ACKNOWLEDGMENTS

An anthology of this size and scope requires the collective effort of too many people to successfully list here individually. Each contributor, witness, lecturer and referenced source provided their own unique and substantial insight to the themes and topics discussed herein, making it a project worth pursuing. Extreme gratitude is given to each and every one of them.

Special acknowledgement must be given to Rep. Spencer Bachus, Chairman of the Financial Services Committee, who helped ensure Rep. Paul was able to achieve his position of Subcommittee Chairman. And also to the active participation of the Members of the Subcommittee: with their engagement the Subcommittee was able to explore topics of monetary policy long ignored.

Particular thanks must be given to the Full Committee staff who helped facilitate DMP hearings and the Congressional lectures sponsored by Chairman Paul. We owe a tremendous debt to all the members of Rep. Paul's Congressional office for being a great support on this project – especially Peter Coyne, who was indispensable in compiling the breadth of these materials. Lastly, special thanks to Tho Bishop, for his help on this project and his assistance throughout the 112th Congress.

EDITORS' NOTE

This anthology grew out of a desire by Chairman Paul and his staff to assemble a record of his tenure as chairman of the Subcommittee on Domestic Monetary Policy. While much of this record is currently available online, it is scattered across several different websites, many of which may not be available electronically in years to come. Accordingly it seemed worthwhile to compile as much material as possible into a single resource for anyone interested in understanding Dr. Paul's stance on monetary policy and the Federal Reserve.

During Dr. Paul's tenure as chairman, the subcommittee held a number of hearings to find out exactly what actions the Fed took during the financial crisis, and what it has done since, in its attempts to manage the economy. The Subcommittee examined problems with the monetary system; the instability of the current fractional reserve banking system; and other monetary policies that impact the economy. In addition, through his congressional office, Dr. Paul invited experts to lecture Members of Congress and their staff about the history and politics of money—lectures which have now been viewed by hundreds of thousands of people on YouTube.

This anthology is organized in a manner it is hoped will provide even the novice reader a clear grasp of the issues surrounding monetary policy. It begins with a brief monetary history of the United States, which explains the history of money in the U.S. and charts the development of our monetary system over the centuries. Without a grasp of the history and evolution of money and monetary policy, an informed understanding of sound monetary systems will remain elusive.

The monetary history is followed by transcripts of the Monetary Policy Lecture Series (the "Tea Talks" as they became known on Capitol Hill). This lecture series sought to educate Congressional staffers on important monetary policy matters. Starting with three lectures on the history of money, the series progressed into the

history and workings of the Federal Reserve System, and then ended with a capstone lecture by Congressman Paul. While videos of the “Tea Talk” lectures have been on YouTube for a number of months, this anthology publishes the written transcripts for the first time.

Over the years Congressman Paul and Fed Chairman Ben Bernanke have had many lively exchanges at the semiannual Humphrey-Hawkins hearings before the full Committee on Financial Services. Transcripts from the last two years of those exchanges while Dr. Paul was chairman of the DMP Subcommittee are included in the anthology after the “Tea Talks.”

Chairman Paul’s hearings before the Subcommittee on Domestic Monetary Policy conclude the anthology. During Dr. Paul’s tenure, the Subcommittee was more active than it had been in years, holding over a dozen hearings on a wide variety of topics. Reproductions of transcripts in their entirety, witness testimony, and supporting materials from the hearings are provided. Certain hearings in this anthology were bolstered by additional expert submissions—original articles written specifically for inclusion in the anthology by monetary policy experts who were unable to testify before the Subcommittee.

Rep. Paul often jokes that if the American people understood what went on at the Federal Reserve, there would no longer be a Federal Reserve. The editors hope this anthology proves a useful tool in improving the people’s comprehension of monetary policy by serving as a single resource for important information related to monetary policy and the Federal Reserve System. Its length was necessary to give justice to the scope and magnitude of the subject, and to thoroughly illustrate the principles that have guided Rep. Paul’s actions as Chairman of the Subcommittee.

“Thoughts and ideas are not phantoms. They are real things. Although intangible and immaterial, they are factors in bringing about changes in the realm of tangible and material things,” wrote the esteemed Austrian economist Ludwig von Mises. Chairman Paul has dedicated his political life to bringing the ideas of liberty and sound money to the forefront of America’s public discourse. The overwhelming support given by the U.S. House of Representatives in the 112th Congress (by a vote of 327-98) for a full audit of the Federal Reserve is one measure of the strength and power of these ideas.

While the return to sound money will take on-going and resolute endeavors by many, it is hoped this anthology will provide a useful resource for understanding monetary policy and reform to support those efforts.

*P*REFACE

When the 112th Congress convened in January 2011, Congressman Ron Paul became chairman of the U.S. House of Representatives' Committee on Financial Services Subcommittee on Domestic Monetary Policy and Technology (DMP). During Rep. Paul's tenure the jurisdiction of the DMP Subcommittee included: agencies which directly or indirectly affect domestic monetary policy – including the effect of such policy and other financial actions on interest rates, the allocation of credit, and the structure and functioning of domestic financial institutions; financial aid to all sectors and elements within the economy; economic growth and stability; and development of new or alternative forms of currency. This meant the Subcommittee was charged with overseeing the Federal Reserve and the monetary system of the nation.

Over the course of two years as Chairman, Rep. Paul convened thirteen hearings related to monetary policy, monetary reform, and oversight; sponsored seven educational lectures in Congress on monetary policy and the Federal Reserve System; and had four exchanges with the Chairman of the Board of Governors of the Federal Reserve System, Ben S. Bernanke, at the semi-annual Humphrey Hawkins hearing. (Due to Financial Services Committee Rules, Chairman Bernanke could only appear before the full Financial Services Committee, not a Subcommittee.)

History shows that the state of monetary policy is an issue of grave importance to the prosperity of a nation. This is particularly true when a country faces economic panic, as was the case for the United States following the financial crisis of 2008. During Rep. Paul's tenure as DMP Chairman, the Federal Reserve continued to engage in unprecedented monetary policy actions, which subjected the Fed to some of its most vocal criticism in a century of existence. One of the goals of this anthology is to capture for posterity the

debate over the Federal Reserve's actions and to provide greater transparency as to nature of the U.S. monetary system.

The materials in the anthology are broken up into four "books." Book 1 is a brief monetary history of the United States; Book 2 features the content of Congressional lectures by monetary experts sponsored by Chairman Paul on vital components of monetary policy; Book 3 is made up of selected exchanges between Chairman Paul and Fed Chairman Bernanke; and Book 4 concludes the anthology with a compilation of transcripts and other materials from the Subcommittee hearings.

The brief review of monetary history provided in Book 1 is included to illustrate the development of the U.S. monetary system and help the reader better understand the system as intended by the Framers' of the Constitution—and how it has transformed over time to what exists today. By understanding the motivations and actions of those who shaped monetary policy in the past, readers will hopefully have a firm understanding of how America found itself on the road to a centrally managed fiat currency and better appreciate the concerns that were raised as the nation went down this path. Readers are encouraged to examine the "Books and Articles" list at the conclusion of Book 1 to further their monetary history education.

The history primer in Book 1 provides a backdrop for the Congressional monetary lectures in Book 2, in which renowned experts from across the country gave insights into and analysis of the foundations and current structure of monetary policy. The lecture series consisted of seven lectures divided into three themes. Part 1 is titled "The Basic Principles of Money," and illustrates how the basic principles of money are what enable the development of society, how money was defined under the U.S. Constitution, and the role money plays in the fermentation of financial crises. Part 2, titled "The Federal Reserve System," provides a thorough overview of the creation of the Fed, an examination of the central bank's operations, and how its current actions influence the future state of monetary policy. The single lecture in Part 3 was given by Chairman Paul who illustrated the role the Federal Reserve plays in the continued growth of the Federal government.

Book 3 recounts the exchanges between Chairman Paul and Federal Reserve Chairman Ben Bernanke. Taking place over the last two years, these four exchanges provide historical snapshots into the state of the debate over the actions of the Federal Reserve relative to the date of each hearing.

Book 4 contains hearing materials that were originally published in the official hearing records. The hearing topics ranged from

general debates about the impact of central banking on the economy, the Fed's responses to real world events such as the Eurozone crisis, to investigations of possible paths to significant monetary reform. The hearings have been organized topically, rather than chronologically, into three parts: Part 1 examines the consequences of monetary policy, Part 2 explores monetary reform, while Part 3 records the Subcommittee's oversight efforts.

In addition to hearing testimony, several experts who were unable to appear as Subcommittee witnesses were asked to contribute written submissions to be included as part of this anthology. These expert commentaries are placed at the end of the hearing for which their contribution is most relevant.

Additional materials, including studies and reports submitted by witnesses as part of their written testimony; data and other witness responses to Subcommittee Member questions; and published articles submitted by Members for inclusion in the hearing record can be found in the Appendices. A portion of *The Case for Gold*, a minority report co-authored by Rep. Paul as part of the 1982 Gold Commission is contained in Appendix A.

*I*NTRODUCTION

My interest in the world of politics began in large part on Sunday, August 15, 1971. For decades, I, like all Americans, had lived in a country where it was illegal to own gold. The idea probably seems preposterous today, but there was a time when the government seized all the citizens' gold and declared gold illegal to own. From that point on, even the paper currency in circulation was no longer backed by gold. Then, on a Sunday in 1971, President Nixon severed the last remaining link that Americans had to gold as money: he closed the international gold window, which allowed foreign governments to exchange 35 paper dollars for one ounce of gold. That was the last day that money had any value apart from the will of government. And nobody seemed to care.

I was very concerned about the government's mishandling of money and what it meant for the U.S. economy and for our freedom. I started looking for ways to restore sound money to the people, or at least allow them to legally own gold again. As I became more involved in trying to legalize gold ownership, I had the opportunity to meet some of the world's most eminent free market economists, including Ludwig von Mises, Friedrich von Hayek, and Murray Rothbard. Being able to meet and learn from such brilliant minds was enlightening not just in terms of learning sound economic theory, but also in learning how to spread that message to the American people.

When my local Congressman stepped down in the middle of his term, I decided to run for his seat, thinking that the worst that could happen was that I would win. As luck would have it, I did win that special election, and won three more terms starting in 1978, at a time when America was facing high inflation, high interest rates, and high unemployment. It had not even taken a decade for the entirely unbacked fiat paper dollar Nixon created to wreak serious economic havoc. Americans were searching for answers, wondering why the economic system that had been touted as bringing economic growth

and liberation from the strictures of gold was now responsible for the most severe and longest-lasting economic crisis since the Great Depression.

From the very beginning of my service as a Congressman, I sought to use my office as an educational platform to make Americans aware of the intrusions and depredations of the federal government. Monetary policy had always been an issue that deeply concerned me because of the importance of sound money to a free society. My involvement with the Austrian School of economics reinforced the importance of sound money, as the Austrian theory of the business cycle – the booms and busts in the economy – accurately explained the disastrous consequences of unsound, fiat money; consequences from which we were actually suffering. And so I tried to educate the American people about monetary matters.

During my first few years in Congress, I served as a member of the House Banking Committee as well as a member of the U.S. Gold Commission, where I shared my rather unpopular Austrian perspective on the state of our money. As a member of the Banking Committee (which has since become the Financial Services Committee), I sought to bring light to the Federal Reserve System and the destructive effects that its monetary policy was having on the dollar and on the standard of living of the American people. As a member of the Gold Commission, I supported returning to the use of gold as currency. Along with Lew Lehrman, I submitted the Commission's minority report, a dissent from the majority opinion which had affirmed the status quo. This report was later published in book form as *The Case for Gold*.

After a long hiatus, I returned to Congress in 1997 and rejoined the Banking Committee, finally acceding to the chairmanship of the Domestic Monetary Policy Subcommittee (DMP) in 2011—the subcommittee with jurisdiction over the Federal Reserve and the nation's money. Chairmanship of that subcommittee was the only position in Washington I had ever wanted, and for many years it seemed that I would never achieve it. When I returned to Congress in 1997, my previous terms of service were not accepted towards my seniority, and so I had to start all over again at the bottom of the heap. Then every time that I seemed to be in line for the chairmanship, something came up and denied me. One time it was a more senior member joining the committee, another time two subcommittees being merged, but the result was always that I ended up excluded from consideration. It was not until 2007, when Spencer Bachus took over as ranking member of the full committee, that I once again became ranking member of the Domestic and

International Monetary Policy Subcommittee (I had previously been ranking member of the equivalent subcommittee in the early 1980s). When Mr. Bachus became Chairman of the Financial Services Committee in the 112th Congress, despite opposition from leadership, he allowed me for the first time to chair the DMP subcommittee.

There are some who have expectations that a single Congressman can single-handedly stop unconstitutional legislation or fix all that is wrong in Washington. When I became chairman of DMP there were probably many who expected that I would somehow stop the Federal Reserve's loose monetary policy and bring the Fed to heel. I wish I could. The reality, though, is that a single Congressman, a subcommittee chairman, even a committee chairman, by himself can do little to move Congress in a direction that it neither understands nor finds politically palatable. It takes numbers to achieve legislative success, and the numbers are not behind sound money. Instead of focusing on what is good for the country, too often members of Congress are more concerned with scoring political points, managing their public image, or maintaining their good standing with party leadership. Because of this state of affairs, I realized that a single Congressman could do very little legislatively to advance the cause of liberty. Even holding the chairmanship of DMP, the subcommittee with power over the Federal Reserve, would afford little opportunity to actually rein in the Fed, when the House is stacked against us, so to speak.

What the chairmanship of DMP did allow me to do is something I have always thought to be necessary in everything I have tried to do: educate. As you examine this anthology, you will find that a main focus of my tenure as Chairman was on education. It is impossible to talk about reform when people know nothing about the system that is to be changed or the options for changing it. So we attempted to bring light to the important issues of money that had not been discussed in the halls of Congress for decades.

In our hearings we examined the problems with the current monetary system; the relationship between the Federal Reserve and government debt; the negative impact of easy money on the economy; the creation of the boom and bust cycle; and the suffering caused by the false prosperity of cheap credit. We examined the problems of our fractional reserve banking system, the impediments to sound money emerging from the marketplace, and even the abolition of the Federal Reserve. Through my congressional office we brought in speakers to lecture staffers from other congressional offices on the history and

politics of money—lectures which have now been viewed by hundreds of thousands on YouTube.

Even with this focus on education, the Subcommittee did not neglect its oversight duty. We managed to conduct more oversight in one Congress than in the three previous Congresses combined. We held hearings about the Fed's actions during the financial crisis, its uncollateralized swap lines with foreign central banks, and explored the status of U.S. government gold holdings—consisting mostly of the gold seized from the American citizens when gold ownership was outlawed. (Our inquiries seem to have prompted the U.S. Mint to undertake an audit of the gold held at the Federal Reserve Bank of New York, which has not been done since the gold was first placed into that vault many decades ago.

Of course, there is much more that might have been endeavored but could not, given our limited time and resources. For that there will always be some regret. But what we were able to accomplish we have tried to comprehensively compile into this anthology. This book will hopefully provide a useful resource to the sound money movement for many years to come, and assist the progress toward monetary reform and the restoration of sound money to the American people.

Noble Laureate Friedrich Hayek said that “...all those who wish to stop the drift toward increasing government control should concentrate their effort on monetary policy.” Through my time in Congress, my brief chairmanship of DMP, and my various other ventures, I have always sought to follow this advice. For those endeavoring to do the same, I commend to you the resources contained herein.

A BRIEF MONETARY HISTORY
OF THE UNITED STATES

A BRIEF MONETARY HISTORY OF THE UNITED STATES

*“Those who cannot remember the past
are condemned to repeat it.”
- George Santayana*

I. INTRODUCTION

To avoid repeating the mistakes of the past and to provide for a more prosperous future, the lessons of history must be both explored and understood. This is no less true for something used in everyday life: money. The present monetary regime did not appear overnight. Rather, it is the result of centuries of concerted action, much of which has been forgotten by history. The following pages are intended to provide the reader with a brief yet relatively comprehensive introduction to the history of money and monetary policy in the United States from the late-18th century to the present. While not an all-inclusive look at American monetary history, this section covers the main historical events that have led to the current U.S. monetary system. If America seeks to achieve a sound and stable economy, it is necessary to examine the history of money in the United States and its evolution over time.

Money as a medium of exchange is what allows civilization to flourish; there is no surer way to erode civilized society than to debase currency and destroy the institution of money. Money and credit allow for the vitally important functioning of markets, since nearly all economic transactions have goods or services on one side and money or credit on the other. As such, money literally comprises one half of most economic transactions.

Money is not just a medium of exchange, however; just as important are its roles as a store of value and a unit of account. Creating new money reduces the value of existing money, lowers its purchasing power, and slowly siphons real wealth from the middle class and the poor to those fortunate few who are closest to the federal government or the power brokers of Wall Street, the levers of money creation. Even the economic calculation enabled by money is skewed when the value of the unit of account is constantly diminishing. Artificially influencing the price of money has real effects throughout the economy, distorting the economy's capital

structure, causing the all too familiar boom and bust of the business cycle, and enhancing the influence of government.

It is for this reason that Nobel laureate Friedrich von Hayek stated that:

Inflation is probably the most important single factor in that vicious circle wherein one kind of government action makes more and more government control necessary. For this reason all those who wish to stop the drift toward increasing government control should concentrate their effort on monetary policy.

The U.S. economy has been beset by crisis after crisis. It is too easy to give credence to those who make the superficial claim that the free market is inherently unstable and that only government firmly at the helm directing economic behavior will result in economic stability. A deeper look reveals that government intervention into and control over money has been the cause of, not the solution to, economic instability.

II. THE EARLY YEARS

Colonial Money and the Continental

During the time of the American colonies the dominant circulating form of money was the Spanish milled dollar. There was no central bank. There was not even a central government mint, as the colonies had been forbidden from operating their own mints, and the export of English coin to the colonies had been prohibited. Due to the global trade in which the colonies engaged, many foreign coins made their way into the thriving and prosperous colonial economies, the most numerous coins being the Spanish milled dollars. The favorable reputation of the dollar was due to its long-standing record as a sound, stable currency that had not been subject to government debasement. It was for this reason that the dollar was chosen as the unit of account when the new United States of America was formed under the U.S. Constitution.

The choice of precious metal money for the unit of account was also due to several disastrous experiences with paper money prior to adoption of the Constitution in 1789. In fact, the first government paper money used in the Western world was introduced by the Massachusetts colony in 1690. This paper currency quickly became devalued, as did similar paper currencies that were eventually issued by other colonies. During the Revolutionary War the Continental Congress issued paper money called the "Continental" to help finance

the war effort. However, this paper currency was printed in such large amounts that it quickly became worthless, leading to the adoption of the well-known phrase “not worth a Continental.” As the debasement proceeded apace, merchants were loath to accept the Continental, as it lost value almost immediately after they exchanged their goods for it. Under the Articles of Confederation that preceded the Constitution, the individual States tried to finance their debts by issuing their own paper currencies similar to the Continental. Succumbing to the same temptation to overprint, the States debased their paper money to such an extent that their economies suffered severe turmoil due to inflation.

Because of these problems with paper money, the framers of the Constitution were determined to ensure that neither the federal nor the state governments would be able to resort to monetary debasement through the issuance of paper currency. Article I, Section 10 of the Constitution prohibits the States from coining money, emitting bills of credit (i.e. paper money), or making anything but gold and silver legal tender. The federal government, in Article I, Section 8, is given the power to coin money and regulate its value, but no power to emit bills of credit or to create a legal tender.

Foreign Coinage and the Coinage Act of 1792

It was not until 1792 that Congress passed a coinage act to enable the federal government to begin minting coins of its own. The Coinage Act of 1792 established the dollar as the unit of account, equal to 371.25 grains of pure silver (the same silver content as the circulating Spanish milled dollars, already the predominant market-chosen means of exchange and unit of account).

The Act also established subsidiary copper coinage, as well as gold coins. Unfortunately, the ratio of silver to gold was legally fixed at 15 to 1, a ratio which diverged from the prevailing market trend, which was moving towards a 16 to 1 ratio. Because of this legally-mandated bimetallic ratio, silver became overvalued relative to gold. Gold coins left the United States almost as soon as they were minted, and foreign silver coinage flooded in. Since Congress also attempted to fix the value of foreign coins by giving them a legal tender exchange value in terms of dollars and cents, the foreign coins in circulation faced similar valuation problems. The result was that certain coins were undervalued and others overvalued, leading to the operation of Gresham’s Law.

Gresham's Law states that when one form of money is legally overvalued and one legally undervalued, the legally undervalued currency will disappear from circulation while only the legally overvalued currency will remain. In layman's terms this means that "bad money drives out good." For example, if a coin with 5 grams of silver were valued at 20 cents, while another coin with 6 grams of silver were also valued at 20 cents, the coins with 6 grams of silver would not circulate. People would begin pulling the 6-gram coins from circulation, as their metal content was worth more than their government stated face value.

This is precisely what happened under the bimetallic monetary regime established by the federal government, which did not comport with the relative values of gold and silver on the market—an inherent problem of trying to legally define one monetary unit as two things: a fixed amount of silver and a fixed amount of gold. As a consequence, higher silver content coins (and gold) were exported, hoarded, or melted. At the same time the U.S. (and most other countries) was operating under a system of "free coinage," where anyone could bring gold or silver to the U.S. Mint to be minted into coins at little or no charge. Every ounce of U.S. gold coins would fetch 16 ounces of silver abroad, which silver could be returned to the U.S. and presented to the U.S. Mint for minting into U.S. coins. Fifteen ounces of that silver could be exchanged for an ounce of new gold coins, leaving one ounce of silver as profit for the arbitrageur. Thus the export and melting of the government's overvalued coins became very common.

The changing market ratios of coinage compared to the government's decreed values caused the supply of money in the United States to be quite erratic. While the attempt to create a unified currency was well-intended, fixing the gold-silver ratio rather than allowing the market ratio to predominate caused severe problems with the circulation of gold and silver coins for many decades. Had the federal government allowed the market to determine the exchange value of various coins rather than intervening in the marketplace of money, it is likely that much of the monetary disruption that took place throughout the 19th century could have been avoided.

First and Second Banks of the United States

The First Bank of the United States was established in 1791 as a national central bank. One of the justifications behind the establishment of the Bank was to combat the supposed scarcity of money and to facilitate commerce through the expansion of credit.

The national bank proposal ignored the true cause of specie scarcity, which was the legal overvaluation of one form of money over another. Whenever money was given legal tender status and a fixed legal value, Gresham's Law took hold and gold or silver vanished from circulation. What proponents of central banking really wanted was an enlarged and eased issuance of credit, especially to the federal government, believing that easy credit was the path to economic prosperity.

The establishment of the Bank of the United States was hotly debated. The Jeffersonians argued that because there was no explicit authority for the federal government to create a bank, the establishment of a bank was therefore unconstitutional. The Hamiltonians argued that establishing a bank was an implied power necessary to the functioning of government and therefore justifiable under the Constitution's Necessary and Proper Clause. President Washington sided with the Hamiltonians and signed into law the First Bank of the United States. This was one example of a number of laws passed in the early years of the Republic which tested the restrictions placed upon the federal government by the Constitution.

While the notes of the Bank of the United States were not legal tender, any of its notes payable in gold and silver coin were to be "receivable in all payments to the United States."¹ This meant that the notes the Bank issued would be treated as good as gold in, for example, payment of taxes or customs duties. Government acceptance of this new currency aided its circulation, and the Bank promptly issued millions of dollars worth of new notes. The Bank's note issuance fueled a wave of speculation, a series of bubbles, and drastic increases in prices.

The Bank's charter was only for twenty years and was due to expire on March 4, 1811. A vigorous debate on the charter's renewal occupied Congress. In the end, a bill to renew the Bank's charter failed by a single vote in both the House and Senate, and the Bank's charter expired. Its stock and buildings were purchased by Stephen Girard, who named his newly acquired bank after himself. That bank funded much of the federal government's bond issues during the War of 1812, and survived until its acquisition by Mellon Bank in 1983.

The War of 1812 roiled the country's monetary system, particularly in the aftermath of specie suspension which was initiated in late 1814. Specie suspension meant that banknotes, which were

¹ "An Act to incorporate the subscribers to the Bank of the United States," Section 10. February 25, 1791. Accessed from: <http://memory.loc.gov/cgi-bin/ampage?collId=llsl&fileName=001/llsl001.db&recNum=314>

issued by banks and usually contained a promise to pay the bearer of the note on demand in gold or silver, were no longer required to be redeemed for gold or silver. Freed from the requirement to back their notes with hard money, banks were able to dramatically increase the dollar amount of notes issued. Not surprisingly, this monetary inflation led to continued speculation and price increases.

Proponents of central banking managed in 1816 to pass a law establishing a new Bank of the United States, ostensibly to combat the monetary mischief overtaking the country. Among the provisions of the new law was a ban on this Second Bank of the United States being able to suspend specie redemption; were it to do so, it would be required to compensate noteholders not only with principal, but with interest accruing at the rate of 12 percent per year. This safeguard tacitly acknowledged the role that suspension of specie redemption had played in the monetary turmoil. Within a year of its chartering, however, the Second Bank of the United States struck a deal with state banks, offering them millions of dollars in credit in exchange for the state banks resuming specie redemption, and promising mutual assistance in the event of crisis. In practice, though, mutual assistance meant that the stronger, government-privileged Bank of the United States would stand ready to bail out the weaker state banks, and not vice versa.

Ultimately the Second Bank of the United States followed the same course as the First Bank. It pyramided large amounts of notes on top of a small supply of specie, and its laxity in demanding specie payments from state banks allowed the state banks to pyramid note issue on top of their specie holdings. Because it was forbidden from suspending specie payments on its own notes, the Bank was eventually forced to demand specie from its debtors, brought specie in from abroad, and sharply contracted credit: policies which helped lead to the Panic of 1819. Continuing its monetary inflation into the early 1830s, the Second Bank created another artificial credit boom that eventually burst, causing the Panic of 1837.

During the credit boom, the Bank still faced opposition, predominantly from President Andrew Jackson, who viewed the bank as unconstitutional and corrupt. The Second Bank's charter was good until 1836, but supporters of the Bank decided to push for renewal early, in 1832—to head off Jackson's opposition to renewal by making it an election year issue. The Bank's president, Nicholas Biddle, successfully lobbied for a recharter bill, which passed both Houses of Congress. Despite political opposition, President Jackson vetoed the bill. Rather than hurting him in the election, his anti-Bank platform aided his election to a second term. Without enough votes in Congress

to override the veto, the Bank's federal charter was allowed to lapse and it received a new charter as a Pennsylvania state bank under Biddle's leadership, eventually going under altogether in 1841.

McCulloch v. Maryland

Even though The Second Bank of the United States lasted only twenty years, it played a major role in one of the most important Supreme Court Cases ever decided, *McCulloch v. Maryland* (1819). The state of Maryland attempted to tax the Baltimore branch of the Second Bank of the United States, as it was a bank operating in Maryland that had not been chartered by the Maryland legislature. The Bank's Baltimore branch director refused to pay the tax, and the ensuing court case made it all the way to the Supreme Court, which decided in favor of the Bank.

The major principle ratified by this decision was that of "implied powers." In the Court's opinion, because incidental or implied powers were not expressly prohibited by the Constitution, the federal government was permitted to exercise whatever powers it deemed necessary to carry out its Constitutional functions. This broad interpretation of implied powers and of the Constitution's Necessary and Proper Clause set a dangerous precedent for future Court decisions, particularly in the development of American banking and monetary policy. In the eyes of the Court, *McCulloch* validated the constitutionality of federal government intervention into the banking sector as well as the creation of a federal government-established central bank.

Coinage Acts of 1834, 1837, and 1853

Due to the fact that the market exchange rate between silver and gold rose from 15:1 towards 16:1 after the passage of the Coinage Act of 1792, legally undervalued gold coinage failed to circulate in the United States. In 1834, Congress passed the Coinage Act of 1834, which retained the dollar as 371.25 grains of silver, but devalued the \$10 gold eagle coin from 247.5 to 232 grains of gold. This was later amended by the Coinage Act of 1837 to 232.2 grains of gold, or 23.22 grains of gold per dollar, which was to remain the gold weight of the dollar until 1934.

The immediate result of this legislation establishing a 16.002:1 ratio (slightly higher than the prevailing world market rate) was that gold coinage began to flow into the United States once again. Fortunately, silver was not so undervalued against the world market

rate that it flowed out, and so, both domestic and foreign gold and silver coins once again circulated side by side in the United States.

Discovery of gold in California and the subsequent California Gold Rush of 1849 led to a decrease in the world market value of gold relative to silver, with the silver/gold ratio moving back down towards 15:1. With the government's bimetallic ratio at 16:1, coins (this time silver) began to leave the country since it was now profitable to export and melt them. Silver coinage being the more practical medium of exchange for everyday purchases, economic transactions became more and more difficult. In response, Congress passed the Coinage Act of 1853, which debased the half dollar from 206.25 grains of 90% silver to 192 grains of 90% silver, with quarters and dimes being debased in the same manner. Additionally, silver half dollars, quarters, and dimes were to be legal tender only to a maximum of five dollars, the first time such restrictions had been placed on silver coinage.

The Gold Rush and Private Coinage

In California, coins of any type were scarce. Not only were silver coins hard to come by, but gold coins as well. San Francisco had a U.S. Assay Office, which could qualitatively assess precious metals, but was not allowed to mint coins since it was not a branch of the U.S. Mint. In the absence of an official branch of the Mint, private mints began producing gold coins, often of original design, in denominations ranging from 25 cents to 50 dollars. These coins circulated as needed until the U.S. Mint established its San Francisco branch and began minting operations.

Private coinage was nothing new in the history of the United States, as areas underserved by the U.S. Mint's operations often saw private mints spring up to mint newly mined metal into currency that was badly needed to maintain economic activity. One prominent example was that of Christopher Bechtler in North Carolina, who minted gold coins for years before the U.S. government opened its mints in Charlotte, North Carolina and Dahlonega, Georgia. As long as the market trusted that the coins contained the amount of gold claimed by the minter, the coins circulated at face value. While they were never as widely circulated throughout the country as U.S. or foreign coins, privately-minted coins served a useful and crucial function in those areas facing a shortage of federal or foreign coinage.

