troy ounce for gold, \$1.29 for silver) so that, relative to their prevailing market values, gold was slightly overvalued and silver was slightly undervalued. These mint prices encouraged the importation of gold for coinage and accumulation of gold reserves at the First Bank. Beyond the political considerations of Hamilton (favoring relations with Britain) and Thomas Jefferson (favoring relations with France), the accumulation of gold was important since foreign creditors required payment of interest and principal of U.S. government debt in gold.

Hamilton’s economic policies had the effect of transforming the U.S. government debt from a liability into a highly valued asset in domestic and foreign financial markets. Thus, Hamilton created a powerful financial tool for the U.S. government to finance its national defense and meet other needs.

During its 20 years of operation, the First Bank was a hybrid central-commercial bank, modeled on the Bank of England. It was a public-private partnership, in which private investors owned 80% of its stock while the federal government owned the rest, with the Treasury conducting regular examinations of the Bank for safety and soundness. In addition to issuing a uniform currency in the form of First Bank notes (bank notes are paper currency), the First Bank served as the depository and fiscal agent of the federal government;

¹⁷⁵ Timberlake, Richard H., *Monetary Policy in the United States: An Intellectual and Institutional History*, The University of Chicago Press, Chicago, 1993, p.5.

supported the credit of the federal government; and regulated state-chartered banks through the First Bank's acceptance of state bank notes or demanding their redemption in specie (i.e., gold or silver coins and bullion). Consequently, as noted by Timberlake, the First Bank began to exercise modern central-banking functions:

through its currency transactions with other banks. If it felt that credit restraint was called for, it presented the notes of other banks for redemption in specie. If it felt that credit ease was in order, it expanded its own credit availability to businesses and to other banks and generally treated the notes of other banks with 'forbearance.'¹⁷⁶

Although the First Bank was careful not to exert too heavy a hand and generally received favorable reviews for fulfilling its purpose, congressional critics in Jefferson's party continued to question the Bank's constitutionality. They would have their hour when the Bank came up for renewal at the end of its 20-year charter.

Storm Clouds Gather Over the First Bank

When the First Bank's charter came up for renewal in 1811, one of the Bank's harshest 1791 congressional critics and opponents, James Madison, had become president. Yet, the dynamics had changed in the intervening 20 years as Madison's concerns had been allayed through witnessing the value and necessity of the Bank.

However, politics being what they were, Madison was afraid of being seen as ideologically inconsistent (i.e., "flip-flopping" on the Bank question), and he wanted to show deference to his mentor, President Jefferson, who opposed the First Bank. So, Madison did not publicly declare support for renewing the First Bank's charter, though he directed Secretary of the Treasury Albert Gallatin to seek renewal of the First Bank's charter from Congress.

The House of Representatives renewed the charter, but the Senate failed to pass it due to a combination of constitutional questions and fears and allegations that British stockholders were dominating the Bank. How the Bank was defeated in the Senate was especially ironic as Madison's Vice President, George Clinton—who had been elected after the 12th Amendment to the Constitution, which aimed to ensure the President and Vice President would not be ideological opponents—cast the tie-breaking vote against his own administration's bill to renew the Bank. So, with the bill's defeat, the United States was left without a central bank, while on the brink of war.

¹⁷⁶ Ibid., p.10

War of 1812 & Life Without a Central Bank

The Madison administration's failure to renew the First Bank's charter proved consequential in the **interregnum period** (1811-1816) when the United States did not have a central bank. Notably, Madison had an especially difficult time financing the War of 1812; Secretary of the Treasury Gallatin could raise only \$38 million out of an authorization for \$61 million in bonds. Furthermore, in this period, the number of state banks grew from 86 to 246, and total bank notes grew from \$28 million to \$68 million, resulting in a cumulative 34% increase in prices. Had the First Bank continued to operate, many of these difficulties could have been avoided.

Second Bank of the United States

Out of the interregnum experience arose the **Second Bank of the United States** (1816-1836). Speaker of the House Henry Clay worked with the Madison administration to charter the Second Bank on the same basis as the First Bank. However, Madison pressed the Board of Directors of the Second Bank to name as its president his Secretary of the Navy, William Jones. This decision proved disastrous. Through both corruption and incompetence, the Second Bank came close to failing as Jones augmented, rather than restrained, a speculative bubble in western lands. In 1819, Jones was forced to resign, and the board chose former House Speaker Langdon Cheves to replace him as the Second Bank's President.

Meanwhile, the Treasury—now under the leadership of Secretary William Crawford—acted like a central bank, while the Second Bank “proved to be nothing more than a convenient buffer for the unpalatable but ‘necessary’ policies of the Treasury Department” to contract the money supply and bring inflation under control. Under Cheves, total bank notes were reduced to \$45 million by 1819. This saved the Second Bank but at the price of much economic pain including: the financial **Panic of 1819** and resulting recession (the first presidential-induced recession); a 27% decline in prices through 1824; and a growing populist sentiment against the Second Bank. Notably, the Second Bank—rather than President James Monroe's administration, which was really the guilty party in the fiasco—drew the ire of presidential aspirant, General Andrew Jackson.

In 1822, Nicholas Biddle succeeded Cheves as president of the Second Bank. Biddle, who proved especially competent, returned the Second Bank to the First Bank's central banking function of regulating the state banks through its acceptance of state bank notes or its demand for their redemption in species. Under Biddle's

leadership, this central banking function was used to stabilize the U.S. economy and prevent financial panics.

Again though, the storm clouds gathered over the Bank with the 1828 election of President Andrew Jackson. In 1832, Jackson vetoed Sen. Henry Clay's bill to renew the Second Bank's charter. Nonetheless, there was dissent even within Jackson's cabinet over the issue of the Second Bank. Jackson fired two Secretaries of the Treasury, who refused to remove government deposits from Second Bank (the Bank's charter, which ran to 1836, had not yet expired) and place them in Jackson-favored state banks. Finally, in 1833 Jackson's acting Secretary of the Treasury Roger B. Taney complied with the demand, and there is speculation that Taney's reward for this action was a subsequent appointment as Chief Justice of the United States.¹⁷⁷

Bad Monetary Policy & Economic Collapse

Through the **Coinage Act of 1834**, Jackson devalued the U.S. dollar by 6.6% to \$20.67 per troy ounce in terms of gold, but not in terms of silver, thus increasing the gold-to-silver mint price ratio from 15:1 to 16:1, which by slightly overvaluing gold and undervaluing silver relative to prevailing market prices again caused an inflow of gold. This led to a 42% increase of bank deposits and a 36% increase in prices from 1834 to 1836.

Distribution of the Surplus and **Specie Circular** were disastrous policies. The populist reaction against the Second Bank and the ensuing policies caused a 36% drop in the money supply in 1836-37. One such policy came from Jackson signing an 1836 bill that distributed the federal surplus of \$28 million to the states. To pay the states, the Treasury withdrew \$28 million in federal deposits from Jackson-favored state banks in specie. This triggered an immediate contraction in loans and bank notes from the banks that lost their deposits. Of these funds, states deposited \$23 million into other state banks and retained \$5 million in specie. This conversion into specie reduced the aggregate reserves available to support loans and bank notes nationwide. Moreover, banks that eventually received deposits from the states took time to expand their loans and bank notes. (In the 1800's, there were no wire transfers. Rather, specie and notes had to be transferred by wagons, often over uncertain roads.) Finally, Jackson's 1836 Specie Circular, which required payment in gold or silver for the purchase of federal lands,

¹⁷⁷ For background on Taney's appointments, see Abraham, Henry J., *Justices, Presidents, and Senators: A History of the U.S. Supreme Court Appointments from Washington to Clinton*, Rowman & Littlefield Publishers, Inc., New York, 1999, pp. 74-76.

increased the demand for gold and silver coins, compounding the contractionary effects of the distribution of the surplus.

Thus, Jackson left office as the U.S. began to suffer from the **Panic of 1837** and the ensuing depression. This policy-induced depression was the second longest and second deepest depression in U.S. history, only superseded by the Great Depression of the 1930's, and as Milton Friedman noted, the great depression stemming from the Panic of 1837, "is the only depression on record comparable in severity and scope to the Great Depression of the 1930's."¹⁷⁸

Bad policies continued to prevail, including the "Independent Treasury," under which President Martin Van Buren consolidated federal deposits from state banks at the Treasury. Ultimately, the U.S. economy did not recover from the Jackson-induced depression until 1843—two years after the defeat of Jackson successor and one-term President Van Buren.

Central Banking from the Treasury

Though the Whig party won the control of both Congress and the presidency in 1840 on a platform that included a pledge to create a Third Bank of the United States, President John Tyler, who succeeded William Henry Harrison after his brief tenure, vetoed a bill to charter a Third Bank in 1841. Consequently, the Treasury assumed a limited central-banking role in the years preceding the Civil War. Tariff revenues were highly elastic, while federal outlays were relatively constant. This allowed the Treasury to act as an 'automatic stabilizer'—issuing U.S. government debt securities (i.e., Treasuries) when tariff revenue was low and redeeming them when revenue was high.

Currency Problems & Technology Preceding the Civil War

Generally, from 1836—when the Second Bank ceased its interstate operations—until the Civil War, the United States did not have a national currency. Historians have called this the **free banking era** (even though the United States never actually had free banking as defined by economists). With many states liberalizing their laws about chartering banks, the quality of supervision and regulation varied widely, creating many problems. Some states, especially in the south and west, suffered from numerous wildcat banks that opened with insufficient capital. The wildcat banks would make loans and issue bank notes, only to fail in a matter of months. As a result, bank notes did not trade at par (face) value with each

¹⁷⁸ Friedman, Milton, *A Program for Monetary Stability*, Fordham University Press, New York, 1959, p.10.

other. Instead, the value of notes from different banks fluctuated daily (much as national currencies do today in foreign exchange markets).

In this environment, economic development suffered from the bad monetary policy of the period. The fluctuating value of state bank notes and losses on notes from failed wildcat banks were costly, taking a toll on the growth of interstate commerce. Yet, technological advances like the steamboat, railroad, and telegraph were forging a single national economy out of the previously separate local economies, highlighting the need for a single national currency—even absent a central bank.

With this as background, one of the sub-issues of the 1860 campaign was the question of a national currency. The newly formed Republican Party, in the tradition of the Federalist and Whig Parties, favored the creation of a single national currency to replace state bank notes, while the Democrat Party supported the status quo. Regardless, changes would be afoot as the nation was driven into its most devastating war, again, absent a central bank.

APPENDIX: DISCUSSION OF STANDARDS

Gold Standard

Classical gold standard: There are two versions of a classical gold standard—**gold coin standard** and **gold bullion standard**. Under a gold coin standard, a country defines its unit of account in terms of a fixed weight of gold (i.e., mint price). The mint will freely coin gold at the mint price, gold coins are in circulation, and the central bank (or commercial banks in the absence of a central bank) will freely convert bank notes into gold coins at the mint price. Under a gold bullion standard, a country defines its unit of account in terms of a fixed weight of gold (i.e., par value). However, the mint will not freely coin gold and gold coins are not in wide circulation. Instead, the central bank will freely buy or sell gold in large quantities, known as bullion, at par value. Exchange rates among the currencies of all countries operating under a classical gold standard are effectively fixed. A classical gold standard is largely self-regulating through domestic and international gold flows.

The profitability of the gold mining industry—which is affected by the size and frequency of new gold finds, mining and processing costs, and technological progress—effectively determines the monetary base and the price level in all countries operating under a classical gold standard. Therefore, a classical gold standard may not provide long-term price stability. Indeed, decade-long periods of both

price inflation and price deflation occurred under the classical gold standard.

Gold exchange standard: Under a gold exchange standard, a country defines its unit of account in terms of another country's currency (i.e. anchor currency) that is freely convertible into gold at par value. The central bank will freely exchange its bank notes for the anchor currency at the fixed exchange rate.

Like a classical gold standard, the exchange rates among countries operating under a gold exchange standard are fixed to the anchor currency and to each other. Unlike a classical gold standard, however, a gold exchange standard is not self-regulating. It is dependent on the behavior of the central bank in the anchor country.

Silver Standard

A silver standard is similar to a gold standard except silver is the metal used.

Bimetallic Gold and Silver Standard

Under a bimetallic gold and silver coin standard, a country defines its unit of account in terms of a fixed weight of gold and a fixed weight of silver, known as mint prices. The mint will freely coin both gold and silver at their respective mint prices. In theory, both gold and silver coin should be in circulation, and the central bank (or commercial banks in the absence of a central bank) will freely convert bank notes into either gold or silver coins at their respective mint prices. In practice, however, a bimetallic standard is actually an **alternative metallic standard**. When one monetary metal becomes “dearer” (i.e., its market price rises relative to its mint price), coins in the “dearer” monetary metal will go out of circulation, and individuals and firms will drain the dearer monetary metal out of the central bank by exchanging bank notes for coins or bullion in the “dearer” monetary metal. The “cheaper” monetary metal, whose market price falls relative to its mint price, will effectively become the sole monetary metal. This process will reverse as market prices of gold and silver fluctuate relative to their respective mint prices.¹⁷⁹

JOINT ECONOMIC COMMITTEE
REPUBLICAN STAFF COMMENTARY
“UNITED STATES MONETARY HISTORY IN BRIEF
PART 2: EXPERIENCE WITHOUT A CENTRAL BANK—
CIVIL WAR TO CREATION OF THE FED”

Monetary policy and the Federal Reserve are often perceived to be shrouded in mystery or incomprehensible to all but central bankers. This three-part monetary history series attempts to remove that veil of mystery by offering an historical vantage point that sheds light upon and makes monetary policy more comprehensible.

Setting the Stage

Part 1 of this series covered the founding of a central bank in the United States by the 1st Congress in 1791; the rise and fall of the First and Second Banks of the United States; and life in America with and without a central bank from 1791-1860. Generally, America’s economy prospered with an independent central bank, managed by competent individuals, and America’s economy did not fare as well absent a central bank or when a central bank endured interference from politicians. The period closed without a central bank—except for the Treasury taking on some central banking functions. Meanwhile, advances in technology were forging a single national economy as the nation headed into the Civil War.

Civil War: From a Gold & Silver Standard to a Fiat Currency

In 1860, the U.S. money supply consisted of \$500 million in both currency and bank deposits. With the opening of Civil War, the public began to hoard gold in anticipation of inflation, and by the war’s end four years later, prices—including that of gold—had doubled.

To combat the hoarding and help finance the Civil War, in December 1861, President Abraham Lincoln suspended the redemption of bank notes for gold or silver at their mint prices, \$20.67 and \$1.29 per troy ounce, respectively. Thus, Americans could no longer demand gold or silver from banks in exchange for dollars, and the effect was to move the U.S. from a bimetallic gold and silver standard to a **fiat currency**. *Fiat money derives its value from government declaration rather than from the value of a metal such as gold.*

The supply of money was then increased in February 1862 by the 37th Congress through the **Legal Tender Act**. This law authorized the issuance of \$150 million in U.S. notes—known as “greenbacks”—and the circulation of these greenbacks was increased to \$400 million

by war's end. Also, Congress authorized the issuance of 3% Treasury notes, which were like savings bonds but could be used as either currency or bank reserves.

Next, the Congress passed the **National Bank Act of 1863** (with significant amendments in 1864 and 1865), which established the Office of the Comptroller of the Currency to charter, supervise, and regulate national banks. National banks could issue up to \$300 million of national bank notes, but unlike pre-war state bank notes, national bank notes traded at par with each other and U.S. notes, thus restoring a national currency.

National bank notes were fully collateralized by U.S. government debt securities (i.e., Treasuries). In other words the notes were fully backed, which increased their demand because the public was protected from losses on notes when a national bank failed. Further, the National Bank Act instituted a punitive 10% tax on state bank notes, which was intended to drive state banks out of business. Nevertheless, state banks survived because of the rapid growth of checkable deposits after the Civil War.

Resumption of the Gold Standard

The U.S. faced difficult challenges following the Civil War, including whether and how to resume the gold standard so that Americans could freely convert dollars to gold. As European countries that had been on either a silver standard or a bimetallic standard were switching to a gold standard during this period, U.S. policymakers did not consider returning to the pre-war bimetallic standard. Four monetary policy options were considered: (1) Contract the money stock, causing a rapid price deflation, reducing the market price of gold to the pre-war mint price of \$20.67 per troy ounce; (2) Freeze the money stock, which (combined with real GDP growth) would cause a gradual price deflation, reducing the market price of gold to the pre-war mint price; (3) Devalue the U.S. dollar by raising the mint price of gold to its market price with convertibility at the new parity; and (4) Abandon the gold standard and have a fiat currency.

During Reconstruction, a combination of the first and second monetary policy options were implemented. From 1865 to 1868, Secretary of the Treasury Hugh McCulloch used federal budget surpluses to retire about \$250 million in greenbacks and 3% T-notes, causing prices to decline by 20%. Then, Congress froze the supply of greenbacks at \$356 million in 1868, though the Civil War era legislation had authorized up to \$400 million, creating a reserve of \$44 million at the Treasury.

President Ulysses S. Grant signed an act into law on July 12, 1870, which increased national bank notes by \$54 million and decreased 3% T-notes by \$45 million with most of the new national bank notes allocated to banks in southern and western states. Yet prices did not fall much and movement toward resumption of the gold standard was minimal during Grant's first term. So, early in his second term, Grant signed the **Coinage Act of 1873**, which demonetized silver and replaced the bimetallic standard with a de facto gold standard.

To those who wanted silver in circulation, this Coinage Act was referred to as the "Crime of 73"—especially following new silver finds in Colorado, which greatly increased the supply of silver and depressed its price. Moreover, gold production slowed beginning in mid-1870's and did not increase until mid-1890's, while real GDP growth boomed in the U.S. and many other countries. Over the next two decades, this combination produced persistent global price deflation and inflamed political disputes about U.S. monetary policy.

Panic of 1873 & the Form-Seasonal Elasticity Problem

During the second half of 19th century, a troubling new policy-induced phenomenon became commonplace—seasonal financial panics. Such was the case with the **Panic of 1873**.

Though technological advances before and during the Civil War helped to forge a single national economy, how individuals operated within the economy varied greatly. For instance, most businesses and urban households used checks to make payments, whereas most farmers and rural households still used cash. As these preferences collided in the national banking system, completely avoidable crises would beset the U.S. economy.

The **form-seasonal elasticity problem** would begin late in the summer as cash would flow out of banks to pay farmers for crops, and then the cash would flow back into banks as farmers paid their bills. Ideally, a monetary system should be sufficiently flexible to allow for seasonal conversions from deposits to cash and back without affecting money supply, prices, or interest rates. However, two principal rigidities in the national banking system of this period limited the form-seasonal elasticity of the U.S. money supply:

- (1) There were federally-established limits on the issuance of U.S. and national bank notes, even though there was rapid population and real GDP growth; and
- (2) Treasuries, which were used as collateral for issuing national bank notes, were in short supply because of the federal budget surpluses of this period, forcing national banks to pay

large premiums to secure Treasuries in the fall.

When cash flowed out the banking system each fall, national banks could not easily expand the supply of national bank notes. To meet the demand for cash, national banks had to build large reserves in the winter and spring. If these reserves proved insufficient, national banks would demand immediate repayment on many of their outstanding loans to generate cash. The ensuing impact on the economy could be devastating. Frequently during the fall, short-term interest rates spiked from less than 2% to more than 30% annualized rates; and asset fire-sales to generate cash resulted in depressed asset prices. Consequently, the U.S. economy was extremely vulnerable to shocks during the months of September and October. This is why panics during this era, such as the Panic of 1873, usually occurred in the fall.

Fallout from the Panic of 1873

The form-seasonal elasticity induced panic of 1873 had national consequences. Treasury receipts dipped below federal outlays in November and December and the Secretary of the Treasury—taking on the role of a central banker—was forced to reissue \$26 million of the \$44 million greenbacks in reserve. The political uproar and populist accusations stemming from this action—the Treasury serving as lender of last resort—flowed freely and in some ways are still echoed in the early 21st century (i.e., Washington favors New York). The resulting political and economic climate for the 1874 election swung control of Congress to the Democrats for the first time since the Civil War.

Populist outcry over the Panic of 1873 remained acute, but it was more targeted at the panic's effects rather than its cause. As a result of the 1874 elections, the outgoing Republican-controlled Congress passed the Specie Payment Resumption Act in January 1875 that required the Treasury to resume the convertibility of dollars to gold at the pre-war mint price of \$20.67 per troy ounce by January 1, 1879.

Free Silver Controversy

Between 1873 and 1896, the United States and major European countries experienced rapid GDP growth while there were no new major find of gold. As a result, long-term price deflation occurred. Consequently, in the U.S., farmers—particularly in the south and west—suffered as the real debt burden of the mortgages on their farmland grew.

So, in opposition to resumption of the gold standard, the free-silver/cheap-money movement emerged. Rep. Richard “Silver Dick” Bland (D-MO) and Democratic presidential nominee William Jennings Bryan became champions of “free silver.” In response, a divided Congress (a Republican-controlled Senate and a Democratic-controlled House) enacted the **Bland-Allison Act** in 1878 after overriding the veto of President Rutherford B. Hayes. This Act was a compromise that required the Treasury to purchase between \$2 million to \$4 million per month of silver and mint it into silver dollars. However, Treasury had discretion about circulating these silver dollars since the federal government was running surpluses. Secretary of the Treasury John Sherman did not circulate the silver dollars, and gradual price deflation continued. Furthermore, through the Bland-Allison Act, Congress froze U.S. notes (greenbacks) at \$346.7 million, which though it prevented a legally mandated reduction of the cap, still maintained a cap, which was again one of the causes of the form-seasonal elasticity problem. Under Sherman, Treasury accumulated gold reserves of \$135 million to back the greenbacks, and resumption at the pre-war mint price of \$20.67 per troy ounce occurred without incident on January 1, 1879.

Nonetheless, free silver advocates were dissatisfied with the implementation of the Bland-Allison Act. In the Republican-controlled 51st Congress, Rep. William McKinley (R-OH) and Sen. John Sherman (R-OH) engineered a legislative compromise between different factions of Republicans. In exchange for the support of pro-silver Republicans from western states for the **McKinley Tariff Act**, Republicans from the northeastern and midwestern states agreed to support the **Sherman Silver Purchase Act**. President Benjamin Harrison signed the Sherman Silver Purchase Act into law on July 14, 1890. This act required the Treasury to purchase an additional 4.5 million ounces of silver bullion every month with a special issue of U.S. notes that could be redeemed for either silver or gold. However, the plan backfired as people turned in the new notes for gold, thus depleting the Treasury's gold reserves. Simultaneously the McKinley tariff increased the average tariff rate to 48%, reducing gold payments to the Treasury.

Panic of 1893

In his second non-consecutive term, President Grover Cleveland presided over the **Panic of 1893** and the subsequent depression—the third worst in U.S. history—which lasted until 1897. The gold drain from the Treasury following the Sherman Silver Purchase Act and the form-seasonal elasticity problem were the primary causes of this panic, though

there were other non-monetary dynamics at work. Among the other things, Cleveland blamed the depression on high tariffs and the Sherman Silver Purchase Act. The Democratic-controlled 53rd Congress repealed the Sherman Silver Purchase Act in 1893 and then enacted the **Gorman-Wilson Tariff Act** in 1894, which reduced tariff rates and imposed a 2% federal income tax on income over \$4,000. However, this income tax was ruled unconstitutional in the 1895 Supreme Court Case **Pollock v. Farmers' Loan & Trust Company**.

The Gold Standard

During the second half of the 1890's, global gold production doubled after major finds of gold ore in South Africa and Alaska, and the invention of new processing technology that increased the yield of pure gold from gold ore. The rapid increase in global gold supply relative to global GDP growth led to mild global price inflation through 1913. In 1900, President William McKinley signed the Currency Act—the Gold Standard Act—that made the gold standard, which had been the de facto standard, the official standard for the United States, marking the high water mark for the classical gold standard.

Combatting the Seasonal Panics

At the dawn of the 20th century, despite three decades of policy-induced economic panics, the root cause of the form-seasonal elasticity problem had still not been addressed. Not until President Theodore Roosevelt appointed Leslie Shaw to serve as Secretary of the Treasury were the first real strides made toward addressing the problem. Shaw was a skilled banker who, as Secretary, engaged in central banking to counter the form-seasonal elasticity problem through: (1) seasonal transfers of federal deposits between the Treasury and national banks; (2) acceptance of other bonds for collateral for federal deposits, freeing Treasuries to collateralize national bank notes; (3) abolishing reserve requirements for federal deposits; and (4) allowing gold importers to use gold interest-free from its purchase abroad until it was delivered to the Treasury. While Shaw served as Secretary from the spring of 1902 to the spring of 1907, the United States was spared from the seasonal panics.

Panic of 1907

Still, something more permanent was necessary than mere reliance on the skills of a talented Secretary of the Treasury like Shaw. This again became apparent in the fall of 1907 when Shaw's successor at the Treasury, George Cortelyou—despite trying to follow

Shaw's policies—was unable to finesse the situation like Shaw, resulting in yet another panic.

During the **Panic of 1907**, Roosevelt worked with banker J.P. Morgan to secure lines of credit from foreign banks and organize national banks to make loans to other solvent, but illiquid banks. Roosevelt sent Cortelyou to Wall Street, depositing \$68 million in national banks in New York City and issuing \$50 million of Panama bonds and \$100 million of Treasuries to provide additional collateral for national bank notes. In essence, Roosevelt asked Morgan to perform the lender-of-last-resort function of a central bank on an ad hoc basis, while Cortelyou supplied additional liquidity.

In response to the Panic of 1907, the following year, the Republican-controlled 60th Congress passed the **Aldrich-Vreeland Act**, which established a **National Monetary Commission**. In 1910, the Commission recommended: (1) Creating the **National Reserve Association** (NRA)—a central bank that would hold the reserves of all commercial banks; (2) Using the NRA's discount rate to regulate the money supply in the context of the gold standard (the discount rate is the interest rate that a central bank charges for fully collateralized loans to commercial banks); (3) Making the NRA the monopoly issuer of bank notes; and (4) Adhering to 'Bagehot principles' related to being a lender of last resort.

Walter Bagehot was an English businessman and editor-in-chief of *The Economist*. In 1873, he published *Lombard Street*, which outlined the principles for lender-of-last-resort operations during financial crises. Central bankers and economists still hold Bagehot's principles in high regard today. In a financial crisis, Bagehot advised, the Bank of England should lend freely to solvent, but illiquid commercial banks and other financial institutions based on collateral that would be good in normal times at a penalty rate of interest.¹⁸⁰

Creation of the Federal Reserve

President Woodrow Wilson, elected in 1912, generally agreed with the recommendations of the National Monetary Commission to create a central bank, though with changes to increase federal oversight.

However, Wilson's support for a central bank faced strong opposition, even from within his own cabinet. In particular, Wilson was presented with a challenging dilemma when his Secretary of State, William Jennings Bryan, threatened to walk out on him and

¹⁸⁰ For further discussion of Bagehot principles, see Joint Economic Committee Report, *An International Lender of Last Resort, the IMF and the Federal Reserve*, 1999.

Available at <http://www.house.gov/jec/imf/lolr.pdf>

lead congressional opposition to the central bank. By acquiescing to Bryan, Wilson would have lost support for reform from bankers and business leaders; by pushing forward in opposition to Bryan, Wilson would have risked a divide within the Democratic Party and a loss of his entire domestic agenda.

Wilson's solution was to work with Rep. Carter Glass (D-VA) and Sen. Robert Owen (D-OK) to find a middle way—the **Federal Reserve Act**—which was enacted in 1913. This act created a Federal Reserve System with:

- (1) A monetary policy mandate to provide an “elastic currency” within the context of a gold standard to combat the form-seasonal elasticity problem;
- (2) 12 regional Federal Reserve Banks, each headed by a Governor;
- (3) A Federal Reserve Board of Directors based in Washington, DC and composed of the Secretary of the Treasury, the Comptroller of the Currency and five other members to supervise the Reserve Banks;
- (4) A requirement that all national banks join the Federal Reserve System by purchasing stock in their respective regional Reserve Bank and an option for state-chartered banks to join; and
- (5) Federal Reserve notes—to replace U.S. and national bank notes—which would be U.S. government obligations.¹⁸¹

The Federal Reserve Act was thus crafted with multiple contradictory provisions, which allowed both advocates and opponents of the central bank to claim victory. On one hand, Bryan Democrats correctly claimed that Board would assure the federal government, not private bankers, would determine monetary policy. However, Bryan Democrats incorrectly assured their constituents that the Federal Reserve was not a central bank because each regional Reserve Bank would conduct an independent monetary policy. On the other hand, northeastern Democrats and Republicans correctly asserted that the Federal Reserve Act had created a central bank. Yet, because of nominal private ownership of the stock in the regional Reserve Banks, northeastern Democrats and Republicans incorrectly assured their constituents that private bankers, not the federal government, would determine monetary policy.

¹⁸¹ In 1913, the Federal Reserve was required to hold gold equal to 40% of the outstanding currency, and 35% of commercial bank reserves.

These contradictory provisions would later ignite a destructive power struggle within the Federal Reserve in 1928, at the front-end of the Great Depression. Further complicating the birth of the Federal Reserve, World War I began before the central bank became operational in 1915, thus requiring Treasury Secretary William McAdoo to once again intervene to prevent a panic in the fall of 1914 by issuing \$363 million in currency under the provisions of the Aldrich-Vreeland Act.

Life in America without a central bank was at an end. The age of seasonal panics—and the recessions and depressions stemming from them—was past. In the coming decades, the country would experience the best and the worst of central banking with the Federal Reserve gradually growing from these experiences into the modern central bank of the 21st century.¹⁸²

JOINT ECONOMIC COMMITTEE
REPUBLICAN STAFF COMMENTARY
“UNITED STATES MONETARY HISTORY IN BRIEF
PART 3: THE FEDERAL RESERVE—
A CENTRAL BANK’S GROWTH THROUGH TRIAL & ERROR”

Monetary policy and the Federal Reserve are often perceived to be shrouded in mystery or incomprehensible to all but central bankers. This three-part monetary history series attempts to remove that veil of mystery by offering an historical vantage point that sheds light upon and makes monetary policy more comprehensible.

Setting the Stage

Part 1 (1791-1860) and Part 2 (1861-1914) of this 3-part series explored the monetary and economic history of the United States. The U.S. did not have a central bank from 1836 to the creation of the Federal Reserve in 1913, and in the absence of a bank, the nation suffered from frequent seasonal financial panics, recessions and depressions. The Panic of 1907, in which New York banker JP Morgan acted as a lender of last resort and the Treasury provided additional liquidity, finally spurred the Congress toward enactment of the Federal Reserve Act of 1913, which reinstated a central bank in the United States.

The Federal Reserve Opens Its Doors

With the creation of the Federal Reserve, the seasonal panics that had dominated the American economy since the 1870’s ceased as the Fed effectively used the tools of monetary policy to provide greater elasticity to the U.S. money supply. Meanwhile, the Great War—World War I—raged as the Federal Reserve officially opened its doors for operations.

The now debunked real bills doctrine, which originated with Adam Smith, guided the Federal Reserve during World War I. The essence of the real bills doctrine held that short-term bank loans extended to businesses, based upon anticipated profitability of sales of goods produced, were not inflationary, while other loans were. So, as might be expected, the real bills doctrine tended to be pro-cyclical monetary policy: When the economy was doing well and sales of goods were expected to be strong, the central bank would loosen monetary policy—though lending restraint was in order; conversely, when the economy was doing poorly and sales were expected to lag, the central bank tightened monetary policy—though more liquidity was in order.

As the early Fed was guided by the real bills doctrine, loans were expanded to member banks during the war-related boom, and prices soared by 119% between 1913 and 1919. Learning from this experience the Fed's Board of Directors began to move away from the real bills doctrine, though the doctrine still held sway with the regional Federal Reserve Banks, other than the district of New York.

The U.S. and International Affairs After the Great War

World War I transformed the world, but perhaps because of the same isolationist tendencies that delayed U.S. entrance into the war, the United States failed to accept its new economic responsibilities as the world's emerging economic superpower.

Examples of the change in America's status abound. The nation's international position had gone from being a net debtor of \$2.2 billion (6.4% of GDP) with the rest of the world in 1914 to being a net creditor of \$6.4 billion (8.4% of GDP). The publicly held federal debt rose from \$1.118 billion (3.3% of GDP) in June 1914 to \$24.485 billion (34.9% of GDP) in June 1919. New York had effectively displaced London as the center of international finance, and the Federal Reserve had replaced the Bank of England as the global guardian of the gold standard.

Meanwhile, as the international economic system deteriorated, the U.S. government refused to forgive its allies their war debts, stemming from \$10.4 billion in U.S. loans during the war.¹⁸³ America's refusal to forgive these debts contributed to the allies' refusal to forgive \$16 billion of German war reparations, which were being relied upon to repay the U.S. To make these reparations payments, Germany had to run large trade surpluses. However, this could only happen if the U.S. and its allies reduced their tariffs and removed trade barriers against German imports.

Regrettably, neither the U.S. nor its allies would allow German imports to displace import-competing domestic industries and their workers. This made Germany dependent on loans from U.S. commercial banks to pay reparations. When Belgium and France invaded the Ruhr in January 1923, because Germany was behind on its reparations payments, U.S. commercial banks stopped making loans to Germany, and German workers launched a general strike with the resulting loss of tax revenue exasperating inflationary pressures leading to hyperinflation. The following year, the allies agreed to the **Dawes plan** in an attempt to stabilize the situation. This plan reduced German reparations payments to \$250 million in

¹⁸³ The \$10.4 billion in U.S. World War I loans included \$4.8 billion to the U.K. and \$3.4 billion to France.

year one with gradual increases to \$650 million in year five. In exchange, U.S. commercial banks resumed lending to Germany.¹⁸⁴

In 1925, Chancellor of the Exchequer Winston Churchill resumed convertibility of the British pound into gold at its pre-war parity, but this was a mistake. World War I had destroyed much of Britain's wealth and potential future workforce and output (through lives lost at the front); hence the U.K. was much poorer after the war. Assigning a value to the British pound in terms of gold greater than the amount of gold a pound could buy on the market after the war overvalued the currency, causing prices to be too low for British imports and too high for British exports, leading to a chronic current account deficit. Ultimately, Britain's return to the gold standard at pre-war parity lit the long fuse leading to the Great Depression.

The Strong Fed: The Federal Reserve in the 1920's

The Fed initially began open market operations¹⁸⁵ in the 1920's to provide income to the regional Federal Reserve Banks. By the end of the decade, open market operations became the Fed's primary monetary policy tool.

Also, in the early part of the decade, the Federal Reserve raised interest rates and contracted the money supply to reverse the inflation that had occurred during the war. This action caused a brief, but deep, recession from January 1920 through July 1921. Afterward, Benjamin Strong, who was the first Governor of the Federal Reserve Bank of New York, emerged as the de facto CEO of the Federal Reserve—largely through the force of his personality.

Strong had a close friendship with the Governor of the Bank of England Montagu Norman, and to help the Bank of England maintain convertibility without devaluing the British pound, the Federal Reserve lowered interest rates in 1927 and 1928—even though an accommodative monetary policy was inappropriate for the booming U.S. economy. This action helped to inflate the U.S. stock market bubble of the late 1920's.

The Fed's Greatest Failure: The Great Contraction

Strong's death in 1928, at the beginning of the Great Depression, triggered a three-way power struggle within the Fed—involving the Governor of the Federal Reserve Bank of New York (George Harrison), the Federal Reserve Board in Washington, and the

¹⁸⁴ Felzenberg, Alvin Stephen, *The Leaders We Deserved (And a Few We Didn't)*, Basic Books, New York, 2008, p.207.

¹⁸⁵ As noted in Part 1 of this series, open market operations include buying and selling of gold, silver, and government debt securities.

Governors of the other Federal Reserve Banks. The Board and the other regional Federal Reserve Banks—either because they believed that prices were too high and wanted to reduce prices back to pre-war levels, or because they resented Strong's support for Britain—pushed for a contractionary monetary policy in 1929, repeatedly blocking Harrison from taking the actions needed to counteract the contraction of the money supply. Thus, the **Great Contraction** began in August 1929 and continued until March 1933.

During the Great Contraction, the Fed failed to perform its lender-of-last-resort function of providing loans to otherwise solvent, but temporarily illiquid, commercial banks.¹⁸⁶ This meant that many solvent banks that could have survived ended up failing. Also, the Fed reduced its holdings of Treasuries through open market operations; and despite massive gold inflows in 1930 and 1931—the Federal Reserve effectively went to sleep on the world's gold reserves by allowing its reserve ratio to increase to a peak of 83.4%. Had the Fed not existed, commercial banks would have had \$1.05 billion of reserves to expand deposits and loans at this critical moment.¹⁸⁷

The adverse economic consequences of the Fed's contractionary monetary policy were both global and monumental. These included: massive price deflation (25%); unemployment (1 in 4 Americans); intensifying waves of bank failures; and fire sales of assets, which undermined net worth.

Franklin D. Roosevelt: Monetary Confusion

President Franklin D. Roosevelt took office on March 4, 1933, and his confused and contradictory views on monetary policy prolonged the **Great Depression** in the United States. While some urged “reflation,”¹⁸⁸ which would have been the correct policy, other forces conspired against them.

On April 5, 1933, private households and firms were mandated by an Executive Order to sell gold to the Fed at a price of \$20.67 per ounce; on April 17, 1933, gold exports were forbidden; on June 5, 1933, “gold clauses” (contracts providing the creditor with the option of demanding payment in gold) were abrogated; on June 12, 1933, the London Conference was convened to discuss restoring the gold standard after devaluation; and on July 3, 1933, the London Conference collapsed after FDR sent conflicting instructions to U.S. delegates. In late December,

¹⁸⁶ During the Great Contraction, the Fed actually reduced its loans to banks from \$1.29 billion in 1928 to \$0.12 billion in 1933.

¹⁸⁷ Timberlake, Richard H., *Monetary Policy in the United States: An Intellectual and Institutional History*, The University of Chicago Press, Chicago, 1993, p.266.

¹⁸⁸ Notably George Warren, Irving Fisher, and John R. Commons urged reflation.

FDR required the Federal Reserve to sell its gold to the Treasury at \$20.67 per ounce. Then on January 31, 1934, FDR signed the **Gold Reserve Act**, which devalued the U.S. dollar by 59% by increasing the gold price from \$20.67 to \$35.00 per ounce.

The Eccles Fed: The 1937 Recession and a Record of Failure

Necessary price reflation began to occur, but FDR short-circuited it by appointing Marriner Eccles (November 15, 1934 – February 3, 1948) as Chairman of the Federal Reserve Board. Eccles was a proto-Keynesian, and he opposed devaluation and reflation; blamed the Great Depression on over-investment by firms and under-consumption by households; favored income redistribution; and thought monetary policy was ineffective, and consequently the Federal Reserve did not expand the money supply.

The Federal Reserve was reorganized into its present structure under the **Banking Act of 1935**. The Act was meant to end confusion at the Fed and to centralize decision-making powers in Washington. The Board of Governors of the Federal Reserve System replaced the Board of Directors; the Secretary of the Treasury and Comptroller of the Currency were removed from the Board; the terms of Board members were increased from 10 to 14 years; Governors of regional Federal Reserve Banks were renamed as Presidents; the Board of Governors was placed in charge of the Federal Reserve System; the Chairman of the Board of Governors was given an executive role; and the Federal Open Market Committee (FOMC) was created. The FOMC was designed to be a balanced body, composed of regional Federal Reserve Bank presidents and members of the Federal Reserve Board, though the FOMC quickly came to be dominated by the Chairman.¹⁸⁹

Meanwhile, cautious bankers who survived the Great Contraction wanted to keep large excess reserves in case of future bank runs, but Eccles thought such reserves would cause inflation. So, from August 1936 to May 1937, the Federal Reserve doubled the required level of reserves that commercial banks were required to keep at the Fed. Banks responded by contracting their loans and deposits to build new excess reserves above the now higher level of required reserves. This caused another severe recession from May 1937 to June 1938, showing Eccles's experiment to be an economic failure.