III. GOVERNMENT BEGINS TO MONOPOLIZE CURRENCY

Coinage Act of 1857

As the 19th century progressed, the federal government sought to enhance its control over the banking industry and the monetary system. In 1857, Congress passed a coinage act which removed the legal tender status that circulating foreign coinage had until then enjoyed. All circulating foreign coins received by the Treasury were to be melted down and recoined. By driving foreign coinage out of circulation, Congress sought to ensure that only U.S. coins circulated, a step towards federal government dominance of the money supply. This was ostensibly to provide a uniform national currency, a stated goal of the federal government since the country's founding. By "uniform national currency" the federal government did not mean adherence to a dollar defined as a specific weight of metal with coinage circulating by weight and valued in relation to that dollar. Instead, the federal government sought to ensure that only the United States Mint's coins would circulate in commerce, regardless of what type of coins the market desired.

A further strike against market choice in currency came in 1864, when Congress passed legislation to prohibit private production of coins. The minting of any coins intended for use as current money was made illegal, even if the coins were of completely original design. This prohibition remains in force today, and was most famously used in recent years to prosecute the creators of the Liberty Dollar.

Legal Tender and National Currency

War often leads to the strengthening of central government, and the Civil War was no exception. In an effort to fund its war efforts, the federal government attempted to raise hundreds of millions of dollars. Facing difficulty in selling its notes and bonds to banks, as well as decreased holdings of specie, Congress in 1862 passed the Legal Tender Act, issuing \$150 million in non-interest-bearing United States Notes. These notes were not backed by specie but had a vague promise to be redeemed at some point in the future. Specie redemption had by this point been suspended, so Congress felt confident that these notes would be accepted. The reverse of the notes was printed with green ink, so the notes came to be known as "greenbacks." The notes were to be accepted as legal tender for all debts, public and private, except for duties on imports, which were required to be paid in specie. This was the first instance in which the

federal government issued unbacked paper money and declared it to be legal tender.

The Legal Tender Act of 1862 was followed by two major National Banking Acts, the National Banking Acts of 1863 and 1864. The system of state banks was much-maligned, and not without reason. Note issue by state banks was required to be backed by state bonds. Banks that needed to issue more banknotes had to buy more state debt. State legislators were only too willing to engage in that symbiotic relationship, with state governments spending into debt without discipline and banks willingly purchasing that debt to back new note issues and inflate the money supply.

For all its drawbacks, however, the state banking system was at least a decentralized banking system that was not controlled by any single entity; as such it was also a system in which banks that made mistakes could fail without taking down the entire system at the same time. The National Banking Acts of 1863 and 1864 attempted to nationalize the banking system and place it completely under federal control, strengthening the federal government's control over the economy and eroding the power of the states. The Acts created a new system of national banks regulated by the newly-created Comptroller of the Currency. Rather than having to back their notes with state debt as state banks did, these banks had to back the creation of notes with U.S. Treasury securities, providing a ready market for the debt the federal government needed to sell in order to fund the Union war effort. The notes, while issued by national banks, would be printed by the Treasury, and thus would further the aim of a unified national currency.

Unfortunately, this did not fix the major problem with the state banking system: note issue required to be backed by government debt. The National Banking Acts merely replicated an already-flawed system, but this time at the national level where its inflationary nature could cause more harm to the economy. In a further attempt to destroy the state banking system, in 1865 Congress assessed a 10 percent tax on state banknotes aiming to force state banks to convert to national charters or leave the banking business. The result was, as intended, a precipitous decline in the number and influence of state banks.

The Greenback Dilemma

In the aftermath of the Civil War, Congress was faced with severe monetary and fiscal problems. The national debt had ballooned in order to fund the war, approaching nearly \$3 billion in late 1865.

Specie redemption was still suspended, and hundreds of millions of dollars worth of greenbacks were outstanding and awaiting redemption. Almost from their inception, and despite government attempts to force them to circulate at par, the greenbacks had depreciated against specie. At one point, greenbacks were circulating at a value of 40 cents to the dollar.

While there were a great mass of people wishing to see the wartime expedient greenbacks retired from circulation and specie redemption resumed, there were quite a few others who wished to continue issuing greenbacks. Throughout history there have always been those who believe that the path to prosperity can be achieved merely through the creation of additional monetary units, and the era following the Civil War was no different.

Proponents of easy money and credit have always heralded the supposed benefits of currency creation, while ignoring the drawbacks. The “Greenbackers” believed that the creation of additional United States Notes would lead to untrammelled economic growth. Among their ranks were found many railroad owners and speculators who knew that the depreciation of the value of the currency, brought about by the creation of additional unbacked fiat paper greenbacks, would steadily depreciate the value of the bonds issued by the railroad companies. Inflation always benefits debtors since they are able to pay their debts with devalued currency. In this way inflation acts as a form of wealth distribution, siphoning wealth from creditors to debtors.

Legal Tender Cases

The government understood the need to return to specie redemption, but was loath to let go of its issue of greenbacks. After all, greenbacks were an interest-free form of debt that circulated as money and could be used to pay off creditors, thus saving the government from having to use its valuable gold and silver. However, from the very inception of the Legal Tender Act, the constitutionality of legal tender paper currency had been called into question. That question was finally resolved after the decisions handed down in a series of Supreme Court cases known as the Legal Tender Cases.

In 1870 the Supreme Court ruled in *Hepburn v. Griswold* that Congress’ bestowal of legal tender status upon greenbacks was unconstitutional. In the Court’s opinion, the Constitution did not grant the Congress power to declare paper notes, the greenbacks, legal tender for all debts, although the case itself dealt specifically

with debts pre-existing the passage of the Legal Tender Act. The following year, after two new pro-greenback Justices had been appointed, the Court in two separate cases, *Knox v. Lee* and *Parker v. Davis*, overturned the *Hepburn* decision and declared that Congress did in fact have the power to declare paper money to be legal tender for *all* debts. Relying heavily on Chief Justice Marshall's arguments in *McCulloch v. Maryland*, the Court in *Knox* and *Parker* ruled that the federal government had broad implied powers to provide a national currency, including the right to make bills of credit legal tender. Finally, in 1884 the Court in *Juilliard v. Greenman* once again reaffirmed the constitutionality of fiat paper money, citing the precedents not only of *Knox* and *Parker*, but also of *McCulloch*.

The Supreme Court had validated the federal government's ability to issue legal tender paper money in the form of greenback notes. And with no pledge for immediate redemption, Congress essentially had given itself an interest-free loan for as long it wished. While the result of these cases was to ensure the continued existence of greenbacks, political pressure on Congress to resume specie redemption did prevent the supply of greenbacks from increasing.

The "Crime of '73"

Due to a combination of European countries moving to the gold standard and new silver mines being discovered (e.g. the Comstock Lode), monetary demand for silver dropped during the late 1860s and early 1870s. This caused the market price of silver to drop rapidly relative to gold. With the government's legal silver to gold ratio still at 16:1, gold began leaving the country and silver began pouring in. Congress responded to the symptom of the problem, gold outflows and silver inflows, rather than the actual problem, the bimetallic system.

The Coinage Act of 1873 discontinued the minting of silver dollars—the original dollar and unit of account of the United States. In its place, the Act established a one-dollar gold coin as the “unit of value.” The Act suppressed the existing silver dollar and only granted legal tender status to silver subsidiary coinage (half dollars, quarters, and dimes) for sums up to five dollars. A new silver trade dollar was introduced that shared the same legal tender status as the subsidiary coinage, but it was intended primarily for use in commerce with China as opposed to domestic circulation. The Act also specified that silver deposited at the Mint could only be minted into trade dollars or into silver bars, and explicitly banned the free coinage of subsidiary silver coinage. Effectively, the Coinage Act demonetized silver and placed the country on a *de facto* gold standard.

Because of the way in which the Act was passed and the fact that gold was made the basis for the currency with hardly any debate, it was referred to as the “Crime of ’73,” particularly by silver producers and supporters of silver as money. While true that had the United States not eliminated free coinage of silver, gold coins would have, in all likelihood, disappeared from circulation and been exported to Europe and massive amounts of legally overvalued silver coins would have flowed back into the United States, the real problem was not addressed. The existence of the government-mandated silver to gold ratio had once again caused a major upheaval in American monetary policy. Unfortunately, rather than allowing market prices to establish the relative values of gold and silver, the federal government acted with a heavy hand to defend its 16:1 legal bimetallic ratio by demonetizing silver.

The debate among the supporters of gold, silver, and greenbacks over the country’s monetary direction colored much of the political debate of the late 19th century. Popular opinion supported the continued use of silver coinage and so in 1878 Congress passed the Bland-Allison Act, which required the federal government to purchase a minimum amount of silver every month and mint that silver into silver dollars. The Sherman Silver Purchase Act of 1890 mandated an increase in the amount of silver purchased. At the end of the 19th century, the fight amongst the supporters of gold, silver, and paper reached a fever pitch. Gold ultimately triumphed, as Congress passed the Gold Standard Act in 1900, officially placing the country on the gold standard with the dollar defined as 23.22 grains of pure gold. That victory, however, was short-lived.

IV. THE RISE OF THE FED

The Panic of 1907

The year 1907 saw a particularly severe financial panic and recession. The underlying cause of the recession, as in previous instances, can be found in the government’s intervention into banking and monetary affairs. The Treasury Department sought to conduct itself as a central bank, even to the extent of making purchases on the open market to supply liquidity to the financial system. Once the Treasury-created inflation bubble burst, banks began to fail and the stock market plunged. Specie redemption was once again suspended, leading to runs on banks.

In the aftermath of the panic, calls for reform of the monetary and banking systems intensified. The nascent central bank movement acted with renewed vigor in its attempt to create a central bank. The Aldrich-Vreeland Act, passed in 1908, established a National Monetary Commission, which ostensibly sought to examine possible reforms to the American banking system. Like many commissions established by Congress, its conclusions were pre-ordained. It was intended to solicit expert opinions in favor of central banking in order to convince the public of the necessity of creating a central bank. The commission surveyed the banking systems of the United States, Canada, Mexico, and many European countries, eventually recommending the creation and formation of a national reserve association, similar in structure to what eventually became the Federal Reserve System.

Creation of the Federal Reserve System

Led by Senator Nelson Aldrich, a group of influential Wall Street bankers met at Jekyll Island, Georgia, in late 1910 to develop plans for the creation of the Federal Reserve System. Great pains were taken to conceal the purpose of the meeting and the identities of its participants from the press while the plan for a new central bank was conceived. One part of the plan was to influence popular and elite opinion through a series of articles, conferences, and speeches in favor of central banking. By the time the Federal Reserve Act was passed in December of 1913, the overwhelming consensus within the banking community favored the establishment of a central bank.

Bankers hoped that with the establishment of a central bank, panics could be averted. They hoped that the central bank would create a more “elastic” money supply, allowing the supply of money to expand and contract with seasonal and other demand fluctuations. In addition, they hoped for the central bank to be a lender of last resort in the event that banks found themselves unable to make good on their obligations. While private clearinghouse associations existed to perform lender of last resort functions, they often lent at penalty rates in order to discourage banks from making regular recourse to loans from the clearinghouse. The creation of a central bank, it was hoped, would allow banks to take out loans at lower rates and with friendlier terms when they got into trouble.

The Federal Reserve's Inflationary Character

Commencing operation not long after the outbreak of World War I, the Federal Reserve almost immediately started expanding the money supply. Just as the creation of the Banks of the United States and the passage of the National Banking Acts were intended to spur the purchases of government bonds, the Federal Reserve was involved from the outset in accommodating purchases of Treasury bonds for the war effort. Through special discount rates, easing of reserve requirements on the banks within the Reserve System, and other policies, the Federal Reserve grew the money supply to unprecedented levels. The cost of the war to the United States was immense, and the Fed's inflationary monetary policy to help pay for the war resulted in a near-doubling of the domestic price index by 1920.

Depression of 1920-21

The Depression of 1920-21 is sometimes referred to as the "Forgotten Depression." As a result of the policies both of the Federal Reserve and the federal government, the federal government's debt level was enormous, and prices were rising at a rate of nearly 20 percent per year. The federal government responded to the end of the war by slashing its budget 65 percent from FY1919 to FY1920, while the Federal Reserve raised its discount rate. The drop in the monetary base and the overall contraction of credit were more severe than during the Great Depression, yet the Depression of 1920-21 only lasted about a year before the country pulled out of it. The federal government continued to slash its budget even further, and engaged in no intervention into the markets to combat the ensuing depression or its effects. The result was that the economy rebounded and recovered very quickly.

In the aftermath of the Depression of 1920-21, the Federal Reserve decided on a program of price stability. While price stability sounds innocuous at first, it really means a policy of subtle inflation. The general prices of goods have a natural tendency to decrease over time if the monetary unit remains stable. (A prime example from modern times is the decline in the price of computers.) When new goods or technologies are first introduced they are often expensive, but as technology improves and production increases, the price decreases. This natural tendency for prices to fall should lead to a gently decreasing price level. As time progresses and the price level

falls, the purchasing power of each unit of currency increases. Increased production thus leads to an increased standard of living.

While industrial production increased throughout the 1920s², the Federal Reserve counteracted what would have been a naturally falling price level by adherence to its policy of price stability. Prices remained relatively stable throughout the decade, since the Fed would not allow prices to fall as low as they would have in an unhampered market. In fact, the money supply increased 61 percent from 1921 to 1929³ and yet the price level remained relatively constant throughout that same period.⁴ The freeing up of resources due to reduced government expenditures and the increased use of newer methods of manufacturing allowed industry and markets to expand throughout the 1920s. But the benefits of lower prices through increased production and efficiency were masked by the Fed's inflation of the money supply, which artificially propped up prices.

The Great Depression

The Federal Reserve's monetary inflation throughout the mid- to late-1920s resulted, not surprisingly, in the Great Depression. As with any credit-induced economic boom, the newly created credit caused a distortion in the allocation of resources. Instead of economic growth resulting from increased real savings and investment, the boom of the 1920s was caused by an artificial increase of credit in the banking system by the Federal Reserve.

Whereas savings-induced growth aligns consumers' present and future preferences, credit-induced growth does not. An artificial increase in credit allows banks to make more loans to businesses, and these increased loans signal to businesses that consumers are saving more in the present in order to consume more in the future. Businesses begin to undertake longer-term, more capital-intensive projects which, once they are finished, they find to be unsustainable because consumers either do not actually want them or cannot afford them because they have not saved enough money to purchase the goods. These resources have been malinvested, or invested badly, into sectors of the economy that do not actually serve the needs and wants of consumers. And it is not just one or two businesses which find

² <http://research.stlouisfed.org/fred2/data/INDPRO.txt>

³ Rothbard, *America's Great Depression*, p. 92

⁴ <http://research.stlouisfed.org/fred2/data/CPIAUCNS.txt>

themselves in such straits, but a whole slew of businesses, often across many different sectors of the economy.

The way out of a crisis had traditionally been to allow these malinvested resources to liquidate. Bad debts had to be liquidated so that prices could fall in order for markets to clear. In doing so, resources that were malinvested would be shifted to be used productively in other sectors. This was what was done during the Depression of 1920-21, in which President Harding refused to allow any sort of intervention by the federal government to alleviate the crisis. As we have seen, that crisis, although quite sharp, came to a quick end as the economy rebounded and returned to normal.

The federal government's response during the Great Depression was completely the reverse of its behavior during 1920-21. President Hoover was determined not to allow bad debts to liquidate, and intervened into the economy on a scale never before seen in American history. In the aftermath of the stock market crash of 1929, Hoover called a series of conferences with industrial leaders and induced them not to reduce wage rates; he introduced a series of farm subsidies to keep the prices of various agricultural commodities artificially high; and he began a series of public works projects. The Federal Reserve increased its purchases of government securities, increased the amount of credit available to the banking system, and lowered its discount rate, keeping poorly-run banks from going under.

Not surprisingly, none of Hoover's or the Fed's policies alleviated the Depression; in fact, they made it worse. Unemployment continued to rise and economic production continued to fall. Passage of the Smoot-Hawley Tariff Act put a damper on international trade and helped to contribute to the economic problems facing Europe. And while private spending continued to decrease, tax rates increased and government spending rose significantly as a percentage of total economic output. Contrary to popular belief, government interventions of the New Deal type originated not with President Franklin Delano Roosevelt, but with Hoover. FDR merely enlarged and expanded upon Hoover's intervention through the programs which came to be known as the New Deal. These programs, too, failed to achieve their intended aim, and the burdens they placed on American taxpayers and American businesses only prolonged the duration of the Depression.

Gold Confiscation

The worsening economic situation led to a fall in confidence in the dollar, as Americans pulled their money out of banks in droves. In response, state governments began to institute bank holidays, forcibly closing banks in order to keep depositors from withdrawing their money. Just after taking office in 1933, President Roosevelt pushed through Congress the Emergency Banking Act of 1933, which ordered a federal bank holiday and also granted the Secretary of the Treasury the authority to order any individual or corporation to turn over any gold under their control to the Treasury.

Less than a month after the bank holiday, Roosevelt issued Executive Order 6102, ostensibly to prevent the hoarding of gold coin and gold bullion. This order made it illegal for any individual, partnership, or corporation to hold gold coins, gold bullion, or gold certificates, with limited exceptions. All gold coin, gold bullion, and gold certificates were to be turned over to the Federal Reserve or to member banks of the Federal Reserve System. From this point on, the United States was no longer on the gold standard. Citizens could no longer redeem their notes for gold, only for silver coins or other notes. It was not until 1975 that gold ownership was once again legalized in the United States.

In 1934, Congress enacted the Gold Reserve Act, which transferred all title of Federal Reserve-held gold to the U.S. Treasury. Almost immediately the government redefined the value of the dollar from \$20.67 per ounce to \$35 per ounce, massively increasing the amount of dollars the government could issue while devaluing the purchasing power of the citizenry's dollar holdings.

The Gold Standard vs. The Gold-Exchange Standard

In some circles, the existence of the gold standard is blamed for exacerbating the Great Depression. Yet since World War I the world had not been on the same international gold standard as existed during the century preceding the war. Instead, there existed a system called the gold-exchange standard, in which international balance of payment settlements were settled with gold-backed national currencies (in particular the British pound sterling) rather than actual gold.

The primary force behind the adoption of the gold-exchange standard after World War I was the United Kingdom. The U.K. had decided to return to the gold standard at the pre-war level of parity. Before the war the pound had been defined as a weight of gold that

made it worth roughly \$4.86. Inflation during the war drove down the pound to where it was only worth around \$3.50. Despite the fact that the currency had been devalued, the British government was determined to return to the gold standard at the pre-war exchange rate.

In order to do so, the British government had to convince other governments to return their currencies to their pre-war rates as well, while at the same time discouraging gold redemption of pounds because the British government did not have enough gold to back up all the new money that had been created during the war. And by also making British notes redeemable only in gold bullion rather than gold coin, the British government ensured that the only conversion of notes into gold would come from foreign governments and not from individuals. Furthermore, the British government would also redeem its pounds in dollars, and in fact preferred to do so in order to conserve its gold balances. Other countries were willing to accept dollars because they knew that the dollar was entirely backed by gold. This led to an international monetary system in which the dollar joined the pound as one of the premier currencies of international exchange because the dollar was “as good as gold.”

As long as no other countries sought to redeem their pounds for gold, the system functioned more or less smoothly. Unfortunately, once the British government was freed from the discipline of having to redeem its pounds for gold, it began to inflate its currency yet again. Eventually the system broke down as the worsening banking crisis in Europe in 1931 caused the U.K.’s international creditors to seek to redeem their pounds for gold, resulting in the U.K. leaving the gold standard for good.

V. THE DOLLAR REIGNS SUPREME

Bretton Woods and Gold

In the aftermath of World War II, the United States cemented its position as the world’s largest and most powerful economy. The new international monetary order created at Bretton Woods, New Hampshire in 1946 was based in part on the gold-exchange standard of the 1920s, only with the dollar as the sole international reserve currency—since it was as good as gold. All countries tied their currencies to the dollar at fixed exchange rates, with the dollar being defined as FDR had left it, at 1/35 ounce of gold (i.e. \$35 per ounce of gold). While individuals in the United States were still unable to own

gold or to redeem their dollars for gold, foreign governments were able to cash in their dollars to the U.S. government and receive gold in return, a process that became known as the “gold window.” While the United States would pyramid its dollar issue on top of its gold reserves, other countries were supposed to hold dollars, and not gold, as their primary foreign exchange holdings.

Just like the gold-exchange standard of the 1920s, the system would work as long as everyone cooperated. Unfortunately, the temptation to print more money was too great for the United States to withstand; just as the U.K. did in the 1920s, the U.S. inflated its currency throughout the 1950s and 1960s. As long as no other countries came to the gold window to exchange their dollars for gold, the United States thought it could reap the benefits of inflation without the negative consequences. Since all other currencies were pegged to the dollar at a fixed exchange rate, inflation of the dollar would overvalue it in relation to other currencies, and other countries would have to purchase dollars to hold them as foreign exchange reserves to keep the pegged exchange rate the Bretton Woods system required. Thus the United States could pursue a beggar-thy-neighbor policy, increasing the amount of dollars in circulation in order to purchase more goods and services while pressuring other countries to hold those dollars and not redeem them for gold.

Gold Outflows of the 1960s

Increasing the amount of dollars, however, led to a decrease in purchasing power of each dollar in circulation. European countries began to realize that the dollar was increasingly losing value, and began to return their dollars to the United States for gold at the defined rate of \$35 per ounce. American gold stocks plummeted, yet the response of American politicians was not to discontinue inflationary monetary policy, but rather to place increased pressure on European countries, particularly France, not to come to the gold window.

The United States sought to collude with other foreign countries in the creation of the London Gold Pool, a mechanism that attempted to maintain the \$35 per ounce market price of gold through targeted buying and selling of gold on the market. This arrangement proved unsuccessful and collapsed in 1968. In its place, the United States and foreign governments sought to create an official two-tiered gold market, with central banks selling gold to each other at \$35 per ounce while the free market gold price was free to fluctuate according to market conditions. As the market gold price very quickly rose above

\$40 per ounce, this created an arbitrage opportunity, as central banks could redeem their dollars for gold at \$35 per ounce and then sell that gold onto the market for an easy profit.

Coinage Act of 1965

At the same time as the U.S. was hemorrhaging gold to Europe, the price of silver was climbing as well. Because of the decline in value of silver during the late 19th century, silver dimes, quarters, and half dollars had long had a face value far in excess of their silver value. Silver would have to be worth \$1.29 per ounce in order for the silver content of dimes, quarters, and half dollars to equal its face value. In the Silver Purchase Act of 1946, the U.S. Treasury was authorized to purchase silver at \$0.905 per ounce and to sell it at \$0.91 per ounce.⁵ By the early 1960s, however, the price of silver on world markets had surpassed this level and was moving towards \$1.29 per ounce. Rather than being a large purchaser of silver, the Treasury was now becoming a large seller, and was at risk of selling silver at a great loss.

While government silver sales were suspended in 1961, legislation was passed in 1963 to repeal the silver purchase acts, with the intention of eventually removing silver coinage from circulation. Realizing this, Americans began to hoard silver coins. Congress responded by passing the Coinage Act of 1965, which called for a half dollar containing 40% silver (as opposed to the previous 90%), and quarters and dimes which contained no silver whatsoever. While 1964-dated silver coinage continued to be minted through 1966⁶, and the government publicly claimed that silver coinage would circulate alongside the new clad (copper and nickel) coinage, for all intents and purposes silver coins no longer circulated as money. They were pulled out of circulation almost as soon as they were minted, and millions of coins were melted down in the mid- to late-1960s as the silver price rose above \$1.29 per ounce and it became profitable to melt the coins for their silver content.

Silver certificates continued to be redeemable at the Treasury for silver bullion, but only until June of 1968, after which time the government's promise to redeem the certificates for silver was abrogated. From this point on, circulating coinage in the United States had no precious metal content, and circulating bills had no precious metal backing (since private citizens could not redeem bills

⁵ <http://minerals.usgs.gov/minerals/pubs/commodity/silver/880798.pdf> p. 140.

⁶ http://www.usmint.gov/faqs/circulating_coins/#anchor15

for gold or silver). The domestic system of circulating money was now a completely fiat system.

The 1970s and Stagflation

The continuing outflows of gold throughout the late 1960s and into the early 1970s began to worry the federal government greatly. The Federal Reserve had severely inflated the money supply to accommodate the massive government debts resulting from President Johnson's Great Society programs and from funding the Vietnam War. As the U.S. dollar devalued, redemption demands from France and other foreign countries for gold increased to such an extent that there was a very real threat that the entire gold supply of the United States government might be wiped out. Rather than restraining the inflation of the money supply, President Nixon responded to the gold outflows by announcing the closure of the gold window on August 15, 1971. From that day forward, foreign countries would no longer be able to redeem their dollar holdings for gold. The market price of gold skyrocketed in the aftermath of Nixon's actions, with the monthly average gold price reaching above \$60 per ounce by June of 1972, and \$100 per ounce by May of 1973.⁷

Freed from the limited constraints imposed by the gold-exchange standard of the Bretton Woods system, the Federal Reserve was free to continue inflating the money supply. Economic growth began to stagnate in the early 1970s, while unemployment began to rise and inflation hit double digits. At the time, mainstream economists believed in a tradeoff between unemployment and inflation, thinking that higher inflation rates led to lower unemployment rates, and vice versa. The 1970s saw the first instance of what came to be known as stagflation: the existence of high unemployment and high inflation rates at the same time. Whereas the overall money supply (as measured by M3) had increased by 50% over the five years prior to Nixon's closing of the gold window, the money supply increased by 70% over the next five years, and nearly tripled by 1981.⁸ Unemployment had risen from 3.4% in 1969 to 6.1% by the time Nixon closed the gold window. By 1975 it rose to 9% and, after a modest drop back to 6% in the late 1970s, continued to climb to nearly 11% by 1982.⁹ It was only with the appointment of Paul Volcker as Chairman of the Federal Reserve that the rate of

⁷ http://www.kitco.com/scripts/hist_charts/yearly_graphs.plx

⁸ <http://research.stlouisfed.org/fred2/data/M3SL.txt>

⁹ <http://research.stlouisfed.org/fred2/data/UNRATE.txt>

monetary growth was slowed significantly for a few years, as Volcker allowed the federal funds rate to reach over 20 percent.

The 1980s to the Great Recession

Economic conditions became so bad by the late 1970s that calls to return to the gold standard increased. Congress established a Gold Commission in 1980 to examine the possibility of a return to gold. Although President Reagan was publicly sympathetic to the gold standard, he did not restrain the anti-gold members of his administration. As a result, the Gold Commission was packed with supporters of the existing unbacked fiat monetary system. Despite the Commission's ultimate endorsement of the fiat paper money system, the Commission's work did provide some impetus towards the eventual adoption of legislation to authorize the minting of Gold Eagle coins by the U.S. Mint—the first gold coins minted by the United States since 1933.

While Chairman Volcker's moves to combat inflation temporarily calmed fears, monetary growth began again in earnest after this period, and the three decades since have seen a series of booms and busts. Monetary pumping in the mid-1980s resulted in the stock market crash of 1987 and the ensuing recession, which Chairman Greenspan attempted to paper over with yet more inflation. This led to the dot-com bubble of the late 1990s, the popping of which was countered with even more inflation, leading to the overheated housing market and the financial crisis of 2008-2009, an economic crisis that has been prolonged and papered over by more artificially cheap credit.

Each economic boom has been the result of the Federal Reserve pumping newly created credit into the banking system. Just as in previous economic booms, the expansion of credit by the Federal Reserve leads to malinvestment of resources. Once the malinvestment is discovered, the economy must correct itself. Bad debts must be liquidated, malinvested resources repurposed, etc. Just as in the 1920-21 Depression, allowing the economy to self-correct will remedy the problems caused by the Federal Reserve's monetary intervention.

Unfortunately, just as during the Great Depression, the Federal Reserve over the past 30 years has resorted to credit expansion to counter economic recessions. The seeds of the recession are sown as the Fed lowers the federal funds rate and expands credit in the banking system. When the credit expansion ceases and the

malinvestments are discovered, the Fed tries to solve the problem it created by expanding further, driving the federal funds rate down even lower than during the last economic boom, and sowing the seeds for yet another economic downturn. This cycle continues, resulting in more of the same economic problems. Each boom seems to take the economy to higher and higher heights, and each bust to deeper and longer-lasting lows.

The Fed now finds itself with no room to maneuver in terms of its normal monetary policy actions since it has lowered the federal funds rate to zero, causing real rates actually to be negative. It has resorted to unconventional measures such as quantitative easing to purchase trillions of dollars worth of mortgage-backed securities and newly-issued Treasury debt. With all the talk in Washington about systemically important financial institutions (SIFIs) and how to wind them down in the event that they threaten the stability of the financial system, the one SIFI whose importance is completely ignored is the Federal Reserve. No other organization can be and has been as destructive to the economy as the Federal Reserve System.

VI. THE FUTURE

Monetary policy is the most important, yet also the most ignored, issue facing this country. Congress has abdicated its responsibility for monetary policy to the Federal Reserve, with disastrous results. Now that the recent financial crisis has exposed the malfeasance of the Federal Reserve's monetary policy, more and more Americans are beginning to understand the destructive nature of the Fed's monopoly on money. As prices continue to rise and the value of the dollar continues to fall, the necessity of a return to sound money becomes more evident every day.

However, without a firm understanding of the past, one can neither understand the present nor advance to the future. Far too many people today, both in Washington and outside of it, take our present monetary system as a given. To anyone under the age of 50, Federal Reserve Notes have been the only paper money they have ever known, and coins have always been made of copper, nickel, and other base metals. The idea that our monetary system could be and in fact has been different sounds utterly implausible to most, and so, calls for change too often fall on deaf ears.