¹⁸⁹ Currently, the FOMC is composed of 12 members: seven members from the Board of Governors; the President of the Federal Reserve Bank of New York; and four of the remaining 11 regional Federal Reserve Bank presidents. (The seven other regional bank presidents currently do not vote.)

Finally, the Federal Reserve began to increase the money supply in 1939 to finance war-related spending, and by 1943 prices finally exceeded their 1929 level—showing that reflation worked, when it was tried.

World War II, Korean Conflict, and "The Accord"

Through World War II, the Federal Reserve assumed a role subservient to the Treasury. To help the Treasury finance the war, the Fed targeted the long-term Treasury bond rate, keeping it at 2.5%. However, this built inflationary pressure during wartime, though price controls and rationing disguised it. Nonetheless, inflation exploded after the war when the price controls were lifted.

The **Bretton Woods system** was instituted after the war. This system created the **International Monetary Fund (IMF)** and the **World Bank** (and eventually the World Trade Organization (WTO)).¹⁹⁰ The Bretton Woods system required the United States to exchange gold for U.S. dollars at a fixed price of \$35.00 per ounce, but only with foreign governments or their central banks—not U.S. households or firms. Simultaneously, Bretton Woods required other countries to maintain a pegged exchange rate with the U.S. dollar.¹⁹¹ This arrangement is sometimes referred to as the **gold exchange standard**.

Because of Eccles's opposition to monetizing the federal debt, President Harry S Truman replaced Eccles with Thomas B. McCabe (April 1948 to April 1951) as Chairman. As the Korean conflict began, inflation soared, and the Federal Open Market Committee (FOMC) challenged the Treasury's interest rate policy. This led to **the Accord** between Chairman McCabe and Secretary of the Treasury John W. Snyder, which was brokered by Assistant Secretary of the Treasury William McChesney Martin, Jr. on March 4, 1951. This Accord provided for the Federal Reserve to conduct open market operations in Treasury "bills only," allowing the market to determine long-term Treasury bond rates; and it began the Fed's operational independence.

Truman then appointed Martin to succeed McCabe as Chairman, believing Martin would allow the Treasury to recapture the Federal Reserve. Instead, Martin supported the Federal Reserve's newly won independence.

The Martin Fed: Unnecessary Volatility

¹⁹⁰ The World Trade Organization was finally created in 1995.

¹⁹¹ The U.S. dollar was fixed at \$35.00 per ounce of gold, but only foreign central banks could demand gold for U.S. dollars. This was not a gold standard, but a gold exchange standard.

During the Martin era (April 2, 1951 – February 1, 1970), monetary policy decisions were largely based on Martin’s “feel of the market.” In practice, Martin targeted interest rates and acted in a pro-cyclical fashion, whereby the Federal Reserve would add reserves to hold down interest rates when output rose and subtract reserves to maintain interest rates when output fell. This contributed to the short business cycles in the 1950’s.

The Federal Reserve’s “bills only” approach was dropped during the Kennedy Administration and replaced with Operation Twist. In **Operation Twist**, the FOMC bought Treasury bonds to lower long-term interest rates and spur domestic investment, while simultaneously selling Treasury bills to increase short-term interest rates. The goal was to attract foreign portfolio investment, support the U.S. dollar, and reduce gold outflows. However, Operation Twist is now regarded as a failure. Eventually, economists Milton Friedman, Karl Brunner, and Allan Meltzer became leading critics of Martin.

The Burns Fed: The Great Inflator; Gunning the Money Supply

Succeeding Martin as Chairman of the Fed was Arthur Burns (February 1, 1970 – March 8, 1978), who became known as the Great Inflator.

In the early 1970’s, attempts were made to save the Bretton Woods system of fixed exchange rates tied to the dollar. On August 15, 1971, President Richard Nixon announced his **New Economic Plan**. This plan imposed a 90-day price freeze followed by comprehensive price controls; a 10% tariff on imports, and effectively ended the gold exchange standard, thus removing the last vestiges of a link from the U.S. dollar to gold.

In reaction to the New Economic Plan, Treasury Secretary John Connolly negotiated the Smithsonian Agreement with other G-10 countries. This agreement provided for a devaluation of the U.S. dollar from \$35.00 per ounce of gold to \$42.22 in exchange for the resumption of the Bretton Woods system. However, this agreement quickly fell apart. By March 1973, the era of freely floating exchange rates, not tied to gold, began.

Chairman Burns succumbed to Nixon’s pressure to “gun the money supply” while price controls were in place to make the economy appear better than it was when Nixon ran for reelection in 1972. Under Burns, the Fed followed a go-stop approach with unpredictable swings from loose to tight monetary policy, and stagflation resulted.

Briefly succeeding Burns as Chairman in 1978 was G. William Miller, who was appointed by President Jimmy Carter. Miller was a Keynesian who opposed higher interest rates to check inflation and blamed inflation on “real” factors such as oil shortages and labor contracts with cost-of-living wage adjustments. Miller continued Burns’s misguided policies. Price inflation soared; and the foreign exchange value of the U.S. dollar collapsed. Carter appointed Miller as Treasury Secretary to remove him from the Fed.

The Volcker Fed: Breaking the Back of Inflation

President Carter next appointed Paul A. Volcker (August 6, 1979 – August 11, 1987) as Chairman. Until 1982, Volcker followed a **pseudo-monetarism**, under which the Federal Reserve stopped targeting the federal funds rate and claimed that it was targeting monetary aggregates. This allowed high nominal and real interest rates to arrest price inflation; but it was mainly a ruse, designed to shield the Federal Reserve from the blame for the resulting recessions. (Under true monetarism, a central bank would focus on the growth rate of money aggregates to achieve price stability. Monetarism assumes that the velocity of money is stable.)

Volcker overreacted to President Reagan’s tax cuts as being inflationary—an error that contributed to the severity of the August 1981 to November 1982 recession. Afterward, Volcker adopted a variety rules-based approaches at different times, and the FOMC abandoned targeting monetary aggregates.

In 1985, Volcker concurred with the **Plaza Accord**, which committed the United States to a depreciation of the foreign exchange value of the U.S. dollar. Then, just two years later in 1987, Volcker concurred with the **Louvre Accord**, which committed the United States to stop the depreciation of the foreign exchange value of the U.S. dollar. The monetary flip-flop from accelerating money supply growth in 1985 to decelerating money supply growth in 1987 to meet U.S. commitments in these accords contributed to the “Black Monday” stock market crash on October 19, 1987.

The Early Greenspan Fed: Rules-Based Policy Works

President Reagan appointed Alan Greenspan (August 11, 1987 – January 31, 2006) to follow Volcker as Federal Reserve Chairman. Greenspan had established strong credibility early in his tenure on “Black Monday” as he issued a statement that affirmed the Fed’s “readiness to serve as a source of liquidity to support the economic and financial system,” and he exerted behind-the-scenes pressure on commercial banks to provide credit to independent investment banks. These actions prevented a wider financial crisis, and Greenspan’s credibility

grew even stronger as he helped to nip inflation during the July 1990 to March 1991 recession.

Greenspan also received high marks for increasing the Fed's transparency. In 1994, he began announcing federal funds rate targets publicly after FOMC meetings; and in 1998, he began releasing even more details. During the great boom of the 1990's, Greenspan tightened monetary policy, increasing U.S. interest rates and the foreign exchange value of dollar.

The era under Volcker and Greenspan is generally referred to as the **Great Moderation** (1983-2000), during which the Fed pursued price stability through rules-based monetary policy, much along the lines of the Taylor rule, devised by Stanford economist John Taylor. Generally, the Taylor rule holds that the Fed should increase the federal funds rate as inflationary forces increase and lower it as they decrease. This approach resulted in two long economic booms, low inflation, and lower unemployment rates.

CONCLUSION

Covering more recent events at the Fed and U.S. monetary policy prescriptions for the future is beyond the reach of this history series. Those subjects will be covered in future JEC Republican papers.

In sum, the monetary history experience in America has been:

- (6) Economic freedom and prosperity with an independent central bank, managed by competent individuals (e.g. the First Bank, the Second Bank from 1822-1828, and the Federal Reserve during the Great Moderation);
- (7) Challenges absent a central bank (e.g. 1811-1816, 1836-1915); and
- (8) Recessions, depressions and stagflation when the central bank endures interference from politicians (e.g. the Second Bank from 1816-1822 and 1828-1836, the Eccles Fed, and the Burns Fed.)

The American experience is that economic freedom and prosperity are best served by monetary policy that is rules-based and non-interventionist.¹⁹²

JOINT ECONOMIC COMMITTEE
REPUBLICAN STAFF COMMENTARY
**“UNITED STATES MONETARY POLICY GOING FORWARD: A SINGLE
MANDATE FOR PRICE STABILITY WILL HELP MAXIMIZE JOB
CREATION AND ECONOMIC GROWTH”**

INTRODUCTION

In recent years, the Federal Reserve has shifted away from well-established norms for monetary policy. These policy deviations contributed to the inflation of an unsustainable housing bubble, a global financial crisis, and increased market uncertainty, which has inhibited a robust recovery. Avoiding these policy deviations may well have mitigated the ensuing negative fallout. Therefore, the Federal Reserve should implement a rules-based monetary policy going forward in order to promote long-term price stability, economic growth and job creation.

The Federal Reserve deviated from norms for monetary policy in the period from 2002 to 2005 by holding its target rate for federal funds too low for too long. This deviation contributed to the inflation of an unsustainable housing bubble and, once the Federal Reserve raised interest rates, a dramatic decline in home prices after they peaked in the summer of 2006. When the housing bubble burst, the severe correction in home prices led to an unprecedented increase in residential foreclosure rates.

During the past decade, the proliferation of mispriced derivative financial instruments in the financial services sector resulted in a systemic vulnerability to defaults in home loans. The unexpectedly high default rates occurred because many widely-held derivatives had as reference assets either (1) residential mortgage loans, (2) securities containing residential mortgage loans, or (3) securities of companies engaged in residential mortgage securitization. As a result, disruptions in the housing market cascaded throughout the financial system, and a global financial crisis ensued. Had monetary policy followed its previous policy route, the severity of the crisis and the subsequent recession likely would have been mitigated.

During and after the financial crisis, the Federal Reserve engaged in several additional unconventional policy actions. Some of these actions—such as providing emergency liquidity to the market during the height of the financial crisis—were in keeping with the Federal Reserve’s role as the lender of last resort and its emergency authority. Other actions—such as the Federal Reserve’s controversial intervention into the housing market—are more questionable because they occurred after the acute effects of the crisis had passed. Significantly, these post-crisis actions have sustained the Federal Reserve’s balance sheet at unprecedented levels—triple

its pre-crisis size—thereby risking the possibility of harmful future price inflation.

In light of the housing bubble, the global financial crisis, and the subsequent anemic economic recovery, federal policymakers are reconsidering the oversight and regulation of U.S. financial institutions and markets. So far, federal policymakers have focused on perceived microeconomic causes of the crisis, including: (1) federal housing policies that sought to increase the rate of home ownership; (2) possible market failures; (3) shortcomings in federal oversight and regulatory regimes for financial institutions and markets; and (4) wrongdoing by certain firms and individuals.¹⁹³ However, the financial crisis had both macroeconomic and microeconomic causes. Federal policymakers have paid insufficient attention to the macroeconomic causes of the crisis—especially the Federal Reserve’s monetary policy in the lead-up to, during, and after the crisis.

This study begins with a brief discussion of the advantages of rules-based monetary policy over discretionary monetary policies. It then reviews the Federal Reserve’s implementation of monetary policy in light of the rules-versus-discretion dichotomy and finds that discretionary actions by the Federal Reserve have contributed to past economic disruptions and pose a threat to the economy going forward. It concludes by commenting on the Federal Reserve’s recent adoption of an explicit inflation target guiding its monetary policy decisions and by providing four policy recommendations for implementing a rules-based monetary policy going forward: (1) creating a single mandate for the Federal Reserve to maintain long-term price stability; (2) requiring the Federal Reserve to monitor asset prices for signs of incipient asset price bubbles; (3) restricting open market operations to U.S. Treasuries, repurchase agreements, and reverse repurchase agreements during normal times; and (4) requiring the Federal Reserve to clearly articulate a lender-of-last-resort policy.

Designing Monetary Policy

Well-reasoned, stable and predictable monetary policy reduces economic volatility and promotes long-term economic growth and job creation. Generally, “rules-based” policies reduce uncertainties and facilitate long-term planning and investment. Rules-based policies are most successful when they are designed “with a clear focus on the longer term, and with allowance for future contingencies.”¹⁹⁴

¹⁹³ Initial investigation into these areas culminated in the enactment of the *Dodd-Frank Wall Street Reform and Consumer Protection Act*. PL 111-203 (July 21, 2010).

¹⁹⁴ See Chapter 3, “Design of Fiscal, Monetary, and Financial Policies,” *Economic Report of the President together with the Annual Report of the Council of Economic Advisors* (1990).

Policymakers should set the rules of the game and make a credible commitment to abide by them; but, inflexible or overly prescriptive policies can prevent essential emergency actions during times of crisis.

Conversely, activist, interventionist, and discretionary monetary policies have been historically associated with increased economic volatility and subpar economic performance. Reasons for this are numerous and, in large part, practical. First, it is difficult for policymakers to identify in real time the economic inflection points that mark the beginning of financial crises and recessions; this is due to the extraordinary complexities and dynamism of the economy. Forecasts based on economic models are generally unreliable in identifying such inflection points. Hence, it is very difficult for policymakers to establish a proper baseline from which monetary policy adjustments should be made.

Second, even when economic circumstances are both known and well understood, implementing the appropriate monetary policy response is rife with difficulties. One well-known implementation problem, identified by Nobel laureate Milton Friedman, is the long and variable lag between a monetary policy action and its effects on the economy. Another problem is the “time inconsistency problem,” a theory for which Finn Kydland and Edward Prescott won the 2004 Nobel Prize in Economic Sciences.¹⁹⁵ The time inconsistency problem refers to the difficulties created by the time lapse between the announcement of a policy and its implementation. During this time lapse, the optimal policy response may change, and such changes induce policymakers to shift course over time. Taken together, these shortcomings mean discretionary policies are a drag on the economy because they are unpredictable, may be ill-timed, and inappropriate.

These two conclusions about the rules-versus-discretion dichotomy are quite logical, given that private businesses and households make plans based on expectations of future economic conditions. Unpredictable monetary policy creates uncertainty in markets and increases risk premia, thus boosting the cost of capital for business. An investment must yield a higher expected return to induce a business to invest in it. Consequently, unpredictable monetary policy lowers aggregate investment. This relationship between discretionary policy and reduced investment is particularly

¹⁹⁵ See Kydland, Finn E. and Prescott, Edward C., “Rules Rather than Discretion: The Inconsistency of Optimal Plans,” *Journal of Political Economy* 85/3 (1977); Barro, Robert J. and Gordon, David B., “Rules, Discretion and Reputation in a Model of Monetary Policy,” NBER Working Paper No. 1079 (1983); see also Dennis, Richard, “Time-Inconsistent Monetary Policies: Recent Research,” *Federal Reserve Bank of San Francisco Economic Letter* (2003).

acute in illiquid assets, such as buildings, equipment, and software, which are key drivers of long-term job creation.¹⁹⁶ Similarly, households are less likely to make large purchases, including homes and automobiles as economic uncertainty increases.

RECENT MONETARY POLICY OF THE FEDERAL RESERVE

The Turbulent 1970's and the Great Moderation of the 1980's and 1990's

The distinct impact of discretionary and rules-based policy is readily apparent when viewed within the context of U.S. monetary policy over the past 40 years. During the 1970's, the Federal Reserve implemented "a pattern of 'go-stop' policies, in which swings in policy from ease to tightness contributed to a highly volatile real economy as well as a highly variable inflation rate."¹⁹⁷ These unpredictable and disruptive policies were guided, in part, by a misplaced belief in a simple version of the "Phillips Curve," a widely discredited economic theory that found an inverse relationship between the unemployment rate and the inflation rate. Under the Phillips Curve, the destructive phenomenon of stagflation, which is the combination of stagnant growth, persistent high unemployment, and high inflation, could not occur. However, the Federal Reserve, using the Phillips Curve to guide its monetary policy actions during the 1970's, produced stagflation through its unpredictable policy actions.

A sea change in monetary policy occurred with the appointment of Paul Volcker as Chairman of the Board of Governors of the Federal Reserve System in 1979. His mandate was to break the back of inflation. In order to accomplish this goal, he raised the federal funds target rate from 11% in August of 1979 to a range of 18 to 20% by mid-1981 before lowering it incrementally to 8% in mid-1985. The economy suffered back-to-back recessions (January 1980 to June 1980 and July 1981 to November 1982). However, inflation (measured by the consumer price index) dropped from 13.3% in 1979, the year Volcker joined the Federal Reserve, to 3.8% in 1982, and thereafter averaged 3.0% over the next 20 years as Chairman Volcker and, later, Chairman Alan Greenspan implemented, with some exceptions, a transition toward a more rules-based monetary policy.

Comparing other economic indicators under the "go-stop" monetary policy of the 1970's and the relatively predictable monetary policy climate associated with the 1980's to 1990's (i.e., the "Great

¹⁹⁶ See Greenspan, Alan, "Activism," *Council on Foreign Relations* (March 3, 2011).

¹⁹⁷ "The Great Moderation," Remarks by Governor Ben S. Bernanke at the meetings of the Eastern Economic Association (2004).

Moderation”) highlights the performance advantages of rules-based monetary policy. Most notably, macroeconomic volatility decreased during the 20 years after the 1970’s, with quarterly output volatility (measured by standard deviation) falling in half and quarterly inflation volatility falling by two thirds. Moreover, two robust economic expansions occurred during the same period—the November 1982 to July 1990 economic expansion, which lasted 31 quarters, and the March 1991 to March 2001 expansion, which lasted 40 quarters. Unsurprisingly, the unemployment rate trended down over the same period. By contrast, the longest economic expansion of the 1970’s was only 10 quarters long.¹⁹⁸

The Taylor Rule and a Major Policy Deviation in the 2000’s

Many economic researchers and commentators have suggested that, after a nearly 20 year period of relative predictability, the Federal Reserve deviated from a rules-based monetary policy during the 2002-2005 period by holding the target federal funds rate too low for too long. However, this critique requires a framework for analysis, and it begs the question: from what did the target rate deviate? One particularly useful method for assessing policy deviations is to compare the historical target federal funds rate to the rate prescribed by the “Taylor rule.”¹⁹⁹ The Taylor rule, devised by Stanford economist John Taylor, is a monetary policy rule that derives a recommended federal funds rate based on the level of inflation relative to the Federal Reserve’s target inflation rate and the level of real output relative to potential output.²⁰⁰ Generally speaking, implementing the Taylor rule would result in the Federal Reserve increasing the federal funds rate as inflationary forces increase and lowering the federal funds rate as inflationary forces decrease. The Taylor rule is both descriptive and prescriptive:

One such rule, the original Taylor rule, fit the data particularly well during the late 1980’s and early 1990’s, a period of generally

¹⁹⁸ Blanchard, Olivier and Simon, John, “The Long and Large Decline in U.S. Output Volatility,” *Brookings Papers on Economic Activity* 32/1 (2001).

¹⁹⁹ For a historical overview of the development of the Taylor rule, see Also, Pier Francesco, Kahn, George and Leeson, Robert, “The Taylor Rule and the Transformation of Monetary Policy,” *Federal Reserve Bank of Kansas City Research Working Papers RWP 07-11* (2007).

²⁰⁰ *The general formulation of the Taylor rule is as follows: $i_t = rr^* + \pi_t + \beta(\pi_t - \pi^*) + \gamma(y_t - y^*)$; where i_t is the recommended policy rate; rr^* is the equilibrium real interest rate (assumed to be 2% in the original formulation of the Taylor rule); $(\pi_t - \pi^*)$ is the difference between the inflation rate and its long-run target (with π^* assumed to be 2% in the original version); and $(y_t - y^*)$ is the output gap, or the difference between real GDP and potential GDP; and β and γ are both set to 0.5 in the original version. See Kahn, George A., “Taylor Rule Deviations and Financial Imbalances,” *Federal Reserve Bank of Kansas City* (2010).*

favorable economic performance. Because this rule also performed well in a variety of macroeconomic models, keeping the volatility of inflation and output relatively low, the rule over time became viewed as a normative prescription for how policy should be set, conditional on a few economic indicators.²⁰¹

The Taylor rule is also robust with respect to specification, meaning a variety of formulations of the rule itself result in similar prescriptions. These theoretical and practical advantages led to a de-facto institutionalization of Taylor rule guidance in the Federal Open Market Committee's (FOMC's) decision-making process after its initial release in 1993. The FOMC is composed of 12 voting members and directs the Federal Reserve's open market operations, which effectuate the purchase and sale of Treasuries and other securities to influence the federal funds interest rate.²⁰² Members of the Committee often referenced various Taylor rule specifications during the Committee's regular meetings, and utilized it as a baseline for conducting monetary policy actions. The past effectiveness of the Taylor rule establishes it as a reliable tool for assessing Federal Reserve policy discretion.

During much of the period from 1986-2002 following the initial taming of inflationary forces, the target federal funds rate tracked closely the rate prescribed by the Taylor rule, with the exception that the actual federal funds rate was above the Taylor rule prescription for a period during the mid-to-late 1990's when the economy was experiencing explosive productivity growth (Figure 1).

²⁰¹ *Ibid.* at 65.

²⁰² The 12 voting members consist of "the seven members of the Board of Governors of the Federal Reserve System; the president of the Federal Reserve Bank of New York; and four of the remaining eleven Reserve Bank presidents, who serve one-year terms on a rotating basis. The rotating seats are filled from the following four groups of Banks, one Bank president from each group: Boston, Philadelphia, and Richmond; Cleveland and Chicago; Atlanta, St. Louis, and Dallas; and Minneapolis, Kansas City, and San Francisco. The seven non-voting Reserve Bank presidents "attend the meetings of the Committee, participate in the discussions, and contribute to the Committee's assessment of the economy and policy options." Source: Federal Reserve Board

The bursting tech stock bubble in early 2000, the economic shock of the terrorist attacks on September 11, 2001, and the 2001 recession precipitated possible deflation concerns among some members of the FOMC. However, subsequent analysis of the economic indicators suggests that such concerns did not have a strong foundation. For example, headline consumer prices never experienced a year-over-year decline during the period from 2001-2005. In fact, the CPI averaged 2.5% year-over-year growth during that period, and experienced a low average of 1.6% year-over-year growth in 2002. Contemporaneous analysis of inflationary data is difficult; however, this analysis certainly refutes the contention that the economy needed aggressive monetary stimulus.

Nevertheless, the FOMC voted to reduce target rates from 6.5% in December of 2000 to 1.82% by December of 2001. It then held the target rate below that level for nearly three years before incrementally raising it back to 5.25% by June of 2006. During that period, the target federal funds rate averaged 2.17 percentage points below the level prescribed by the Taylor rule (using quarterly data).

Professor Taylor has argued that the cumulative effect of this monetary ease contributed to the housing bubble and thereby increased the magnitude of the decline in residential real estate prices on the back end of the bursting bubble.²⁰³ There is growing, but not universal, agreement among economists about Taylor's findings.²⁰⁴ For example, a study by Federal Reserve Bank of Kansas City vice president George Kahn found that "[w]hen the Taylor rule deviations are excluded from [my] forecasting equation, the bubble in housing prices looks more like a bump."²⁰⁵

Of course, Federal Reserve monetary policy from 2002 to 2005 was not the sole cause of the housing bubble. Microeconomic factors, including the housing policies of President Bill Clinton and George W.

²⁰³ Taylor, John, "Housing and Monetary Policy," Presentation for the Policy Panel at the Symposium on Housing, Housing Finance, and Monetary Policy, hosted by the Federal Reserve Bank of Kansas City in Jackson Hole, Wyoming (2007).

²⁰⁴ See, e.g., Kahn, George, "Taylor Rule Deviations and Financial Imbalances," Federal Reserve Bank of Kansas City (2010); Jarocinski, Marek and Smets Frank, "House Prices and the Stance of Monetary Policy," European Central Bank (2008); Ahrend, R., Cournede, B, and Price, R, "Monetary Policy, Market Excesses and Financial Turmoil," *OECD Economics Department Working Papers No. 597* (2008). An alternative theory, posited by Chairman Ben Bernanke, holds that a "global savings glut," which resulted in significant international capital flows into the U.S. economy, was a primary factor in causing the housing bubble. Bernanke, Ben, "International Capital Flows and the Returns to Safe Assets in the United States," *Financial Stability Review No. 15*, Banque de France (2011).

²⁰⁵ Kahn, George, "Taylor Rule Deviations and Financial Imbalances," Federal Reserve Bank of Kansas City (2010).

Bush to expand homeownership among historically disadvantaged and low-income households; pressure from federal regulators to lower credit standards for extending residential mortgage loans; the panoply of federal tax preferences for housing; market-distorting housing finance government-sponsored enterprises (Fannie Mae and Freddie Mac); inaccurate ratings reports; and opaque derivatives markets, among others, contributed to the financial imbalances in the U.S. housing market. Other macroeconomic factors, including, most notably, massive capital inflows to the United States from abroad also contributed to the housing bubble.²⁰⁶ However, the Federal Reserve's monetary policy in the 2002 to 2005 period were undeniably a contributing factor—one that was wholly avoidable had the FOMC simply followed well-established and stable monetary policy norms rather than engage in discretionary policies.

Financial Crisis Monetary Policy

The Federal Reserve responded to the bursting housing bubble and the financial crisis of 2008 by taking a series of unconventional actions (see Appendix A). Some of these actions clearly were in keeping with the Federal Reserve's role as "lender of last resort," and were initiated pursuant to the Federal Reserve's emergency authority under section 13(3) of the **Federal Reserve Act**. In times of crisis, depositors and other creditors cannot distinguish between healthy and unhealthy banks and other financial institutions. As a result, the flow of credit freezes, and all borrowers are penalized. A lender of last resort "ensure[s] that healthy financial institutions have access to sufficient short-term credit, particularly during [such] times of financial stress."²⁰⁷ By addressing the liquidity problems of solvent, but temporarily illiquid banks and other financial institutions during a financial crisis, a lender of last resort can prevent unnecessary failures that could cause a financial crisis to spread to non-financial sectors of the economy and escalate into a depression.

Other Federal Reserve actions—including those preceding and during the crisis, both as general policy and directed to specific individual firms—addressed solvency problems, or selectively allocated credit to markets pre- and post-crisis. Insolvency reflects a fundamental weakness in the balance sheet of a firm because its liabilities are greater than its assets. However, addressing solvency problems in this way can induce firms to take undue risk under the

²⁰⁶ Bernanke, Ben, "International Capital Flows and the Returns to Safe Assets in the United States 2003-2007," Financial Stability Review No. 15, Banque de France (2011).

²⁰⁷ Carlson, John et. al, "Credit Easing: A Policy for a Time of Financial Crisis," Federal Reserve Bank of Cleveland (2009).

assumption that they will later be “bailed out” if the risks don’t pan out. Selectively allocating credit to favored markets can also distort financial decision making and lead to future asset bubbles. Thus, it is unclear whether this second category of actions was necessary, proper, or even helpful. The sum total of the Federal Reserve’s actions over the past four years has been an unprecedented expansion of the Federal Reserve’s balance sheet, which remains a risk to the sustainability of the economic recovery because it increases the danger of accelerating price inflation as the economy strengthens.

The impact of the bursting housing bubble spread throughout the financial system and credit markets deteriorated well before the market crash in the fall of 2008. Within the bounds of traditional monetary policy, the Federal Reserve began lowering the target federal funds rate from 5.25% in August of 2007 to a range of 0 - 0.125% by January 2009. However, it also simultaneously implemented several discretionary policies in the year leading up to the crisis, including creating specialized lending facilities aimed at supporting financial firms with deteriorating balance sheets. Among these lending facilities were the Term Auction Facility (TAF), the Term Securities Lending Facility (TSLF), and the Primary Dealer Credit Facility (PDCF). The TAF was essentially a repackaging of existing Federal Reserve lending capabilities aimed at alleviating the stigma associated with borrowing from the traditional discount window, while the TSLF and the PDCF represented new lending to unconventional non-commercial bank borrowers. During this same period, the Federal Reserve engaged in the first iteration of an on-again, off-again bailout policy by facilitating the sale of the investment bank Bear Stearns to JP Morgan-Chase with a loan of almost \$30 billion.²⁰⁸ It also extended currency swaps to foreign central banks to enable them to stabilize dollar-based markets under their jurisdiction.

Initially, these pre-crisis actions did not increase the size of the Federal Reserve’s balance sheet because the Federal Reserve “sterilized” (or offset) their effects by selling over \$300 billion of its U.S. Treasury holdings during the first several months of 2008. Then, when credit market deterioration accelerated in September 2008, the Federal Reserve expanded its existing crisis lending facilities and introduced new ones. Between September and November 2008, the Federal Reserve introduced the Asset-backed Commercial Paper Money Market Fund Liquidity Facility (AMLF), the Commercial Paper Funding Facility (CPFF), and the Term Asset-

²⁰⁸ “Maiden Lane Transactions,” Federal Reserve Bank of New York, available at <http://www.newyorkfed.org/markets/maidenlane.html>.

backed Loan Facility (TALF). Each facility sought to stabilize the financial system by providing liquidity to key credit markets outside of the traditional banking system. The Federal Reserve also bailed out American International Group (AIG), a large global insurer after allowing the investment bank Lehman Brothers to file for bankruptcy.

Leading into the fall, the Federal Reserve halted its sterilization efforts because it was concerned about disrupting the Treasury market by flooding it with additional supply. Therefore, as firms began drawing heavily upon the myriad lending facilities, the Federal Reserve's balance sheet expanded massively—doubling to \$2.2 trillion in just six weeks (see Figure 2 on the following page). The Fed's balance sheet remained at this elevated level through the end of 2008.

The most acute effects of the financial crisis had begun to recede by January 2009. Consequently, borrowing through the Federal Reserve's crisis lending facilities declined sharply, as the Federal Reserve's balance sheet fell by \$300 billion in the first four weeks of the year. The size of the crisis lending facilities continued to taper off into the summer months, and, by the end of 2009, the great bulk of the related borrowing had ceased.

If all else remained equal, the size of the Federal Reserve's balance sheet would have tapered down to pre-crisis levels as well. However, the Federal Reserve instead took additional discretionary actions to maintain and even expand the size of its balance sheet.

In early 2009, the Federal Reserve announced a program of large-scale asset purchases, dubbed "quantitative easing 1" (QE1). The mechanical effect of the program was simply to sustain the size of the central bank's balance sheet as the emergency liquidity facilities tapered off; however, the policy implications of the program were significant. Most importantly, the Federal Reserve began to actively support the housing market by purchasing over \$1.25 trillion of residential mortgage-backed securities (RMBS) and \$172 billion of debt securities issued by Fannie Mae, Freddie Mac, and Ginnie Mae.²⁰⁹ In essence, the Federal Reserve was attempting to manipulate the economy by subsidizing the housing market. It hoped lower home mortgage interest rates would encourage refinancing activity, thereby increasing consumers' disposable income.

Despite the Federal Reserve's extraordinary efforts in 2009, the summer of 2010 brought a marked slowdown in the already anemic economic recovery: job creation sputtered, economic growth slowed and a manufacturing sector recovery melted away. The 2010 mid-term elections drastically changed the composition of Congress, and federal policymakers were unlikely to implement fiscal stimulus programs in an attempt to spur the economy. Within that context, Chairman Bernanke announced in August a second round of quantitative easing (QE2), in which the Federal Reserve would purchase \$600 billion of U.S. Treasury securities over eight months beginning in November 2010. The purchases brought the Federal Reserve's balance sheet to nearly \$3 trillion—more than triple its pre-crisis size.

More recently, in August and September 2011, the Federal Reserve took two additional unconventional policy actions. First, the Federal Reserve announced in its August FOMC statement that

²⁰⁹ Federal Housing Finance Agency, "Data as of October 1, 2010 on Treasury and Federal Reserve Purchase Programs for GSE and Mortgage-Related Securities," *available at* www.fhfa.gov/webfiles/17990/TreasFED10012010.pdf.

economic conditions warranted “exceptionally low levels for the federal funds rate at least through mid-2013.”²¹⁰ Federal Reserve policymakers hoped this so-called “communications channel” would spur economic activity where large-scale asset purchases have fallen flat because it effectively commits the central bank to a highly accommodative monetary policy in the medium-term.²¹¹

Second, the Federal Reserve announced in mid-September that it would implement another unconventional bond-buying program, known as “Operation Twist,” running through the end of June 2012. The program is modeled after the Federal Reserve’s previous “Operation Twist” in the 1960’s, which was considered a failure by most economists because it only lowered long-term interest rates by 10 to 20 basis points at most.²¹² The effect of this program is to extend the average duration of the Federal Reserve’s Treasury holdings by selling \$400 billion of U.S. Treasuries with maturities of three years or less and using the proceeds to purchase \$400 billion of U.S. Treasuries with maturities of six to 30 years.²¹³ Like quantitative easing, which reduces long-term interest rates, the program seeks to stimulate borrowing in order to finance consumer purchases of durable goods and housing and business investment in buildings, equipment, and software. However, unlike quantitative easing, the program will not increase the size of the Federal Reserve’s balance sheet.

In addition to Operation Twist, the Federal Reserve has committed to reinvesting the principal payments from its holdings of federal agency debt and RMBS into agency RMBS. This change is a major policy reversal. Previously, the Federal Reserve had said that its massive intervention into housing finance was temporary and that it would allow its portfolio of federal agency debt and RMBS to decline gradually as principal was repaid. Now, the Federal Reserve has indicated that its portfolio of federal agency debt and RMBS is more or less permanent. Thus, the Federal Reserve will continue to allocate credit selectively toward politically favored borrowers.

Analyzing the impact and appropriateness of the Federal Reserve’s policy over the past four years is challenging. It is difficult

²¹⁰ Press Release, Federal Open Market Committee Statement (August 9, 2011).

²¹¹ Historical evidence demonstrates that clear and credible Federal Reserve communications about forthcoming monetary policy actions can influence the policy’s effectiveness. *See*, “Central Bank Talk and Monetary Policy,” Remarks by Governor Ben S. Bernanke at the Japan Society Corporate Luncheon (2004).

to differentiate between the concepts of liquidity and solvency, which are often interconnected. Moreover, dynamic and complex markets are ill-suited to clean, post-hoc dissection and explanation. A lack of consensus among economists about the ultimate effect of the Federal Reserve's discretionary actions reinforces this view.

However, three observations about the Federal Reserve's recent actions are worth mentioning:

- (9) The Federal Reserve's actions have increased market uncertainty. During the height of the crisis, the Federal Reserve pursued a scattershot approach to addressing market failures. Some programs were poorly articulated, while others were implemented differently than advertised or not at all. With respect to individual firms, the Federal Reserve may have even contributed to the liquidity crisis by "saving" some firms and not others, thereby complicating creditors' risk calculus and creating moral hazard.
- (10) The Federal Reserve's decision to sustain the size of its post-crisis balance sheet through its quantitative easing programs has increased the risk for accelerating price inflation as the recovery strengthens. QE1 and QE2 have jointly extended two trillion dollars of credit to the banking sector, as reflected by the staggering increase in the monetary base beginning in the fall of 2008. To date, banks have chosen not to lend these funds out. As a result, excess reserves held on deposit at the Federal Reserve are over \$1.5 trillion (Figure 3). These funds represent a real risk to the economy because if they are lent out more rapidly than Federal Reserve policy can manage, high and destructive inflation will ensue.

Figure 3. Massive Expansion of Federal Reserve Liabilities since 2006, (millions \$)

Source: Federal Reserve Board

(11) The discretionary monetary policy climate of recent years has once again correlated with a period of increased economic volatility and subpar performance. For example, the current recovery has greatly underperformed relative to the next most severe recession-recovery cycle, which occurred in the early 1980s under President Reagan. In that recession, the economy grew 15.8 percent and the unemployment rate fell 3.6 percentage points in the first ten quarters of the recovery. By contrast, the economy has grown just 6.2 percent and the unemployment rate has only fallen 1.7 percentage points since the recent economic recovery began in June 2009 (Figure 4).

A Note on the Federal Reserve's New Inflation Target

In its most recent monetary policy statement (January 2012), the Federal Open Market Committee adopted two new policies. The first policy was an extension of an existing one: the Federal Reserve communicated that it intended to hold the rate for federal funds at extremely low levels for an additional year, until late 2014. This action places the Federal Reserve on an even more aggressive monetary policy footing.

The second policy was even more consequential: the Federal Reserve adopted an explicit inflation target. It noted, “[t]he inflation rate over the longer run is primarily determined by monetary policy, and hence the Committee has the ability to specify a longer-run goal for inflation.”²¹⁴ The FOMC determined that a 2% inflation rate, as measured by the annual change in the price index for personal consumption expenditures, was most appropriate.

Articulating an explicit inflation target was a significant, positive step toward a more rules-based and predictable monetary policy. Many central banks, including the Bank of England, the European Central Bank, and the Reserve Bank of New Zealand, have successfully executed monetary policy by using an explicit target for the price inflation rate.²¹⁵ The benefits of these targets are three-fold: (1) they increase accountability for monetary policy at the central bank; (2) they increase transparency of central bank monetary policy formation; and (3) they increase the independence of the central bank relative to elected policymakers.

However, there exist unknowns related to the Federal Reserve's implementation of its new target. A primary question relates to the Federal Reserve's tolerance for short- to medium-term inflation, which can also be damaging to economic growth and job creation. Does the new 2% long-term inflation target allow for 5% inflation, or perhaps more, over a short-term time horizon? If so, the current articulation would be insufficiently restrictive. What is the highest tolerable rate of inflation over 5 years? 10 years? The answers to these questions go to the heart of the Federal Reserve's commitment to price stability. A related question focuses on the 2% inflation target itself. Is the 2% inflation rate a middle point, a lower bound, or an upper bound? Again, this kind of clarification is important to revealing the Federal Reserve's true intention with its new policy.

POLICY RECOMMENDATIONS

²¹⁴ Press release, Federal Open Market Committee Statement (January 25, 2012).

²¹⁵ Cobham, David (Ed.), “Twenty Years of Inflation Targeting: Lessons Learned and Future Prospects,” Cambridge University Press (2010).

The Federal Reserve's monetary policy deviations in the period between 2002-2005 contributed to a destructive housing bubble; and new discretionary policies in the wake of the financial crisis of 2008 have increased uncertainty in the market and risk higher inflation in the future. These recent decisions represent a distinct shift away from the rules-based policies that characterized the Great Moderation of the 1980's and 1990's. Since it is well understood that predictable, rules-based policies create macroeconomic certainty and spur long-term economic growth and job creation, it would behoove federal policy makers to return to such a rules-based approach. Thus, the Federal Reserve should implement a rules-based monetary policy going forward. This study makes four recommendations that policymakers should adopt, either individually or jointly, in order to increase the likelihood of a more stable monetary policy:

(12) Create A Single Mandate For Long-Term Price Stability

The Federal Reserve's dual mandate—stable prices and maximum employment—has been in place since 1977. However, in practice, most central bankers have focused their efforts on achieving long-term price stability. In fact, among the 47 central banks and monetary authorities surveyed by the Bank of International Settlements in 2009, only the Bank of Canada and the Federal Reserve have additional mandates that are equal to the weight of price stability.²¹⁶ This is because a consensus exists among economists that monetary policy only affects real output and employment levels in the short term, whereas fundamental market factors (e.g., productivity growth and innovation, which are largely driven by budget, tax, and regulatory policies) affect real output and employment levels in the long term. Because an environment of price stability is conducive to long-run economic growth, achieving long-term price stability necessarily maximizes the sustainable positive effect that monetary policy can have on long-term employment levels.