Yet it is clear that the current monetary regime has been a complete and utter failure. In fact, the course of American economic history is riddled with economic crises caused by some sort of

government intervention into money and banking. Almost from the beginning of the republic the federal government sought to exert control over monetary matters. The history of the 19th and 20th centuries demonstrates this slow, steady, methodical march towards government control over money.

Just in the last 100 years, since the Federal Reserve's creation in 1913, the dollar has lost 96% of its value according to the government's own statistics, and nearly 99% of its value when compared to gold. The U.S. has seen a cycle of booms and busts that seem to be getting larger and more severe with each passing. This latest business cycle has been one of the worst financial crises the nation has ever faced, one which shows no signs of abating. And because of the Federal Reserve's insistence on creating ever more money and credit, it is only sowing the seeds for another, even worse financial crisis. Will that crisis be the depression to end all depressions, the final bust that utterly destroys the economy? One can only hope not. But one thing is certain: the monetary and banking system of this country needs a major overhaul.

There are many within the financial and political establishment who see nothing wrong with the current monetary regime, and who in fact want to give the Federal Reserve even more power. There are others who seek a more tightly-controlled and regulated international monetary framework or even a single world currency. There are even those whose sympathies towards gold cause them to advocate for a return to gold-backed currency, albeit through a system closer to that of the 1920s gold-exchange standard or Bretton Woods than a true gold standard.

But at least the monetary issue is gaining some exposure. The Republican Party recently embraced a gold commission in its party platform, Forbes magazine has called for serious consideration of a gold standard, and even former Federal Reserve Board governors are beginning to question the wisdom of the Federal Reserve's monopoly on currency creation. Most importantly, the young people of today understand what the Fed is doing. Quantitative easing and the destruction of the dollar inherent in the Fed's response to the economic crisis is destroying savers and imperiling the economic future of millions of young Americans. More than any other generation before, this current generation understands that we need to end the Fed's monopoly on money and return to a sound monetary system.

In the end, however, the only successful monetary system is one that allows the market for money to function free of government

interference. Despite the earliest attempts at centralization, such a system existed and, government meddling to the contrary notwithstanding, thrived during the first three-quarters of a century of the United States' existence. Our present situation affords both hindsight and the means to avoid the mistakes of the past by relying on advances in technology that have made it far easier to do business in foreign currencies, precious metals, and other non-dollar forms of payment. It is past time that we draw the correct lessons from our monetary history and roll back the tide of government intervention.

Book Two

MONETARY LECTURE SERIES

PART 1.

THE BASIC PRINCIPLES OF MONEY

I. WHAT IS MONEY?

JOSEPH T. SALERNO, PH.D.¹⁰
PROFESSOR OF ECONOMICS
LUBIN SCHOOL OF BUSINESS
PACE UNIVERSITY

MODERATOR: Good afternoon ladies and gentlemen. I'm Lydia Mashburn, Chairman Ron Paul's Policy Director for his Subcommittee on Domestic Monetary Policy. On behalf of Congressman Ron Paul and his office I welcome you to the first in our three part afternoon tea lecture series on the basic principles of money. Thank you for coming.

Today's question, "What Is Money?" is a simple one, but a rarely asked question and as such not properly understood. Understanding money as a market phenomenon versus understanding it as a government phenomenon is crucial to understanding our economy in general and understanding crises that we have faced in the past few years.

To help us answer this question of "What is Money?" we have joining us today Dr. Joseph Salerno, who is a professor of economics at Pace University. He is also the Academic Vice President of the Mises Institute in Auburn, Alabama, and he is the author of the book *Money, Sound and Unsound*. He will speak for about 35 to 40 minutes followed by Q & A. Without further ado please join me in welcoming Professor Salerno.

SALERNO: Thank you, Lydia. And thanks for all being here, it's a great turnout. And I'm thrilled to be here.

As Lydia pointed out, what I want to do is address a deceptively simple question, the question of "What is Money?" We all use it every day. It's part of our daily lives. But if you examine it a little bit more closely, if you think about why you would accept for maybe a house that you're selling or your very valuable labor time, little pieces of paper with green ink on them, that – the materials in which cost about four cents – that might puzzle you. Because you have no intention to use these notes, or paper tickets, directly, right? You can't eat them. You can't use them as wallpaper – well, you could use

¹⁰ [The video of the lecture may be found at:
http://www.youtube.com/watch?v=vowbrq_g5NM.]

them maybe. Maybe a miser would want to lie in his bed at night and fondle them or something. But normal people have no direct use for these pieces of paper.

So, there's a lot of questions that come up when you're talking about money. For example, why are 80 percent of the hundred dollar bills that have been printed in the US outside the country? Being used to finance drugs trade or being used as a hedge against inflation by citizens of other countries with irresponsible monetary systems, things like that which I won't address. But the basic question of why would we accept paper tickets worth very little in exchange for very valuable goods deserves an answer. So, what I want to do is to give you that answer, but that answer has to be given historically.

We want to start from the beginning and that is: what occurred before there was money? If you go back to primitive times, you will find that there were instances of barter. You won't find many of them. Even the ancient Babylonians' first records talk about money, but there was a time before there was money.

And that state of affairs is called barter, where people would exchange things that they intended to use directly to satisfy their wants, for other things that they valued less. So I put up a little model up there [Figure 1].

What I want to point out is that there's an almost insurmountable problem with barter, or a problem that makes it very costly in terms of time and resources to use barter to satisfy your wants. And that is what we call double coincidence of wants.

That term which seems forbidding at first really refers to the fact that: Look, I may want what you have. Or, I may want that pastry that you have. But, you may not want my watch. You may have enough watches. So in this case let's say that A is in desperate need of a pair of shoes and has eggs. So he wants what B has. But B is allergic to eggs, breaks out in hives and so on. Doesn't want to hear about eggs, even the thought of them makes him nauseous. Now, that could be the end of it. He would then have to begin to search – and especially in an area that's not densely populated – for someone else

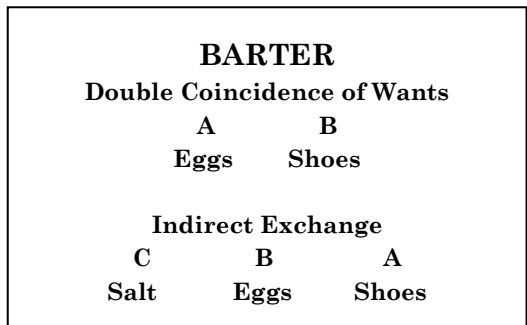

Figure 1

that is capable of producing shoes. But if he was ingenious and persistent, he would hit upon a solution that at first seems more complicated and less likely to achieve his ends, but in fact is much more efficient. And that is indirect exchange.

He may know that everyone in that society uses salt. This is before refrigeration, so people use it to season their foods, but also to preserve their perishable meats, and so on and so forth. And so he knows that there is a wide demand among people who may have many different goods for salt. So what he would do then would be to take his eggs to some person C – there's a lot of C's out there, many people have salt – and find a person who would want his eggs in exchange for salt. But he himself doesn't want the salt.

At that moment in time you have the emergence of indirect exchange, the first step towards money. We don't know when it happened, we don't know what individual discovered that way of solving the problem of barter – the double coincidence of wants – but what we do know is that A would turn around with that salt and use it in or to exchange for the shoes that he initially wanted. Others will see that A solved his problem that way and will then, will begin to emulate him. But the more people use salt for a medium of exchange, the more widely acceptable it is, and therefore the better a medium of exchange it is.

So, as time goes on, salt becomes, in that society, a medium of exchange. Yes, it's still used directly to satisfy certain human wants, but its main use becomes the facilitation of further exchanges. As we'll see then, everyone is permitted to specialize, because whatever they produce, they can always sell it for salt, and then use the salt to buy all the other things they need.

Another problem with barter, very quickly, is if someone has an indivisible good, like a dairy cow, and that person wants clothes, whiskey, shoes, and other things. Well, if he cuts the cow up it loses its value. So how does he buy these different things from different people, without dividing up the cow? Very simply, he takes the cow and sells the cow for salt. He sells it for maybe 15 barrels of salt and then divides the salt up among the other specialists he wants to buy from.

So, these problems are then solved in that way. And we know in history that many useful items were used as media of exchange – the plural of medium of exchange – which means the intermediary good that people buy, not because they want it, but because they want to give it away again in the future for something more valuable. Which is why we hold the dollars. We'll come back to that. Cattle was used

in Greece; leather in Rome; maize or corn in Mexico; wampum – strings of beads that were used by the American Indians, you've heard the story, whether apocryphal or not, that the Dutch purchased Manhattan Island from the Indians for \$26 worth of wampum; dried fish in the Canadian maritime colonies, salt was used and so were iron implements, farming implements in ports of Africa; wives were used in ancient Egypt. Before the advent of capitalism, women were little more than chattel property, so if they were bothering you while you were watching a football game, you could say “You're going to be someone else's wife, tomorrow;” and finally dried tobacco was used in the colonies of Virginia.

So, all these things were used, but a few goods came to be used throughout the world over time, because of the qualities that they embodied as media of exchange. But before I get to those goods, let me just mention that there are some interesting modern examples of money arising in emergency situations. Some of you had economics so you must have heard the story of the German POW camps. American prisoners received rations from their German captors, as well as care packages from the Red Cross during WWII. An American economist happened to be a captive in a POW camp and recorded all of this. And what he found was when people got their care packages and their rations every week or month, there were many things in those packages: chocolate, razor blades, socks, underwear, cigarettes, and so on. But if you've seen old WWII movies, what does everybody do? They all smoke.

What occurred – and this is representative of what actually happened – is that since everyone used cigarettes, eventually people who had too much chocolate and wanted razor blades but couldn't find someone with razor blades who also wanted his chocolate would begin to exchange for cigarettes. So eventually, on each barracks – each prison building – there was posted cigarette prices of the various prison services. So, money emerged. And there was inflation and deflation. As the months wore on people smoked the cigarettes so that prices went down until just a few were in the camp, and then when the new packages arrived, they went up again.

But I found another interesting example in Iraq. There was an article by a former Marine who did a seven month stint in Iraq and he was posted in a number of different farming villages. A lot of wealth had been destroyed, real wealth: houses, cars, trucks, fishing boats, and so on. The people in those villages rightly so, didn't put much trust in the paper money issued by Baghdad and what they did was – they all owned sheep and if you're affluent you owned a whole

herd of sheep, but even the poorer families had some sheep. And what happened was – people began to exchange sheep for other goods and services, and write their contracts in sheep, and repay debts in sheep.

But sheep were very big and valuable in that sort of an economy. So, a second good began to emerge, alongside the sheep. These villages were located near the Euphrates River. The water in the Euphrates was suitable for watering their crops and the sheep, but not for human consumption, so water from the cities was generally purchased and came in big trucks. For smaller purchases, people began to use water, because everyone drank water, especially in the summer. And then, finally, cigarettes – usually smoked at night with a Chai tea by the villagers – were in circulation. So we have three parallel monies, and the paper money wasn't used at all. This was in 2007 that this occurred. So, this is some examples.

As trade between different regions and countries began to develop, as small groups began to trade with other small groups, and we began to get a network of inter-regional and even international trade, during the Middle Ages, a few goods emerged as the general media of exchange.

When we talk about a general medium of exchange, we mean that good that is universally and routinely accepted by everyone without giving it a second thought. And right now the Federal Reserve note is such a good. We don't think twice about accepting Federal Reserve notes, or claims on Federal Reserve notes – which is bank deposits – in exchange for all the goods that we sell or the labor that we sell to our employers. So, it's a medium of exchange in that sense, when people do not think twice about it but simply accept it and pass it on.

The question I asked in the beginning could be answered by pointing out that the reason we accept these pieces of paper is because they have a preexisting purchasing power: You know that people will be willing to accept them at certain prices for different things so that you accept them and pass them on. That happened with gold and silver. So, over centuries an evolutionary process took place in which gold and silver, and to a lesser extent copper, out-competed all other local media of exchange, so that they became the world money.

Now let me just – very quickly – talk about the qualities of a good medium of exchange. First of all – as you saw in the Iraq example – they have to be generally acceptable. They have to be widely used in that society. That's the first quality. It's extremely important. Gold and silver were used in almost all societies and cultures in religious

rituals, for ornamentation, as jewelry, to embroider the dresses and suits of the nobility, so everyone accepted them.

Second, they were also highly durable. Remember, when you accept a medium of exchange, you don't want it to deteriorate overnight. That's why cigarettes for example aren't a good medium of exchange: they're used up in their natural function. Because you want to hold them until you find attractive opportunities on which you want to spend the gold coins or silver coins. Just keep in mind that almost all the gold that was mined when, let's say, Jesus of Nazareth walked the earth, is still in existence today. Even if you go back beyond recorded history: all the gold and silver ever mined is still in existence today, except that which was lost in fire – gold can be melted and lost in a fire – or sunk in ships. So, gold is extremely durable. Ah, but if that's so, why isn't iron a good medium of exchange? Iron did serve as a medium of exchange for a while but was out-competed. It's enormously durable, very highly durable.

Well, there's a third characteristic that's very important, and that is that it must be portable – easy to carry. Now, you could say, “An ounce of iron is just as easy to carry as an ounce of gold.” But the key is: the good must have a high value-to-weight ratio. So, if you wanted to buy a lawnmower at Sears or at Wal-Mart, or something, that cost three hundred dollars, you'd have to bring only a small amount of gold – maybe a fifth of an ounce of gold – but you'd have to bring a ton of iron. So, iron wasn't very portable, because it had a very low value-to-weight ratio, so it was out-competed.

It also must be highly divisible. That you can divide up gold into very small pieces, without them losing any of their value. You cannot do that for example with precious gems, which were used as a medium of exchange. If you break up a diamond into small pieces, it loses its value. So, that's why precious gems were out-competed.

Every unit has to be identical to every other unit. So every ounce of gold ever mined is exactly the same, in all its physical properties, as every other ounce of gold, which we call homogeneous. That's not true of diamonds. In fact, diamonds are precisely desired – especially for engagements, and so on – because no diamond is like any other diamond, like no two snowflakes are exactly the same. When two things are exactly the same it is easy to recognize the value of it. Whereas, when each time it's different, the value of it would have to be appraised at each purchase and that would be highly expensive.

Finally, it has to be easily recognizable. In those old cowboy movies, when a coin was passed in the old West, you'd see a cowboy biting down onto it. Well, the gold leaves teeth marks, because it's

malleable, it's easy to work with. Whereas fool's gold, which looks very much like gold – I don't know which chemical element it is – is very hard. So, there were easy chemical tests which allowed you to quickly and inexpensively find out if you were dealing with a counterfeit or not.

So, the bottom line in all this is that money was not invented. It was not created by the State. There wasn't some wise old king benevolent that said, “My people are suffering from a lack of coincidence of wants and therefore I must get all my wise men together and solve this problem.” And then they got together and said “Yes, we have to use salt!” That's nonsense, that's not the way it happened. Nor was there a big town meeting where all the Virginia colonists got together and made a contract that they would all use dried tobacco leaves as money. That's not the way it happened either.

It happened as the result of a market process, which embodied the actions of millions of people over time, all seeking their own benefit, all seeking to solve the problems of indivisibility and coincidence of wants, and in doing so, motivating others to follow their example so that over time money arose on the market. Government had nothing to do with it. It stepped in much later and actually distorted the monetary system later on.

Let me mention one other thing here, and that is: Could money come into existence as a paper fiat currency? “Fiat” meaning “issued by the State.” “Fiat” is a Latin word for “this must be” or “this is my will,” you will use this paper. No, it couldn't. And the reason why it couldn't is because, if you issued paper ... let's say you trusted me completely despite the fact that I'm from New Jersey and my name ends in a vowel, you still thought I was very trustworthy. So, I came to you and I said, “Look, here's ten Salerno's. Can I have your pen or can I have your watch?” Even if you trusted me you wouldn't accept it, because “What the hell is it worth?” There's no past history. But with gold, silver, salt, iron, there's a past history: there's barter. They were exchanging for other things under barter. So you had an idea of what they were worth. So that's why money must come in existence as a useful market commodity and cannot be imposed from without by the State.

Now, let me just mention some of the benefits of money. First of all and very importantly, it serves as a unit of pricing. It allows you to compare prices against one another. And also as a unit of economic calculation, it allows businesses to calculate their revenues, costs, profits, and losses. In a barter economy, let's say there are only 1,000 goods. That means there are 499,500 prices to keep track of, because

each good has 999 other prices – because each good can potentially be exchanged for each of the other 999 goods. In a money economy, money is always one half of every transaction so if there are 1,000 goods, there's 1,000 prices and not 499,500 prices. That's just 1,000 goods. The average supermarket in the US today has 27,000 items. So there's millions and millions of barter prices for those goods, if they were exchanged against one another. There'll be no way to have a supermarket under barter.

Also under barter: there's very little specialization, that is, people specialized in those things in which they are most productive, which raises our standard of living and the productivity of labor so greatly. And the reason is the following: Let's say I'm an economics professor and I want a Wall Street Journal. Well, how do I get it under barter? There is no money, so I can't sell my services for money. I have to go to the guy and give him a ten-minute economics lecture, or something like that, which he probably doesn't want to hear, so he won't give me the Wall Street Journal anyway. Or, if I want breakfast, I'd have to stand there and talk to the waitress, or whatever. You see the problem.

And there's a third problem. The third problem that money solves is that you can't produce large, durable consumer goods or capital goods, because how is the entrepreneur going to pay the workers? Let's say you're producing cars. Are you going to pay the workers in cars? Are you going to break up the cars and try to pay the workers every two weeks, or something like that? That's impossible. Or, if you're producing something that's not even a consumer good, like oil or steel. Are you going to give them bars of steel or barrels of oil? They don't want that. So, you have a very primitive economy under barter and money solves that problem. Again, no one set out to solve all of those problems, no one set out to invent money. It, again, happened as a result of the interactions of hundreds of millions of individual human minds over time.

So, what is the monetary unit? Money comes into existence as a useful commodity. Most commodities circulate by weight or by volume – ounces of gold, pounds of silver, barrels of salt. Well, money circulates by weight, that is, the unit of money is a unit of weight of a specific commodity. Even when the gold standard in the nineteenth century came into existence – and by then we had names for different national currencies – it was still a unit of weight. Let me just take three different currencies, the British pound, the French franc and the American dollar. They were actually just names for units of weight. Let me give an example of that:

1834 – 1933 \$ 1.00 = 1/20 oz gold

1821 – 1931 £ 1.00 = ¼ oz gold

1806 – 1914 FF 1.00 = 1/100 oz gold

Okay, let's stick with the pound and the dollar. For about a hundred years the dollar was legally defined as about one twentieth of an ounce of gold, that's an approximation. And the British pound was defined from 1821 to 1931, when Britain went off the gold standard, as one fourth of an ounce of gold. They weren't different monies. They were the same money.

Now, the exchange rates for all the 19th century – I was in Austria last week where I was watching the continually changing exchange rates between the euro and the dollar in order to make the most advantageous exchanges from the dollar to the euro and from the euro to the dollar, and it was changing all the time, every day – but for a hundred years it was stable. The exchange rate between dollars and pounds was approximately \$4.86 per pound.

Some people – and many economists – say that under the gold standard we had “fixed exchange rates”, but an exchange rate is a price between two different things. The pound and the dollar during the 19th century were not two different things. They were different weights of the same thing. So it's wrong to say that that is an exchange rate. That is determined, not by the laws of economics, but by the laws of arithmetic. In the same way that the “exchange rate” between a quarter and nickels is 5 to 1. Because a quarter is defined as one fourth, or .25, or 25 cents of a dollar, and the nickel is defined as one twentieth, or .05, or 5 cents of a dollar. Since the quarter refers to five times more of a dollar than does a nickel, five nickels exchange for a quarter.

Well the same is true here: the pound was defined as having approximately five times the amount of gold and therefore was five times more valuable than the dollar: \$4.86 / £1.00. That is not true today. All currencies are different things now because they are issued by different monopolists, different monopoly central banks.

What was the money supply under this, what we call the commodity standard? Money developed as a useful commodity, so we called it commodity money. Today we call money, fiat money, because it's a piece of paper or it could even be this bottle. The government or the US central bank as a legal monopoly that can print money, can put in this space here [points to the label on his water bottle] “ten dollars” or “twenty dollars,” and it would be legal tender. You could

use this eraser, you can use my shirt, it can use anything. It's not necessary to use paper. But under a commodity standard, there was one thing that was the commodity, that was the money and that was the physical commodity itself. So, the money supply was the total quantity of the commodity that was in monetary form, the total amount of gold in the country that was in the form of bars, which is called bullion, or coins. Or even gold dust was used in western towns. Or gold nuggets. So, all of those things constituted the money supply.

Let me talk just a few minutes before I end on, how did the money supply behave under commodity money? Did we have inflation? Did we have deflation? In the case of gold, the only time the money supply increased was when gold was mined. So it increased very slowly over time. Every once in a while it would jump because a new source was discovered, in Australia in the 1870s, in California in 1849, in South Africa in 1896, and so on. Or when a new improved technology for extracting gold was developed. So, there was very little inflation. In fact, there wasn't even inflation. There was a fall in prices.

Since gold and the money supply increased very slowly, the increase in goods and services – real wealth – was faster. And so, as a result what happened was as the supply of goods and services shifted out – there was an increase in the supply of these things – in relation to money – and money is what lies behind the demand for these things – prices actually fell. To take an example, even though the money supply is increased very rapidly and has been increased very rapidly since WWII, we still found that if goods and services in certain sectors of our economy increased more rapidly than the money supply, prices are going to fall, and we are going to benefit from those falling prices.

Take the example of computers. A mainframe computer, produced by IBM in the seventies, cost about three million dollars. A personal computer nowadays costs five hundred dollars, and the PC is faster and has more memory. So, we've had a tremendous drop in prices. Now, did this “deflation” cause any sort of problems in the computer industry? In fact, no. In 1980 there was about a half a million PCs shipped. By 1999, twenty years later – despite the fact that prices had come down from \$20,000 to less than \$1,000 for PCs – you had eleven million or twenty-two times the amount of computers shipped. So, falling prices, when they occur naturally on the market as a result of goods and services being increased due to improvements in technology and in capital that brings about labor productivity, bring about a very benign – what we call – growth deflation.

And that's actually what happened in the 19th century. So, to end up with a few of the statistics: In 1800, it took only 79 cents to purchase what a dollar in 1800 could buy. In 1913 years, the value of one dollar had gone up 27 percent. In other words, what you could buy for a dollar in 1800, cost you only 79 cents to buy in 1913. What you could buy in 1913 for a dollar, the year the Fed came into existence, didn't cost you less, it costs you much more, it costs you 22 dollars today. So, under the commodity standard, the value of the gold dollar went up by about 27 percent, because prices fell very gently.

Under the fiat standard, that is controlled by a central bank, the Federal Reserve System, the value of the dollar has shrunk to about a nickel of what it was worth in 1913, when the Fed was established. Basically, what you've got for all countries on the gold standard during the 19th century was a very slow decline of prices. Which meant that all the fruits of improved technology, of increased investments in machines and other labor productivity increasing type investments, all of those things were spread to the whole population, whether your salary went up or not in money terms. Because prices were coming down, as they have for computers, your dollar became more powerful. So, if you go back to a commodity standard, you'll find that, over time, the value of money would rise.

QUESTIONS & ANSWERS

QUESTION: [inaudible]

SALERNO: Under the gold standard, eventually, the governments began to get involved. They took over monopoly over the mints. They began to debase the coins. They made them lower and lower in weight. The kings would call back the coins to re-coin them. When they had a one full ounce – let's say there was a King Nitwit, who was king of some realm. The first thing he did when he took over the mints was put a name on the face of the coin. And he would charge people a lot of money to get their gold minted into coins. That's called seigniorage. It was a monopoly price for getting your gold coined.

In any case, what would happen then is every once and a while the coins would get worn or a new king would come in and want to put his face on it. So they called the coinage, but instead of giving you a full ounce of gold back, they would only give you eight tenths of an ounce of gold. And they would put the same name on it: one nit. So what they did was in effect was increase the money supply by twenty percent, because they would keep the twenty percent that they stole from the people who were turning in their gold coins and mint them

into their own coins, so that they could pay for more palaces, wars, mistresses, and so on.

Over time, and after the printing press was discovered, they found that an easier way of creating money, that was less costly, was simply to print paper, set up a central bank – the first central bank was set up in that fashion with the Bank of England in 1694 – get the bank to loan them money, to pay for the wars, and so on. And then the bank would promise to pay back the notes that the king spent in gold. So, people got used to paper money over time, but we still had a gold standard.

But, to get to your question, by the 19th century it wasn't a pure commodity standard anymore. So, the central banks would keep maybe 20, 30, or 40 percent of the notes they issued in the form of gold. And then you had private banks beginning to start. And they would hold, not gold itself, or very little gold, but they would hold the notes of the central bank. So, eventually, all the gold which backed up the money became centralized in the central bank. So you had maybe 10 percent backing up – Let's say there was ten million dollars in the economy, then there was only a million dollars worth of gold in the central bank. So that, if everyone came and demanded gold – or even a significant portion of the population, because they didn't trust paper money – the whole system would collapse literally like a house of cards.

So, there were problems under even the gold standard, because the banks could create paper money and lend it out, pushing the interest rate down, and cause inflation to occur. And at that point, when prices went up, people began to buy goods from other countries, where the prices were lower. But other countries didn't want the paper, they wanted gold. At least under the gold standard the central banks would start to lose gold as people turned in their dollars to pay for their imports from China and so on. At that point, everyone would begin to get fearful that they wouldn't get their gold back, so the central banks had to stop inflating.

So the gold standard was called “the golden handcuffs,” because if the banks got too inflationary, gold would start to flow out. The people would see that, the clients of the banks who had deposited their money would see that. They would begin to get nervous, and that would increase the outflow of gold, because people would rush to the banks. To prevent that from happening, they always nipped the inflation in the bud.

After 1933 we went off the gold standard, almost every country did. They tried to reconstruct it after World War II, in 1946. It was

called the Bretton-Woods system, the brainchild of John Maynard Keynes and Harry Dexter White – who turned out to be a Soviet spy. He worked for the US Treasury. That system was a phony gold standard. Normal people, like you or I, or your parents or grandparents, could not redeem our dollars for gold at the stated price of \$35 per ounce. Only the foreign central banks and governments could do that.

But the US continued to inflate to pay for the Vietnam war and then also for the War on Poverty under President Johnson, and as a result of that we began to lose a lot of gold to the rest of the world. Initially people were willing to hold US dollars, because we had most of the gold at the end of World War II. And since our own people couldn't get hold of that gold, they couldn't convert their dollars, the rest of the world said, "There is more than enough gold to accommodate all the outstanding dollars."

But the Fed, to pay for government deficits, created so much money during the 1960s, that – I think that towards the end of the sixties we had twelve billion dollars worth of gold that we had, and foreigners held eighty billion dollars, so that the French under De Gaulle and the Germans wanted to en masse convert their dollars into gold. And we basically blackmailed the Germans, and tried to blackmail the French by basically saying, "We have to remove our nuclear umbrella. We have to stop protecting you from the Soviet Union, if you do this. It's going to cost a lot of money."

In any case, the Germans backed off, the French dropped out of NATO, and at the end of the whole story, we were still losing gold like crazy, so by 1971, when we had about two weeks left of gold, President Nixon – it's forty years this past August, right? – then stepped up to the podium and said, "We're going to close this gold window." So, we reneged on the solemn pledge that we made to the rest of the world in 1946, and the whole thing collapsed. From 1971 on, there was enormous inflation because now there was no more danger of losing any gold.

QUESTION: Would you recommend going back to the gold standard as a commodity based standard, and if so how would you accomplish that?

SALERNO: The answer to the first question is yes. The answer to the second question is, that's very, very difficult. But I think you could accomplish the first few steps in that direction.

A few things that you could do is to allow people to buy and sell gold without any capital gains taxes, without any sales taxes, excise taxes. Remove all the taxes on gold and silver so that now people

could use them if they wanted as a parallel currency. At the same time allow people to hold euro accounts in American banks, and Swiss franc deposits. So, then the American government would be looking at the fact that dollar deposits are losing popularity vis-à-vis these alternative monies. That's one way you could begin to be working back in that direction. And in the meantime stop the inflation.

QUESTION: What about repealing legal tender laws?

SALERNO: You're absolutely right. And repealing legal tender laws. So people could make their contracts in gold or silver, and they would have to repay them in gold or silver. Legal tender allows you to repay any debt you owe in paper money. It forces the creditor to accept the paper money.

QUESTION: Just to single out what he just said. It actually seems that the most common objection to going back to a gold standard is that precious metals is one of the least abundant phenomena in the world today. Is that actually true?

SALERNO: Well, remember, there's not enough of anything in the world to satisfy the human wants for it. That's why we have prices for things. So if the price is right.... In the Soviet Union at the end, even a simple item like toilet paper was in short supply. If you've seen the movie "Moscow on the Hudson," people were lining up to get toilet paper. Because the prices were kept so low. Well, the same thing is true for gold. At some price of gold it will be enough to back the dollar, and so on. And also I think silver would be used in smaller transactions.

QUESTION: So you're saying basically commodity money often goes up in value, becomes more valuable, that's deflation, and fiat money becomes less valuable through inflation. How come a lot of talking heads blame the Japanese recession of the eighties and nineties on deflation?

SALERNO: Because they're confusing depression with deflation. If you look at it, there is a little deflation in the Japanese economy, but the money supply was almost always increasing. You really can't have deflation without a fall in the money supply unless there's a big increase in the demand for money, when people are frightened of the future and want to hold their money – which happened here in the US in 2008 during the financial crisis.

So even though the money supply is going up, the demand to hold the money and not spend it was going up by more. So that can cause prices to fall, but that only happens during crisis situations. For the most part, Japan did what all American economists were urging them to do. They ran big deficits and they increased the money supply. But

they have a very productive economy, so they never really had much of a recession. They had what's called a growth recession – their rate of growth went down. Their economy shrunk only for a few quarters.

So, I would say that main problem with Japan is the fact that its labor markets are extremely rigid, its business organizations are tied into government and aren't flexible. There was actually a very good article about all of this very recently [inaudible] and it had to do with the fact that Japanese companies are looking down on this new firm – I think it's called Uniqlo – which is selling a lot of clothing throughout the world, like a low tech product, and it's looked down on in Japan and people are dismissing it. But the guy who owns it – Yanai – is the second wealthiest man in Japan, now, and he's broken the whole Japanese model. He's hired foreigners and he's poaching – going to other companies trying to bid away good talent – which isn't done. So I think it's the rigidity in the Japanese economy that has a lot of government intervention that really caused that recession. China had falling prices for a long time, and they were growing like crazy, because they're very entrepreneurial.

QUESTION: Is there a lot of money that's owned [inaudible] that they're holding, to still release into the economy and what would happen if we really repatriate money: lower capital gains, decreased regulation and start encouraging money that's being held also flow into the economy. What happens if it comes from both directions?

SALERNO: You're asking a good question. The first part of that question: The Fed has increased what's called the monetary base. That is, the reserves of the banks, and currency. The banks, because of the bad business climate, aren't lending them out to the extent that they could lend those reserves out. They're holding what's called excess reserves. They're allowed to lend out 90 percent of all their deposits, but they're not doing that.

So, you're right, if things pick up and that money is lent out – and also by the way, they're discouraged from doing that because the Fed is paying them a quarter of a percent on holding that money at the Fed rather than lending it – that could cause an enormous inflation. But the way the Fed could offset that is try to begin to sell off some of its assets that it has purchased in mortgage backed securities, and so on, and begin to absorb those extra dollars from the banking system. Because when it sells things to the banking system, the banks have to pay with their own reserves. So that's a question what the Fed will do and I think it will try to prevent that sort of an inflation.

The other part of your question is people themselves holding money, investors, and not investing. Because they're fearful of the

potential cost of Obamacare, what is going to happen with taxes as a result of the trillion dollar deficits we keep racking up, and all of those questions. That kind of spending is good for the economy. In other words, then people will begin to be taking risks to invest in actually producing goods and services. And that will actually cause prices to fall, all other things equal.

QUESTION: Milton Friedman blamed the lack of action on the part of the Federal Reserve as one of the causes of the Great Depression. If we'd taken away the Fed's ability to expand the money supply, how would we've ever gotten out of the Great Depression?

SALERNO: If we had taken it away before that, we would've never had a Great Depression. I don't mean to be flip, but the point is during the 1920s the Fed expanded the money supply at between six and seven percent per year. Most – all – of American economists believed the true indicator of inflation was consumer prices. Whereas the Austrian economists who observed America – and came to America such as Hayek, the Nobel prize winner, and Mises, in Austria – they pointed out that the American economy was growing tremendously during the 1920s.

We had electricity now coming into general use, refrigeration was being developed, cars were being mass produced after World War I, so there was tremendous industrial activity. Prices should have actually fallen a great deal every year, but prices didn't change. Between 1921 and 1928 prices stayed about the same when they should have come down tremendously. What caused prices to stay up? Inflation.

The Fed was inflating the money supply, the money was being lent out to the banks, pushing interest rates down, causing people to speculate on the stock market and drive up real estate prices. So, my response to Friedman would be that had they not had that power, prices would have naturally fallen, as they did during the 1880s and 1890s, and we wouldn't have had a crash that led to the Depression.

And the reason why it was extended – and this will be talked about in another lecture – was that there was a lot of legislation that prevented prices and wages from falling to meet the fact that... Look, people didn't want to spend during the Depression, they were afraid of the future. So, yes, there was a deflationary pressure, but if the Fed tried to stop that, they would simply reproduce the problem. So that would be my response, it's a very short time period to give you that. But, yeah go ahead.

QUESTION: Are you sure that there aren't times when monetary policy is necessary? Maybe where we did things right but we still get

into a new recession or depression or something like that. What do you propose we do then if we have no access to all those tools?

SALERNO: Again, that's a good question, and I'm not sure how much that confuses depression with deflation. If a depression occurs, that means that the relationships between prices are wrong. That is, costs are too high in relation to selling prices, so businesses don't want to invest. So, by holding up wages and by holding up prices of agricultural commodities and so on during the Great Depression, the New Deal prevented the reestablishment of profitable margins.

So, let's put it this way. Anything that monetary policy can do, you're right, in the short run if you can inject money in the economy to push prices up, so that businessmen believe that there's a profit to be made. But that's only a short run solution, because then costs catch up again. A better approach, a better solution, would be the micro-economic solution. Getting rid of all government legislation such as special privileges to labor unions, minimum wage laws, price support for farm products, that keep costs up.

QUESTION: You said that computers are so much cheaper right now, so are you saying they should be cheaper than that?

SALERNO: Yeah, I would love for them to go down to a nickel. No, I'm serious!

QUESTION: So you would like it if we were still on nickels and cents?

SALERNO: Yeah, very good question. The price of a car was \$350 in 1915 or 1916, right after they started to be mass produced. And maybe they should be that much, or a little bit less, whatever, yeah! I mean prices would be going down, sure. In other words, the actual price doesn't matter. It's always the relationships between prices.

If your salary doubled tomorrow, but prices tripled, you'd be worse off, not better off, right? But if your salary fell by ten percent, but prices fell by fifteen percent, you'd be better off. So you should get away from this illusion of what's happening to the actual height of these nominal prices. It's always the relationships between prices.

QUESTION: [inaudible] At what point do the falling prices become an issue for the producer? We see that in agriculture, today. Let's say potatoes. They produce so much of it; they can't make a living out of producing them anymore.

SALERNO: OK. There's two parts, so two answers. It's a good question. The first part is that in industries that are growing, like computers, costs are coming down, faster than the prices are dropping. That's why the computer industry is expanding even though prices are dropping. So, industries like that you don't have to

worry about. As long as costs are falling, no matter how far prices fall, as long as costs are falling too – and they're producing more, because it's now more profitable – you're going to have growth.

The problem comes with farmers: there are too many farmers. We are supporting inefficient farming. Because, as farming technology develops, some of the smaller farms are unable to take advantage of that and would go out of business – normally, as prices come down. We don't let that happen with all our farm subsidies, and so on. So, that's a market adjustment that needs to happen.

We used to have two hundred years ago maybe 97 percent of the labor force work in farming, and we could barely feed the whole United States. Do you know what proportion is involved in farming today? One and a half percent. So, all those jobs went elsewhere, and that's fine. Because farming labor is so much more productive today, because of capital investment, technological improvement, and so on.

But that doesn't mean that in some cases you're going to have firms going out of business as a result of these low prices. But if those prices are manipulated in any way, that's giving a signal: that look, we have too much farming goods, and not enough other goods.

QUESTION: So, if we didn't have these farming subsidies, there would be no need for a price for it, because there would be less farmers producing less of it.

SALERNO: Right. More efficient farms would expand as these other farms went out of business.

QUESTION: In terms of, if the price of computers could drop to, say, I don't know, maybe \$200 per computer, but right now they're able to and making a decent amount of money charging \$1,000 per computer. Why wouldn't they simply charge still \$1,000 per computer because they could get enough people to buy those computers?

SALERNO: Competition. Because the other guys are going to... The ballpoint pen was first introduced in 1946. It sold for \$25. In today's world that's \$200, eight times as much. People would leave them on their coffee tables, just like you would leave your BMW... just to show that you were affluent. Within two years, the price went from \$25 to eighteen cents, or something like that. And the costs had come to like ten cents. Because of the fierce competition. You could prevent that from happening if you allow patents and crap – stuff like that. But otherwise it's same with computers.

QUESTION: But why wouldn't that competition I mean occur, now as well...?

SALERNO: Competition is occurring.

QUESTION: But why aren't prices lower now?

SALERNO: Because they're as low as costs will permit them to be. If everyone can enter, and no one is entering, that means there's some sort of an equilibrium, right? That that rate of return is what everyone is satisfied with. But if someone finds an even cheaper way of making it, so that they can increase the rate of return to themselves, they'll enter and they'll sell at a slightly lower price and the others will have to adopt that new technology, or go out of business.

Thank you.

MODERATOR: I'd like to thank you all for coming today. Again, this is the first in our three part series. The next one will be occurring in October, the third one in November. October's lecture will be on "What is Constitutional money?" We will be looking at how the Constitution looks at a dollar and what those ramifications are for the economy. And then in November we will be discussing "What about money causes economic crises?" How did we get into this financial mess we're in now? So I hope you will join us for that, details will be coming shortly. Thank you again for coming and please, let's give another round of applause for Dr. Salerno.

★

II. WHAT IS CONSTITUTIONAL MONEY?

EDWIN VIEIRA, JR. J.D., PH.D.¹¹

AUTHOR

*PIECES OF EIGHT:
THE MONETARY POWERS
AND DISABILITIES OF THE
U.S. CONSTITUTION*

MODERATOR: I'm Lydia Mashburn, Policy Director for Chairman Ron Paul's Subcommittee on Domestic Monetary Policy. On behalf of Congressman Ron Paul and his office, welcome to the second in our three part afternoon tea lecture series on the basic principles of money.

Today's question is going to be "What Is Constitutional Money?" This is following up on our first lecture which was "What Is Money?" At that lecture – if you missed it – we had Professor Joe Salerno come and talk about money. Essentially money is a natural market driven phenomenon that satisfies, fulfills the properties of indirect exchange. So money is a commodity.

Throughout history various things have fulfilled the role of money: salt, leather, cattle, and of course silver and gold. So, if money is a naturally occurring market phenomenon, why is it that governments are so involved in money? Which brings us to today's question: "What is constitutional money?"

The Founders had a very particular understanding of money, based on their own historical circumstances and some rather disastrous experiments with money that governments did. Based on this understanding they put in provisions in the Constitution, to help ensure sound money existed throughout our great nation. Unfortunately, those provisions have been either misinterpreted, misunderstood, or completely forgotten. And I'd say today, we've completely forgotten why the Founders put in certain provisions or what their understanding of those provisions was.

So I'm delighted to say that we have to talk to us about constitutional money, Dr. Edwin Vieira, Jr. Dr. Vieira holds four degrees from Harvard, including his J.D. as well as his Ph.D. He is also the author of this lovely work *Pieces of Eight*, this is two

¹¹ [The video of the lecture may be found at:
<http://www.youtube.com/watch?v=k6gMkKmQSW4>.]

volumes, more than 1700 pages, on constitutional money. The full title is *Pieces of Eight: The Monetary Powers and Disabilities of the US Constitution*. To give a sort of a Cliff's Notes version of his magnum opus he will be answering the question "What Is Constitutional Money?" Please join me in welcoming Dr. Ed Vieira.

VIEIRA: Thank you, Lydia. Thank you ladies and gentlemen.

"What Is Constitutional Money?" covers essentially three centuries of American history, so put your seat belts on, we're going to have a very fast flight.

As Lydia pointed out, governments have historically become involved in monetary questions and the reason for that, basically, is redistribution of wealth. Whoever controls the substance and the supply of money at the source, can do a great deal of redistributing wealth, either directly through government expenditures or indirectly through government involvement with the private sector. So keep that in mind as we go through some of these historical principles.

Now, to understand the Constitution one has to do more than simply read it. You have to put yourself in historical context of "We the People" – the people: the Framers, the Founders. You have to put yourself in the political context, the legal context, and in the linguistic context as well. Because there are some terms – terms of art, legal terminology – used at that time which don't quite correspond to the terminology we use today. Or at least, the original meaning has been lost.

Historically, if you go back to the colonial period, the pre-Constitutional period, the Colonies generally speaking had no power and did not claim a power to coin money. There were some desultory attempts in Massachusetts and Virginia, but they mostly fizzled out because that power was one of the prerogatives of the King and was jealously guarded. And if you read Blackstone's *Commentaries on the Laws of England*, which anyone who studies the Constitution should start with, because it puts you in that historical-legal context of Anglo-American law at the time, Blackstone discusses this prerogative of the King, which was essentially to take a standard – the pound-sterling was the one that England adopted – and then arithmetically regulate the values of all of the coinage with respect to that standard. Pretty simple process.

Now, some of the English kings, Henry VIII especially, Edward VI – well, Edward VI was a minor, the people around him – engaged in debasement of the currency. And Blackstone went out of his way to

show that if this wasn't a usurpation, it was certainly an aberration under the English constitution.

So this was the basic principles of coinage, but it didn't have much to do with the Colonies per se, because they weren't in a position to coin money. So the Colonies were using two sources of coinage, one, English coinage – of course, they were English colonies – and secondly, foreign coinage, which was coming in through foreign trade and in fact, the major foreign coinage that was used was coming from Central and South America. And that's why in 1704 in a proclamation of Queen Anne and in 1707 the Statute of Parliament, the Spanish milled dollar was established as the standard for all foreign coins within the Colonies.

I emphasize the Spanish milled dollar because you're going to hear about this again. The Spanish milled dollar was silver coin, actually the Spanish unit was the real, and there were eight reals in a silver dollar. And in those days there wasn't a tremendous amount of coinage and people would literally cut Spanish dollars in little wedges. There were eight potential wedges and they were called "bits", colloquially. Two of those bits made up a "quarter". Four of those bits made up a "half". You following this now? This is why Wall Street until a few years ago, quoted stocks in "eighths", "quarters" and "three-quarters". They were referring back to this original monetary system. So, here were the Colonies using the coinage that was supplied from England, and supplied through essentially the Spanish trade and part of that of course was the infamous triangle trade – the slave trade between New England, Africa and the West Indies.

But that wasn't really sufficient, or they didn't believe it was sufficient for their economy, so the Colonies started generating paper money. I emphasize those two words, because money was always considered to be coinage – gold or silver – and then there was this other thing, this paper money, which was a different concept entirely. And it's interesting to see how these statutes come out.

Typically speaking, you'll see first a statute that deals with raising troops to engage in some kind of military adventure. Especially in New England where they're going after the French and the Indians in Canada. And there'll be the statute raising so many troops and all the logistics that are involved and then as part of that statute – or as the next statute in the line – is a statute for emitting bills of credit. That's the special term of art: a bill of credit. That's what they called paper money in those days. Because it was a bill, a note, a promise to pay – some kind of debt instrument based on

“somebody's” credit – back there. And it was typically the credit of the colonial administration and it might have been paid off in terms of taxes, so that you take your bill of credit and pay your taxes or other public dues with it. Or it might have been a redeemable bill of credit, at some point in the future, that colonial administration would pay in gold or silver, supposedly the face value of those notes.

So these were the two forms that the colonial governments used. Parliament, however, did not like the emission of bills of credit. English merchants did not like to be paid with bills of credit, especially colonial bills of credit that were made “legal tender,” that could be forced on a creditor. So Parliament passed two statutes in the middle of the 1600s extremely limiting the ability of the Colonies to emit these things, especially with legal-tender character.

Alright, so there's the background. Now we come to the period of the War of Independence. The thirteen Colonies become thirteen independent States and now start asserting for themselves the full panoply of governmental authority with respect to essentially everything. From potentially coining money – although none of them really did – to raising troops and fighting a war.

The first document of consequence you need to think about is the Articles of Confederation, because that is the precursor to the Constitution. The Articles of Confederation created a Congress which had both legislative and executive authority. And it granted to that Congress the power to coin money and to regulate the value of money that was coined by the States, because the States were still claiming that they had this authority. Secondly it granted to Congress the power to borrow money or emit bills on the credit of the United States.

Notice how they were treated as two separate powers, the power to borrow or the power to emit bills to create this paper money or paper currency. And in fact, Congress used the second of those powers – it didn't do any coinage of consequence (it may have sent out a couple of base alloy coins) – but they certainly used the power to emit bills. And they generated a paper money called the Continental. And I think everybody knows the economic history of the Continental and the phrase “not worth a Continental.” For one reason or another – especially over-issue and the fact that Congress had no power to tax, so it really didn't have a credible way to say it was going to redeem these things – the purchasing power of Continentals dropped terrifically and eventually they were anything like 212 to 1 when they were finally paid off.

Now the States also engaged in the printing of bills of credit of their own. So you had bills of credit coming out of Congress and you had bills of credit coming out of the States and you had essentially a near hyper-inflationary event going on at that period of time. The war is on, you have stagflation, depreciation of all of these paper currencies. During the war Congress had asked the States to make the Continentals legal tender, so that they could be forced on merchants, especially so that they could buy materials for the war. And eventually that didn't work out too well even with price controls and all sorts of typical government interventions and they had to give that up. The legal tender provisions were repealed.

So now we're in a position of essentially economic chaos. And what's interesting is that the same people who had fomented this economic chaos, the same people who had been in the Continental Congress, the same people who had been in the State legislatures, many of them now repaired to Philadelphia for the federal convention to deal with the drafting – well actually it was supposed to be the amendment of the Articles of Confederation – but they ended up drafting a new constitution. And this has always struck me as a fascinating thing, because it's one of the few instances – maybe the only instance I know of in world history – where the politicians who had made these blunders turned around and said to themselves, “We made a mistake.” And then corrected it.

How did they correct this? Well, let's take a look at the provisions of the Constitution dealing with monetary affairs. First one: Article I, Section 10, clause 1. Article I, Section 10 contains three clauses, a whole slew of limitations of the powers of the States. With respect to money, Article I, Section 10, clause 1: no State shall coin money.

They remove that power from the States, primarily because they didn't want thirteen types of coinage circulating. No State shall emit bills of credit. Period. Any kind of bill of credit, whether legal tender bill of credit or not. They didn't want State paper money anymore. No State shall make anything but gold and silver coin a tender in payment of debts. Interesting way to phrase it. “Anything but gold and silver” meaning there's a reserved power and actually a duty to make gold and silver coin the tender in payment of debts. Why were they concerned about that?

Well, what are debts? Typically, debts are some kind of obligations arising in the commercial realm; at least the most important of them do. So, dealing with commercial transactions, where were most commercial transactions, if they came to litigation, going to be settled at that time? Well, in the State courts; there were

no federal courts. So what they were looking at was a situation where the merchant class was going to go into the State courts, and the State courts were being told by the Constitution that when they issued judgment on this debt it had to be payable in gold and silver coin; it could not be made payable in something else, as a matter of State law.

So, now if you look at the State level, you have a gold and silver economy, absolutely. Where is this gold and silver coin going to come from? We'll get to that in a moment. What about the congressional side, the Congress side? Article I, Section 8. Article I, Section 8, clause 5. Congress has been delegated the power to coin money, regulate the value thereof, and of foreign coin. So we have: coinage taken away from the States; coinage given to Congress. It's pretty clear that Congress' power at least as a government to coin money is exclusive, because the States' power has been completely removed. This is interesting language: regulate the value thereof. That takes you back to Blackstone. Blackstone told us how to do that.

If you have a unit of silver, and this coin has twice as much silver in it, then it's worth: two units. If it has half as much silver, then it's worth: half a unit. Whatever that unit may be. When you factored gold into the equation you have another element to look at, because the exchange rate between gold and silver in the market place is never 1 to 1; it's never been 1 to 1; it probably never will be 1 to 1. Gold has always been more valuable in the market place than silver. So you have to factor in that market ratio. So if a gold coin has the same weight as the silver unit and the ratio in the market is 10 to 1, that gold coin is worth 10 units – again it's simply arithmetic. That's regulation of the value.

“And of foreign coin.” Why were they interested in that? Because they wanted to monetize the entire gold and silver coin in the world as part of the American monetary system. And if you look at what happened early on in the area of tariffs, customs duties, you'll see exactly how that worked. Foreign merchants come into the United States, bring in their goods; they have to pay some customs duty. Paid in what? Well, typically they would pay in some kind of foreign money. That's what they would have. So Congress passed a series of statutes right away setting out the various foreign monies that would be acceptable and what they were worth; the regulated value of those foreign monies in terms of the United States' standard. Of course, that brings you to this question: What is the United States' standard?

Well, the Constitution talks in two places about “dollars”: Article I, Section 9, clause 1 – the slave tax clause, so-called; a tax of 10

dollars on every person imported into the United States. Some of those “persons” might have been indentured servants, or possibly they might have been free people who would be brought in some way. But it was directed at the slave trade. And then of course, the 7th Amendment – jury trial in any case in which the issue is of greater value than 25 dollars – 25 dollars or more. Does the Constitution define the word “dollars?” No! There are quite a few words in the Constitution it doesn't define; one of the few that it does is “treason.” You look at that, that is a good example because they wanted to narrow the definition. The English definition of treason was extremely broad. It was a political crime, essentially.

But most terms in the Constitution are not defined, you're supposed to know what they mean. And at that time people did know what they meant. The “dollars” they were talking about were what dollars? From 1704 and 1707 – what dollars? The Spanish milled dollars! How do we know they were talking about this? Because the Continental Congress of the Articles of Confederation adopted the Spanish milled dollar as the American dollar. It was Thomas Jefferson who proposed that. So, when the Constitution is written and refers to dollars, they're thinking back to what was done under the Articles of Confederation, and proposed by Jefferson and adopted – they're thinking back to this Spanish milled dollar. And of course, if you go historically and try to find anything else that was called “the dollar” in those days, you will get frustrated very quickly.

So, it is fairly clear that the standard in this system is going to be the dollar. What is a dollar? Again we come to Mr. Jefferson and Mr. Hamilton. This is one of the few things on which they agreed. During the first Washington Administration, Jefferson was Secretary of State and Hamilton was Secretary of the Treasury, and the question is: “All right. The dollar is the standard. What is a dollar?” These were pretty practical men, they went out and got some merchants and said: “Go out on to the market place and do” – what we today would call a statistical sampling or analysis - “and get what appears to you to be a good sample of Spanish milled dollars that are circulating by tale in the economy.” And that means they are taken at sight. Because, obviously, when a coin is worn sufficiently, people don't take them at sight. Then they have to go and be remelted somewhere. Some of these would be pristine, some of them would be worn to the point almost at which they would no longer be taken.

They went out and did this analysis, melted them down, divided by the number of coins, and they said: “The average Spanish milled dollar that's now circulating in the economy contains 371 ¼ grains of

silver.” And they put that into the coinage act, the Mint Act of 1792, which says that the dollar or unit shall be of the value of the Spanish milled dollar as the same is now current and containing on average $371 \frac{1}{4}$ grains of silver.

Notice the language: “shall be of the value of the Spanish milled dollar.” What are they talking about? “Value” is weight in silver that it contains. Not “purchasing power” as we think of it today, but the actual weight of the coin. “...as the same is now current...” “Current”, Latin: *curro, currere*; to run; running, in the market place, accepted in the marketplace. So what they were doing in that statute was determining an historical fact. They were determining as a historical fact what that word in the Constitution meant. Because it was out there, in the market place.

Now, I suppose today we could come back and we could find that bar of melted silver that they had somewhere off with the Ark of the Covenant there hidden away in the Archives and if we gave that to some top flight analytical chemist, we could come up with a more accurate number, like 371.32 or 370.99; whatever it would be. It's essentially irrelevant, because whatever the unit is, it's arbitrary. But it's fixed, or it was fixed in 1792. That's the unit.

What are they going to do with the gold coinage? In that same statute they created gold coins. Did they call them dollars? Well of course not. You can't call something by a name that doesn't apply. They called them eagles. And they gave them values in dollars by looking at – what? Their weight and what was the exchange value in the market place at the time, which was about 15 to 1. So there was the system. And there's absolutely no other way to interpret what was done, because actually there's a hundred something years of history that ties it all together. So there you have the coinage system.

Now the problem in that coinage system was the gold-silver ratio. Because, I said, the gold-silver ratio was not fixed; never has been. Typically, for several hundred years before the American War of Independence, it fluctuated a little between $14 \frac{1}{2}$ and 15. So it was relatively stable and given the lack of ability for information to be transferred from one place to another, it worked fairly well. So they adopted that principle, so-called bimetallic standard, a fixed exchange ratio between silver and gold in that statute. And that was their mistake, their practical mistake. I'll tell you about that a little later.

Now, what about paper currency? Well, go back to Article I, Section 10, clause 1: No State shall emit bills of credit. End of discussion. That was their word for paper currency. There shall be no official currency coming out of the States. But what about Congress?

Remember, the Articles of Confederation had the power of Congress to borrow money or emit bills on the credit of the United States. And the first draft of the Constitution in the Federal Convention essentially borrowed that language directly from the Articles of Confederation. In fact, you'll find a lot of language in the original draft of the Constitution and even in the final draft of the Constitution that you can trace right back to the Articles of Confederation.

So, it was proposed initially that Congress should have the power to borrow money and emit bills. And for those of us interested in reading legislative history – who I assume you are, being connected to the Legislature – if you read Madison's notes on the debates with respect to that provision of the Constitution, Article I, Section 8, clause 2, you'll see that there was a tremendous dispute over those three words: “And emit bills”.

Some people wanted them left in, because they thought Congress should be able to emit paper currency in an emergency, at least. Some of them wanted them absolutely to be removed. There were two delegates who said they would vote against the whole Constitution if those three words were not removed. And they were removed. And if you read Farrand's notes on the Constitutional Convention – he has Luther Martin's report to the Maryland legislature. Luther Martin was one of Maryland's delegates. And Martin makes it very clear. He says: “By the removal of those three words you have absolutely disabled Congress from emitting paper money.” Why? “Because Congress has only the power that is granted to it. Congress, this Congress especially, did not exist prior to the Constitution of the United States. So there is absolutely no way that you can find an implied authority in this entity when it was proposed to give it that power, and those three words were removed.”

So, 1788 – 1791, Bill of Rights, that period of time; what do we have? We have a system that's running in principle entirely on a gold and silver coin basis – as official money. And I say “official money” because nothing in the Constitution would preclude private parties from engaging in banking. And, typically, what banks did then – and they do now, at least through the Federal Reserve cartel – but individual banks did then was to emit their own bills of credit, private bills of credit, banknotes, which typically they promised to redeem in gold or silver, usually on demand, so that they pushed the circulation.

But there is nothing in the Constitution that prevented that kind of activity, except insofar as it was fraudulent and then the Commerce Clause could come into play, or the State police powers

could come into play. So you had a private sector monetary system that would depend upon honest bankers, and then you had an official system that was based entirely on gold and silver. Why? Because that's the one system that prevents the government from redistributing wealth.

Unless the government happens to have gold and silver mines, where does the coinage come from? It comes from the free market through some minter. And the system of minting that you find in the Mint Act of 1792 is what was called "free coinage." The mint was open to all the gold and silver that might be brought from the market place. And it would cost the individual who brought that gold and silver nothing to have it converted into coinage – they were essentially treating coinage as a public utility. Or if the individual wanted to take the coinage immediately he had to pay a premium for that. But basically the government's role was to mint gold and silver, and by putting a stamp on those coins – defined in the statute – to certify what the weight of the gold and silver was in the official coins that were coming out of the mint. Period. End of discussion.

Now we go back to what I was discussing a little bit earlier: the gold-silver ratio. Of course the gold-silver ratio changed – fairly quickly – after the 1792 Mint Act. It moved up. It went from 15 to the 16 level. So comes the statute of 1834, the Coinage Act of 1834. Congress now recognizes this problem, and they engaged in regulation of the older coinage. They changed the value of the older gold coinage, and they came up with a new gold coinage that would reflect this new 16 to 1 ratio.

What was interesting is that at the time there was a Senate committee, the Coinage Committee, that recommended what I think everybody today would recognize as the right thing to do. They said: "Look, let the gold coins flow." That's our term, not theirs. "Don't give them a dollar denomination. We're calling them eagles anyway. Simply put a weight denomination on them, and let the market place determine from day to day what these gold coins are valued in terms of the silver dollar."

But apparently traditionalism overcame innovation, as it were, and so they stuck with the bimetallic ratio. And apparently there was also lurking in the background the idea that if they used that fixed ratio they'd be able to put pressure on the Bank of the United States. So there was a political brouhaha in the background.

So there was a point at which a great deal of future difficulties could have been avoided, but weren't.

The next example of that is 1849. A gold dollar was coined. Very small coin. Looked like a button. And in principle I suppose one could say, well, if what you're talking about there is a gold coin that has the value of a dollar. That's alright. But, in fact, it began to have people think of a gold dollar as opposed to a silver dollar, well, "silver dollar" is a redundancy. So now this is the beginning of the gold-silver political controversy, which eventually breaks out in a large scale after the Civil War, 1873.

Alright, now let's go back to paper money. No paper money being generated out of the Treasury, no paper money being generated by the States, paper money being generated by the banks. But there was this – let me call it an incestuous relationship – between Congress and the banking system.

Alexander Hamilton said it very well, he said: "We need to have the merchants on the side of the government, and to have the merchants on the side of the government we need to give them a amount of special interest legislation." He didn't put it quite that way, but that's what he meant. And the Bank of the United States was one of those pieces of special interest legislation. It was a private entity, but the government of the United States had some influence over the selection of the directors.

And it was generating its own banknotes. We had the First Bank of the United States, that wasn't ... we had the Second Bank of the United States – famous bank fight with Jackson. And the charter was not renewed. By the time we get to the Civil War, you don't even have a connection between the government of the United States and private banking. You have these two episodes and then they're gone. At the State level there were a lot of private State banks chartered by the State governments. So the system is pretty much the same as it was at the beginning.

Now comes the Civil War. The Union government had a problem. It was an unpopular war. There were a lot of Southern sympathizers, even to the extent of being the so-called Copperheads, really sympathizers with the South. There's great difficulty in raising taxation to the level necessary to pay for this war. The banks were charging astronomical rates of interest, so now the Union Congress found itself in a fiscal squeeze. What do they do?

Well, Salmon P. Chase, the Secretary of the Treasury comes forward and says, "Aha, we're going to do the same thing I told you they did during the Colonial period. You know, when they had a war, what was the first thing they did after they raised the troops? They printed paper money!"

So, February of 1862, the first paper money under the government of the United States under the Constitution – orderly under the Constitution – is emitted. The so-called “greenbacks” because on one side they were printed with green ink. And these were made legal tender and lawful money: legal tender for all payment of all debts and lawful money. Supposedly they were going to be redeemed, but they weren't going to be redeemed during the war, because the government wasn't redeeming anything. There was what's called the suspension of specie payments during the war.