A recent study by the vice president of the Federal Reserve Bank of St. Louis, Daniel Thornton, echoes this analysis and provides an additional perspective through a historical

²¹⁶ Ortiz, Guillermo and Yam, Joseph (Chairs of the Central Bank Governance Group), "Issues in the Governance of Central Banks," Bank of International Settlements (May 2009).

analysis of the FOMC's statement of policy objectives.²¹⁷ Interestingly, until December 2008, the Federal Reserve had never mentioned the maximum employment prong of the dual mandate in its statement of policy objectives (which is found within the policy directive the FOMC votes on every six weeks)—a period covering almost 30 years since the dual mandate was created. This first mention occurred just before the Federal Reserve began its first large-scale asset purchase program (QE1). Again, in November of 2010, as the second program (QE2) program was initiated, “[r]eference to the objective of maximum employment was more prominent.”²¹⁸ Although it is unclear whether these references indicate a substantive change in Federal Reserve policy, they do suggest that Federal Reserve governors might be using the maximum employment prong of the dual mandate as a “cover” for engaging in unconventional and discretionary policies.

The best way to achieve maximum real output and employment through monetary policy is, in fact, to achieve stable prices; and given the Federal Reserve's possible use of the dual mandate as a basis for engaging in disruptive, discretionary policies, policymakers may want to consider simplifying the Federal Reserve's mandate to include only stable prices.²¹⁹

(13) Require the Federal Reserve to Monitor Asset Prices for Signs of Incipient Asset Price Bubbles

The Federal Reserve should monitor whether or not its selected price index fully captures price movements in the economy. In measuring inflation, the Federal Reserve should consider the effects of monetary policy on asset prices and the potential misallocation of capital. While an easy monetary policy usually flows evenly into the prices of goods and services, an easy monetary policy sometimes flows disproportionately into the prices of certain assets. In such cases, broad-based goods and services price indices (e.g., the consumer price index (CPI), the personal consumption expenditure (PCE) deflator) will not fully capture the price

²¹⁷ Thornton, Daniel, “What Does the Change in the FOMC Statement of Objectives Mean?” *Federal Reserve Bank of St. Louis Economic Synopses No. 1* (2011).

²¹⁸ *Ibid.*

²¹⁹ See Thornton, Daniel, “The Case for ‘Inflation First’ Monetary Policy,” *Federal Reserve of St. Louis Economic Synopses No. 47* (2009).

inflation occurring in the economy. As a result, the disproportionate impact of monetary ease on asset prices may cause unsustainable price bubbles in certain assets without broad-based goods and services price indices registering significant price inflation.

The Federal Reserve's response to potential asset price bubbles would vary depending upon the circumstances. No consensus exists as to whether a central bank should simply "lean against" asset price bubbles (i.e., factor them into the mix of indicators signaling inflationary or deflationary forces) or take more aggressive actions to "prick" asset bubbles.²²⁰ The policy response might involve monetary policy tightening, supervisory suasion, or regulatory action to reduce the excessive flow of credit to fund speculation in the asset class. Of course, the correct course of action might require a combination of actions. However, regardless of the outcome of the current debate, the impact of monetary policy on individual asset classes should be considered within the context of monetary policymaking.

(14) Restrict Open Market Operations to U.S. Treasury Securities, repurchase agreements, and reverse repurchase agreements during Normal Times

The Federal Reserve's post-crisis purchase of over \$1.25 trillion of residential mortgage-backed securities has been one of its most controversial actions in recent years, and with good reason. By moving beyond the confines of the U.S. Treasury market (including most repurchase agreements and reverse repurchase agreements, which are collateralized by U.S. Treasuries), the Federal Reserve began allocating credit to selected markets, such as the residential mortgage market, which now features artificially low mortgage rates dampened by the Federal Reserve's purchase program.

The Federal Reserve faces a fundamental threat to its ability to independently conduct U.S. monetary policy when it begins allocating credit outside of the U.S. Treasury market—therein politicizing its actions. Initially, the Federal Reserve's RMBS portfolio was set to run off over time, as mortgages were refinanced, homes were sold, or principal was repaid over

²²⁰ For an example of an analysis suggesting "asset prices are relevant only to the extent they may signal potential inflationary or deflationary forces," see, Bernanke, Ben and Gertler, Mark, "Monetary Policy and Asset Price Volatility," NBER Working Paper No. 7559 (200).

time. However, in September 2011, the Federal Reserve reversed this policy and announced that it would begin reinvesting the principal payments from its holdings of federal agency RMBS—thereby holding constant its position in the market—instead of allowing it to taper off as originally proposed. It may or may not be coincidental that the Fed's policy reversal coincided with intense political pressure to support the ailing housing market in order to spur a more robust recovery. Regardless, what is clear is that the Federal Reserve should not insert itself into political debates unless it is absolutely necessary under circumstances similar to those required for the Federal Reserve to invoke its 13(3) authority to extend emergency loans.

(15) Require the Federal Reserve to Articulate a Clear Lender-of-Last-Resort Policy to Govern Future Crises

In the wake of the financial crisis, Chairman Bernanke justified the extraordinary steps taken by the Federal Reserve to bail out several firms that were previously outside its regulatory purview by noting, “Because the United States has no well-specified set of rules for dealing with the potential failure of systemically critical non-depository financial institutions, we believed that the best of the bad options available was to work with the Treasury to take the actions we did to avoid those collapses.”²²¹ To be sure, in its nearly 100 year history, the Federal Reserve has never clearly articulated its lender-of-last resort strategy.²²² Well-known economist and Federal Reserve historian Allan Meltzer clearly describes the problems this policy void creates:

The absence of a [lender-of-last-resort] policy has three unfortunate consequences. First, uncertainty increases. No one can know what will be done. Second, troubled firms have a stronger incentive to seek a political solution. They ask Congress or the administration for support or to pressure the Federal Reserve or other agencies to save them from failure. Third, repeated rescues encourage banks to take greater risk and increase

²²¹ “Federal Reserve Policies to Ease Credit and Their Implications for the Fed’s Balance Sheet,” Remarks by Chairman Ben S. Bernanke at the National Press Club Luncheon, National Press Club, Washington D.C. (2009).

²²² See Meltzer, Allan H., “Policy Principles: Lessons from the Fed’s Past,” in *The Road Ahead for the Fed*, Hoover Institute (2009).

leverage. This is the well-known moral hazard problem.²²³

Requiring the Federal Reserve to clearly establish a lender-of-last resort policy—or at a minimum, a framework or set of guidelines—will decrease uncertainty in the market during a future crisis and mitigate the moral hazards created by the legacy of the recent “too-big-too-fail” bailouts. A clear lender-of-last resort policy will also provide policymakers a benchmark against which oversight can be conducted.

CONCLUSION

This study suggests four possible Federal Reserve reforms that policymakers may want to consider to ensure a stable monetary policy going forward.

- (16) Creating a single mandate for price stability;
- (17) Requiring the Federal Reserve to monitor asset prices for signs of incipient asset price bubbles;
- (18) Restricting open market operations to U.S. Treasury securities, repurchase agreements, and reverse repurchase agreements during normal times; and
- (19) Requiring a clear lender-of-last-resort policy.

Each reform seeks stability through increased transparency and predictability. Concurrent with policymakers’ consideration of these reforms, the Federal Reserve itself should outline a clear exit strategy from today’s discretionary climate and begin fostering a climate characterized by flexible, rules-based policies.

APPENDIX A: UNCONVENTIONAL LENDING FACILITIES AND BAILOUTS

<i>Federal Reserve Action</i>	<i>Start Date</i>	<i>Description</i>
Term Auction Facility (TAF)	12/12/2007	The TAF auctioned funds to depository institutions under terms similar to the Federal Reserve's discount window. The TAF initially auctioned up to \$20 billion every two weeks, but this amount was increased on several occasions to as much as \$150 billion every two weeks.
International Swap Lines	12/12/2007	The Federal Reserve provided dollars temporarily to foreign central banks in exchange for foreign currency collateral and interest, enabling them to stabilize dollar-based markets within their jurisdiction.
Term Securities Lending Facility (TSLF)	3/11/2008	The TSLF allowed primary dealers (e.g., investment banks) to post collateral and temporarily swap illiquid assets for highly liquid assets such as U.S. Treasuries in order to increase liquidity in financial markets.
Federal Reserve bails out Bear Stearns	3/14/2008	The Federal Reserve facilitated the sale of the investment bank Bear Stearns to JP Morgan through a nearly \$30 billion loan—the first financing of a non-commercial bank institution in four decades.
Primary Dealer Credit Facility	3/16/2008	The PDCF sought to improve broker dealers' access to liquidity in the overnight loan market banks use to meet their reserve requirements.

(PDCF)		
Federal Reserve bails out AIG after allowing Lehman Brothers to fail	9/16/2008	Just days after allowing the investment bank Lehman Brothers to fail, the Federal government effectively nationalized the insurer American International Group and the Federal Reserve lent the firm \$85 billion.
Asset-backed Commercial Paper Money Market Fund Liquidity Facility (AMLF)	9/19/2008	The AMLF made non-recourse loans to banks to purchase asset-backed commercial paper. The AMLF would soon be superseded in importance by the creation of the Commercial Paper Funding Facility.
Commercial Paper Funding Facility (CPFF)	10/7/2008	The CPFF was used to purchase highly rated secured and unsecured commercial paper from issuers. It was the first Federal Reserve facility in modern times with an ongoing commitment to purchase assets, as opposed to lending against assets, and the first time in 50 years that the Federal Reserve provided financial assistance to non-financial firms.
Money Market	10/21/2008	The MMIFF was created to lend up to \$540 billion to private sector special

Investor Funding Facility (MMIFF)		purpose vehicles that invest in commercial paper, but the facility expired at the end of October 2009 without ever being used.
Term Asset-backed Loan Facility (TALF)	11/25/2008	The TALF addressed problems in the market for asset-backed securities (ABS). Using this facility, the Federal Reserve made non-recourse loans to private U.S. companies that had a relationship with a primary dealer to purchase recently issued, highly rated ABS.
Federal Reserve bails out Citigroup	1/16/2009	The Federal Reserve worked jointly with the U.S. Treasury and the Federal Deposit Insurance Company to provide a package of guarantees, liquidity access and capital to Citigroup.

SUPPLEMENTAL MATERIALS FROM THE
“ROAD MAP TO SOUND MONEY: A LEGISLATIVE HEARING ON
H.R. 1098 AND RESTORING THE DOLLAR”
HEARING OF THE SUBCOMMITTEE ON
DOMESTIC MONETARY POLICY AND TECHNOLOGY

Tuesday, September 13, 2011

QUESTIONS FOR THE RECORD

FROM CHAIRMAN RON PAUL TO
LAWRENCE M. PARKS
EXECUTIVE DIRECTOR, FOUNDATION FOR THE
ADVANCEMENT OF MONETARY EDUCATION

Question 1:

Part of the purpose in discussing H.R.1098 and holding this hearing was to initiate a discussion on how we begin to achieve sound money. Your Foundation for the Advancement of Monetary Education has been educating people for more than 17 years about the benefits of an honest monetary system and the perils of, what you call in your testimony, legal tender irredeemable paper-ticket-electronic money. From your experience, what are your suggestions to expedite implementing an honest monetary system that is in conformity with the Constitution?

Answer:

For the reasons outlined in my written testimony, it is urgent that the United States begin a transition to an honest monetary system to replace our current legal tender irredeemable paper-ticket-electronic monetary system before it completely collapses.

Here is what needs to be done.

Preconditions:

Before the problem of how to change our monetary system can be addressed, there must be widespread recognition that there is a problem. While the symptoms of our dysfunctional and dishonest monetary system are well recognized and complained about, few have traced the cause back to legal tender irredeemable paper-ticket-electronic money.

The parameters of the problem need to be stated and legitimized. That is the role of intellectuals. As a precondition for implementation, those intellectuals who help establish credibility and build support for an honest monetary system must be paid. As I outline the steps, please keep in mind that all of this will need to be financed.

Because of the almost 100 years of misinformation and disinformation about our monetary system, putting what I

call the money issue on the national agenda in a manner that its importance becomes widely recognized is a large task. Here are some of the steps that are usually taken to affect social change and which can be employed:

- (1) Engage “academic cover.” Teaching about the perils of legal tender irredeemable paper-ticketelectronic money and the benefits of an honest monetary system will require some combination of:
 - a. Endowed chair(s);
 - i. There are not many candidates for an endowed chair who are knowledgeable about the perils of legal tender irredeemable paper-ticket-electronic money and the benefits of an honest monetary system. Professor Richard Ebeling, the former von Mises Professor of Economics at Hillsdale College comes to mind. An endowment requires several million dollars. It should be named after a famous person to give the chair the imprimatur of legitimacy. Best if the school is well respected. The holder of an endowed chair many times becomes head of department, which would give one some control of the curriculum, the selection of textbooks, the hiring of additional staff, and a say in awarding tenure appointments.
 - b. Academic prizes;
 - i. Prizes help confer the mantel of being an expert on a prize holder. This is a common technique to legitimize concepts. For example, the so-called *Nobel Prize in Economics* is not one of those prizes that Alfred Nobel established in 1895. The Economics prize came in 1968 and is endowed not by the Nobel Foundation but by the Central Bank of Sweden. It is a *bank* prize, and its real name is the *Sveriges Riksbank Prize in Economic Sciences in Memory of Alfred Nobel*. This prize is never awarded anyone who even hints at the dishonesty of legal tender irredeemable paper-ticketelectronic money or questions the

legitimacy of central banking.

- ii. Prizes help spur research and books. For example, the Gilder-Lehrman Institute for the past 12 years has awarded a \$25,000 book prize about Frederick Douglass, an important historical figure, but certainly not one that most people have heard of. If memory serves, at this year's award ceremony it was mentioned that there were 63 books submitted for consideration. Imagine all of the study, articles, academic courses and other activities resulting from this kind of prize.
- c. Honorariums for lectures/presentations;
 - i. Academics, just like everyone else, are quick to respond to financial incentives. In industry, to establish the *bona fides* of concepts, products, etc. it is common to hold events where leading academics make a presentation. Wall Street does this all the time. It is only natural for someone who is being paid, say \$50,000 (not an unheard of amount), to be the keynote speaker at a conference to understand what one is expected to say.
- d. Research grants;
 - i. Later in the process for achieving social change, e.g., getting legislation passed, there will be legislative hearings. Witnesses will be called (who might be the witnesses today to support getting rid of legal tender irredeemable paper-ticket-electronic money?), and evidence will need to be introduced. Lawmakers will require "cover" as well. Research findings will be necessary. Today, the Federal Reserve, for example, sponsors hundreds, maybe thousands, of reports, studies, etc. in support of the current system. Those who back an honest monetary system will need intellectual ammunition and their own expert witnesses to counter these.

- (2) Engage think tanks. There is a worldwide network of think tanks that conduct research and engage in advocacy. They staff recognized experts in almost every area.
 - a. Think tanks produce research reports (which will be needed to support proposed legislation), their experts write op-eds and articles which are published in the general media, they hold conferences and other events that are attended by media people, and they arrange for their experts to appear in the major media. Think-tank sponsored conferences are another distribution channel for imparting legitimacy to ideas.
 - b. Also, when journalists and researchers want information about a topic, they most times approach those who are considered to be “expert.” As with prize winners, heads of department in the Academy and authors, think tanks are many times the source of expert opinion. Think tanks help establish credibility for and legitimize ideas.
 - c. To attract attendees when a business enterprise holds an industry conference, it many times arranges for “entertainment.” A top intellectual from a well-known think tank not only adds the prestige of being a scholar, but also provides name recognition of the think tank that the scholar represents.
 - d. As with other distribution channels, radio and television programs also seek to have “experts” appear. Think tanks many times are sources of authorities.
 - e. It may be beneficial to sponsor new think tanks to address the money issue.
- (3) Engage a public relations firm.
 - a. Public relations firms typically provide a distribution channel to the major media. While they many times also help devise a media strategy for introducing concepts and ideas to the general public, their most

important function is to get publicity for content. To do that, public relations firms are generally staffed by former editors, television producers, and others who have relationships with the major media. That's how many op-eds, articles and television program specials get placed. Public relations firms expedite media appearances and conference participation.

- (4) Make use of Internet technology.
 - a. New innovations, e.g., Facebook, Twitter, mobile device apps, email marketing, etc. should be used to help distribute intellectual ammunition highlighting the perils of legal tender irredeemable paper-ticket-electronic money and the benefits of an honest monetary system.
- (5) Engage lobbyists.
 - a. Legislation will be required to make a transition to an honest monetary system. I think it is fair to say that no important legislation gets passed in the U.S. without significant lobbying. A key issue is: who will pay the lobbyists? (More about this follows.)
- (6) Management: An umbrella organization will be needed to oversee and manage this process.

Rebut stated objections to eliminating paper money

The principal objections to transitioning from paper money must be addressed (that will be the task of experts who will need to present convincing and truthful research). It is not my purpose to counter these objections here except to say that they are all easily addressed with empirical evidence and logical reasoning.

- (1) The proposition that financial markets are inherently unstable.
 - a. The argument is that since financial markets interconnect all other markets, and since financial markets have historically gone through periods of

boom and bust¹, there must be some mechanism, called the “lender-of-last-resort,” to rescue financial markets when they become vulnerable to collapse. Otherwise, the argument goes, society could collapse. If we don’t have paper money, i.e., if we have gold-as-money or money that is somehow linked to, redeemable into, or otherwise connected with gold, there may not be enough gold to go around. Therefore, it is claimed, we must rely on paper money and associated institutions, e.g., central banks.

(2) Need for safety nets.

- a. Sometimes, even without a systemic collapse, such as occurred in the 1930s, there come times when there are severe economic dislocations and high unemployment, as we have now. The argument is that this requires safety nets, e.g., unemployment benefits. If politicians don’t have easy access to legal tender irredeemable paper-ticket-electronic money, then it may not be possible to finance the safety nets. Also, it is further argued that it may be necessary for government to provide “stimuli” in the form of government-sponsored “investments,” say in infrastructure or whatever, to “get the economy moving.” If we don’t have a monetary system that includes legal tender irredeemable paper-ticket-electronic money, such government action may not be possible.

(3) Not enough gold for government to honor entitlement promises, especially Medicare.

- a. Regardless of whether our legal tender irredeemable paper-ticket-electronic monetary system is maintained, Medicare and Medicaid promises cannot be met. Current legislation aimed at reducing payments to providers and limiting coverage is just another way of defaulting. The solution, regardless of the monetary system, is to eliminate the monopoly

¹ Famed economist John Maynard Keynes hypothesized that financial excesses are driven by “animal spirits.” I interpret this to mean that every now and then something in folks’ pituitary gland causes them to go off the rails financially. In my view, this is nonsense, and, to paraphrase Keynes, “nonsense on stilts.”

that doctors have on the delivery of healthcare and the stranglehold that the FDA has on approval of new drugs and devices. It is well-known that whenever there is a monopoly prices increase and the level of service goes down. What is the mystery that this principle should not apply to healthcare?

- a. Social Security can easily be made solvent by increasing the retirement age and other adjustments, as should have been made long ago, again, regardless of the monetary system.

(4) Not enough gold to fund defense.

- a. The argument is that historically, when countries were on the gold standard, which system is not being recommended, the ability to redeem gold certificates for gold was frequently suspended in order to finance war with legal tender irredeemable paper-ticket-money. However, it was always understood that after war was over convertibility would be resumed. In fact, there is always enough gold and accumulated wealth to finance wars that have the support of the people. It is only wars of adventure and the stationing of troops all over the world that will have difficulty being financed.

(5) Without paper money, the ability of politicians to manage the economy would be severely constrained.

- a. This is true. However, for those engaged in producing goods and final services that improve the lives of ordinary people, as opposed to those who profit from moving paper around, the ability of politicians to manage the economy should be constrained, if not totally eliminated.

(6) Limits to the amount of gold to support a growing economy.