So now we have gold and silver coinage and the irredeemable legal tender paper notes. Comes the end of the war. You had two political – parties, if you will. You had a greenback party, a greenback movement that wanted to expand the paper money; who thought it was a great idea. And then you had a sound money movement that wanted to redeem and then remove the paper money entirely. So they compromise. And the compromise was that the paper money would be redeemed, as it came into the Treasury, for gold and silver coin, but then the Treasury could re-emit that paper money. And here's where the Supreme Court comes into play because there were two interesting cases dealing with the constitutionality of paper money.

The first is the Knox case of 1871, and there's the Juilliard case, of 1884, I guess. The question in the Knox case was: Is this stuff constitutional? There was a 5 to 4 decision. Interestingly, Salmon P. Chase had become the Chief Justice of the Supreme Court in the interim. But he was in the minority, he said, “Oh no, this was wrong. This is unconstitutional. I should never have done this.” But it didn't matter. There were a bunch of railroad lawyers on the Court by then, Republicans and... not Republicans, but a political point of view in this. And they said, “Look, this was necessary to win the war. It was emergency legislation that was necessary to win the war. And besides we can't go back now, declare unconstitutional and unwind all of those contracts made in it.” Now, that was false. Because, in fact, there was a whole series of cases in which they unwound contracts that had been made in Confederate money and had come up through the court system to determine whether those contracts could be enforced. But that was the basis for an emergency piece of legislation.

Well now comes the readmission of the Treasury notes. And somebody noticed: “Wait a minute. We're not in an emergency anymore, there's no war going on here.” There was another challenge: the Juilliard v. Greenman case. The Supreme Court said: “Well, we said that about an emergency then, but actually it's for Congress to decide when it should do this.” You see, this is the incremental way

the Constitution has been subverted. Really. And I lay it all at the doorstep of the Supreme Court. They don't operate properly in dealing with the Constitution. They treat the Constitution as some common law document, which it isn't. But anyway, there we have it.

So now we have paper money as a permanent fixture in the system. But it's paper money that is redeemable in gold or silver – even the earlier decision had pointed that out – and it's paper money that issues from – where? From the United States Treasury. Not from a private institution of some kind. Now, meanwhile the banks are coming into closer involvement with the government. Civil War – you have the National Currency Act, the creation of the National Bank system; we still have those banks, the national banks: Chase Manhattan National Bank, Wachovia National Bank, is that still around, Wachovia? Well, whatever. The national banks come from the Civil War, in 1863 and 1864, two statutes were passed. That system was kind of a cartel, because you had the rural banks and the small city banks and the big city banks.

The rural banks were supposed to deposit their money at the larger banks and the larger banks at the big city banks which are in New York and Chicago. So it was a way to essentially focus financial resources behind the big players, essentially in Wall Street and Chicago. But it was limited because the currency depended upon the banks buying US bonds and depositing the bonds with the Treasury, and then they could emit currency, 90 percent of the value of their bonds. And this was at a period of time when the United States government and the people were not particularly interested in extending public indebtedness. They had huge public indebtedness from the Civil War. So there was a restriction on the banks.

Well, banks don't like restrictions on the emission of currency, because – How do they make their money? – they emit currency and interest, right? So the more they can emit, the more return they make. They didn't like that. Well, fractional reserve banking; you probably heard, if you've heard Joe Salerno, he'll tell you that fractional reserve banking is an inherently unstable process, so you had a series of bank crises from the Civil War through to the turn of the 20th century, eventually the big one, 1907. During this period of time the bankers came up with the idea that, “Well, we need a central bank. This cartel structure we have is too loose, we need to bring it together with a lender of last resort, a capstone.” And this is the basis of the Federal Reserve System.

Now, the Federal Reserve System is interesting because Federal Reserve notes are not simply notes of a private banking system or a

bank cartel or private, individual banks, although all the Federal Reserve regional banks and the commercial banks, are all private institutions, thank you very much. Federal Reserve notes were made obligations of the United States. So now you have the American people on the hook for this banking system.

Now, they were also originally to be redeemed in lawful money or gold. But the banks actually didn't have to redeem in gold, the Treasury had to redeem in gold. So, once again you had the US Treasury on the hook, as the ultimate surety of this system. The system was sold on the basis that this was scientific management of currency. We would no longer have depressions, we would no longer have stringencies, we would no longer have inflations. All that stuff that we had had in the 19th century would be gone. Twenty years later: the greatest depression the world had ever seen... okay.

Now what's fascinating here is – I'm going to have to stop in a moment, I'm just going to tell you about Franklin Roosevelt – here Franklin Roosevelt comes in. And what he wanted to do is raise prices. That was the theory of the New Deal: prices are being driven down by the Depression, and we have to raise prices, so we're going to kill pigs and pour milk in the streets and do a lot of stuff to raise prices. And one of the ways he wanted to raise prices was to depreciate the value of the gold currency.

The gold dollar – the dollar actually of the Coinage Act of 1900 which had finally settled on this gold unit. He wanted to depreciate that value. And he did that how? He did that by seizing all the gold from the American people, and then simply putting an arbitrary value on gold from day to day until he came up to \$35 an ounce. You ought to read how he did that. Henry Morgenthau, the Secretary of the Treasury would sometimes come in to Roosevelt, and Roosevelt was lying in bed, “How much are we going to put it up today, Henry? How about 25 cents more?” “OK. Let's do that.” It's going to be arbitrary, right?

Remember how I told you that the value of currency, of money was supposed to be set? Well, the ratio between gold and silver in the 30's never went below 50 to 1. So, if Roosevelt had simply come in... if I'd been Roosevelt's advisor I would have said, “Franklin, here's what we have to do. We have the wrong ratio between silver and gold at 16 to 1. If we put in the correct ratio, let's say 51 to 1, that will effectively depreciate the gold coinage versus silver, and we'll get what you want, constitutionally. We won't have to seize the gold from the American people, and we won't have to prohibit gold clause contracts, and we won't have to have this huge political brouhaha, if

we would just follow the Constitution. And, oh, by the way, we can depreciate it far more than Congress is willing to let you depreciate it now. They're only willing to let you depreciate it 60 percent. We can depreciate it 76 percent." So it would really have been valuable if Franklin Roosevelt and Henry Morgenthau and the people around them had known a little bit – just a little bit – about the Constitutional principles of money.

So where are we today? The answer is, where we are today, we have an irredeemable paper currency – actually an electronic currency, because most of it is just generated on electronic account books – an irredeemable paper currency coming out of a private banking cartel for which the American people are on the hook, in some kind of bailout. Because, of course, the bank cartel comes to us and says, "Oh, we've made terrible mistakes. We'll admit that and now they may be fatal to the economy, if you don't bail us out." And of course, "They'll be worse next year. And you can bail us out next year..." This thing just perpetuates.

So this is the system we have now. And I would suggest that it's even worse than the worst events that occurred under the Colonial and State systems prior to the Constitution. Because there's absolutely no control on this system whatsoever. Except for one – actually two: the States can take action. You're going to see, I think, in the next couple of years, action being taken by the States to deal with alternative currencies – Section 30 of the Federal Reserve Act. You know what Section 30 does? Section 30 of the Federal Reserve Act: "Congress retains the right to alter, amend or repeal legislation at any time".

Why is that even there? In most of the statutes you people see, there's no provision like that. "Congress retains the right to repeal this." Of course Congress has the right to repeal. Because they recognized that those banks were private entities and by creating this charter and by giving them these powers some smart lawyer in the future might come along and say, "Wait a minute. You can't take these away! Because you've made a contract with us." Actually the Supreme Court said that a long time ago, that the Legislature makes this kind of arrangement, maybe a contractual arrangement, and it cannot be rescinded.

So Congress put this in – it's also in the Social Security Act, by the way, the Railroad Retirement Act, a number of these provisions, where Congress recognizes it might have a problem in changing the terms of the deal, so it puts that kind of language in there. Well, that means that the Federal Reserve system, the Federal Reserve note is

what John Exter, now deceased, pretty famous banker, called it, it's an I owe you nothing currency in the truest sense of the word. The banks don't owe you anything. And Congress can turn around and tell you it owes you nothing too. So, I'd suggest that you people and the people you talk to should begin thinking about just what we are going to do to correct this situation, before the roof falls in.

Now, I'll take whatever questions you have.

QUESTIONS & ANSWERS

VIEIRA: The first question is of course, how long? How long before the roof falls in? Well, I don't predict such things, but I'm willing to predict this: It will not be a depressionary phenomenon, it will be a hyper-inflationary phenomenon. Won't necessarily start in this country, it could start in Europe. But a hyper-inflationary phenomenon. What I mean by that is 50 percent depreciation per month, minimum.

You always come out of every hyper-inflationary phenomenon, at least to my knowledge in the world – except for one, because we had one during the War of Independence, except for that one – with some kind of police state, a dictatorial system. Always. Because the chaos that's generated by that event – especially at this time you have the most complicated price structure in the history of the world. It depends entirely on essentially a stable monetary unit of some kind. When you blow that monetary unit out, what happens? The price structure collapses. You go to barter? How do you go to barter? What are the number of products out there? How do you settle on a product, a series of products, a small number of products to be used as the bartering medium? It's essentially an impossibility.

So we're looking at an unprecedented situation. If this currency system goes into hyper-inflation, you're going to have an economic collapse, the world just – you can't contemplate what's it going to be like. That's why I'm saying, somebody has to begin to think what would be the alternative currency if this one goes down. And don't tell me it won't go down, it's already gone down once, in 1932. Well, 1930 to 1932. It's already gone down once. And that was on a 40 percent gold reserve, thank you very much. 40 percent behind the notes and 35 percent behind the demand deposits in the Federal Reserve regional banks. And that wasn't enough. Now you have no reserve.

So this is like the Titanic. And the Titanic had the one possibility that someone might have gotten there in time. There's nobody coming to help us. It's going to have to be done – I'm sorry to say – right here. Because the system is now essentially out of control.

And I think you see that especially in Europe now. I've been watching the Italian situation. You can smell the panic coming over the Internet, from this. And Italians you know, they're kinda voluble. But these are mostly not Italians that are panicking, it's mostly Germans. But really you can smell it, coming out of Europe. And who's going to bail them out? Do we have a guess as to who's going to do that? It's going to be Mr. Bernanke. Because they cannot face – and I think correctly so – the consequences of a depression.

Can you imagine what a 1930's style depression in this country would be like? That's what they won't have happen. And the one tool they have that they think can prevent that in the short term is – what? Quantitative easing, inflation, generating money, generating paper currency, bills of credit. Well, bills of discredit, because they're not going to be paid. We keep generating this stuff and we hope that something will happen. We're playing for time, financially. But think what Machiavelli has said, "That's a fallacy. Time brings all things, bad as well as good."

And the only solution here, I think, is to come up with an alternative currency. A lot of people have proposed exactly how to do this. This is not something that's difficult. On the shelf technology. We can set this thing up in 30 to 60 days after the statute is passed. An alternative sound currency based on silver and gold. Start using that in the market place. Start transitioning the governments into using it for purposes of taxation and spending. And let the banks figure out how to solve their own problem. Because we can't figure it out.

It's a problem of what's called rational economic calculation. Which is the problem of all central planning. There is no way from the top down how to reform this system, it has to be reformed from the bottom up, through the market place. And to do that you have to give the market place an alternative, sound currency to generate a price structure that works.

Which we're going to discover very shortly we do not have. Interesting problem, you know. I've been doing this for a long time and I never thought it would get to this. I thought I'd miss out. I'm watching it. But no. I wouldn't want to be anywhere else. It should be fascinating to see how this plays out.

QUESTION: Just curious whether you have any view with regard to the sort of little baby steps the States take, you talked perhaps Virginia as well, to perhaps protect themselves from their own government and to give themselves the leeway to do what you suggested for themselves in the event that the U.S. economy gets so

unstable that they need to protect their own folks and their own economies.

VIEIRA: Well, yeah, I know about these things because I've been involved in a lot of them going back several years. New Hampshire to begin with and then Montana. Virginia, we're trying to get them to...the Virginia State Legislature came up with a commission to study this problem, primarily to educate the legislators.

In most states the legislators have never thought about this. Most state legislators treat it as some kind of a federal problem, that doesn't relate to them. But basically the idea is exactly what I said: the States adopt an alternative currency unit which is actual silver, or actual gold. I'd like to see that done on the electronic basis because that already has been tested on the market place. Those systems are there, they work. You can funnel any kind of gold and silver into the market.

It doesn't have to be a particular kind of coinage, it can be bullion. And they're capable of working down to very small amounts. One of them – one of the private companies out there – goldmoney.com founded by a fellow by the name of James Turk, whom I've known for a long time. They're down now to a thousandth of a gram of gold, and a thousandth of a gram of silver, that they'll use in transactions: Well, now you're making small change in gold.

And that was always the problem in the coinage era. You had coins of certain sizes, but how did it work out in between? You'd have some kind of token coins, some kind of paper credit, or whatever; it was rather cumbersome. And if you look at it today, it's even worse; because, what's the value of an American Liberty silver dollar, one ounce, the coins that are now coming out of the Mint under the 1985 Act?

Well, it's somewhere between 35 and 40 Federal Reserve notes, right? So your one dollar silver piece is worth 35 of these other things in the market. That's not going to be that useful in the supermarket. Well, it will be later, when hyperinflation sets in, but right now it isn't. Or the American Eagle, the gold coin; what are those? That will probably be close to \$2000 now, one ounce of gold in coin form.

So if you look at the coinage system we have, once again because Congress – because they're the ones that are supposed to be doing the coinage here – because Congress has not kept up to date with our problem, we have a coinage system that really is not workable. The states can't coin money, so we couldn't see any reform there. But the states can make gold and silver tender in the payment of debts, and they can certainly use these electronic systems. The Supreme Court

already ruled on that twice. Not on electronically, but they ruled on the right of the states to have an alternative currency of their own.

So we don't have to worry on the legality of the thing. And if that were done – let's say it were done in Virginia – don't want to take some ... I mean Montana is kind of a backwater, people might not pay attention to it, but Virginia is difficult to ignore; here's Virginia, right next door to DC, right? Virginia does this, what do you think the influx of capital into Virginia is going to be?

Virginia will be the only polity in the entire world with a sound money system. And you don't think that other States that border Virginia will say: "Oh, my goodness, it will be to our advantage to pick this up too, because we have cross border trade." And on and on it goes. And of course, this particular system, if you use the electronic system – international trade, because everybody can be tied into the Internet too – that's the way it runs.

So, I told these legislators, I said: "Listen, 30, 60, 90 days after the statute – tell me how fast you want it done – we can have this up and running." And what it would mean is that the average Virginian – because you'd have to tell them to do this – would get a debit card, and he'd be told how he'd go on the Internet and sign up for this; transfer his funds from his regular bank account into this; all very simple. You don't force him. If he wants to do it, fine, if not... But he has to have the capability. And then the State simply starts taxing in the alternative currency. And paying out from that tax fund to creditors of the State, first come first served to whoever asks for it. What do you think is going to happen?

Those creditors are going to deplete that fund as fast as it is built up. And then the Treasurer is going to come back to the General Assembly in Virginia and say: "I need to expand the tax base here." And pretty soon you'll have the Commonwealth of Virginia on a gold and silver basis treating Federal Reserve notes as a foreign currency – because they may need those Federal Reserve notes for something. And you'll have the economy of Virginia following along with this, because the state has given them the mechanism and the state of course, is a big player in the economy – a lot of money passes through state finance. Now you have shown how it can work.

And my view of the thing is, if people have two choices, a relatively sound currency here and a rotting vegetable currency over here, which one are they going to choose? Well, they'll choose this one, of course. That's the reversal of Gresham's Law. Gresham's Law says what? Bad money drives good out of circulation. That's how it's usually formulated? It's actually Aristophanes' Law, I think it's in the

play “The Frogs”. It goes back to the ancient Greeks. Gresham had nothing to do with it.

Why is that true? I have bad money in one pocket and good money in the other, and you're willing to take money, what am I going to give you? The bad money, right? Think of Mommy with Jimmy, and there is Jimmy and Billie playing in the sandbox. And Billie is crying, because Jimmie won't let Billie use one of his toy soldiers, and Mommy says, “Be fair Jimmy, let him use one of your toy soldiers.” Which one is he going to give to the other child? The nice one that's beautifully painted, or the other one with one arm broken off and the head that's twisted. You tell me. That's Gresham's Law. It's at the kindergarten level of intelligence here.

But it works the other way too. If I'm going to you to make a contract, I'm going to demand what? The bad money or the good money? I'm going to demand the good money, right? So we can reverse this whole system if you once put into play somewhere a significant player in the marketplace – has to be a fairly large size – that's using this good money and we can force that through taxation. Start off with a certain amount of State taxation. Congress can do this too!

Maybe I'm being facetious, but in principle Congress can do this too. And I should think Congress would have more understanding of this problem, it's their power we're talking about, monetary power. The difficulty I always have with state legislators – always talking to them is you know–: “Oh we can't do that. States can't do that.” And I say: “Well, wait a minute. Article I, Section 10, ...” We go through this little litany of constitutional principles and then eventually the little light bulb comes on over their head: “Oh, yeah, I guess we can do that.” And then there's the problem: “Well what's the six o'clock news going to say about me? That I'm a gold bug, they're going to making fun of me.” That type of thing. You're getting into the political problem there.

But as a practical solution – I shouldn't say solution, there is no solution, this thing is going to happen; we can't stop it from happening – as a practical direction, putting a floor under, mitigating, the damage, I'm willing to bet a stack of Krugerrands this high this is the only way it can be done. If someone can think of another way that doesn't involve Congress passing... I rack my brain...

If someone came to me and offered me some huge fee to write a statute to correct the Federal Reserve problem, through the Federal Reserve, could I do it? No. I think I'd say “I can't take the money, I

can't do it. It won't work. There's no way we can correct that." The market has to correct it. And the market won't correct it, unless it has an alternative to work with. Wasn't it Archimedes who said: "Give me a place to stand and I will move the earth with my lever." We need a place to stand monetarily. We need the alternative currency.

An example, go back to Weimar Germany; everybody remembers Weimar Germany, right? Six months: June, July till the end of November, they blew the currency out. An egg that cost 80,000 marks in June – they created a lot of inflation during the war and immediately after the war – 80,000 marks was like a trillion marks by the end of November. And the first week of December the currency was gone. How did they survive? Because they had a whole slew of alternative currencies circulating in Germany. From other European countries, from the United States, from England – England wasn't considered a European country – and people using these and making contracts in them. So they had a kind of black price structure in alternative currencies. So when the mark collapsed the entire economy didn't go with it.

QUESTION: So you're assuming that we still keep the Federal Reserve but states can create their own currency? But then how will the big banks themselves, will they stop being a member given that the states will have to create their own State Bank or will they be a member of the Federal Reserve?

VIEIRA: Well, there would be a state depository to deal with the alternative currency, because the alternative currency system is not really banking, it's warehousing. What I anticipate would happen is – if I were writing the complete statute for... I'd say: Look, we need to set up some private institutions dealing with what used to be called "real bills." 30-, 60-, 90-day banknotes based on real commodities, because that kind of puts an underpinning to the use of gold and silver.

In a lot of transactions you don't need to use gold and silver, if you have real bills. And those private institutions I would imagine at some stage they might also come into the depository. That'll be the loan function. See, the depository function is the warehousing function. The loan function is a different situation and you can have a loan bank which is paying on demand. The depository obviously is paying on demand, paying immediately, electronically.

So you'd set up banks dealing with the 30-, 60-, 90-day real bills, and you'd set up banks – or it could be those same banks – who set up accounts that would be longer term. But the fractional reserve aspect of it has to be cut out entirely. That's the devil in the detail, as the

word goes. You cannot lend short and borrow long for very long. That's why fractional reserve systems and banks have always failed, because the notes are out there to be paid on demand, and they don't have a hundred percent reserve to pay those notes.

Leaving aside if that were inherently fraudulent or not, I guess it wouldn't be if people were completely told about it. But the other assets that might be Fed into that pool, they're not on demand. Who knows how long those assets might be until they're paid. The banks might invariably get into these squeezes, because they extended themselves too much. And there's only one way to get around that and that's to prevent it at the beginning.

Our problem is, we've painted ourselves into a – I won't say we, I don't want to include myself. Somebody out there has painted me into a corner, and you as well. We're painted into this corner, and either we're going to go down with the Titanic, or we're going to get in a lifeboat and row away. That's the difference between the Titanic situation and our situation: on the Titanic they didn't have enough lifeboats and they didn't have a way to build any more.

We don't have enough lifeboats now, but we have 50 ways to build them. This can be done at the state level. And I don't say there won't be a lot of wailing and gnashing of teeth, economically. Or that a lot of people won't be very sorry that we put up this system and ran it as long as we did and ran it into the ground. But that's not my problem.

My problem is, I'm sort of the salvage yard guy, here. You've brought me this mess, and you say clean it up: and I say "This is the most I can do." Or like trauma surgery, "You've got to lose the leg. Don't blame me. You shouldn't have been driving drunk."

Oh I know, I sound so pessimistic, but do you know what the definition of a pessimist is? He's an optimist who knows the facts. Thank you.

MODERATOR: I'd like to thank you all for coming today. We have our third and final lecture in December, details coming shortly. Just for one quick exposition, this is an 8 reales, this is a Federal Reserve note. Well, there went a Federal Reserve Note. Which one do you want? I don't know.

III. WHAT ABOUT MONEY CAUSES ECONOMIC CRISES?

PETER SCHIFF¹²
PRESIDENT & CEO
EUROPACIFIC CAPITAL

MODERATOR: Good afternoon ladies and gentlemen. I'm Lydia Mashburn, Policy Director for Chairman Ron Paul's Subcommittee on Domestic Monetary Policy. On behalf of the Congressman and his office I'd like to thank you all for coming to our concluding lecture in our afternoon tea series on the basic principles of money.

Today's question is going to be "What About Money Causes Economic Crises?" It's sort of the culmination of what our other lectures have led to. Our first lecture was "What Is Money?" And then our second one was "What Is Constitutional Money?"

In those two lectures – our first lecture Dr. Salerno very nicely laid out for us what money is, that money is a commodity. It is a market-chosen commodity that serves the role of money. And what the market needs money to do is, it needs it to be recognizable: then you know that this is the same thing that they're able to trade in future. They need to be able to divide it, so that they can purchase large or small things. They need it to be portable: they need to take it with them – cattle as money didn't work very well, because it's a little difficult to move them from one place to another. And then one of the pinnacle faculties of money is that it has a stable value. You need it to maintain value for what you exchanged it for.

Which then brought us to our second lecture where Dr. Vieira talked to us about Constitutional money. The Founding Fathers wanted us to understand... or wanted us to keep stable money. And it had turned out that the market had chosen gold and silver to fulfill money because it filled all those properties of divisibility, portability, recognition and stable value. So they set up in the Constitution certain provisions to maintain what the market had chosen as money. Because they had already experienced through the Revolutionary War and then under the Articles of Confederation some terrible

¹² [The video of the lecture may be found at: http://www.youtube.com/watch?v=npj0CUT8d_Y.]

experiments with paper money where it did not retain its value because you could increase it at whim.

Dr. Vieira sort of took us through I think roughly 200 years or more of history and showed how, over time, that stable value of money has eroded, legally and got us to the point where we are today where we are now able to talk about what happens when your money loses its value. So, while it's terrible that over time your money does lose its value, what's even worse – I don't know if it's even worse, but it's not good – is that it also can cause booms and busts in an economy. It causes economic crises.

That's what brings us to today's question: What about money causes economic crises? Which is why I am delighted to say that we have Peter Schiff to answer this question for us. He is CEO and president of EuroPacific Capital. He is a financial analyst. He is an author. And most importantly though – at least to me – he was one of the few financial analysts to predict the collapse of the housing bubble. Everyone else was like “Housing prices have gone up! They just keep going up. They've never historically dropped.” And he said: “Look, it's going to collapse, because it's not sustainable.” Because he understood what it was about money that caused these bubbles in the economy. And he knew it was going to collapse.

Analysts running the gambit laughed at his face. And when he was proven correct, we're now left picking up the pieces. But unfortunately we are still not understanding what it is that caused the crisis to begin with. So our policy prescriptions are kind of off base in terms of dealing with the aftermath.

I'm delighted to welcome and I hope you'll join me in welcoming Peter Schiff.

SCHIFF: Thanks everybody for coming. Hopefully most of you are not here for the free desserts. Let me just talk a little bit about money.

One of the roles of money – that you have just alluded to – is that money needs to represent a store of value. The reason that that is so important is because that facilitates savings. You are not going to save money if you anticipate that its value is going to erode over time. So you need something that has a store of value.

The reason savings are so important in a market economy is because – contrary to the conventional wisdom – spending is not what grows the economy. People who believe that are basically putting the cart before the horse. What actually grows an economy is the opposite of spending, it's under-consumption, it's savings. It's the money that we don't spend that makes the economy grow. Because when we don't

spend it and it's saved, that money is available to finance capital investments, business expansion, job creation. All the things that grow the economy flow through from savings.

You know, popular refrain among the Occupy Wall Street crowd when they say that “businesses don't create the jobs.” “So,” you say, “we're gonna tax the job creators?” They say, “No, no, no, the job creators are the consumers, because they're the ones that are spending the money,” and they say “if there were no customers, there'd be no businesses.” Of course, what that theory overlooks is, where do consumers get the money? They get it from their jobs.

So you can't say that the consumers create jobs when you need jobs to have consumers. So, it's the other way around. And what gives the consumer purchasing power is his productivity. If everybody just had a job from the government and the government printed money and gave it to people, there'd be no demand because there'd be no supply. There'd be nothing to buy, because nobody would be working.

What creates the purchasing power is the production. And the production comes from productivity. And what makes workers productive is capital. It's the tools and the equipment that they have. If they were simply using their hands, they couldn't produce nearly as much. And all of that capital and all of those tools are only here because of savings. So savings are very important.

And also, savings help determine the rate of interest. Because interest rates are a very important aspect of money. Because interest rates represent a price. And like all prices they are determined by supply and demand. The supply is all the savings. The demand is all the people that want to borrow money. Whether it's businesses, whether it's college students, someone who wants to buy a car, the government. Everybody borrowing money is competing for this store of savings. Because for every dollar borrowed, someone had to save that dollar. Somebody had to not consume and put that dollar in savings so somebody else could spend it or invest it. And so, if you have a lot of savings, then you're going to have lower interest rates, because the supply is going to be greater. And what does that mean, if there is a lot of savings, what economic signals is that sending to the market?

If people are saving a lot of money, what that says is that people prefer future consumption to current consumption, because after all, while you're saving money, you're just deferring consumption. Every dollar you save is going to be spent eventually. Except you're not going to spend it today, you want to spend it tomorrow. And hopefully you'll spend the dollar tomorrow plus all the interest that you earned

over time. So, it sends out signals, that there's, if there's a lot of savings, that there is low interest rates. And then, of course, the economy will react, investments will be made, based on the fact that consumption has been deferred to the future.

Also, one of the reasons that people might save in a free market economy is, in a free market economy – contrary again to conventional wisdom – prices go down. The natural tendency in a free market is deflation. Prices go down. Prices went down for almost the entire history of the United States, until the Federal Reserve. Our grandparents would tell us stories about how cheap things were when they were a kid. Well, their grandparents, or their grandparents' grandparents told the opposite stories. How expensive things were when they were a kid and how much cheaper they are now.

The politicians try to tell us “No no, inflation is a good thing”, and “Money losing value is a good thing, because the economy would collapse if prices weren't rising”. They try to make us feel that falling prices would be a disaster, when, of course, it is the opposite. Falling prices are a reward for capitalism. They make wages more valuable, they make savings more valuable.

The argument is, if prices are falling, nobody is going to buy anything. We'd all just be waiting for lower prices. And of course that's absurd. We all have cell phones, we all have laptop computers, we all have plasma TV's. The prices for those items are falling all the time. That doesn't stop people from buying them. In fact, it encourages people to buy them. If cell phones were still as expensive as they were when they first came out, nobody in this room would have one. The reason that we buy them is that the prices are coming down. So, it's the exact opposite. Falling prices create demand. It's not the other way around.

But there's another reason that people save. If you save your money and money gains value, you can buy more stuff in the future, not only because you earned interest, but because things got cheaper, the money became more valuable. So, if you have lot of savings, you can have low interest rates. If you don't have a lot of savings, well, you're going to have high interest rates.

And the beauty of this is, let's assume there's not a lot of people saving money, and a lot of people who want to borrow money. You have a very limited supply; you have a lot of demand, what happens to the price? The price goes up. Interest rates go up. Higher interest rates discourage people from borrowing because it's more expensive, and they encourage people to save. And ultimately the market is going to create an equilibrium between savings and debt, and you're

going to have a market rate of interest. And investments are going to be made, capital projects are going to be made that can be adequately financed.

Now, the problem comes in – now that we don't have real money and you don't know what that is – now that we have fiat money or a money substitute, the Fed can create money out of thin air. And they create money, they don't actually create any real value, they're just printing money. So, they diminish the value of the money that already exists.

But also, when the Fed creates money they do it in a way where they buy up Treasuries and they also control short term interest rates raising the cost of money to banks. And when they do that the Federal Reserve can bring down interest rates. That has the effect of sending the same types of signals to the market that there's more savings, because interest rates are low. But people aren't saving their money. There is no real change in time preference for money. It's the same, and so you send out this false signal to the market and as a result of that false economic signal a lot of investments are made that really should not be made. There's no real viability there. But they are made because of these false signals.

And I often joke, you know, when the housing bubble burst and one of the things that President Bush said at the time was, he blamed everything on Wall Street and he said, “well, Wall Street was drunk and they did a bunch of stupid things.” And, well of course yeah, they were drunk, but he never asked the question why. Where did they get all that alcohol? Why were they drunk? They were drunk because the Fed liquored them up.

Alan Greenspan kept interest rates very, very low for a very long period of time. And just like anybody, if you're drunk you're going to do some stupid things while you're drunk. You don't realize it until you sober up the following morning. So, this is what causes the business cycle. People think that the business cycle is just some flaw in capitalism. Just for some reason we have these booms and busts. And that's not the case. These booms are caused by malinvestments that are created in response to the Fed intervening in the money supply, where you have the Fed price fixing interest rates, creating too much money and fueling these bubbles. And one thing all these bubbles have in common is debt. A lot of them are financed by borrowing money, particularly the housing market.

I mean, obviously, what made it possible for people to buy houses they couldn't afford, other than Freddie and Fannie or the FHA that might have been guaranteeing the mortgages, was the fact that the

interest rates were so low. When people buy houses in America they buy them based on the monthly payment. And the monthly payments were a function of the mortgage rate. And especially when you got an interest-only payment, when the only thing you're paying is the interest, then the low interest rates really made it cheaper. And when you had the Fed with interest rates at one percent and the banks were offering teaser rates based on those temporarily low interest rates, people could really get in over their head. So, this was a function of money being too cheap. Instead of the market setting interest rates, you had central government planners at the Fed picking an interest rate. And why did they pick one that was so low?

Well, the reason is that politicians like the boom. They like it when people feel good, when voters feel good, because they are more likely to reelect the people who are in office if they feel good. If they think they're getting rich in housing, if they think they can get rich without working, they're going to be happy. Especially if you're taxing them so much on what they earn, if you can create the illusion that they are making money in the real estate market, well, then they are not going to be so upset at the taxes they have to pay. So, the politicians like the boom.

In fact, everybody thinks that the boom is what's good and then the minute you have a recession, what does Congress want to do, what does the President want to do? "We need a stimulus. We can't have this recession. We need to stimulate the economy." What they don't understand is the stimulus is why we have a recession. The stimulus is what caused the boom. But the boom is the problem. The boom is where all the mistakes are made. The recession is where the mistakes are corrected. That's where the cure takes place. So, we need the recession.

Now, when I try to say "We need the recession," people say, "Oh, you're heartless. You're happy that people are suffering." But it doesn't mean we're happy about it, it just means it's necessary. It's just like when somebody checks into rehab because they're a drug addict and then they're going through withdrawal, that doesn't mean that the rehab center is happy that the people are suffering through withdrawal. They just know that they want to get healthy and kick the habit, they going to have to go through withdrawal. That's just part of the cure. If you checked into rehab and every time you have withdrawal symptoms they gave you drugs, you're not going to get cured. You might be popular, you might be a popular rehab center if you're giving out drugs to everybody, but not because you're curing anybody.

And so what happens is, the minute the narcotic of the cheap money begins to wears off, we realize the mistakes that we made and people say “I can't believe I bought that condo” or “How did I buy that Internet stock?” You don't see this when it's the mania. So, interest rates eventually rise and – the mistakes – and what happens during the recession is the market tries to correct all these imbalances. Because during the boom resources are misallocated. Capital, labor is misallocated. In the housing bubble too much capital went into building homes, remodeling homes. Too many people were buying all kinds of furnishings for their homes, buying cars based on home equity loans. Too many people were working in the mortgage industry, in the finance industry. People had jobs where they shouldn't have gone.

Because the whole idea of an economy is to allocate resources, which includes labor, capital and land, in a way to maximize productivity, to maximize our enjoyment, our utility from these resources, so that we can have a rising standard of living. But if labor, capital, or land are not where they're supposed to be, you have to correct that. Well, what does that mean? What happens when the bubble bursts? People that have made bad investments, they lose money. People with jobs that they shouldn't have, they have to lose those jobs, so that they can get other jobs.

You see, a lot of times in Washington, people don't differentiate between jobs. They just think that as long as people have a job, it's okay. If someone has a job digging a ditch, and someone else has a job filling it back up, as far as Washington is concerned, they are both employed. But, they're employed doing what? What do you have to show for the labor? Nothing. You filled a hole in the ground, you have exactly what you had before they started.

We don't want jobs because we want jobs – jobs are not an end, they're a means. What people want when they have a job is all the things they can buy with their paychecks. But you can only buy stuff as something is produced. So people have to be employed productively. That's the key.

In the old Soviet Union, before it collapsed, one of the things they used to brag about is that they had no unemployment. They would tell their citizens, “Look at these Americans, they have all this unemployment, but nobody in Russia is unemployed.” And of course, everybody worked for the government. Everybody had a job. But they had to wait in line for six hours to buy some bread, or whatever. Because nobody was baking bread, everybody was working for the government. And so, if no one is producing anything, your salary

doesn't have any value. It's just money. You can print all you want. That's not the solution.

A lot of people now talk about how we don't have enough demand. You hear all the Keynesians saying “The problem with the economy is that Americans are broke. They have big mortgage debt. They have car loans. They have student loans. They don't have any money. So the government needs to print money, so we can have more spending.”

But if you're broke, just adding money isn't going to change the circumstances. Because money in and of itself doesn't have any value at all. It's just a little piece of paper. They're broke because they're loaded up with debt and they're not productive. And more money isn't going to change that. Or if the government – they'll say “Well the people are broke, so the government has to spend.” Spend what? If the people are broke, the government is broke. Where does the government get the money? It doesn't get it from the moon. It gets it from the people. So, if the people are too broke to spend, the government is too broke to spend. Because the government has to tax them to get the money.

But one of the problems with the monetary system we have now is that people think that, “We don't have to tax them to get the money. We can just print it. And then we can spend that.” As if there are no adverse consequences to printing money. Because that's a tax like anything else, except instead of taking your money away from you, what that does is take the purchasing power away from your money. So you don't necessarily see the tax, but you feel the tax.

But if you go to the supermarket and groceries are more expensive, or go to the gas station and gasoline costs more money, a lot of people don't see the connection. They don't see that that's a tax. Especially when you have the government, or the economists blame the high prices on a greedy oil company or on OPEC, or on natural disasters, or bad weather, or a flood. So they tell us it's not the governments fault.

And then you have the economists saying “Look, it's a good thing that the prices are going up, because otherwise we might have deflation. So this is the price that you have to pay to avoid deflation as you've got to pay higher prices.” So they don't make the connection and it lets the politicians off the hook. Because the public doesn't understand how all these benefits are being financed.

Now, the other source of this big bubble, the other big problem has to do with the role of the dollar as the world's reserve currency. Up until the Second World War all the countries were using gold.

Everybody was on a gold standard, including the United States. After the Second World War, America had pretty much all of the world's gold, or ninety percent or more of the world's gold was owned by the U.S. government.

Where did we get all that gold? We didn't mine it all. We got it because people used it to buy the products that we produced. And how did we produce all these products? We produced them because we were the freest country in the world. We had more capitalism and more freedom, and as a result we were more productive. The world wanted the stuff that we produced yet they weren't productive enough to produce stuff for us, so they had to give us their gold. So we had all this gold.

We went around to all the other countries and basically proposed a new monetary system. And this was going to be where instead of foreign central banks backing up their currencies with gold, they would back them up with the dollar. The dollar though was backed up by gold. Of course, that's the only reason it made sense. If the dollar was backed by nothing, then we couldn't have coned the world into signing up for this arrangement.

But everybody knew the dollar was as good as gold and if you had \$35 you get one ounce of gold. That was the deal we made with the world. And what was in it for the world was, if they held dollars, they got interest. If they held gold they got storage costs. So, it made sense, hold the dollars, run a dollar standard, the dollar is the reserve currency, the dollar is backed by gold, America is the world's richest country, they have biggest trade surplus, they're the biggest creditor nation, they've got all the gold. Good deal.

Well, it was a great deal for us, because the minute we got that privilege we abused it. Because now, all of a sudden, we could pay for our imports by printing money. Technically we were supposed to have the gold to back it up, but that didn't stop the government. They just lied, they just wrote checks that they couldn't really cash, assuming that people would just not care or not notice.

After the 1960s when we had the guns 'n butter economy, the war on poverty, the Great Society, we went to the moon, Vietnam, all this stuff, we were running big deficits. And some of our creditors began to notice this and realized that we couldn't possibly have enough gold to back up these IOU's, which is what these Federal Reserve notes were. They were promises to pay real money. The real money was the gold that the Fed had in its vaults.

So, rather than acting responsibly, rather than devaluing the dollar and allowing a deflation to occur, cutting government spending

and doing the right thing, the politicians did the expedient thing, an almost unthinkable thing. They defaulted. Nixon basically told our creditors, “We promised to give you gold for your Federal Reserve notes, we're now going to give you nothing. You can hold on to them if you want, but you're not going to get any gold.”

The world should have gone back on a gold standard at that point. But they didn't. Now, they marked the dollar down, rather dramatically. The dollar was marked down by about two thirds, during the 1970s. When the 1970s began you could buy four deutschmarks for the dollar, at the end you could get about one and a half. The swiss franc went from like 23 cents to 75 cents. The yen, you used to get 360 yen for the dollar, later in the decade it was down to like 150. Of course it's much lower now, but that was a big drop during the 1970s.

Oil prices went from \$3 a barrel to \$30 a barrel. I mean, that's why the oil prices went up. It wasn't because of the Arabs, it was because of Nixon. It was because of what the government did, it was all the money we printed. Money lost value. Oil prices didn't go up at all. But, in terms of the depreciated dollar, oil went from \$3 a barrel to \$30 a barrel. And gold prices went up from \$35 to over \$800.

Another thing happened too during the 1970s. A lot of women came into the workforce and it wasn't because they were liberated. In fact they were liberated before. But, as a result of all this inflation and all these taxes, their husbands could no longer afford to support them. So they had to start working. You know, our standard of living declined dramatically with the loss of the purchasing power of the dollar.

And in fact, I mentioned oil, I often use as an example – I think I even used it in that congressional testimony – when people say “Oh, gasoline prices are so high now, we're paying almost \$4 a gallon. These are record high prices.” I say “They're not! They're actually lower than they were in the 1950s.” “How do you mean they're lower?” “Well, back in the 1950s you could buy a gallon of gasoline for a quarter. That's all it cost: 25 cents. If you have a 1957 Chevy and if you scoop around in the seat cushions and find a [silver] quarter that was dropped there in 1957, you could still buy a gallon of gas for that quarter. You get change, too.” Because it doesn't cost that much, it costs less. Real money held its value. The only reason oil is more expensive is because we're paying for it with depreciated dollars. That is the problem.

So, the standard of living declined dramatically during the 1970s, but even though the world marked down the dollar, after it collapsed,

it stabilized. It stabilized when Paul Volcker came in and interest rates went up to 20 percent. Ronald Reagan came in promising to reduce government and lower regulations and cut government spending. And that created some confidence in the dollar. It kind of stopped the hemorrhaging.

The world then continued to function. The dollar was still the reserve currency, even though it was backed by nothing. And that was the problem. Because the whole idea was that if the deutschmark wasn't backed by gold, it was backed by the dollar that was backed by gold. But if the deutschmark is backed by the dollar that is backed by nothing, then the deutschmark is backed by nothing.

So that's when basically we embarked on this giant experiment – that has failed every time it's ever been tried – in fiat money. The whole world is on this fiat money system. But of course, once the world knew the dollar was backed by nothing, now it was so much easier for the government to run deficits. Much easier than when they had to pretend it was backed by gold. At least back then, when Lyndon Johnson was doing this, he had to worry that somebody might figure out what was going on. But when we basically told the world “You're going to get nothing for your dollars,” there was no limit to how much we could print.

And that's when the U.S. economy began this massive transformation from the world's biggest creditor to the world's biggest debtor, from the world's best, biggest manufacturer of low cost, high quality stuff ... I mean all the low cost merchandise was made in America. Everything. Even though we paid the highest wages in the world. If something was imported, it meant it was expensive. People used to brag about the fact that they could afford to buy imports. If you bought imported products that meant you were rich, because everything that was imported was expensive. All the bargain basement stuff was made here. And it wasn't because we had low labor costs, we had the highest labor costs in the world. But our workers were the most productive, because they had the most capital. They had the most tools and the most equipment. Our businesses had the fewest regulations. So it was freedom that made us prosperous.

But all that changed and we began to live off the printing press. Because when the dollar was just printed out of thin air and the world was going to take it, we could buy all these products from our trading partners for nothing. When the Chinese are making things for Americans, they need land, labor, and capital, and people have to work hard in factories. What are... do we give them in return? Just some money that ran off a printing press. And what do they do with

it? Nothing. They can't even spend it. All they can do is loan it back to us and buy Treasuries.

And then, what are Treasuries? Just more dollars. And again, a lot of people confuse this. They think the Chinese are benefiting from this relationship. They're not gaining at all, we're benefiting, right? We get all the stuff and they get all the work. Well, what good is the work without the stuff? See, we're trying to say "They get jobs." So what? The slaves had jobs. Wasn't a good deal for the slaves. These jobs are not a good deal for the Chinese, if we get all the stuff that they produce. They're working. The whole idea about exporting is not to create jobs. It's really to eliminate jobs.

I mean, the reason you export is to import something else because you want to consume. How do you consume as much as possible? Well, if there is something that you can do really well, that you can make more efficiently than somebody else, rather than try to make everything, you just make the things you make best and then trade for the things that other people make better than you. But, the whole reason to export something is so you can buy something else. You don't export something just so you can have a job, you'd just be wasting your labor.

Well, what happens when we trade with the world is they send us stuff and what we basically say is "I got nothing for you. But I've got an IOU – dollars – will you take the IOU?" And they take it, because, you know, it's the reserve currency. And maybe in the back of their mind, or I guess in the front of their mind, they figure that one day they can use it to buy something. But meanwhile, what are they going to buy? What are we making? Every year we're making less and less stuff that they want. The stuff that the Chinese want to buy is all made in China. That's where the stuff that we want to buy is.

This whole thing is maintained. We now have this entire bubble, we have this entire phony economy that is now predicated on Americans borrowing money they didn't save to buy products that they can't afford and didn't make. This whole thing is phony. And all of our economic policy is designed to sustain this. Nobody wants to allow it to be corrected, because the correction happens in a recession.

We have a lot of problems. The biggest problem in the US economy is that interest rates are too low. Interest rates have to go up. We're never going to have a recovery, we're never going to have real economic growth, we're never going to create productive jobs, unless interest rates go up. But that's going to be very painful, because we're so overly indebted.

What's going to happen when interest rates go up? Banks are going to fail, and next time we're not going to be able to bail them out. What's going to happen to the housing market? It's going to go down more. It needs to go down more, that's part of the correction. Prices are too high, they're still too high.

What about the government? What's going to happen when interest rates go up? The government is going to have to dramatically reduce spending. In fact they may have to default on the bonds they've already sold. Because the only reason the government can pay the interest on the debt is because the rates are really, really low.

Well, what happens if interest rates go up? Then we can no more afford to pay our bonds back than the Greeks can. For a while interest rates in Greece were at record lows and the Greeks had no problem. But then interest rates went up and now you have a crisis. The same thing is going to happen here. Now, there are people who think that that will never happen here because interest rates are never going to rise. But that's just impossible. They have to rise.

What is the consequence of keeping interest rates artificially low? We continue to screw up our economy. Instead of allowing market forces to correct the imbalances, we make the imbalances bigger. The more we stimulate the economy with this toxin – because that's what the stimulus is, it's a toxic sedative and eventually you overdose on it. What is happening if we keep interest rates low? Nobody is going to save. Who's going to save money that's depreciating in value? You're going to destroy your savings. You're going to destroy the ability of the economy to generate capital, to generate growth, or production. You're going to create massive inflation.

Now, the government can lie about inflation for a while. They can hide it for a while behind these doctored-up CPI numbers that are mechanized, or so manipulated – not that there's a conspiracy, but the formulas they use to calculate prices going up are flawed. They're deliberately engineered to get a low number. That's why they're there. But of course, when they're measuring prices they're not even measuring inflation, they're measuring an effect of inflation.

But at some point, inflation is going to be so pronounced, and its effect on prices is going to be so great that the government is not going to be able to pretend that it doesn't exist. And then at that point interest rates are really going to have to rise and then it's all going to hit the fan. And as I said, that's when the banks are going to fail. And next time the banks fail: if the Fed is doing the right thing – raising interest rates, then that means not only do the banks fail, not only do the bondholders lose money, but the depositors lose money.

Because if the government is having trouble paying its own debts, how is it going to bail out the FDIC? Where is it going to get that money?

So, there are tremendous losses and all we're doing now and all of our policy is designed to postpone the day of reckoning beyond the next election. That's all Congress cares about. "How can we get through 2012 without it hitting the fan?" And they don't care that the policies they're pursuing are making all the problems worse. And when we look at the economy, people say "Oh the economy is growing. Look at the GDP". The economy is not growing: we're spending more borrowed money. That's not economic growth.

Look at the debt. In the last few years, since Obama has been President, look at how the debt has skyrocketed. It's grown by much more than the GDP. So, all this consumption has been financed with debt. It's not real prosperity. It's phony. It's like looking at half of a balance sheet. You're looking at the assets and you're ignoring all the liabilities. Or on an income statement, you look at the income but not at the expenses.

We're not better off because the GDP went up, we're worse off. Where did the money come from? We borrowed it. And what do we do with it? We spent it on consumption. We didn't invest it. We don't have more plants and equipment. We blew it. The government spent it.

The bubble that we had as a result of the cheap money that the Fed created in the 1990s, that inflated a stock market bubble. When that bubble burst, instead of letting the market correct the problem, they deliberately gave us more stimulus and that created the housing bubble. When that bubble burst, again, instead of sucking it up – "Gee, we really screwed up after the last bubble. Let's do the right thing now. Let's let the market run its course" – instead of doing that and taking the more painful recession, which was now necessary because we didn't take our medicine the first time, they did the same mistake and now they're inflating a government bubble.

The government bubble is bigger than the housing bubble. It is bigger than the stock market bubble. It's going to burst. It's no more sustainable than the previous bubbles and you can see it in the bond market, you can see it in the currency market. But the real crisis that's coming as a result of the fact that we no longer have sound money, that we've been printing all this money and that we've created all these huge imbalances, there's a sovereign debt crisis, a collapse of the US government bond market, a collapse in the dollar on a much grander scale than we now see playing out in Europe.

And if you remember when the housing market first began to crack, when the signs first showed up in the sub-prime market, everybody, all the experts, from the Administration down to Wall Street, was on television reassuring everybody not to worry, that it was all contained, that it was just a sub-prime problem, "Tiny little problem. Don't worry about it. The market is sound."

Of course, at the time I was saying "That's not true. It's not a sub-prime problem." It was a mortgage problem, that we were just seeing the symptoms first in sub-prime. But the symptoms were there. And it wasn't even about contagion, about spreading. Everybody was already sick. It was just a matter of time before the symptoms showed up. Well, the thing is happening with sovereigns. This is not an Italian problem, or a Greek problem, or an Irish problem. It's a debt problem. And we've got more debt than Europe. Just because we can print money and we have the world's reserve currency doesn't mean that we're immune from these laws.

Right now, I think, is the time in history when the sovereigns are being held accountable. Just like the Italians or the Greeks have borrowed more money than their citizens can repay, the American government has borrowed more money than Americans can possibly repay. And we're not going to pay off the debts by raising taxes on the 1 percent. We can't even do to it by raising taxes on the 99 percent. As if we can even extract all that revenue. It's going to have to come through a restructuring, it's going to have to come through a default, one way or another. And there's two ways that that can happen.

We can legitimately default: Congress can level with its creditors and say "We're not going to pay you a hundred cents on the dollar on these Treasuries." It can level with people who expect a government pension or a Social Security check and say "Look, the money's not there. We can't pay you everything that was promised." They'll come up with some way of means testing, they'll come up with something so we can make do with less. Or we're going to inflate the currency into oblivion. And it won't just be "not worth a Continental", it'll be not worth a Federal Reserve Note.

Because one way or another, the people who loaned money to Americans are going to lose. The savers are going to lose, the creditors are going to lose. Either they're not going to get their money back, or the money they get back isn't going to have much value. But the problem is, the longer we wait the worse it's going to be for everybody and the more damage we're doing to do to our underlying economy. Because, the longer we allow these malinvestments to build

up, the bigger the impact when they collapse and the harder it is to restore balance.

And part of that would be going back to sound money, going back to a gold standard. I'm confident that the world is going to go back on a gold standard. The question is how much longer is it going to take and how high is the price of gold going to be when that happens. But if we go back on a gold standard we'll have discipline again in Congress. Because Congress won't be able to spend money unless they can extract it from the taxpayer. They're not going to be able to print money. They're not going to be able to run all these trade deficits. If we want to import, we're going to have to export. If not then we're going to have to settle our accounts with gold and if we can't mine the gold then... And so that's going to bring everything back into balance. And the longer we wait to do it, the more mistakes we make in the interim, the harder it's going to be.

And the real threat to our liberty is that this real crisis that's coming and the economic collapse that's coming, the financial crisis is going to be much worse than 2008. The problem is, all these problems result from government. They result from government meddling in the economy. All these distortions that the regulations, the subsidies, and the money printing create.

But the government is very successful in blaming capitalism for the problems it creates. It mixes capitalism with socialism and then it causes a problem and they say "You see, capitalism doesn't work, we need more government." And then you get more government and then you get more problems. Well, this is such an enormous problem that we might end up with total government and completely change the fabric of our country.

So I think it's very important that as many people in Congress as possible – and that's where you guys can come in – understand the root cause of this problem. It's not that we have too much freedom and too much capitalism but the reverse. Capitalism doesn't work when government distorts it and interferes with it, tries to micromanage it. That's where all the problems come from. The solutions are going to be in the market. It's not going to be more government, it's less government. It's rolling back all these rules and regulations that are distorting the market and returning to sound money.

And if we do that we're going to have real economic growth, we're going to have real prosperity. We might have to suck it up and bear some pain. Just like you can swallow some bitter tasting medicine. It might not taste good, but if it works you've got to do it. But denying

that you're sick or covering up the symptoms while you get sicker is not the way to go. But that, unfortunately, is what we're doing now.

Anyway, let me just open it up to questions. Yeah.

QUESTIONS & ANSWERS

QUESTION: Can you talk a little bit about your views on unemployment insurance and if the structure of the economy and our work force is changing? Do cyclical and structural unemployment factor...

SCHIFF: Obviously there's an economic truism that you're going to get more of what you subsidize and you're going to get less of what you tax. I mean, if you pay people not to work, people are going to take you up on it. I mean, I did it myself.

I remember the one time in my life I collected unemployment benefits, I did not look for a job until I exhausted my benefits. I was in my twenties and I was living in Southern California and the weather was great and I liked the beach and I liked that better than working. And if I can get paid for lying on the beach – as long as I had enough money for gas and booze – it was fine with me. There are a lot of people today who are doing the same thing. I mean, it's not wrong, it's human nature! And if you can collect unemployment for two years, man, that's a lot of time on the beach.

People forget that leisure has value. People would rather not work. People save up so they can retire. Well, you can retire early now on unemployment. A lot of people say “That's ridiculous. It's only \$300 or \$350 a week.” True. If somebody offered an unemployed person a \$100,000 a year job, they'd probably take it. But what if the only job they're offered is only \$400 or \$500 a week? They probably won't take it. They'd rather have unemployment. Because it's like a huge tax on getting a job. The highest marginal tax bracket is faced by someone who's collecting unemployment. Because, not only does he have to pay taxes on what he earns, he loses all of his unemployment benefits. So the tax rate is enormous.

And what people forget is when you get a job, you don't get to keep all of your income. There's a lot of expenses that the IRS won't want you to deduct. What if the job that you get offered is 45 minutes from your house? What's it going to cost you in gas money to get there and back? And maybe you have to eat in a restaurant, maybe you have to wear a suit, maybe you have to go to a dry cleaner. What if you have a kid? What if you have to put your kid in day care? How much is that going to cost? So, it's so much easier just not to work.

The more lucrative we're going to make it, the more people aren't going to work.

I've talked to plenty of people, small businessmen, who've told me they can't find people to work. And if they find anybody, they're only willing to work if you pay them under the table. Why? Because they don't want to give up their unemployment benefits. There are people in my family, right now, who've told me – in my family! – that they're collecting unemployment. That's their job. But when I did it, when I had to do it, I actually had to go down to the unemployment office and pretend I was looking for work.

And I remember, I used to actually go, because I was afraid that the government might catch me. So I actually went and met with ... I dropped off some resumes, I made a little log, so I could at least look like I was looking for a job. But I didn't want one. I just wanted the unemployment benefits. But I at least had to pretend that I was looking. Today you don't even have to do that, today you don't even have to look someone in the eye and lie. You do it all online. You can just be in South America collecting those unemployment benefits. Because they go a lot further if you go down to Costa Rica. The money is going to go a lot further if you're lying on a beach down there.

So, yeah, I mean, it's a racket. But the politicians love it. The unemployed, "Yeah, extend those benefits" because they'll vote for whoever extends them. And of course part of the problem is we've got all these illegal immigrants coming in. Who's going to take those jobs if they can get unemployment benefits?

I mean, we shouldn't even have mandated unemployment insurance. If someone wants unemployment insurance let them buy it. I mean, you buy car insurance, you buy health insurance, you buy fire insurance. If you want insurance against losing your job, just go and buy it in the private sector. It'd be there if the government didn't provide it. At least then it would make more sense, you'd have market setting premiums and people who wanted it could buy it. It would have different incentives; it would probably pay off in a lump sum if you lost your job.

But now we give people all kinds of incentives not to work. We pass laws that make it illegal for people to work. Probably the dumbest law we've passed is the minimum wage law. But everybody in Congress just loves it, because they can pretend "Oh, it's terrible! Nobody should have to work for \$5 an hour, so let's make the minimum wage \$7.50." But what does that mean? It means if you're not worth \$7.50, it's actually illegal for you to get a job. And it's not just \$7.50. Actually, you have to cover all your payroll taxes, other

fees, mandates. And of course, there's a lot of legal liability that comes with being an employer. So an employer has to assign that value. Because the minute you hire somebody there are a million ways you can be fined or sued.

If the government doesn't like the way you're hiring people, they'll sue you. If they don't like the way you're firing people, you can be sued. So it's very risky, the government has made it very risky to hire somebody. So a lot of people have made a rational decision not to hire people. Or, to hire as few people as possible. Or, if you have to hire somebody, hire in another country, where you don't have all these liabilities. So, if we got rid of that minimum wage law and also got rid of all these unemployment benefits, a lot more Americans would have jobs.

How can it be? Look at all the stuff that we're importing. Yet we have all these unemployed people. One of the statistics I – this is ridiculous – we import 90 percent of our seafood, 90 percent of it. We're surrounded by oceans, we've got all these lakes and we got all these unemployed people. You don't think they can fish? Just pick up a rod! But why aren't they doing it? They don't have to.

So, we have to get rid of all these rules and regulations, that are making it illegal to work, that are making it expensive to hire people. Because people forget where jobs come from. I've hired a lot of people. Why did I do that? Is it because I'm a humanitarian and I just want to create jobs? No, I want to make as much money as possible and I figure I can make more money if I hire people. That's the reason jobs are there, because someone wanted to make money. And they hire somebody to make money. But the more difficult the government makes it, the more expensive the government makes it to hire people; the less likely it is that somebody is going to do it. If I'm going to hire people and I'm going to lose money, obviously I'm not going to do it. So, you have to have more profit, more opportunity.

And, of course, the other thing you need is capital. I can't hire workers if I don't have any tools to give them, if I don't have any equipment to give them. Where is that all coming from? That comes from savings, that comes from underconsumption. The government keeps talking about “We have to raise taxes. We have to raise taxes on the wealthy. Because they're not the ones spending money. If we just raise taxes on the wealthy, they'll just have less money to save.” Yeah! Which means they'll have less money to invest, which means they'll create fewer jobs and we'll have a lower standard of living. So if the politicians that are saying “We need more jobs,” if they really understood where jobs come from, they would understand that they

need to reduce the regulations and that they need to reduce the taxes on the people that create those jobs.

QUESTION: One argument that I've heard over and over again about the gold standard is that there's not enough gold for the money that we've printed. Do you have a rebuttal for that?

SCHIFF: Well, not at this price, there's not. The gold price will just have to go up, that's all.

But the idea that there's not enough gold in the world is ludicrous. It doesn't matter how much gold there is. Prices are just going to adjust to the gold that exists. Money needs to be scarce, that makes it valuable. If it was plentiful, if there was all the gold that we needed, then it would have no value. What makes it rare and valuable is that it's scarce. And if you look historically, the gold supply increases by maybe one or two percent a year. That's it. That's pretty predictable, pretty consistent.

And it works great. I mean, we had the industrial revolution on a gold standard. People that say "The economy can't grow on a gold standard" – our economy grew more on a gold standard than since we left it. If you look at the standard of living of the average American from, let's say 1800 to 1900, and compare the way the average American lived and the way he lived at the end of that century, and then compare that to the changes we made since we've been on the fiat standard, it's a much bigger difference. The standard of living grew a lot faster. Imagine how much wealthier society would be, how much less we would all be working, how much more prosperity and leisure we would all enjoy, if we would have continued on the gold standard for the twentieth century. Instead we went off it and we sacrificed a lot of economic growth in the process.

QUESTION: If you operate on the assumption that Washington writ large basically keeps doing what it's been doing, rather than do the right thing and just keeps progressing the way they've continued to progress, how do you see events unfolding? Obviously, you alluded to larger financial crisis, but how does that manifest itself in a world where you have a Ben Bernanke and members of Congress determined to do their best not to let nature take its course?

SCHIFF: Eventually it just has to happen, because the numbers are just so large. Just like the people who were buying houses using a teaser rate on their sub-prime mortgage. The problem was, the teaser rates expired and they couldn't afford the higher payments. Well, we've got the same thing.

I think, about 40 percent of the national debt matures in the next year. That's a lot of money. That's six trillion dollars – I don't know

the exact amount – but it's two to three times what the government collects in taxes. How can we possibly pay that off? Well, we can't! And the idea is that we don't have to, because we'll just borrow the money. Well that's the same idea that Bernie Madoff had. And it worked for a while for Bernie, but it didn't work forever.

We're not going to be able to constantly roll this debt over. Not at near zero percent interest. Eventually our creditors will want to get paid. And we can't pay. And then, we're not going to have a crisis until it's forced – we're not going to do the right thing until there is a crisis. So we're not going to preempt it.