- a. The argument is that as an economy grows, there needs to be more money to fund that growth. With gold or other commodity money there may not be enough and growth will be unnecessarily constrained.

Unstated Objections to eliminating paper money

Whenever legislation is proposed or opposed, there is a stated agenda, usually positioned that the legislation will be good or

bad for the country (whenever possible, legislation is also positioned as being good or bad for children). There is also almost always an unstated agenda that the proposed legislation will help or hurt a particular special interest. Proposals to change the monetary system away from legal tender irredeemable paperticket-electronic money are vulnerable to very material unstated objections. The reason they are unstated is that, because few would agree that the objections are valid if they were openly acknowledged.

- (7) Eliminating legal tender irredeemable paper-ticket-electronic money limits politicians' ability to extract "campaign contributions" for granting special privileges and protecting suppose interests. Fewer "campaign contributions" impair politicians' tenure in office.
- (8) The most important unstated objection to eliminating legal tender irredeemable paper-ticketelectronic money is that it limits financial leverage and profits to the financial sector. For example, today there is something north of \$60 trillion under professional management generating a fee stream on the order of \$500 billion (no typo) per year. Additional hundreds of billions are garnered from transaction fees. This fee stream would almost totally evaporate if we don't continue with legal tender irredeemable paper-ticket-electronic money. Those who profit from the current system will mount a spirited defense of it and will denigrate any proposed monetary system based on gold.

Who should decide the parameters of a new monetary system?

On March 11th, 2009, the *Financial Times* ran a large article about who would be called upon to fix the financial debacle². Of the 50 names put forth, only three were from the productive (the article called them "industrialists") sector. The corpus consisted of central bankers, bankers, economists whom they have coopted, financial sector regulators, financial sector investors, heads of financial sector institutions, and politicians whose allegiance that the financial sector has bought off with what are euphemistically referred to as "campaign contributions." If in fact these folks should come up with a plan, I think it fair to say that "the fix would be in."

² Lionel Barber, "Fifty who will frame a way forward", March 11 2009, The Financial Times, <http://www.ft.com/intl/cms/s/0/2fe0826a-0dac-11de-a10d-0000779fd2ac.html#axzz2GWA SA8RI> (last accessed December 30, 2012)

Ideally, the monetary system should serve the needs of ordinary people and those who produce products and final services. Thus, those who should be responsible for determining the structure, i.e., what the money should be, of the monetary system are manufacturers, farmers, end-product service providers (as opposed to intermediaries), private sector organized labor, small countries, savers, seniors, and our trading partners. There may be others, but the point is to exclude financial sector participants for reasons which shall be stated shortly. Others should include the same categories of participants from Canada, Mexico, Germany, the UK, China, France, South Korea, Japan, etc.

The reasons why financial sector participants should be excluded from shaping new monetary system specifications are:

- (9) Financial sector participants do not produce any final service or product. At best, they are intermediaries facilitating production or services. In other words, while their services are necessary, their services are analogous to friction which costs should be minimized; and,
- (10) They have a conflict of interest with everyone else. What producers of products and services want is a monetary system that will minimize the cost of transferring wealth over time along with monetary, foreign exchange, interest rate, and balance sheet stability. The costs which producers want to minimize are revenues to the financial sector. Moreover, because the financial sector garners so much of its profits from trading, it does not want stability. It wants volatility. For the past 100 years at least, the *structure* of the monetary system has been largely left in the hands of financial sector participants. They have rigged that *structure* to their benefit and to the detriment of everyone else.

Those in the public sector, especially politicians, should also not provide input to the monetary structure. Once the parameters are determined by end users, it will be up to the politicians to accept or reject the recommendations.

Implementation

There needs to be broad support from those who have a real and legitimate stake in defining a new monetary system.

Fortunately, there is precedent whereby the major beneficiaries of a proposed system have gotten together on a worldwide basis to design a new system. The model which could easily be emulated is the highly successful Global XML Initiative.

The Global XML Initiative was a joint effort by many of the world's largest companies (cross-industry and cross-geography), especially those engaged in international trade, to develop a set of protocols whereby they could communicate with one another and their suppliers over the Internet to send purchase orders, acknowledgements, etc. and to eliminate, or at least greatly reduce, paper processing. Think of the result as akin to the ability of any bank to send wire transfers to any other bank worldwide across all industries.

The Global XML Initiative, after joint study and conferences, set up protocols that all companies subscribed to. I propose a Global Currency Initiative using a similar methodology.

Who will finance the Global Currency Initiative (the "GCI")?

It is anticipated that funding will come from three principal sources:

- (11) Gold sector participants (gold producers, gold funds, and hedge funds that have allocated significant assets to gold) on the theory that the conclusion of the GCI will be gold-as-money. In that event, gold sector participants can expect material relative asset valuation increases;
- (12) Large industrial enterprises on the theory that the new monetary system will eliminate, or at least greatly reduce, foreign exchange, interest rate and balance sheet volatility. While the costs of foreign exchange and interest rate volatility are not reflected in company financials, revenues to the financial sector are borne largely by productive sector businesses. I estimate those revenues, and the concomitant amounts that will fall to the bottom line for companies in the productive sector to be more than a trillion dollars per year. In addition, current systemic instability introduces enterprise risk for major businesses, i.e., the careful accumulation of productive capital over generations could be obliterated in the blink of an eye; and,
- (13) Foundations and other charities whose mission includes

increasing the standard of living for all people and helping to ensure peace and stability.

The Global Currency Initiative

The primary purpose of the GCI will be to establish criteria for a new monetary system. Then GCI participants will mobilize their already-on-retainer lobbyists to lobby elected representatives to legislate a new system. To signal that the GCI should be considered seriously and to attract high-level participants, someone who has earned worldwide respect in industry should lend his/her name to the project, e.g., Andy Grove or Bill Gates.

It is proposed that the criteria for a new monetary system be consistent with three guiding principles:

- (14) Full disclosure of all relevant information;
- (15) No misrepresentations; and,
- (16) No coercion, i.e., people should be free to accept or reject any particular form of money. The jargon for monetary coercion is legal tender, a power not authorized to the United States Government by the U.S. *Constitution*.

Possible criteria for the new monetary system to be considered should include (but not be limited to):

- (17) Low and stable interest rates;
- (18) Stable foreign exchange rates;
- (19) Price stability;
- (20) Balance sheet stability;
- (21) Conformity with the U.S. *Constitution*;
- (22) Conformity with the teachings of the major religions about money;
- (23) No special privileges for any sector or government (thus eliminating moral hazard);
- (24) Minimize the cost of transferring wealth over time.

After there is agreement on the criteria for the new monetary system, proposals for particulars will be evaluated on the basis of how well they meet the desired criteria. My research indicates that the system that best meets the criteria is gold-as-money. However, it is proposed that the GCI

participants reach their own conclusions.

Gold-as-money monetary system

After the GCI has been consummated, I anticipate that the new monetary system will be the one system that has been the choice of free people whenever gold (and/or silver) was available: a monetary system that uses gold-as-money.

To make the switch-over in the least painful way, mindful that pain is unavoidable as the current legal tender irredeemable paper-ticket-electronic monetary systems implodes, is to leave everything in place: the so-called “dollar,” the Federal Reserve, the “lender-of-last-resort,” the International Monetary Fund, the World Bank, the euro, the yen, the yuan and all central banks and banking institutions worldwide. Any government or company or person who wishes to continue to use and save irredeemable paper-ticket-electronic money should be free to do so.

However, the coercion associated with irredeemable paper-ticket-electronic money, legal tender laws, should be repealed worldwide. Further, there should be no taxes of any kind (sales taxes, income taxes, VAT taxes, etc.) levied against gold or silver. In addition, at least in the U.S., the gold that supposedly resides in Fort Knox and other depositories should be distributed per capita to citizens, and perhaps the same worldwide, and mints should be opened to free coinage. Gold and silver coins should be denominated by weight.

It is anticipated that as irredeemable paper-ticket-electronic money continues to depreciate, transactions for future settlement will more and more be denominated in gold by weight, not dollars or any other paper money. In this way, it is hoped that a monetary transition, as opposed to a monetary discontinuity/collapse, can be made over time.

Question 2:

Answer:

In your testimony, you suggest that H.R.1098 is necessary to implement an honest monetary system in conformity with the Constitution in part because H.R.1098 repeals legal tender laws. However, it would appear that existing legislation already empowers one to contract for payment in gold and compel specific performance. If this is correct, please explain further why you believe H.R.1098 is essential legislation.

In my testimony I highlight how the Founders abhorred legal tender, especially Thomas Jefferson and Tom Paine. I also quote from Justice John Marshall and Daniel Webster who also opposed legal tender. I explain how it came to be that the Supreme Court legitimized legal tender in what today (and at the time when the decisions came down) prominent legal scholars called the decisions questionable at best. As Judge Bork once put it:

[t]his Nation has grown up in ways that do not comport with the intentions of the people who wrote the Constitution -- the commerce clause is one example -- and it is simply too late to go back and tear that up. I cite to you the legal tender cases. These are extreme examples admittedly. Scholarship suggests that the Framers intended to prohibit paper money.³

I also emphasize that Chief Justice Salmon Chase dissent in *Knox vs. Lee* declared: “The legal tender quality [of money] is only valuable for the purposes of dishonesty.” A clearer condemnation is not possible, in my view. One would hope that our government would stop being a party to something that is *prima facie* dishonest.

Professor Lawrence White, while endorsing competition in currency, makes the valid point that there is already an exception to the “Legal Tender Statute,” 31 USC, §5103 in that since 1977 one may insert a “gold clause” in contracts and insist on receiving payments in gold, or in an amount of dollars indexed to the price of gold.

Because gold (with a minor exception being silver, and which is irrelevant) is the only commodity for which there is more than a year’s worth of production above ground that could easily be brought to market—there is in fact more than 65 years’ worth of gold production above ground—gold is the only commodity when used as money that could provide price stability for future payments. Thus, if price stability is to be a criterion for a new monetary system, with full disclosure and absent coercion and misrepresentations, gold-as-money will be a principal candidate.

One might conclude, therefore, that on account of the 1977 exception for gold, HR1098’s repealing legal tender is not

³ Hearings Before Senate Comm. on the Judiciary 100th Cong., 1st Sess. Nomination of Robert H. Bork to be Associate Justice of the Supreme Court of the United States: art 1 at 84-85 (1987), as referenced by: http://www.law.duke.edu/boylesite/bork.htm#N_60 (last accessed December 30, 2012)

necessary, and that if one wants to transact with gold-as-money one could and would do so now. In my view, this is wrong and HR1098 is necessary and essential if we are going to transition away from legal tender irredeemable paper-ticket-electronic money for the following reasons:

- (25) Hardly anyone knows that contracts payable in gold are now legal and supposedly enforceable. All over the world, gold has been “demonetized.” The International Monetary Fund, for example, modified in 1978 its *Articles of Agreement*, Section 4-2b, to prohibit member countries from linking their currencies to gold and only to gold. Irredeemable paper-ticket-electronic money is legal tender in every country, as far as I know. Thus, absent a clear repudiation by the world’s leading monetary power, the United States, legal tender will remain an impediment for using gold-as-money for international transactions as well as domestic transactions.
- (26) U.S. Gold Eagles, authorized by the *Gold Bullion Coin Act of 1985*, have a nominal face value of \$50 and are themselves “legal tender.” The market value of the gold content in Gold Eagles is almost 38 times their face value. Gains on the dollar value of gold using U.S. Gold Eagles for transactions is considered income by the IRS and are subject to special additional income taxes, because the IRS has categorized gold as a “collectible.” In some locales gold and/or bullion coins are subject to sales taxes. These factors alone stymie anyone attempting to switch away from legal tender irredeemable paper-ticket-electronic dollars to gold-as-money.
- (27) As a practical matter, a gold clause requiring payment in gold in contracts is, in my view, a deal killer. For example, how could a debtor have any confidence that he could perform? Further, if one promised gold as payment, where might one reliably get gold at the time that payment is due? Today, on information and belief, commodity exchanges provide that contracts for gold bought for future delivery may be settled in cash, i.e., paper money. In addition, there is material counterparty risk that any arrangements that a debtor makes to pay in gold could be frustrated. Why would a debtor or creditor undertake the risk of payment in gold? Further, to acquire U.S. Gold Eagles, the most reliable form of gold-as-money for use in commercial transactions, one must pay a 3% premium on the dollar market value of the coins, which is charged by the U.S. Mint, plus a commission to a

selling dealer which is generally in the range of one to two percent of the dollar market value of the coins. I am aware of no commercial transactions that use gold-as-money in the form of U.S. Gold Eagles or any other form of physical gold for future payment. In other words, the exception to the Legal Tender Statue cited by Professor White is of no practical significance.

- (28)The notion of fiat money, i.e., arbitrary money whereby a politician(s), under the color of law, designates something that is inherently worthless (such as a piece of paper) gussied up with seals and signatures as having value as money has historically been repugnant to the American sense. These days, in part because the concept of fiat money has been removed from course curricula in almost all government schools, few have any knowledge of the history or threats of fiat money to their economic and political well-being. This was not the case as recently as 1933. Then, ordinary people understood what fiat money was and would not have tolerated it. Evidence for this is that on March 5th, 1933, President Roosevelt, relying on a dubious interpretation of a long-ago lapsed *Trading With the Enemy Act of 1917*, froze all transaction in gold. Seven days later, on March 12th, in the first of his famous Fireside Chats, when he spoke to the nation over radio during which time he explained his actions, he made it a point to declare about [Federal] Reserve Banks issuing currency: “This currency is not fiat currency.” Even in the depths of the Great Depression, the American public would have rejected fiat money, and President Roosevelt knew it. Fiat money became a worldwide phenomenon when on August 15th, 1971 the United States defaulted on its sovereign promise to redeem the dollar, which is widely said to be the world’s “reserve currency,” held by foreign governments and foreign central banks for gold at the rate of one ounce of gold for \$35. The result is that the entire planet is now awash in legal tender irredeemable paper-ticket-electronic money.
- (29)Despite the provisions in U.S. law referred to above, those who are at the pinnacle of the monetary authority understand full well that legal tender is necessary to coerce people into using fiat money. No less authority than Alan Greenspan, then Chairman of the Board of Governors of the Federal Reserve System wrote to Congressman Dr. Ron Paul on November 20,

2003, a copy of which letter is appended hereto, in which Mr. Greenspan states unequivocally: “So long as we issue fiat currency, I see no alternative to a legal tender law.”

- (30) The notion that one can enforce payment in gold by a court is a bad joke. As a practical matter today, non-“small claims” disputes of less than say \$50,000 cannot be adjudicated mostly on account of the monopoly that lawyers have on access to the court system and the monopoly fees that they charge. Larger transactions, where it may be economic to retain an attorney, are at risk because U.S. courts cannot be relied upon to enforce the law as written. There’s a long history in the U.S. whereby the courts, including the Supreme Court, don’t enforce legally binding contracts calling for payment in gold.
- a. For example, pursuant to an Act by Congress of September 24, 1917, the United States issued Liberty Bonds to help finance World War I. These bonds had a gold clause which stated that “The principal and interest hereof are payable in United States gold coin of the present standard of value.” *The Emergency Banking Relief Act of March 9, 1933* empowered the President to regulate or prohibit transactions in gold. Subsequently, in a Joint Resolution of June 5, 1933, Congress nullified all gold clause obligations of the United States. An action on this matter reached the Supreme Court: *Perry v. United States*, 294 U.S. 330 (1935). The Supreme Court decided that the Government, on the theory that it is sovereign, has the power under the *Constitution* to renege on its promises. The explanation was couched in legal gobbledygook, e.g., that since gold ownership had been outlawed, while the plaintiff had a right, there was no remedy. It should be noted that Justice James Clark McReynolds in dissent stated: “The *Constitution* is gone.”⁴
 - b. It has long been held by the courts that “as a legal medium there could be no distinction between notes and gold.”⁵ An example is given of dispute over a contract drawn on June 17, 1862 providing payment “in the current gold coin of the United States, in full

⁴ Henry Mark Holzer, *The Gold Clause*, 1980, ISBN # 0595139671, p65

⁵ George Cyrus Thorpe, “Contracts Payable in Gold”; United States Senate Document #43, 73rd Congress, 1st Session.

tale and count, without regard to any legal tender that may be established or declared by any law of Congress' was held satisfied by payments in the nominal value in any legal tender money. The court said that it was not a contract to be paid in bullion, or in so many pounds or ounces of gold, but in a certain number of dollars, in coin. The transaction did not regard gold as a commodity but as money. The Legal Tender Act had made Treasury notes of like value with gold. As a legal medium there could be no distinction between notes and gold.”⁶

- c. “The theory of the suit brought on contracts payable in specific chattels is that the court’s judgment is not for payment in articles in kind, but for the damages resulting to the creditor in consequences of breach of contract, and this judgment can be paid off and satisfied in whatever money the law has clothed with the attributes of legal tender. Although it was a notorious fact for purposes of trade and in commercial transactions a difference was made between Treasury notes and specie coin, whatever fluctuations might arise from extraneous causes, the debtor’s right to pay in whatever medium he chooses could not be affected. In administering the law, it was necessary that gold and Treasury notes should be considered equal. (*Appel v. Woltman* (1860) 38 Mo. 194.) A note payable “in gold” was held enforceable only for the face value of the note payable in any lawful money, and a judgment for a premium on gold in addition was declared invalid. (*Henderson v. McPike* (1864) 35 Mo. 255.)”⁷
- d. “In New York, the words “in specie, gold, and silver coin” were held not to affect the right to discharge an obligation, for the payment of a certain number of dollars, by paying in legal tender notes. (*Murray v. Harrison* (1867) 47 Barb, 484, affirmed (1868) 52 Barb. 427.) So also a bill of exchange payable “in specie or its equivalent” could be paid in legal tender notes called greenbacks.” (*Jones v. Smith* (1867) 48 Barb. 552.)⁸

⁶ *ibid*

⁷ *ibid*

⁸ *ibid*

- (31) Rather than quote more extensively from the reference cited, suffice it to say that there are myriad examples of courts denying plaintiffs the right to be paid in gold as provided by contract.

Without doubt, Mr. Greenspan has it right. If the U.S. is to transition away from legal tender irredeemable paper-ticket-electronic money, legal tender must be repealed.

BOARD OF GOVERNORS
OF THE
FEDERAL RESERVE SYSTEM
WASHINGTON, D. C. 20551

ALAN GREENSPAN
CHAIRMAN

November 20, 2003

The Honorable Ron Paul
House of Representatives
Washington, D.C. 20515

Dear Congressman:

Thank you for your letter dated October 27, 2003, regarding legal tender laws. You asked me for a more detailed explanation of the Federal Reserve's position on the economic effects of and justification for legal tender laws and for my position on your Honest Money Act (H.R. 2779), which would repeal 31 U.S.C. § 5103, the "Legal Tender Statute."

As I indicated in my letter of September 2, 2003, the Legal Tender Statute specifies those items that, when transferred to a creditor, constitute a legal tender for a preexisting debt. Thus, a person who owes a debt to a creditor can provide United States coins and currency to the creditor in an amount equal to the debt and subsequently conduct his or her business with the knowledge that the creditor cannot successfully sue for further payment. The statute provides legal certainty to the final settlement of debts required for the efficient functioning of the nation's financial system. ~~So long as we issue fiat currency, I see no alternative to a legal tender law.~~

I hope these comments are useful. Please let me know if I can be of further assistance.

Sincerely,
Handwritten signature of Alan Greenspan in black ink.

**STATEMENT FOR THE RECORD FROM EDWIN VIEIRA, JR.
“SOME OBSERVATIONS ON THE LEGALITY OF ‘ALTERNATIVE
CURRENCY’ IN THE UNITED STATES”**

27 July 2012

The Honorable Ron Paul Chairman, Subcommittee on Domestic Monetary Policy and Technology Committee on Financial Services United States House of Representatives 203 Cannon House Office Building Washington, D.C. 20515

Dear Dr. Paul:

Attached hereto is a brief study on some of the basic legal issues surrounding the use of “alternative currency” in the United States, which I should appreciate being considered and included in the record of the hearing to be held on this subject on 2 August next.

In the present economic climate, I can think of few matters more important than for Congress to secure the right of all Americans to protect themselves against debasement of their money by having available the option of employing currencies other than Federal Reserve Notes in their day-to-day transactions.

Although these are, of course, simply the views of only a single individual (albeit one who has looked into these matters rather extensively over the years), I hope that the attached study will prove useful to that end.

Your servant,

Edwin Vieira, Jr.

SOME OBSERVATIONS ON THE LEGALITY OF “ALTERNATIVE CURRENCY” IN THE UNITED STATES

BY EDWIN VIEIRA, JR.

For the purposes of this study, an “alternative currency” will be defined as United States gold or silver coins¹ which are used in normal financial transactions in preference to Federal Reserve Notes² or United States base-metallic coins³. Although the Federal Reserve System and Federal Reserve Notes are burdened with many constitutional infirmities⁴, this study will assume *arguendo* that these problems are not material.

I. Present law already allows Americans to use “alternative currencies”: on the one hand, Federal Reserve Notes irredeemable in either gold or silver⁵; and, on the other hand, United States gold and silver coins, specifically gold “American Eagles” and silver “American Liberty” coins.⁶

A. In general, all “United States coins and currency (including Federal Reserve notes * * *) are legal tender for all debts, public charges, taxes, and dues.”⁷ In particular, American Eagle and American Liberty coins are “legal tender”, too.⁸

In practice, any contract or other obligation for which the medium of payment is denominated in undefined or undifferentiated “dollars”⁹, such as by the use of “the dollar sign” (“\$”) without more, is payable in whatever “legal-tender” United States coin or currency, the value of which Congress has set in some number of “dollars” pursuant to its power “[t]o coin Money[and] regulate the Value thereof”¹⁰, the debtor wishes to tender.

B. Americans can, however, avoid this effect of the “legal-tender” law by entering into so-called “gold-clause contracts”, which specify that *only* a certain type of coin or currency—typically, gold or silver coin—may be used as the medium of payment. As relevant here, “‘gold clause’ means a provision in or related to an obligation” which “give[s]

⁸ 31 U.S.C. § 5112(h).

⁹ See 31 U.S.C. § 5101.

¹⁰ U.S. Const. art. I, § 8, cl. 5.

the obligee a right to require payment in * * * a particular United States coin".¹¹ Such "particular United States coin" is the *only* "legal tender" for such a contract. "[E]xpress contracts to pay coined dollars can only be satisfied by the payment of coined dollars. They are not 'debts' which may be satisfied by the tender of * * * notes".¹²

1. "Gold-clause contracts" have a constitutional basis. The Constitution provides that "[n]o State shall * * * make any Thing *but* gold and silver Coin a Tender in Payment of Debts".¹³ This amounts to an explicit constitutional reservation of the States' right, power, and *duty* to "make * * * gold and silver Coin a Tender".¹⁴ Most "Debts" for which "gold and silver Coin" would naturally be "a Tender" would arise out of "gold-clause contracts", in which the parties have explicitly chosen such "Coin", and only such "Coin", as their medium of exchange and therefore "Tender". Thus, the Constitution *requires* the States to recognize and enforce their citizens' "gold-clause contracts".

That being so, the Constitution disables Congress from prohibiting or inhibiting the enforcement of "gold-clause contracts" in the States' courts. In addition, "[t]he judicial Power [of the United States] shall extend * * * to Controversies * * * between Citizens of different States".¹⁵ Such "Controversies" which involve the enforcement of "gold-clause contracts" usually must be decided under the particular State laws pursuant to which the contracts were negotiated. Perforce of the Constitution, all of the States are required to enforce such contracts in their courts specifically by the payment of the gold or silver coin the contracts designate as the sole allowable "Tender". So, because the courts of the United States must follow State law on this matter, Congress cannot prohibit or otherwise impair the enforcement of such "gold-clause contracts" in the courts of the United States.

2. "Gold-clause contracts" have a statutory basis, too. Any American may now enter into private contracts that "give the obligee the right to require payment in * * * gold", or "a particular United States coin or currency", or "United States money measured in gold or a particular United States coin or currency".¹⁶ (Perforce of the Constitution, the States may enter into such contracts. As a practical

¹¹ 31 U.S.C. § 5118(a)(1)(B).

¹² *Bronson v. Rodes*, 74 U.S. (7 Wallace) 229, 254 (1869). *Accord*, *Butler v. Horowitz*, 74 U.S. (7 Wallace) 258, 260-261 (1869). See *Dewing v. Sears*, 78 U.S. (11 Wallace) 379, 380 (1870) (court judgment on a "gold clause contract" must be "entered for coined dollars * * * instead of * * * notes equivalent in market value")

¹³ U.S. Const. art. I, § 10, cl. 1 (emphasis supplied).

¹⁵ U.S. Const. art. III, § 2, cl. 1.

¹⁶ 31 U.S.C. § 5118(a) and (d).

matter, however, the United States have disabled themselves from entering into such contacts.¹⁷)

II. At the present time, the use of United States gold and silver coin as an “alternative currency” pursuant to “gold-clause contracts” has two practical limitations.

A. The amount of American Liberty and American Eagle silver and gold coinage being minted is not optimal. The present statutes require that those coins shall be minted and issued “in quantities sufficient to meet public demand”.¹⁸ “Public demand” is now gauged by the sale of the coins “at a price equal to the market value of the bullion [measured in Federal Reserve Notes] at the time of sale, plus the cost of minting, marketing, and distributing such coins”.¹⁹ The correct method for determining the true public demand for silver and gold coinage, however, is so-called “free coinage”, whereby the Mint coins all of the silver and gold that the public presents for coinage.²⁰ Adoption of “free coinage” would surely produce more coinage than the present scheme.

B. Perhaps of more immediate consequence is the problem of how a “gold-clause contract” providing for the payment of United States gold or silver coins should be valued, particularly for purposes of taxation. For instance, is the value of a “gold-clause contract” which stipulates payment in (say) ten “\$50” American Eagle gold coins²¹ the aggregate face value of those coins (“\$500”), or the much greater “dollar” value of the Federal Reserve Notes against which those coins would exchange in the free market? The Internal Revenue Service and various State agencies generally take the position that the value of such a contract for purposes of taxation is the latter. But the correct answer, for all purposes, is the former (“\$500”).

1. American Eagle and American Liberty coins are minted pursuant to statutes enacted under Congress’s constitutional authority “[t]o coin Money, [and] regulate the Value there of”.²² They are therefore “lawful money” by definition. They are also specifically constitutional “currency”, because the only use in the Constitution of a word related to “currency” is the reference to “current Coin of the United States”.²³ More generally, they are “currency” because they are “[c]oined money * * * authorized by law” which, when “gold-clause contracts” are involved, “in fact circulate[s] from hand to hand as the

¹⁷ See 31 U.S.C. § 5118(b) and (c).

¹⁸ 31 U.S.C. § 5112(e) and (i)(1).

¹⁹ 31 U.S.C. § 5112(f)(1) and (j)(2)(A).

²⁰ See, e.g., Act of 2 April 1792, ch. 16, § 14, 1 Stat. 246, 249.

²¹ 31 U.S.C. § 5112(a)(7).

²² 31 U.S.C. § 5112(a)(7) through (10), and 5112(e), enacted under aegis of U.S. Const. art. I, § 8, cl. 5.

²³ U.S. Const. art. I, § 8, cl. 6.

medium of exchange”.²⁴ And they are designated “legal tender”, on an equal basis with all other United States coins and currency.²⁵

The statutes providing for American Eagle and American Liberty coins explicitly set their values at their face values²⁶. The coins announce their values on their faces²⁷. And no other statute sets any other values for these coins, or purports to delegate authority to anyone to set other values by regulation or otherwise. Therefore, the coins’ values as “lawful money”, “currency”, and “legal tender” are their face values, and nothing else.

2. Today the United States have a “dual monetary system”, consisting of: (i) gold and silver coinage; and (ii) Federal Reserve Notes and base-metallic coinage which the United States refuse to redeem in gold or silver.²⁸

Different United States coins and other currency have different economic purchasing powers in the marketplace. For example, a “\$10” American Eagle gold coin or ten “\$1” American Liberty silver coins both buy far more than a “\$10” Federal Reserve Note or “\$10” face value in base-metallic coinage. This economic discrepancy, however, is irrelevant to the legal values as money of these various coins and currency. Applying mutatis mutandis the controlling case-law with respect to a “dual monetary system” and “gold-clause contracts” in the United States—

the laws for the coinage of gold and silver [in the present United States Code] have never been repealed or modified. * * * And the emission of gold and silver coins * * * continues * * *.

Nor have those provisions of law which make these coins a legal tender in all payments been repealed or modified.

It follows that there [a]re two descriptions of money in use * * * , both authorized by law, and both made legal tender in payments. The statute denomination of both description [i]s dollars; but they [a]re essentially unlike in nature. The coined dollar [i]s * * * a piece of gold or silver * * * . The [Federal Reserve Note i]s a promise to pay a coined dollar * * * . It [i]s impossible, in the nature

²⁴ See Black’s Law Dictionary (rev. 4th ed. 1968), at 458 (“currency”), 459 (“current money”).

²⁵ 31 U.S.C. §§ 5112(h) and 5103.

²⁶ 31 U.S.C. § 5112(a)(7) (“[a] fifty dollar gold coin”), (a)(8) (“[a] twenty-five dollar gold coin”), (a)(9) (“[a] ten dollar gold coin”), and (a)(10) (“[a] five dollar gold coin”); and § 5112(e)(4) (“One Dollar” in silver).

²⁷ 31 U.S.C. § 5112(e)(4) (“have inscriptions of * * * the words * * * ‘One Dollar’”) (American Liberty); and § 5112(i)(1)(B) (“have inscriptions of the denominations”) (American Eagles).

²⁸ See 31 U.S.C. § 5112(a)(7) through (10), (e), and (i); 12 U.S.C. § 411; 31 U.S.C. §§ 5112(a)(1) through (6), (b), (c), and (d), and § 5118(b) and (c). No legal disability prevents Federal Reserve Banks from redeeming their notes in gold. See 12 U.S.C. § 354. It is the banks’ practice not to do so, however.

of things, that these two dollars should be the equivalent of each other, nor [i]s there anything in the currency acts purporting to make them such * * * .

If then, no express provision to the contrary be found in the acts of Congress, it is a just and necessary inference, from the fact that both descriptions of money were issued by the same government, that contracts to pay in either [a]re equally sanctioned by law. It is, indeed, difficult to see how any question can be made on this point. Doubt concerning it can only spring from that confusion of ideas which always attends the introduction of varying and uncertain measures of value into circulation of money.²⁹

One owing a debt may pay it in gold coin or in legal-tender notes of the [Federal Reserve System], as he chooses, unless there is something to the contrary in the obligation out of which the debt arises. A coin dollar is worth no more for the purposes of tender in payment of an ordinary debt than a note dollar. The law has not made the note a standard of value any more than coin. It is true that in the market, as an article of merchandise, one is of greater value than the other; but as money, that is to say, as a medium of change, the law knows no difference between them.³⁰

Cases such as *Bronson and Thompson* stated the law of America's "dual monetary system" and "gold clauses" until 1933-1934. When Congress then prohibited the private ownership of gold and declared certain "gold clauses" unenforceable, those cases became temporarily obsolete.³¹ They were not overruled, however. The private ownership of gold was statutorily permitted in 1973-1974.³² "Gold clauses" (other than for the United States) were allowed statutorily post-1978.³³ And the minting of American Eagle and American Liberty coins was authorized in 1985.³⁴ At that point, *Bronson*, *Thompson*, and related cases once again provided, and today continue to provide, the controlling legal standards, as the United States Court of Appeals for

²⁹ *Bronson v. Rodes*, 74 U.S. (7 Wallace) 229, 251-252 (1869). It is no longer entirely true that "[t]he [Federal Reserve Note] is a promise to pay a coined dollar". Federal Reserve Notes must be redeemed for "lawful money". 12 U.S.C. § 411. Both the Treasury and the Federal Reserve Banks will redeem Federal Reserve Notes with United States base-metallic coinage. See, e.g., 31 U.S.C. 5112(a)(1) through (6). But the Treasury refuses under color of statute to redeem them for gold or silver coin. See 31 U.S.C. § 5118(b) and (c). And the banks as a matter of practice refuse to perform such redemption, too. This refusal of the Treasury and the banks is the reason that United States gold and silver coinage constitutes an "alternative currency", and not an integral part of the Federal Reserve System's currency, in contrast to the original arrangement specifically as to gold. See Act of 21 December 1913, ch. 6, § 16, 38 Stat. 251, 265-267.

³⁴ Act of 9 July 1985, Pub. L. 99-61, Title II, 99 Stat. 113, 115; Act of 17 December 1985, Pub. L. 99-185, 99 Stat. 1177.

the fifth Circuit recently recognized by explicitly relying on Thompson in *Crummey v. Klein Independent School District*.³⁵

On these points, the differences between the United States Treasury Notes at issue in Bronson and Thompson, on the one hand, and Federal Reserve Notes, on the other, work against the latter. Both were or are obligations of the United States, “legal tender”, and irredeemable in gold or silver coin. But the Treasury Notes issued directly from the Treasury, whereas Federal Reserve Notes are “issued at the discretion of the Board of Governors of the Federal Reserve System”. And the Treasury Notes were explicitly designated as “lawful money”, whereas Federal Reserve Notes are to be “redeemed in lawful money” (and obviously cannot be the very things in which they are to be redeemed).³⁶

No decision of the Supreme Court has overruled, limited, or even questioned Thompson or Bronson. So lower courts must follow these precedents “no matter how misguided the judges of those courts may think [them] to be”.³⁷ A fortiori, all other governmental agencies are bound by the principles stated in these decisions.

Because, as the Court of Appeals opined in *Crummey*, “[b]y statute it is established that federal reserve notes, on an equal basis with other coins and currencies of the United States, shall be legal tender”, it must also be “established” that American Eagle and American Liberty coins are “legal tender” “on an equal basis” with Federal Reserve Notes.³⁸ So, “[a]s legal tender, a dollar is a dollar, regardless of the physical embodiment of the currency”.³⁹ Any attempt by a court or an agency such as the IRS to re-value a “gold clause contract” in terms of some United States coin or currency other than the “particular United States coin” in which the contract is payable, where such re-valuation results in a value in “dollars” more or less than the aggregate face value of the “particular United States coin” the contract specifies, thereby attempts to “[re-]regulate the Value” and change the “legal tender” character of that coin contrary to the express determination of Congress. The power to “regulate the Value” of money and “to declare what is and what is not ‘legal tender’”, and at what value in “dollars” particular coins or other currency shall

³⁹ Slip Opinion at 3.

be taken as such, however, “lies with Congress and not the Courts” or any other governmental body.⁴⁰

3. The contrary contention is frivolous. The Supreme Court has described claims “so attenuated * * * as to be absolutely devoid of merit” in several ways: as “wholly insubstantial”, “obviously frivolous”, or “no longer open to discussion”.⁴¹ “A claim is insubstantial * * * if ‘its unsoundness so clearly results from the previous decisions of this court as to foreclose the subject’”.⁴² As explained above, “the previous decisions of this court”—that is, the Supreme Court—in *Bronson*, *Thompson*, and related cases establish beyond question that, where “gold-clause contracts” are concerned, “[a] coin dollar is worth no more for the purposes of tender in payment of an ordinary debt than a note dollar. The law has not made the note a standard of value any more than coin.”⁴³

Congress itself has approved the use of “gold-clause contracts” according to these principles. When Congress authorized private “gold-clause contracts” by statute in 1977, its Members knew the applicable law as stated in *Thompson*, *Bronson*, and other decisions of the Supreme Court.⁴⁴ Also, because Congress was fully aware of its own constitutional power “[t]o * * * regulate the Value” of “Money”,⁴⁵ it knew that it could effectively modify or overrule the holdings in those cases as to how “gold-clause contracts” should be valued in “dollars”.⁴⁶ Yet Congress has never taken any such action.

With the statutory authorization of “gold-clause contracts” in 1977, Congress recreated essentially the same “dual monetary system” which existed during and after the Civil War. Congress then strengthened this system in 1985, by authorizing the minting of American Eagle gold and American Liberty silver coins as “legal tender” and “in quantities sufficient to meet public demand”.⁴⁷ At both times (and ever since unto today as well), Congress knew that:

(i) This “dual monetary system” consists of paper currency not redeemable in gold or silver coin (United States Treasury Notes then, Federal Reserve Notes now) and United States

⁴⁰ See U.S. Const. art. I, § 8, cl. 5, and *Linne v. Baker*, 1986 WL 9502, at * 40 3, aff’d, 826 F.2d 129 (D.C. Cir.1987).

⁴¹ See *Newburyport Water Co. v. Newburyport*, 193 U.S. 561, 579 (1904); *Bailey v. Patterson*, 369 U.S. 31, 33 (1962); *Hannis Distilling Co. v. Baltimore*, 216 U.S. 285, 288 (1910); *Levering & Garrigues Co. v. Morrin*, 289 U.S. 103, 105 (1933); *McGilvra v. Ross*, 215 U.S. 70, 80 (1909).

⁴² *Goosby v. Osser*, 409 U.S. 512, 518 (1973) (emphasis supplied).

⁴³ *Thompson*, 95 U.S. at 696.

⁴⁴ See *Cannon v. University of Chicago*, 441 U.S. 677, 696-697 (1979).

⁴⁵ U.S. Const. art. I, § 8, cl. 5.

⁴⁶ See *Albernaz v. United States*, 450 U.S. 333, 341-342 (1981).

⁴⁷ 31 U.S.C. § 5112(e), (h), and (i)(1).

gold and silver coins.

(ii) Under this system, individuals can choose, through “gold-clause contracts”, to employ United States gold and silver coins as their media of payment to the exclusion of Federal Reserve Notes.

(iii) As a matter of law, perforce of Congress’s monetary statutes as applied under the rule enunciated in Thompson, the value of a “gold-clause contract” is the aggregate face value in “dollars” of the coins involved.

(iv) As a matter of fact, equal face values of United States gold and silver coins and of Federal Reserve Notes do not have equal purchasing powers in the marketplace. Therefore,

(v) Individuals who employ “gold-clause contracts” might obtain some tax benefits therefrom—unless Congress enacted a statute preventing that result, along the lines of a statute it enacted shortly after the Civil War, when America’s first “dual monetary system” existed.⁴⁸ But,

(vi) No such statute was in force in 1977 or 1985. And Congress has enacted no such statute since then.

One may posit numerous, and compelling, reasons why Congress created and has maintained such a “dual monetary system”, including:

- to enable Americans, by increasingly employing gold and silver coin in preference to Federal Reserve Notes, to pressure the Federal Reserve System into adopting policies that would stop the depreciation of those notes relative to specie;
- to enable Americans to protect themselves financially against the consequences of the Secretary of the Treasury’s failure to perform his duty to “redeem gold certificates owned by the Federal reserve banks at times and in amounts the Secretary decides are necessary to maintain the equal purchasing power of each kind of United States currency”;⁴⁹
- to provide Americans with an alternative currency (and a set

⁴⁸ See Act of 13 July 1866, ch. 184, § 9, 14 Stat. 98, 147, amending Act of 10 March 1866, ch. 15, §§ 3 through 5, 14 Stat. 4, 5, repealed by Act of 14 July 1870, ch. 255, § 1, 16 Stat. 256, 256. See *Pacific Insurance Co. v. Soule*, 74 U.S. (7 Wallace) 433, 440-443 (1869).