But we had this phony crisis with the debt ceiling crisis, when we refused to raise the debt ceiling. The real crisis is when the lenders won't raise the lending ceiling. And in fact, we actually admitted to our creditors how much trouble we're in. We said: "If we don't raise the debt ceiling, we're going to default." That's what we told them. We told them we were running a Ponzi scheme. We didn't say that if we don't raise the debt ceiling we're going to raise taxes so we can pay our debt. Or that we're going to cut Social Security spending or military spending so that we can honor our commitments. We said: "If we can't raise the debt ceiling and borrow more money, we're not going to pay off the people we borrowed money from." So, we told our creditors that they're the little man on the totem pole. So they already know this, but at some point they're no longer going to be buying this debt. The Chinese are going to wake up.

They're going to stop buying this. People think that the Chinese are going to throw good money after bad indefinitely, that they've got two trillion in Treasuries that they can't afford to lose, so they're going to keep on buying. Well, pretty soon they're not going to be thinking of the two trillion they have, but five or ten trillion they're going to buy if they don't stop. Might as well lose money on two trillion than lose money on ten. So at some point they are going to wake up.

And their economy is going to boom the minute they stop doing this, that is the biggest irony. You have American politicians beating up on China for manipulating their currency, but the benefactors of that policy are not the Chinese, it's the Americans! We get to buy stuff for cheap. We have all this stuff that the Chinese are sacrificing. If the RMB went up, the Chinese would be buying all this stuff, not us. They would have the fruits of their labor, instead of just the labor, and we get the fruits.

Now, long-term the Chinese aren't doing us a favor, because they're helping to undermine our economy. But in short-run we have

a higher standard of living, because it's financed on the backs of people in China working in factories and not getting the full benefit of what they produce.

But, the way the crisis is going to come: we can't borrow any more money and the Federal Reserve has to print, they have to do QE3 or QE4, or maybe they won't call it anything, they'll just do it. And then prices will really start to rise much faster. I know prices are rising, for food, for energy. Look, I just got my health insurance premiums from last year and my initial increase was 19 percent. Now I had to shop it around to get my increase down to 12 percent, but that's just in one year for the same coverage. But it's health care, it's college tuitions that are going up; prices are going up. The only place they're not going up is in the CPI.

I wish I could buy the CPI. But unfortunately I have to buy real things and they're getting more expensive. But at some point they'll get a lot more expensive and the government is not going to be able to pretend it doesn't exist. The dollar is just going to collapse. Right now, Europe is temporarily buying us some time, but it's going to be very expensive time because it's enabling us to go deeper and deeper into debt.

But again, where is this debt going? It's going to finance more government. The government bubble is worse than the housing bubble, it's worse than the dot-com bubble. Because at least, in the dot-com bubble we got a couple of companies that had value. At least in the housing bubble we got houses. We might have spent too much money on it, but they're there. The crazy thing is guys like Alan Greenspan who argued for burning them. He wanted to destroy them so we would have no benefit whatsoever from the housing bubble. At least we got houses. But what are we getting from the government bubble? We're not getting anything. More bureaucrats. We're getting more consumption, more spending. So this is the biggest bubble of them all. And it is going to unravel.

The question is what is going to happen when the dollar really starts to collapse and prices start spiraling out of control. What are we going to do? Are we going to do what Nixon did and put in wage and price controls? We probably won't need wage controls because wages probably aren't going up. That's the one price that probably won't rise. But the price of everything else is going up, which is going to be particularly problematic.

You know, a lot of economists make the incorrect assumption that you can't have inflation without rising wages. Oh yes you can. It's just a lot more painful when the wages don't go up. But employment costs

go up. Maybe not wages, but other costs associated with employment. But, people working doesn't create inflation. In fact, people working helps bring prices down. It's people not working that makes prices go up. Because prices are a function not just of demand, but of supply. People working creates supply. When they're not working you have less supply.

And also, what happens is, when the dollar crashes the supply of goods in America goes down because we can't afford to import. In addition, we export less. So, what happens is, capacity comes down. You can see that now in the airlines. The airlines are raising prices even though fewer people are flying. How are they doing that? Because they're reducing capacity and they're going to have to reduce it a lot more and air prices are going rise dramatically in the next few years, even though fewer people are going to fly. Fewer people are going to fly, but they'll pay a lot more.

The same thing is going to happen as we're starting to export more refined gasoline now. That's more and more of that that's going to happen. So even as Americans are using less and less gas, they'll pay a lot more for the gas they use. Because the supply is going to be less, because a lot of the gas that used to be here is filling up a car in China. And that's going to be even more dramatic once the Chinese RMB goes up. Once the Chinese let their currency go up, everything goes on sale in China. So the Chinese will buy more of everything. Well, where are they getting all that stuff? It's the stuff that we used to buy, but that we can't afford anymore. Because, if the prices go down for the Chinese, they go up for Americans.

So, this whole collapse is coming. And if we want to do anything about it, we have to recognize what the fault is and then we have to start dealing with the real cause of the problem: which is Big Government, all the regulations, all the taxes, all the spending. And we can't just talk about cutting taxes, we've got to cut spending. That's the tax. The cost of government is measured by what it spends, not what it taxes. Because all government spending has to be paid for, one way or another. And either they're going to pay for it through taxation, or through inflation. Now, temporarily they can borrow, but that either means that they're going to have to raise taxes in the future or raise inflation in the future. So ultimately, they can either tax or inflate, but that's it. So that's the cause.

But when people talk about "Hey, we've cut your taxes", but they have these huge deficits, they haven't cut our taxes at all. If government is more expensive, we're paying more to support it, one way or another. The politicians can lie about it when they run the

deficits, but ultimately we're going to have to pay. So we have to shrink the government dramatically if we're ever going to get out from under this mess.

The only reason this phony economy works now is because we can borrow the money to sustain it, because the world will take our paper for their stuff. But when that stops we cannot function, this economy cannot function with this level of bureaucracy. We're going to have to make some deep rooted changes. And they're obviously going to have to come from here.

QUESTION: Kind of a two-part question. First, it's good that the Austrian School is starting to get more attention nowadays, but for a long time it was more in the public's view sort of an intellectual battle between Keynesians and the Chicago School. So, what do you say to the suggestion that the Chicago School could be very, very dangerous, because they essentially preach the free market except when it comes to currency and debt, and then, when something goes wrong, the Keynesians say "look, the free market doesn't work"?

SCHIFF: Yeah, I mean, it's a bad comparison. You give capitalism a bad name when you preach it but don't really practice it. That's what's happened. I think you really have to start to look at the Austrians who have a much better explanation for what's happened, and a much better understanding.

But the problem – and the reason why Keynesianism is so popular here on the Hill – is it's exactly what the politicians want. Keynes gives them a reason to do what they wanted to do anyway. Because it's so easy to just spend government money. And if you can argue that it's going to grow the economy [inaudible]...and where you can often destroy their arguments, like they're saying we have to extend unemployment benefits because it's going to help the economy, how is it going to help the economy? "Well," they say, "because the unemployed are going to spend the money." Well, if just printing up money and giving it people to spend grew the economy, why just limit it to the unemployed? Why not give the benefits to everybody? Then we'd have even more growth. And why not double the benefits? Then we'd get double the growth. Why not triple them, quadruple them? Why not give everybody a million dollars? Then, at some point they're going to say, "Well, that's too much." "Well then, what if we do a dollar less. Is that too much?"

You see, it never works, because whatever the government gives the unemployed, it has to take it from someplace else. The government has nothing, all it does is redistribute. So it's not going to help the economy, it's going to hurt the economy. Apart from the fact

that it subsidizes people not to work, so the economy is deprived of the labor and the output that would have otherwise accompanied that work – instead somebody is idle – but when you transfer money around, you're lessening economic growth. The deficits that we create to pay for those unemployment benefits are going to do more damage to the economy than whatever benefits you get from spending those unemployment checks.

So, it's easy to critique that, but the Keynesian view is the more politically popular. And that is the problem. Everything we need to do that are good for the economy, are bad politics, and everything that's bad for the economy is good politics. Among the people who understand that government is the problem, a lot of them still want their Social Security benefits. They want a lot of stuff from the government and they don't realize that the government doesn't have the money.

QUESTION: So when this collapse does occur, is there any country around the world that will fare better? Or how will America fare relative to other countries?

SCHIFF: I think the countries that have the most to gain are the countries that are bearing the lion's share of the burden of supporting us. So, if you look at the countries that are amassing enormous foreign exchange reserves, particularly in dollars – countries that have these huge sovereign wealth funds – these are the countries that have the most to gain, because they are paying the lion's share of the subsidy.

America gets a huge subsidy. A lot of people will be able to conceive that Americans live beyond their means. We buy a lot of things that we didn't produce, we borrow and we spend. So, we live beyond our means. Well, that's only possible because other people are content to live beneath their means. Well, the people who've been living beneath their means, when they don't do that anymore, they're going to see big gains.

The Chinese for example, when they allow their currency to rise, all of a sudden the Chinese are going to be able to afford a lot of things that today are out of their price range. And so the Chinese are going to see a big increase in their standard of living. At the same time we're going to see a corresponding decline in ours, because now we're not going to have these things. And if an American wants to buy something made in China, maybe he's going to have to pay three or four or five times as much money.

QUESTION: And then, as an individual, is there anything you can do to lessen the blow for yourself in this situation?

SCHIFF: Well yeah, as an individual, you can recognize that the dollar is going to lose value and so you don't save dollars. And that's part of the problem. We need savings to grow the economy, yet you'd have to be a fool to save dollars. So we can't get the savings that we need if we're chasing capital out of the country. But you can buy gold, you can buy silver, you can invest overseas, you can have foreign currencies, you can have stocks abroad, in economies that are going to improve when this dollar at the center of the global monetary system comes to an end.

This is the problem. We have polluted the entire global economy. We export our bad monetary policy. Because the dollar is reserve currency, everybody is trying to maintain a parity in relationship with the dollar. But instead of being a force for good and stability, we're a force for instability and recklessness. Because it's a race to the bottom. We're disrupting the entire global economy. We are at the epicenter of these massive global imbalances that are the real root causes of the problems and the booms and the busts. But when that ends, the world can collectively breathe a sigh of relief.

But it's going to be difficult in America to get used to actually having to live within our means. Because then we'll have to acknowledge how dramatically our means have been diminished, over the years. And as I said earlier, if we're going to restore our economy, we can't do it with all this government. We never could've produced the wealth we once had if we had all this government. It's the absence of government that allows us to be productive, it's freedom. That's what we need. If we want to help people we need to give them more opportunity, more freedom. And we don't get that by passing laws, we get that by repealing laws.

QUESTION: I had a question about convertibility, because the American history textbook explanation for us leaving the gold standard is that other countries, particularly France, converted *en masse* our debt into gold. Can the United States, if we go through an organized default rather than letting the markets tear us apart, be the only economy that switches back to a gold standard if there's that risk of convertibility? Or, if the dollar skyrockets, how will we export?

SCHIFF: Well, the way we exported before. Just because you have a strong currency doesn't mean you can't export. In fact, if you have a strong currency, it diminishes your capital costs, you have more savings, you have more investment, it diminishes your raw material costs, it makes imported components less expensive. It

means you don't have to give as much in wages, because your workers are getting wages in a higher purchasing power. They don't need a nominal [inaudible]. So there are a lot of benefits.

But yeah, if we were to be proactive and admit right now, "OK, the country is broke. Let's restructure on our own terms. Let's figure out what we have to do." Because as I said, we need higher interest rates. That is the only way we're going to solve the problem.

But we have to acknowledge that if interest rates go up, this whole phony thing collapses. Which is, of course, a good thing, because the sooner this economy collapses the sooner we can build something real in its place. But everybody is so afraid of the short term consequences that they want to postpone it as long as possible. Which means it's not going to be on our own terms. It's going to be a crisis that hits us from abroad.

If we do it ourselves, if we preempt, it still is going to be painful; but it is not going to be as painful. It'll be a lot better. And, of course, a lot of the pain is not going to be uniform. The pain is going to be felt principally on people who are living off the government. The people who are getting checks from the government will be getting smaller checks. Or in some cases, no checks at all. We're going to remove the burden off of the backs of the American public. So it's not like I'm going to talk about austerity. Austerity for who? Not the people paying the bills. The people riding in the wagon are getting austerity, not the people pulling it. They're going to get some relief. Which is what they need.

But, some of the things that we can do, as far as getting government out of the way, will have such immediate benefits. If we got the government out of education and out of student loans, tuitions would plummet. All of a sudden, college wouldn't be such an insurmountable expense. Families wouldn't have to worry about saving for college, because it wouldn't be so expensive. And maybe not all their kids would go. I mean, now everybody goes to college, even when you've got no aptitude for it whatsoever. What's the point? What's the point of sending a kid to college so he can party it up for five years and get drunk, and then graduate with a lot of debt and no skills, no knowledge? What if we got government out of health care and all of a sudden medical costs would collapse. Isn't that a good thing if it doesn't cost so much to go to the doctor, if it doesn't cost so much if you get sick?

So, there are a lot of things where, if you just get government out of the way and you get free market efficiencies in, you get an immediate benefit. Now, who does that hurt? Well, someone's going to

hurt. If tuitions come down, some overpaid administrators at universities are going to earn less money. Oh well. And some people working at universities are going to lose their jobs. OK, then they didn't need those jobs and they'll have to do something productive. And if they do something productive, we're all going to benefit. The more people employed productively – everybody benefits from that productivity. The more people that are doing things that they shouldn't be doing because of some government subsidy, we're all made poorer as a result.

So, it's not going to take that long, if we do all the right things. It's like ripping off a band-aid. If you just rip it off it doesn't really hurt that much. But if you peel it off slowly, then it hurts. So, if we just get rid of all this government, and bring back freedom, there is not going to be that much suffering – not long. Some people, sure. People who thought they were going to retire on Social Security, OK, they're going to find out that that's not going to happen. They have to work, they have to save their money. But, they're not going to get Social Security anyway. So, let's deal with it now, instead of paying them off in worthless money. What good is that going to be? Because that's the end result.

But, not only do the politicians not have the integrity to do the right thing, most of them don't know what the right thing is. Hopefully we can educate people. There's got to be somebody in Congress, other than Ron Paul, that actually cares about the country. And a lot of times when the Congressmen think, “Well, I can't do that, that's too big of a risk.” Well, what's the risk? That you don't get reelected? What's so terrible about that? There are people that risk their lives on a battlefield for their country. You can't risk not getting reelected? Big deal!

So people have to understand. And this is a very pivotal point in our history.

*P*ART 2.

THE FEDERAL RESERVE SYSTEM

IV. WHY WAS THE FED CREATED?

DR. GEORGE SELGIN¹³
PROFESSOR OF ECONOMICS
THE TERRY COLLEGE OF BUSINESS
UNIVERSITY OF GEORGIA

MODERATOR: Good afternoon everyone. I am Paul-Martin Foss, Congressman Paul's Legislative Assistant for monetary policy and on behalf of Congressman Paul and his office I would like to welcome you to the first lecture in our second series of tea talks.

The first series of lectures dealt with money, what it is and how it came to be and the second series of lectures will build on that and explore further issues in money and banking by focusing on the Federal Reserve System.

Today's lecture will explore the issue of why the Federal Reserve System was created and we are pleased to have with us today to explain this topic Professor George Selgin, professor of economics at the Terry School of Business at the University of Georgia. Prof. Selgin is a renowned expert on money and banking and the author of such books as "Bank Deregulation and Monetary Order," "The Theory of Free Banking," and "Good Money." In the words of Don Boudreaux, professor of economics at George Mason University, quote: "there is today no finer, more informed, more thoughtful, more learned, and more eloquent scholar on issues of money in banking than George Selgin" unquote. So without further ado I present to you Professor George Selgin.

SELGIN: Thank you for that very nice introduction. I will see Don Boudreaux this evening and I'll thank him for it as well. Thanks to all of you for coming on such a beautiful day it's hard to compete with the sunshine, but I at least can hope to fulfill my charge, which is one of enlightening you about the origins of the Fed. It's tempting in a talk on that subject to want to go way back, at least to the days of the First and Second Banks of the United States or perhaps further back to the founding of the republic and the constitutional clauses that concern money and banking or even back to the Bank of

¹³ [The video of the lecture may be found at: <http://www.youtube.com/watch?v=JelljifA8Ls.>]

England, which after all is the crucial precedent for all modern central banks.

But we don't have time for that kind of thing, so I'm going to settle for taking you briefly to the period just before the Civil War to talk about what the banking system was like back then. And I'm going to do so by first pointing out to you that there's a lot of myths about what banking was like in the days prior to the Civil War, but after the demise of the Second Bank of the United States in 1836. The myth concerns the claim that banking was a fly by night, unregulated industry, and that the consequence was a lot of wildcat banking with many bank failures and so on.

The truth of the matter is that, first of all, the banking and currency system of that day wasn't very good. It wasn't quite as bad as it's made out to be, particularly by the outbreak of the war, but it wasn't very good. Not because there was no regulation, although it's true that there was no federal regulation, but because States did regulate banks and often regulated them in heavy-handed ways. For example, the most common cause of bank failures during that time, and there were plenty of them, turns out to be state regulations that variously required banks in the States in question to buy specific assets. Usually consisting of the bonds of the state governments in question to back their notes and then engaging in such reckless fiscal policies that the bonds became worthless. That was the most common cause of bank failures. In other words banks failed most often because they were forced to buy assets that turned out to be junk.

Another criticism of the old pre-Civil War system, which is true, is that the currency was not uniform. That is if you took a note from any bank in any part of the country, say any state, and traveled far from that state perhaps not very far even to a neighboring state in some cases, that note would no longer be worth its full face value in gold or silver. It would be worth something less. And this was also related to regulations. In this case the fact that the vast majority of banks, almost all of them, were not allowed to branch by their statutes or by their incorporating laws. And as you know it would be another hundred years before banks could generally branch, especially nationwide.

So that was the most common... the most basic cause of non-uniform currency because it meant that, well, it was costly to bring a note back to its source to get gold or silver for it and you could only get gold or silver for the full value at the source. Those costs were reflected in the various discounts from face value that these notes were subject to.

By the way, the non-uniformity was not as bad on the eve of the Civil War as you might think. I know this because I actually went through the trouble of finding out the exact value of notes every bank had outstanding in 1863. I think October was the last year for which I had the relevant statistics. I left the south out because the southern banking system by then was in shambles. I took all of the notes of the union banks, figured out what value they had outstanding, figured out what they would have been worth in Chicago or New York if you sold them to a broker and calculated the total discount from face value. Suppose I had bought all those notes in 1863 at full value and then tried to sell them in New York or Chicago it doesn't matter where. What would my percentage loss have been, anyone want to guess how much I would have lost? Ten percent, twenty, eighty? Less than one percent.

So, you heard a lot of stories about how bad things worked, they were bad, but it wasn't because of lack of regulation it was because of bad regulations and they weren't that bad. In any event during the Civil War there's some major changes made to the US currency and monetary system, two of which are especially important for us, well one really, the other important one is the greenbacks. The US treasury gets in the business of issuing its own currency we go off the gold standard that's temporary, the greenbacks will be around for a while and then they'll be gone. So they don't have much of a role ultimately in the emergence of the Fed.

The other change that is of more enduring significance is the establishment of a new kind of federally chartered bank, national banks. They still exist now right, the national banks you see with that name in their title and many others that don't have national in their title. This is... this marks the federal government's re-entry into the banking business, but this time unlike in the past it charters lots of banks not just one at a time.

Now, here's what significant though about this new national banking legislation or national currency legislation. As a condition for issuing currency and in those days a bank could hardly survive if it couldn't float its own circulating notes. National banks have to back their notes more than a hundred percent with specially designated securities. Guess whose securities. This was during the Civil War anyone want to guess? Hmm?

SPECTATOR: The federal government.

SELGIN: Yes, thank you, bonds of the US government. So a bank could only issue notes if those notes were fully backed by US government securities, which securities would be held as collateral in

the event that the bank got wound up by the comptroller of the currency which was also created, an office created by this reform.

Now, what was the rationale of this currency setup? If you read the textbooks they'll often say well it was done to create a uniform currency. But that's not really true. First of all, as I mentioned the currency wasn't that non-uniform but the more important point is this measure was very obviously a revenue measure. They were trying to sell government bonds to pay for the war and by creating this new system of national banks they thought they had a way of creating... of making the banking industry, the banking system, forcing it to become a new market for federal government debt. As a matter of fact, at first the banks didn't go for it, that is the demand for national bank charters was very, very meager. And ultimately, they had to change the law in a number of ways but also they taxed the state banks out of the currency business with a ten percent tax.

Now this is all very significant because if it had in fact been true that the national bank currency was superior, as the textbooks would have you believe, then consumer preferences should have driven state bankers to convert en masse to national charters because the public would have demonstrated a preference for national bank notes and national banks that were established should have outcompeted the state banks. Nothing of the sort happened. In fact, it was only by forcing state banks out of the currency business that the Congress was ultimately able to create a widespread demand for the new national bank charter. State banks barely survived this measure and they eventually recovered by becoming pure banks of deposit that don't issue currency which is what all banks are like today, except the Fed.

Okay, so how did this measure for basically nationalizing the currency, how did it perform? Right, so after the Civil War state banks no longer issue currency. All currency other than the greenbacks comes from these newly established national banks. So was this a good currency measure? Well, we can ask that question two ways. First we can ask was a good wartime measure? And there the answer would have to depend on whether it did succeed in raising revenue for the Union. I'm not even going to answer that question, I'll let you... we can just assume, though some people have questioned this, that, as a wartime fiscal measure, the national currency and banking acts were a good idea but what I want to make clear is that as peacetime monetary reform measures, that is, as the basis for the foundation for a peacetime, economy and a peacetime banking and currency system the measures were disastrous.

And the reason they were disastrous had to do with the fact that, under this arrangement, the stock of currency or the only potentially variable component of the stock of paper currency is tied to the availability of government debt. One way to put that starkly is, imagine that the government retired all of its debt. What would be the maximum amount of currency the national banks could issue? The answer would be under this law none. And if it hadn't been for the greenbacks then, which would eventually be retired, people would have had no currency with which to make payments and in those days checks weren't important and needless to say there were no debit cards. Currency was the main medium of exchange that people relied on. Paper currency that circulated from hand.

So, in fact of course the government never did retire its entire debt but it came pretty close because after the Civil War, in starting in the 1870s, the federal government ran surpluses regularly year after year after year. Cool, huh? It doesn't do that anymore but in those days it did. And just as when you run a deficit the way you, a government deals with that is by issuing more debt in those days these regular surpluses were used to retire outstanding federal debt. So the government was throughout the period roughly from 1870 to 1900 or so, was reducing the number of its bonds outstanding, the federal government. But because of the currency laws enacted during the war when the government wanted to issue more debt and get somebody to take it, the stock of currency now could not grow. In fact, it had to shrink because the bonds that banks needed to back the stuff were becoming scarcer and scarcer and scarcer.

Also the rules for a bank to get new currency were such that quite apart from it becoming harder and harder over the years it was very awkward. In fact, it was entirely uneconomical for banks to get hold of bonds to secure more note issues only for the purpose of meeting temporary demands for currency for example during the harvest season. The harvest season back then was the time of peak demand for currency. You needed it to pay the people moving the crops who were mostly itinerant laborers who certainly didn't know anything about bank deposits and checks.

So, the currency was what people at the time refer to as inelastic. It couldn't adjust for the general growth of the economy. Instead it was tending to shrink and it couldn't adjust at all for short run changes in demand especially seasonal changes, harvest season changes. This inelasticity of the stock of currency in the US economy was the ultimate cause or crucial cause, not the sole cause, of a series of very serious financial crises during the last half of the nineteenth

century which were not accidentally known at the time as currency panics. Currency panics, because suddenly there wasn't enough currency to go around.

By the way, if a bank couldn't issue enough of its own notes, it had to part with gold reserves and that meant they would have to contract credit. So an inability of a bank to supply all the currency that its customers needed when they came to convert deposits in the currency, for example or if they needed loans would translate into a credit crunch. There were major crises of this kind in 1873, though that one had other elements as well, 1884, 1893 and 1907 and the trend was for them to get worse and worse.

Now, I have only one picture (Figure 2) to show you, but it's a crucial picture because it helps to drive home a very important point I want to make. Which is these currency shortages and crises were unique products of the way in which we regulated our banks, in the way in which we regulated banknotes, which prevented the supply of bank created currency from being at all capable of meeting the needs of the economy.

And what this chart shows, it shows two plots the smoother plot, which is descending for most of the period, and by the way the period at the bottom covers 1880-1900. The smoother plot is the left-hand scale and it starts at about three hundred million dollars and then descends to a little less than half of that by 1890 and you'll notice it doesn't have any saw-tooth pattern. The second plot is the one that's rising with the distinct saw-tooth pattern and it goes with the right-hand scale, which is similar to the left but about one-tenth the magnitudes.

Well, if I didn't tell you anything else about this chart except that both plots refer to two different economies and that the 1880-90s are periods of rapid economic growth in both and in both economies there is a significant harvest season where the demand for currency peaks in that season is roughly from August to November every year. Which country would you say has the more scientific currency system that seems to be adjusting with economic needs: the ones with the saw-tooth pattern or the one that's rising on the whole or the one that's shrinking with no saw-tooth pattern? It's a rhetorical question you don't have to answer. The right scale and the saw-tooth pattern are Canada's; the left scale is the United States with its bond-secured currency.

Figure 2

As you can see in the US... and we had rapid economic growth right the currency stock falls to... loses more than fifty percent of its value in the ten years of 1880 to 1890 and behind that decline is the fact that the Treasury's retiring the bonds that, because of old Civil War legislation, are supposed to back every outstanding national bank note. And the supplies you see has no seasonal adaptability; it's just not worth it to banks to take this stuff out if they can't leave it out given the costs of abiding by the regulations. Canada in contrast has a currency supply that seems to be adapting quite naturally to the needs of a growing economy with a substantial peak demand for currency every fall. Now, you might wonder what has Canada got here? Perhaps it has an enlightened central bank, regulating the money supply to make sure that there are no shortages. And by the way, Canada avoided all those major crises that were plaguing the US economy.

But if you thought that it was because of a central bank you'd be wrong. Canada didn't adopt a central bank until 1935 and if anyone wants to ask me later about the politics behind that decision I'm happy to answer. But in this period it not only has no central bank, what it has is a competitive and largely deregulated currency and banking system. Now largely deregulated. They had a charter system and entry into Canadian banking was restrictive. But they still had a couple dozen banks and they were allowed to branch anywhere and to back their notes with general bank assets. No special securities have to be purchased to back the notes. This competitive system with very little regulation, apart from regulation limiting total numbers of banks that were allowed into it automatically provided a fluctuating supply of currency that didn't grow excessively but adjusted according to changing needs over time both secular and seasonal and cyclical. It was a good system.

In contrast, as I pointed out in the United States, we had one crisis after another and everyone understood that these crises were due to the bad manner in which our currency system was regulated. And this of course led to calls for reform especially after the 1893 crisis. The reform movement that ensued after that went through two distinct phases; the first phase was something that has come to be known as the asset currency movement. The second phase was originally known as the reserve bank movement, but of course it was a movement to establish a central bank. I'd like to tell you about both phases of the currency movement because you can best understand how we turned to the idea of a Federal Reserve System by understanding why the alternative wasn't successful.

The asset currency movement took Canada in fact or a system like Canada's as its model for reform. It was essentially a program for deregulating banking and currency. It called for repealing the bond backing requirements that dated back to the Civil War and letting banks back their notes with the same general assets they used to back their deposits, in other words, no special collateral requirements. It also in some of its manifestations called for abolishing the ten percent tax that had been used during the Civil War to force state banks out of the business of issuing notes or force them to convert to national charters. Finally and crucially, the asset currency proposals mostly included proposals for allowing banks to branch not only within States but nationwide. They were a hundred years ahead of schedule in the sense that it would take about that long for similar legislative reforms to actually become successfully adopted.

Why did the asset currency people want branching? Because they understood that the reason why the Canadian currency supply could go up when it needed to by virtue of the lack of special bond backing requirements but also came back down when extra currency was no longer needed was the presence of a widespread system of bank branches. Each branch was like a little vacuum that would suck up excess currency when it was no longer needed as rival banks found it very easy and convenient to return items to each other the way they might today through a clearinghouse. So branch banking was seen as a way to make sure that banks, freed from special restrictions on their powers to issue notes were nevertheless forced by competitive forces with the help of widespread branch networks to mop up extra currency when it was no longer wanted by their customers, by the public.

Unfortunately, that branch-banking element of the asset currency reform proposals turned out to be the proposal's political Achilles heel. You see the fact is that something like a dozen different bills were presented in Congress all involving these reforms, asset currency measures. You can read all about them and they tried and tried and tried again, but they all failed because of opposition by special interests to branch banking. Opposition that I probably don't have to tell you too much about since it continued in one form or another as I said for another hundred years. But the basic political story was this - there were two groups actually who opposed these measures and one group that was in favor but outnumbered.

The group that favored asset currency was mostly Midwestern-city banks who saw these reforms as a way that they could spread

their branches and get a foothold on the banking business of the rest of the country. Of course the political economists were also behind these proposals because they thought that they would result in a more stable and crisis free monetary system. But opposed to them all and especially to branch banking were Main Street, of course, where the small independent banks thought that they would get crushed by larger banks spreading out from Wall Street and ironically Wall Street. Wall Street banks opposed it because under the unit banking system, the only way other banks everywhere in the country could get access to the New York money market was by using them as correspondents which was really good business. If those other banks could have branches in New York it would be kaput to the correspondence system and bad news for the Wall Street banks.

So, Wall Street lined up with Main Street and they voted down these measures. It was as a result of this that roughly at the time just following the Panic of 1907, attention shifts in the reform movement away from the asset currency idea, which fails politically towards the alternative of a central reserve bank or simply as we would call it today a central bank.