⁴⁹ 31 U.S.C. § 5119(a). If the Secretary fulfilled this 49 duty, the exchange-rate between Federal Reserve Notes and United States gold coin would immediately become close to unity, because a one-ounce American Eagle gold coin is statutorily denominated “\$50”, and the statutory standard for the redemption of gold certificates is “\$42-2/9” per ounce. Compare 31 U.S.C. § 5112(a)(7) with § 5117(b).

of market prices denominated in such currency) that could enable the markets to continue to function even if the Federal Reserve System should collapse in hyperinflation or depression; and

- to supply the several States and the United States with an alternative currency then in use by many Americans on the basis of which public business could be conducted even were the Federal Reserve System to collapse.⁵⁰

In any event, the very existence of this “*dual monetary system*”, *unrestricted by statute with respect to the calculation and payment of taxes, establishes that Congress has authorized and empowered Americans to employ that system to the maximum extent they desire and for the maximum benefit that it can afford them, even with respect to taxes.*

III. Notwithstanding the foregoing, certain practical problems in the use of United States gold and silver coin as “alternative currency” remain. Fortunately, the solutions are not particularly difficult:

A. Congress should enact a statute under its powers “[t]o lay and collect Taxes” and “[t]o coin Money, [and] regulate the Value thereof”,⁵¹ or the President should promulgate a directive under his power and duty to “take Care that the Laws be faithfully executed”,⁵² requiring the IRS and all other agencies of the United States to follow the rule of valuation set in *Thompson v. Butler*. And under its power “[t]o coin Money, [and] regulate the Value thereof”, Congress should enact a statute requiring the same compliance from all State agencies.⁵³

It might be objected that, in a system of taxation with “progressive” rates, applying the rule of *Thompson* would encourage individuals to enter into “gold-clause contracts” simply to reduce their tax-liabilities through the lesser number of “dollars” that would be involved in such transactions (as opposed to the same transactions when conducted on the basis of Federal Reserve Notes as the media of payment). The best way to deal with this possibility, however, would be for Congress (and the States’ legislatures) to require that taxes on transactions effected with United States gold and silver coins be paid with the same type of coins involved in those transactions. Thus, taxpayers would file specific returns for “gold-clause contracts”

⁵⁰ A model statute for the adoption of an “alternative-currency system” by the States can be found in E. Vieira, Jr., *Pieces of Eight*, ante note 4, Volume 2, at 1664-1666.

⁵¹ U.S. Const. art. I, § 8, cls. 1 and 5.

⁵² U.S. Const. art. II, § 3.

⁵³ See U.S. Const. art. VI, cl. 2. A model statute can be found 53 in E. Vieira, Jr., *Pieces of Eight*, ante note 4, Volume 2, at 1663-1664.

payable in gold, and pay the taxes on those transactions in gold; they would file specific returns for “gold-clause contracts” payable in silver, and pay the taxes on those transactions in silver; and would file general returns for all other transactions conducted in Federal Reserve Notes, and pay the taxes on those transactions in such notes.

B. As noted above, the first step in maximizing the amount of gold and silver coinage available for use as alternative currency must be to reinstate “free coinage” in the United States Mint.

A second valuable step would be for Congress to declare by statute that specifically designated foreign gold and silver coins will be “legal tender for debts” at their values in terms of American Eagle or American Liberty coins.⁵⁴ For example, a foreign gold coin that contained one ounce of pure gold would be valued at “\$50”;⁵⁵ a foreign silver coin that contained one ounce of pure silver would be valued at “\$1”;⁵⁶ and coins of other weights would be valued proportionately. This would effectively incorporate all of the reliable gold and silver coinage of the entire world into the monetary system of the United States. If the same procedure were applied to bullion, all of the gold and silver of any form useful as money to be found anywhere in the world would in principle be incorporated into that system.

The imprudence in not taking these steps, in the face of the present worldwide monetary and banking crisis, speaks for itself.

⁵⁴ Contrast the present provision on this subject, in 31 U.S.C. § 5103. Congress has taken this route in the

past. See E. Vieira, Jr., *Pieces of Eight*, ante note 4, Volume 1, at 199-205.

⁵⁵ See 31 U.S.C. § 5112(a)(7).

⁵⁶ See 31 U.S.C. § 5112(e).

Fed Gave Banks Crisis Gains on \$80 Billion Secretive Loans as Low as 0.01%

By Bob Ivy - May 26, 2011

[Credit Suisse Group AG \(CS\)](#), [Goldman Sachs Group Inc. \(GS\)](#) and [Royal Bank of Scotland Group Plc \(RBS\)](#) each borrowed at least \$30 billion in 2008 from a Federal Reserve emergency lending program whose details weren't revealed to shareholders, members of Congress or the public.

The \$80 billion initiative, called single-tranche open-market operations, or [ST OMO](#), made 28-day loans from March through December 2008, a period in which confidence in global credit markets collapsed after the Sept. 15 bankruptcy of Lehman Brothers Holdings Inc.

Units of 20 banks were required to bid at auctions for the cash. They paid interest rates as low as 0.01 percent that December, when the Fed's main lending facility charged 0.5 percent.

"This was a pure subsidy," said Robert A. Eisenbeis, former head of research at the [Federal Reserve](#) Bank of Atlanta and now chief monetary economist at Sarasota, Florida-based Cumberland Advisors Inc. "The Fed hasn't been forthcoming with disclosures overall. Why should this be any different?"

The [Federal Reserve Bank of New York](#), which oversaw ST OMO, posted aggregate data about the program on its website after each auction, said Jeffrey V. Smith, a [New York](#) Fed spokesman. By increasing the availability of short-term financing when private lenders were under pressure, "this program helped alleviate strains in financial markets and support the flow of credit to U.S. households and businesses," he said.

Not in Dodd-Frank

Congress overlooked ST OMO when lawmakers required the central bank to publish its emergency lending data last year under the [Dodd-Frank](#) law.

"I wasn't aware of this program until now," said U.S. Representative Barney Frank, the Massachusetts Democrat who chaired the House Financial Services Committee in 2008 and co-authored the legislation overhauling financial regulation. The law does require the Fed to release details of any open-market operations undertaken after July 2010, after a two-year lag.

Records of the 2008 lending, released in March under court orders, show how the central bank [adapted](#) an existing tool for adjusting the U.S. money supply into an emergency source of cash. Zurich-based Credit

RECORD

Suisse borrowed as much as \$45 billion, according to bar graphs that appear on 27 of 29,000 pages the central bank provided to media organizations that sued the Fed Board of Governors for public disclosure.

New York-based Goldman Sachs's borrowing peaked at about \$30 billion, the records show, as did the program's loans to RBS, based in Edinburgh. [Deutsche Bank AG \(DBK\)](#), [Barclays Plc \(BARC\)](#) and [UBS AG \(UBSN\)](#) each borrowed at least \$15 billion, according to the graphs, which reflect deals made by 12 of the 20 eligible banks during the last four months of 2008.

No Exact Amounts

The records don't provide exact loan amounts for each bank. Smith, the New York Fed spokesman, would not disclose those details. Amounts cited in this article are estimates based on the graphs.

One effect of the program was to spur trading in mortgage-backed securities, said [Lou Crandall](#), chief U.S. economist at Jersey City, New Jersey-based Wrightson ICAP LLC, a research company specializing in Fed operations. The 20 banks – previously designated as primary dealers to trade government securities directly with the New York Fed – posted mortgage securities guaranteed by government-sponsored enterprises such as Fannie Mae or Freddie Mac in exchange for the Fed's cash.

ST OMO aimed to thaw a frozen short-term funding market and not necessarily to aid individual banks, Crandall said. Still, primary dealers earned spreads by using the program to help customers, such as [hedge funds](#), finance their mortgage securities, he said.

'Spreads Vary'

"Spreads vary from one transaction to another," making any calculation of dealers' profits on the Fed loans impossible, Crandall said.

The Fed opposed disclosing details of its open market operations because doing so would probably cause borrowers "substantial competitive harm," according to a March 2009 declaration by Christopher R. Burke, vice president of the New York Fed's markets group. The declaration is filed in federal court.

Revealing the borrowing "could lead market participants to inaccurately speculate that the primary dealer was having difficulty finding term funding against its collateral in the open market and that the dealer itself must therefore be in financial trouble," Burke said in opposing a media request for records about the borrowing.

Bidding [Interest Rates](#)

The New York Fed conducted 44 ST OMO auctions, from March through December 2008, according to its website. Banks bid the interest rate they were willing to pay for the loans, which had terms of 28 days. That was an expansion of longstanding open-market operations, which offered cash for up to two weeks.

Outstanding ST OMO loans from April 2008 to January 2009 stayed at \$80 billion. The average loan amount during that time was \$19.4 billion, more than three times the average for the 7 1/2 years prior, according to New York Fed data. By comparison, borrowing from the Fed's discount window, its main lending program for banks since 1914, peaked at \$113.7 billion in October 2008, Fed data show.

In March 2008, ST OMO was "desperately needed," because of the shaken state of short-term credit markets, said [Michael Greenberger](#), a professor at the University of Maryland School of Law in Baltimore and former director of the division of markets and trading at the Commodities Futures Trading Commission. After the Fed created other lending mechanisms and the Treasury Department began distributing money from the Troubled Asset Relief Program in October, ST OMO became "just a way for banks to have at it," he said.

'Profit-Making Enterprise'

"At such low interest rates, it's no longer a rescue, it's a profit-making enterprise," Greenberger said. "By December, a lot of money was made off this program."

Goldman Sachs, led by Chief Executive Officer Lloyd C. Blankfein, tapped the program most in December 2008, when data on the New York Fed website show the loans were least expensive. The lowest winning bid at an ST OMO auction declined to 0.01 percent on Dec. 30, 2008, New York Fed data show. At the time, the rate charged at the discount window was 0.5 percent.

Stephen Cohen, a spokesman for Goldman Sachs, declined to comment.

December Peak

As its ST OMO loans peaked in December 2008, Goldman Sachs's borrowing from other Fed facilities topped out at \$43.5 billion, the 15th highest peak of all banks assisted by the Fed, according to data compiled by Bloomberg. That month, the bank's Fixed Income, Currencies and Commodities trading unit lost \$320 million, according to a May 6, 2009, regulatory filing.

Under ST OMO, cash changed hands through repos, or repurchase agreements, which the central bank has used to move money in and out of the banking system for at least 60 years. In a repo, the dealer sells securities to the Fed and agrees to buy them back for a higher price after a set period of time.

Open-market operations traditionally use repos to influence the federal funds rate, which is banks' cost of short-term borrowing, said Sherrill Shaffer, the officer in charge of the discount window at the Federal Reserve Bank of Philadelphia from 1994 to 1997. He's now a banking professor at the University of Wyoming in Laramie.

When the central bank increases the money supply -- by paying cash for securities in repos -- interest rates tend to fall. When it drains cash from the system by selling securities in reverse repos, rates can climb.

Pedal to Metal

Using repos to provide emergency cash, a step the Fed announced on March 7, 2008, was a departure from that process, said John H. Cochrane, a finance professor at the University of Chicago Booth School of Business.

“The Fed was slamming the pedal to the metal in the lender-of-last-resort category,” Cochrane said. “What they did was so far from what we conventionally think of as monetary policy.”

Credit Suisse’s borrowing peaked at about \$45 billion in September 2008, the Fed charts show. Steven Vames, a Credit Suisse spokesman in New York, declined to comment.

RBS’s use of ST OMO hit about \$30 billion in October 2008. The U.K. government has had a stake in the bank since Oct. 13, 2008. “RBS no longer makes any use of these emergency Federal Reserve lending programs and all money borrowed from the Fed has been repaid in full with interest,” said [Michael Geller](#), a spokesman for RBS Global Banking & Markets in Stamford, Connecticut.

Annual Report

Frankfurt-based Deutsche Bank’s use peaked at about \$20 billion in October 2008, its chart shows. The bank had 87 billion euros (\$122 billion) in repurchase agreements with all central banks as of the end of 2008, according to its annual report. John Gallagher, a bank spokesman, declined to comment.

London-based Barclays’s peak reached about \$20 billion in December 2008, the chart said. Mark Lane, a Barclays spokesman, declined to comment.

UBS, based in Zurich, borrowed as much as about \$15 billion in late 2008, the chart shows.

“UBS’s usage of those facilities should be seen in the context of our overall desire to maintain flexibility and diversification in our funding sources, even during the crisis,” said Kelly Smith, a spokeswoman for UBS in New York. “Given UBS’s substantial presence and commitment to U.S. dollar-denominated markets, utilization of such facilities was relatively modest.”

Other Banks

Other banks listed in the Fed charts borrowed less than their peers. New York-based [Morgan Stanley \(MS\)](#) and Paris-based [BNP Paribas \(BNP\)](#), France’s biggest bank by assets, took no more than about \$10 billion. [Citigroup Inc. \(C\)](#), JPMorgan Chase & Co. and Merrill Lynch & Co., which is now part of [Bank of America Corp. \(BAC\)](#), borrowed less than \$5 billion each.

Mary Claire Delaney, a spokeswoman for Morgan Stanley, Jon Diat, a Citigroup spokesman in New York, Howard Opinsky, a spokesman for New York-based JPMorgan Chase, and Megan Stinson, a spokeswoman in New York for BNP Paribas, declined to comment on their banks’ borrowings.

“Look at it in hindsight and these programs did exactly what they were intended to do -- stabilize the financial system, provide liquidity and instill confidence,” said [Jerry Dubrowski](#), a spokesman for Charlotte, North Carolina-based Bank of America.

The bar charts were included in the Fed's court-ordered March 31 disclosure under the Freedom of Information Act. The release was mandated after the U.S. Supreme Court rejected an industry group's attempt to block it. Bloomberg LP, the parent company of Bloomberg News, and [News Corp. \(NWS\)](#)'s Fox News Network LLC had sued the central bank after it refused to release lending records under the FOIA.

ATTACHMENTS FROM THE FEDERAL RESERVE IN RESPONSE TO QUESTION 11

The TALF was created to assist financial markets in accommodating the credit needs of consumers and businesses of all sizes by facilitating the issuance of asset-backed securities (ABS) collateralized by a variety of consumer and business loans; it was also intended to improve market conditions for ABS more generally. Under the TALF, nonrecourse loans were issued to holders of eligible ABS, which serve as collateral for the loan.

The TALF loan interest rates consisted of a base rate and a spread. The base rates were chosen to line up with the interest rate paid by the ABS to minimize basis risk. The spreads were chosen to compensate the Treasury and Federal Reserve for risk. In some cases, the spreads were also adjusted to reflect differences in the average level of the base rates; in particular, the prime rate exceeds Libor, which exceeds the federal funds rate. The interest rate spreads on TALF loans were set below spreads on highly-rated ABS prevailing during the early stages of financial crisis, but well above spreads during more normal market conditions to provide borrowers with an incentive to voluntarily repay once market conditions normalized. Over the course of the program, markets have improved and; subsequently, spreads on some TALF collateral asset classes have fallen below the TALF lending rate. As of August 2011, of the \$71 billion in total TALF loans originally extended, only \$11.6 billion remains outstanding. This steep reduction is almost entirely related to voluntary borrower prepayments.

The interest rate on TALF loans varies by the type of collateral securing the loan (and in some cases by the term of the loan):

- ABS backed by federally guaranteed student loans: 50 basis points over 1-month Libor.
- SBA Pool Certificates: federal funds target rate plus 75 basis points.
- SBA Development Company Participation Certificates:
 - Three-year TALF loans: 50 basis points over the 3-year Libor swap rate.
 - Five-year TALF loans: 50 basis points over the 5-year Libor swap rate.
- Commercial mortgage-backed securities:

- Three-year TALF loans: 100 basis points over the 3-year Libor swap rate.
- Five-year TALF loans: 100 basis points over the 5-year Libor swap rate.
- Other eligible fixed-rate ABS:
- Three-year TALF loans: 100 basis points over the 1-year Libor swap rate for securities with a weighted average life less than one year, 100 basis points over the 2-year Libor swap rate for securities with a weighted average life greater than or equal to one year and less than two years, 100 basis points over the 3-year Libor swap rate for securities with a weighted average life of two years or greater.
- Private student loan ABS bearing a prime-based coupon: the higher of 1 percent and the rate equal to the Prime rate minus 175 basis points.
- Other eligible floating-rate ABS: 100 basis points over 1-month Libor.

Following is a breakdown of the interest rates on TALF loans at the time of issuance (most TALF loans have been repaid early as financial market conditions improved and borrowers switched to market-based funding):

- (1) 62 percent of TALF loans were fixed-rate, with interest rates ranging from 1.78% to 3.87%
- (2) 29 percent of TALF loans were floating-rate, at 100 basis points over 1-month Libor
- (3) 4 percent of TALF loans were floating-rate, at the federal funds target rate plus 75 basis points
- (4) 5 percent of TALF loans were floating-rate, at the higher of 1 percent and the rate equal to the Prime rate minus 175 basis points. Since the inception of the TALF, the Prime rate minus 175 basis points has been constant at 150 basis points.

At the time TALF loans were issued there was no active market for financing these types of ABS. In addition, TALF loans have unique features--they have restricted and fixed maturities (3-or 5-year), are non-recourse to the borrower, and have customized risk-based haircuts based on the nature of the underlying collateral. As a result, comparable loan products to the TALF do not exist in the market.

We provide credit spreads on the TALF collateral asset classes for which we have been able to find data. The spreads may be used as proxies for prevailing market rates. However, these spreads are very imperfect proxies since they reflect the market pricing of the collateral, as opposed to market rates for loans with TALF terms and conditions. For example, credit spreads are an indication of the market perception of the riskiness of a security and as such do not incorporate the additional credit protection provided by the haircuts applied to TALF loan collateral. This is particularly notable for legacy CMBS, for which the haircuts started at a minimum of 15% of par (see below for TALF haircut rates). Furthermore, the maturity dates of TALF collateral may have been shorter or longer than the related TALF loan.

Ex-ECB Stark: Bank's balance sheet 'alarming'

By Andrea Thomas

BERLIN (MarketWatch) -- The quality of the European Central Bank's balance sheet is "alarming," former European Central Bank Executive Board Member Juergen Stark told Thursday's Frankfurter Allgemeine Zeitung newspaper.

"The Eurosystem's balance sheet is not only gigantic in its dimension but also alarming in its quality," Stark was quoted as saying. He added the structure of the balance sheet is a cause for concern because increasingly

short-term debt claims are being replaced by long-term ones and this will make it more difficult for the bank to reverse its loose monetary policy.

With his comments, the bank's former hawk Stark is backing Germany's central bank president Jens Weidmann. The head of the Bundesbank told Der Spiegel weekly magazine over the weekend that requirements for banks' cheap loans have been "very generous" and the program calms the situation in the short term, but this calm could be deceptive. He was concerned about the collateral requirements that the banks had to provide.

The ECB's balance sheet soared past the EUR3 trillion level last week partly because the bank has flooded markets with over EUR500 billion in cheap loans for banks.

MEMORANDUM FOR Department of the Treasury, Office of the Inspector General
(Ms. Donna Joseph), 740 15th Street, NW, Suite 600, Washington, DC 20220

SUBJECT: Gold Assay Report

1. In response to your written request, the White Sands Test Center Chemistry Laboratory analyzed 86 samples of high-fine gold for their purity.
2. Results: The results appear in Table 1, Encl 1.
3. Inclusive in this assay report is the Certificate of Destruction.
4. The samples were delivered to the Chemistry Laboratory on 28 Jul 08 and the analyses and analytical review were completed on 25 Aug 08.
5. Point of contact is Dr. Joseph E. Gomez at 575-678-2992.

18 AUG 2005

MEMORANDUM FOR Department of the Treasury, Office of the Inspector General
(Ms. Donna Joseph), 740 15th Street, NW, Suite 600, Washington, DC 20220

SUBJECT: Gold Assay Report

1. In response to your written request, the White Sands Missile Range Chemistry Laboratory analyzed 92 samples of high-fine gold for their purity.
2. Results: The results appear in Table 1, Encl 1.
3. The samples were delivered to the Chemistry Laboratory on 25 Jul 05 and the analyses were completed on 16 Aug 05.
4. Point of contact is Dr. Joseph E. Gomez at 505-678-2992.

FOR THE COMMANDER:

Encl
as

Joel Chavez
JOEL L. CHAVEZ
for Director, Materiel Test

Note: This wip documents the assay results of the 92 gold drill samples tested during the FY05 gold inventory audit. See wip F.5.26 & F.5.27 for results and explanation of differences between assayed fineness and fineness recorded by the Mint.