This movement starts with the establishment after the panic, of the National Monetary Commission, which is appointed to study alternatives and published its results like all commissions appointed by Congress it of course knows what it's going to conclude before the studies are actually conducted and it has been more or less taken over from the start by proponents of a central bank. The central banking solution, the solution that was ultimately embodied in the Federal Reserve Act, there is nothing magical or mysterious about it. Basically it boiled down to this: Instead of removing the shackles from the established national and state banks and allowing them to issue more currency free from the restrictions that had prevented them from doing so before, and also introducing branches, this new reform, the Federal Reserve Act in particular, will establish another bank or system of banks, that are uniquely privileged in not being subject to those restrictions and so when the other banks can issue currency they come like the little fellow in Oliver with a bowl to the Federal Reserve System and say please sire may I have some more.

In fact, the way this actually works is through the mechanism known as discounting which in those days meant this. Suppose you were a bank, a national bank and you want to issue more currency but there were no more bonds to be had to allow you to do that legally, or to be had at a decent price. Then you might have plenty of other assets on your balance sheet right like commercial bills. Under

the new rule you could bring the commercial paper to the Fed, they could discount it for you, which, meant buying it temporarily at a discount from face value, and then they would issue Federal Reserve notes to you. So what you have is a kind of asset currency except only these privileged banks right the twelve Federal Reserve Banks are allowed to produce the stuff.

It sounds like it should have the same results, as deregulating the other banks but it doesn't because the Fed is a monopoly and it's not itself subject to any competitive pressures. It makes all the difference in the world whether you have a few dozen banks all competing on equal footing issuing currency and then sending excess currency back to each other for settlement versus the central bank with a monopoly. When it issues notes nothing automatically brings them back. It has to take steps to bring them back. So, the problem with the central banking solution is, yes the Fed can get it right it can issue just the right amount of currency to make up for the lack of ability to do so by the other banks. It can also issue too little or too much and there's nothing automatically to prevent it from making those mistakes.

I want to say one other thing about the founding of the Fed because I can't help raising this point. I'm not a conspiracy theorist. I actually rather dislike conspiracy theories because I think that they are well, not parsimonious, mere stupidity explains plenty, you don't need to appeal to conspiracies and in fact conspiracies get it wrong because they assume that the people involved are all smart enough to actually know the consequences of what they're doing but, there was an element of conspiracy in the creation of the Fed, because Nelson Aldrich who was the Senator responsible for heading the National Monetary Commission, secretly did hold this meeting at Jekyll Island with a bunch of Wall Street bankers after promising that Wall Street was definitely not going to take this over. And those guys drafted the Federal Reserve bill and they would have kept it secret forever if somebody hadn't snitched in the 1930s, but the fact is that the actual shaping the Federal Reserve legislation was done by a bunch of Wall Street bankers and nobody on the actual commission had any role in it except Aldrich itself. That bothers me as a non-conspiracy theorist; it ought to bother you too.

But never mind. How did the thing actually work? Well in a word rather badly. How did it work with respect to prices? From the founding of the republic till the founding of the Fed, the price level had of course moved around a bit but actually it ended up more or less where it started. And it was very rare to have inflation of more than four percent or deflation of more than two or three percent, the

exceptions were periods like the Civil War when the gold standard was temporarily suspended. After the Fed's founding right from the get-go during World War I you have very rapid inflation. You may think that the 1970's were the worst past inflation rates for the United States of the twentieth century not so. There were some months between 1914-1920 when the monthly inflation rate translated to an annual basis was over twenty five percent. We didn't have anything like that in the 1970's. Prices then fell dramatically during the Great Depression under the Fed's watch, but then starting in the 1970's especially once the last link to gold was severed in 1971 the price level more or less became unanchored and now prices are roughly, oh I don't know twenty three times what they were at the time of the founding of the Fed some large factor. And ours is one of the better central banks on that score.

What about cycles? I have a paper with two colleagues one from Georgia and one from George Mason on how the Fed has performed. It reports all of these statistics that I'm summarizing here very quickly it's called "Has the Fed Been a Failure?" With regard to cycles and fluctuations if you go by the most reliable new statistics of output concocted by some very good economic historians, in particular Christina Romer, who you should be familiar with as someone who was the President of Obama's Council of Economic Advisers for a time, those statistics show the following: that certainly if you include the whole Fed period and compare it to the thirty years before the national currency period, the volatility of output is greater and the number of cycles and their average duration is higher. But here's what's really surprising. Even if you take out period between the two wars, even if you take out the great depression and the crisis in 1920-1921 there's hardly any improvement in the cyclical performance of the US economy, hardly any. In fact, if the recent crisis is fully factored in I suspect you could show that there's a slight deterioration.

Finally what about banking crises? The Fed would like to have you believe that it's solved the problem of banking crises. That's getting harder all the time of course but the reality is quite different. The number if ... we need to divide historical period here between 19..., sorry say the 1870's when the national banking system is up to the 1914 the founding of the Fed and then the next division 1934 which is when the FDIC is in place. If you compare the incidence of bank failures and crises of the first two periods, that is, the period without the Fed and the period with the Fed but without the FDIC, crises get worse not better. The number bank of suspensions gets

much worse not better. After 1934 the record starts to look better but it is evident that this is a result of the FDIC, not the Fed's presence, at least that's what the statistics suggest. And we can very well understand how the FDIC put an end at least for a while to bank runs and panics.

But until it was created, the Fed itself had a dismal record with regard to both things. Okay, so now what. I guess I should conclude and I'll be little ahead of schedule by saying that this all of what I've said to you doesn't necessarily mean we should end the Fed. What it means though, in my opinion, is that we should be doing, we should seriously consider doing, what people were doing after the Panic of 1907. Which is talking about whether you can come up with a better arrangement than the one you've got. We should have a discussion like that too. We should have another national monetary commission preferably one that doesn't already know the answer before it goes out and studies things. But what we need is an honest, serious discussion of whether the Federal Reserve System really is the best of all possible monetary systems. I frankly doubt it very, very much I see nothing in history that should compel us to take that view I think we could have done better than the Fed at least in theory if not politically back in 1913 and I think that it's quite possible that we could do better today. Thank you very much.

And now I am invited to ask you to ask me questions for another fifteen or twenty minutes and I'm very happy to try my best to answer them. Yes.

QUESTIONS & ANSWERS

QUESTION: I think that a lot of our bosses are concerned that the Fed's current policies will eventually lead to inflation. How credible do you think those fears are?

SELGIN: I think they're very real. I think it's very important though to distinguish between the risk of future inflation and the question of whether inflation is in fact the problem we should be fighting now. I know a lot of people who think the Fed should tighten more now, but I think that the idea of tightening in anticipation of a problem that hasn't arisen yet is a very bad idea. They tried that in 1936 and it didn't work well. But, as for the risk being there of a future outbreak of inflation, it is and it's very serious because the Fed created massive amounts of new basic reserve money during the crisis and its aftermath and those reserves are now sitting there in a banking system that for various reasons is not prepared to part with them. But as the economy recovers, which it seems finally to be doing there's a very, very great risk perhaps we shouldn't call it a risk but a

prospect that bank lending will be revived. That will leave the Fed with a major mopping up operation that will require not only its using every instrument it has at hand to try to see to it that excess reserves don't turn into excess spending and inflation but it also will need a great deal of political will to do the job that it has created for itself. So, this is something we have to really worry about. I've already seen evidence and you have perhaps too of the Fed jockeying to try and rationalize inflation. "Oh we're moving our inflation target up, oh well, the CPI is really biased." When you start hearing talks like that you know they're preparing the stage for making excuses when headline inflation starts to go well beyond what originally were said to be limits that the Fed would protect. Over here and then back there.

QUESTION: You said that the period that's up on that screen was a period of significant economic growth.

SELGIN: Yes it was, yes.

QUESTION: I've seen some statistics that would agree with that; however, doesn't that period also contain a large part of the Long Depression?

SELGIN: Ah, the Long Depression.

QUESTION: I was going to ask that... could you explain exactly what was going on...

SELGIN: Yes, sure.

QUESTION: Why it's referred to as the Long Depression?

SELGIN: Oh, that's a lovely question for me. So, there is this myth, I'll come right out and say it, of something called the Long Depression, which in the United States is sometimes said to have been a depression that lasted from 1873 to 1896 which would be this whole period and yet the statistics show a lot of growth. Interrupted by crises, as I've already told you. What's going on here? I'm afraid what's going on here is that some very naive people have assumed that because prices were generally falling during that period at a modest rate on average of perhaps two percent that therefore there must have been a depression because everybody knows that when prices are falling when there's deflation, that's depression. Well everybody knows it, but it ain't so. Because in fact throughout most of history most deflations, mild deflations, haven't been depressing at all. They've been periods of rapid growth where falling unit costs simply were allowed to be reflected in falling product prices. In other words, most stuff looked like computers look in recent history.

The exceptions were episodes famously the 1930's, 1920-1921, and of course the recent episode of 2008-2009 there. Those have been

exceptional cases where deflation was associated with depression. The theory of the Long Depression emerged after the Great Depression when political economists and economic historians got it into their heads that any deflation must be a depression and so they started writing about the Long Depression. They should have written about the long deflation. It wasn't in fact a long depression. And there are whole books, there is a book in fact it's been out there for some time, it's called "The Myth of the Great Depression" which is not about the 30s, it's about the so-called Long Depression. That book is mostly about England where the same false theories circulated because the same deflation was noted during the same time.

But there's a very good University of Virginia PhD dissertation dealing specifically with the American case. There was no depression, there were short depressions within that period but there was no long or first great depression.

Yes.

QUESTION: What banking reserve systems would you point to as better alternatives to ours?

SELGIN: Well I've already mentioned, I made a lot of hay about Canada and there's obvious reasons for picking on Canada, its geographical proximity, its having had closest trading relations. In many ways, apart from its much smaller scale, the Canadian economy sort of looks like the US economy and therefore it seems reasonable to think that a system that could do a good job there has a good prospect of doing a good job here. But Canada's was by no means the only example of a well working currency and banking system that avoided major crises. If I were giving this talk in England I'd be talking about the virtues of the Scottish system, which was again a less centralized system they had many banks issuing notes. Until 1845 they had hardly any restrictions on note issue and they had no central bank unlike England, which of course has central bank, which had many privileges, piled up in it and the remaining English banks were deprived of similar privileges. So the Scottish system was another good example a lot of work has been done on it. There are other examples too that have not been researched as much: Northern Ireland, Switzerland, but rather than go off into a long list of these other systems, I would simply say this, that any serious attempt to get a grip on our monetary system and its historical problems or to reform the system with something, by turning it into something better, has to be informed by a wide variety of historical experiences.

One of the things that bugs me about most American economists, monetary economists who write about money and banking in the

United States, is that the vast majority of them don't seem to know anything about the economic history, the monetary history, the banking history of other countries and so they cannot see the things that you can see if you just look. They can't see even what you can see from a simple chart like this. They've never looked. They think you can figure everything out that you need to figure out by only looking at one country. You cannot do that. You cannot do a good job. In its essence the National Monetary Commission was a good plan because it was charged with looking at all the different countries' experiences so as to find all the necessary clues to sound reform. The problem was that it was politically a set up from the start and as I mentioned the commissioners themselves ultimately played no role in shaping the actual legislation that was adopted. So it shouldn't be done like that. That is, instead of it just being a dog-and-pony show the research on countries should be taken seriously.

Yes.

QUESTION: You mentioned your fear over inflation but the other real concern over inflation, the other fear is that we end up in a Japan-like scenario, there are similarities there. [inaudible] extraordinary actions taken by the central bank, so are the comparisons between the United States and Japan clear?

SELGIN: Well I think that the Japan scenario is precisely the one that was worth worrying about these last couple years. But, I think as the recession ends it becomes less relevant, and less of a concern. And so I think that recovery of course is something we all welcome but at the same time it should cause a shift in our fears in a more inflationary direction. That is not because recovery causes inflation, this is the kind of talk that I really dislike, however, recovery in this case can mean a revival of bank lending that results in all these excess reserves suddenly being dispersed into the economy like so many hot potatoes and that could be very inflationary. Personally though I don't like to make forecasts I don't think the Japan scenario is in our future. I think the inflation scenario is something that might be. I can't imagine the Fed taking such aggressive steps to counter inflation should it break out as to bring us into a Japanese type deflation. I don't think that's likely either. I think if anything they won't do enough to stop the inflation.

Yes.

QUESTION: I have a question about the Canadian system during that period. So, it seems like every time there was a higher demand for currency during harvest season, the banks would sell bonds.

SELGIN: No they didn't have any bond thing going on. All they had to do was the simplest thing in the world, if I had blackboard I'd show you or I can even describe it. So the point of a Canadian bank is it has no special assets it has to be holding when it issues notes compared to when it has deposits outstanding. So imagine, you should never do this on camera all right. Imagine a balance sheet right and this is assets and liabilities and the assets are just commercial assets right. It could be some bonds there but whatever the banks like to invest in right, whatever they considered to be sound loans, investments. And on the other side you have deposits and outstanding notes. Here's the thing, if all the depositors came and said we don't want deposits anymore, we want notes, the banks would just switch the liabilities and it would have no other balance sheet implications, liquidity's the same, the reserve ratio's the same, they're just swapping liabilities.

That couldn't happen under the national banking system because a switch from deposits to notes, right, people moving out of deposits into currency meant that the bank was obliged to come up with more bonds on its assets side because the law said it had to have bonds for notes it couldn't have whatever assets it already had for its deposit and then there'd be a scramble for bonds. Or, if they're just too expensive, and by the end of this, you know 1890, they're commanding a thirty dollar premium over par, then the banks would say well, we just can't get hold of these bonds it's not worth it and then the customer would say, well give us some gold. They go, "please don't make us give you gold. Well, we need something and you're obliged to give us gold." And out would flow the reserves and down would flow the supply of credit.

QUESTION: So the key difference is the Canadian system didn't require getting new assets whereas the American system did?

SELGIN: Right, the Canadian system worked because it wasn't regulated, right. The Canadian... the American system didn't work because it was. But remember, and this is why I took things back to the Civil War. Why is this regulation on the books right? You're bound to ask that question, well because once upon a time we needed revenue, we needed to sell bonds to pay for a war. But it stays there. Think about that when you pass a law, right, it might stay around long after the contingency for which you design it has passed. Then what? Will it then be worth it? This one wasn't.

Yes, sir.

QUESTION: In a shift away from a Federal Reserve System, what are the implications for international trade and the

international banking system? The Federal Reserve note is an international reserve currency and our US treasuries are sort of a safe haven for international banking. So what are the implications and how will those implications differ from those of a US default?

SELGIN: Well, there really isn't an answer to that question because... there's many answers depending on what it is you're shifting towards, right? It's all well and good to talk about getting rid of the Fed, but it means nothing unless you talk about what it is you're going to put in its place. And unless I know what that would be, and I don't, right, I have written about... in that paper I mentioned to you we talked about some possible alternatives, some which would involve going back to a form of gold standard but some which would not, but every one of those alternatives has... provides... implies a different answer to your question, which is a great question. But the more fundamental question is what would we replace the Fed with if we moved away from it and I'm afraid that we won't have time to cover that ground.

QUESTION: One question, could you go into explaining why Canada decided to move to central banking because even proponents...

SELGIN: Oh, you remembered that.

QUESTION: ...of the Federal Reserve, you know, pointed to the Canadian situation as an example of where you didn't need a central bank in order to have stable banking system and currency system.

SELGIN: Right, what happened is after... first of all Canada did very well with its monetary system during the first years of the Great Depression. Canada suffered very badly on the whole don't get me wrong but it was bound to, given its very, very close trade links with the United States it's utter dependence on the performance of the US economy for that of its own, but for example, two facts. The US of course was plagued by bank failures during the early years of the Depression. A third of our banks were wiped out in three years and that was the proximate cause of a massive collapse of the money supply. About 35 percent, if you go by one standard monetary statistic. That's a big collapse. Throughout the entire 1930's Canada had this many bank failures. [holding up fingers to show 'zero'] This many. In the 1920's it had this many. [holding up one finger] and the money stock in Canada during the first crucial three years fell thirteen percent as opposed to thirty four percent or thirty five. So this is an indication that the monetary system in Canada weathered the Depression relatively well. Nevertheless the Depression created a substantial increase in agitation especially in western Canada for

inflationary policies. Partly that was driven by the fact of the Depression itself; partly it was driven by the increasingly popular views of a certain Major Douglas, the social credit theorists. Anyway this guy was a kind of monetary guru who said that everything would be solved by having social credit and more paper money and blah, blah, blah.

As a way of heading off this populist pro-inflation movement, the bank of Canada was created as a sort of sop. The idea was to please the commercial interests who wanted nothing to do with Major Douglas and his ideas, but at the same time create a political agency that could be sold to the populists as something that might give them some more inflation if they really ask nicely and that sort of thing. And this is why the bank of Canada was created. It was not an institution that was needed or bound to improve the performance of the Canadian monetary system. There is in fact an article I think in the Journal of Money, Credit and Banking it might be the Journal of Political Economy with the intriguing title "Why did the Bank of Canada Emerge in 1935?" So it's a question and populism has... the answer has to do with the populist movement.

Any other questions? Anyone else? That's it, that's why we have the Fed. Thank you all.

MODERATOR: I wanted to thank you Professor Selgin for such an enlightening and thoughtful lecture and thank all of you for attending today. I hope all of you will join us for next two lectures in March we'll be dealing in depth with the topic "What does the Fed do?" followed by our third lecture in May on "What is the Fed's future?" Thank you all again for attending and I hope you'll join me in another round of applause for Professor Selgin.

V. WHAT DOES THE FED DO?

MR. JAMES GRANT¹⁴
FOUNDER & EDITOR
GRANT'S INTEREST RATE OBSERVER

MODERATOR: Good afternoon ladies and gentlemen. I'm Lydia Mashburn. I'm the policy director for Chairman Paul's Subcommittee on Domestic Monetary Policy and on behalf of the Congressman and his office I'd like to welcome you all to today's afternoon tea talk on the Federal Reserve System, where we're asking the question "What does the Fed do?" If you'll bear with me a few moments, I would like to sort of share with you a little bit where we've come in our tea talks as we like to call them, over... I guess we've had four of them so far. So our first series started out talking about the basic principles of money very simple questions; "What is money?", "What is constitutional money?" followed by "What about money causes economic crises?"

It's really important to understand these simple things about money to understand our economy better. But, so what we learned essentially was that money is a commodity, it is derived from the marketplace and it is whatever commodity the marketplace chooses to use as a medium of exchange.

Many things have been money throughout history including beads and shells, salt, tobacco and of course silver and gold. Silver and gold...the market has chosen them to be money more often than not because they satisfy certain properties of money, which are that they are divisible, recognizable, portable and they retain their value. Our founding fathers... we then talked about our ...what money is constitutionally and our founding fathers had set up in our constitution that silver and gold should be our money because it did retain its value so well and they had personally experienced some pretty terrible... experiments with paper money which caused inflation and economic booms and busts. Which is what our third lecture in that series was about.

¹⁴ [The video of the lecture may be found at:
<http://www.youtube.com/watch?v=pRipVd5wxhI>.]

It was about what about money causes economic crises which is when you have this...no longer have a market derived money system it can be - it doesn't give the market what it needs and isn't regulated by the market anymore you can end up with too much of it or not enough of it at times because you're managing the money supply. So when you do that we end up with again inflation, booms and busts, and economic hardship.

So that was essentially our money talk. So now we moved into this second series, which is the Federal Reserve System where we're continuing to talk about money actually, because the Federal Reserve as our central bank is integral to our money. So we had Professor Selgin last time talk to us about how the marketplace for money, money in the banking system prior to the creation of the Federal Reserve was regulated in such a way that we were not given a stable money system and things went poorly and then what we so often do in a crisis instead of responding to the real problems, which were these bad regulations, we instead just added more regulations and created the central bank--Our Federal Reserve System. If you missed any of those lectures I encourage you to go to the Congressman's YouTube channel, they're all posted there. We had some great lectures but then this brings us to today's question which is "what does the fed do?" how does it actually operate how do we conduct monetary policy.

Which is why I'm delighted to say that we have with us today Mr. James Grant. James Grant is the founder and editor of *Grant's Interest Rate Observer*, one of the most highly respected newsletters and widely circulated newsletters in Wall Street, on Wall Street. He's a great scholar as well, he's written a number of books, his most recent one is *Mr. Speaker!* so he has some little bit of understanding about how Congress works itself and...in the House at least. The other interesting thing about Mr. Grant and this is just recently, he was invited by the New York Federal Reserve to come and talk to people at the New York Fed about some of the more critical or some of the elements that people are more critical of about the Federal Reserve. So I'm delighted that he's now here to talk to you all about what the Fed does and hopefully to give us all a much better understanding about how it's involved in our money and in our lives and in our economy so please join me in welcoming Jim Grant.

GRANT: Well thank you what a pleasure it is to be here. Yes I did go to the New York Fed. They invited me to come in and tell what was wrong. I said when Dr. Paul and I enter the government officially, he in the presidency and myself as his Fed chairman, that

would be I guess next year, there will be some changes. They were most gracious and accepting of this information. I want to... my plan today is to describe how the Fed operates in contrast to how it was meant to operate by its founders. And to propose a few modest points of improvement and the way it does operate. If you read the Federal Reserve Act you are struck, you must be struck, by how little the 21st century model resembles the projected central bank. Actually, it was not to be a central bank, the founders were quite certain about that. It was to be a decentralized system of reserve banking. The act projected an institution quote, and my challenge to you is to identify in these not very many words the pregnant phrase that gives you a sense it could have given more a sense of where this was going, okay, so here it is the act projected institution quote: "to provide for the establishment of the Federal Reserve banks, to furnish an elastic currency, to afford means of re-discounting commercial paper and to establish a more effective supervision of banking in the United States and for other purposes."

Yeah, right. For other purposes was the meat and we do indeed have these purposes. If you go on the Fed's website or read their publications they admit to four big purposes and the fifth and unacknowledged purpose I will identify presently. So here's what they do own up to doing every day. You wonder what they do for a living, here it is.

Number one, they conduct the nation's monetary policy. Well that's new because in 1913 there was none, no monetary policy.

Number two, to supervise and regulate banks and to quote: "protect the credit rights of consumers." Well, there were no such rights under Woodrow Wilson.

Number three, to maintain the stability of the financial system. Well, this at least would have rung a bell with the founders because in the thirty years before the law's enactment there was... there were more than a few banking panics.

Number four, to clear checks to administer Fedwire, which is an automated clearing system for currency and securities and to serve as a kind of sales window for the Treasury and operate a custody business on behalf of the Treasury for foreign central banks and other such institutions. Now, in 1913, clearing was done privately. The public debt was insignificant and the prompt settlement of international payments deficits was the sine qua non of the gold standard then in force. Ergo, no mountain of treasury securities rising up on the balance sheets of foreign central banks as we see today so that's what they acknowledge.

Number five...there are five, what I have identified in my thirty years or so of hurling brick bats their way. Number five, is to serve as a kind of a national economic oracle. Of all the changes this one from the vantage point of the first Wilson administration would seem least explicable. In a free market, after all, of what use is a government seer?

The deviations of present function from original intent are almost too numerous to count and some may hope they will stay uncounted if the point of adding them up is to charge the Fed with the heinous crime of evolution of adaption. Institutions either adapt or they fall by the wayside. It will be correctly observed the United States Navy, to pick a bureaucracy out of the hat, has adapted by deploying aircraft and guided missiles even though John Paul Jones knew nothing about them. Open market operations and econometric modeling would similarly have drawn a blank from the central banks legislative fathers including Senator Carter Glass of Virginia.

So, the argument goes that the Fed like the navy has only kept up with modern improvements. Or maybe not, for here we encounter the difference between physics and economics. Both use quantitative methods to build predictive models but physics deals with matter; economics confronts human beings. And because matter doesn't talk back or change its mind in the middle of a controlled experiment or buy a lot, high with the hope of selling even higher, economists can never match the predicted success of the scientists who wear lab coats. If you believe that human action is unpredictable you will be... not be overly impressed by econometric forecasts of next year's GDP, still less will you share the confidence of some Federal Reserve officials in the ability of interest rate manipulation to herd human beings in a desired direction.

Now the incumbent chairman of the Fed, Ben Bernanke, is one of the true believers. He is a believer in the physics-like capability of economics to predict the future and even - even to improve it before can arrive. Hear him give a lecture many ... not so many years ago at the London School of Economics, quote he said, "if all goes according to plan"... now that's getting off on the wrong foot, isn't it?"...If all goes according to plan, the changes in financial asset prices and returns induced by the actions of monetary policy makers lead to changes in economic behavior that the policy was trying to achieve." close quote. Now, ladies and gentleman, if all went according to plan the London School of Economics [inaudible] case studies in the triumphs of the Soviet economy although, for all I know, it is. So the question before the House is, what the heck does the Fed do all day

long. It has a lot of time on its hands, thousands of employees, 250 plus Ph.D.'s in Washington alone, can you imagine it? Do you know what they do? I'm going to read to you some of the titles... the research projects of the recent Federal Reserve economic research staff: "A Bayesian Analysis of Stochastic Volatility Models with Levy Jumps: Application to Risk Analysis," "Are Spectral Estimators Useful for Implementing Long-run Restrictions and SVAR's" and "An Empirical Investigation of Consumption Based Asset Pricing Models with Stochastic Habit Formation". Now, "habit formation" we can get our arms around! The rest of it I don't know.

I propose to you rather by way of preface for what's going to follow that, that we must distinguish between progress in money and finance on the one hand and progress in science on the other. In science, progress is cumulative; we stand on the shoulders of giants. In money and finance progress is cyclical; we keep stepping on the same rakes. It is the signal error, to me, of the Federal Reserve not to acknowledge this humble truth. Now I have, as the editor of Grant's Interest Rate Observer, I have had one success only in changing the behavior the Federal Reserve Board and even that I'm not sure of. Years ago the announcements, the press releases from the Federal Open Market Commission would invariably contain the somewhat presumptuous phrase the "foreseeable future". Oh, I wrote them about that, "Tell me Chairman Greenspan how much of the future to you is foreseeable, one fiscal quarter, five minutes, tell me, Is it going to rain next Wednesday? Please, we want to know." He never answered but, but the phrase vanished from the FOMC minutes and wasn't I pleased. I was.

I'm working on another project with the Fed I proposed this to them on Monday. Is that actually, I couched it in terms of my agenda as the imminent chairman of the Fed I said that during my incumbency the first step I would take is to institute an Office of Unintended Consequences. Do I have any volunteers? It would please me greatly and it would not harm your careers if you put your hands up right now. I saw a couple hands. So how does the Fed do what it does and what does it do? Well, I enumerated the kind of bland functions. And, I will go into a little bit more detail, then I'll circle back and describe how what they do today is at variance with what they were meant to do and propose perhaps new ways forward.

The most important--well the Fed has subsidiary functions as well as its major one as I mentioned it's the fiscal agent for the Treasury, it handles the distribution of Treasury securities. It does this through the agent of so-called primary government dealers.

These are twenty-one financial institutions, some of them very mighty indeed. Have you heard of Goldman Sachs recently? It's the one that used to have culture. By the way, what was that culture when they had it? I forgot now, but the Goldman Sachs is one, Namura securities is one of these primary dealers so is ...so is... Paribas Bank in France is one; they have many domestic some few foreign primary dealers. A primary dealer is the business of buying and selling treasuries and mortgages and dealing sometime... some of them foreign exchange. What you get to do if you're a primary dealer is to interact with the open market desk of the Federal Reserve Bank in New York, the flagship bank. And this is a pretty sweet thing to do because you get to hear from the traders in the open market desk what the Fed is thinking about. You are obligated as a primary dealer to respond to the Fed's request to bid on securities. The Fed says we want to sell a hundred billion dollars worth of two percent notes maturing in ten years you have to come forth with the bid for that lot of bonds. You have to stand ready to kind of commune with the Fed and tell them your views of the market. In short, you have to be a participant in this vast enterprise called the public debt. That is the job of the primary dealers.

So what does the Fed do else besides that, well, it regulates banks. Does it ever regulate banks? Have you heard of Dodd-Frank? The Fed is a most extraordinary institution in that, as a consequence of its signal failures of prediction and analysis going into our sorrows of 2007-08-09, and counting in consequence of that lapse, the Fed has emerged with much enlarged power. Wouldn't you once in your life like to own the stock that does better after the company does worse? That's the Fed. It has come away from this crisis with immense powers of regulatory oversight. It is the sidewalk superintendent of world finance. The Fed is also in the business of consumer protection. Now frankly, this is a little rich. There is something called the Protection of Savings Act of 1991...protection of savings. Do you know what rate of interest you earn on savings these days? I'm sorry, the Truth in Savings Act. Anybody, what rate of interest you earn? Okay, answer to this question, nothing, and that's before tax. After tax it's horrible. So the Fed is in charge of protecting the consumer while at the same time stripping the consumer of interest income that he or she was accustomed to getting for the first two hundred odd years of American history. And by the way I'm speaking a little bit in unacknowledged and unadmitted interest, my publication's called Grant's Interest Rate Observer and there are currently no interest rates to observe and nobody's getting any younger, I can hardly see

these things on the page they're tiny. So it's not good for business, well, it is good for business ... financial news is ever so interesting...not good for people, but it's great for the press.

The Fed, as Chairman Bernanke protested on 60 Minutes, does not actually print money. The literal printing of money falls to the Treasury's own Bureau of Engraving and Printing, which does by the way a pretty, pretty economical job at this. What would you reckon to be the cost of producing a unit of American currency? It doesn't matter if it's a hundred dollar bill or a humble one-dollar bill, what would you guess the cost is? Well, I'm glad you asked. It's six point four cents, which happens also to be about the cost of producing a nickel, but paper is cheap and the Bureau of Engraving and Printing is efficient so that happens a little bit off stage. But, the Fed nonetheless through its monetary operations produces the impulses through which these units of currency are brought into the world. And, it's the monetary policy function of the Fed that ought to occupy us because that is the function that truly moves the face of the earth from hither and yon.

How does the Fed influence the value of money, how does it affect interest rates, how does it affect asset values, how does it affect the economic lives we lead? It has a mighty lever in what is known in the trade as the federal funds rate, this is the basic wholesale money market interest rate and the Fed influences the level and the rate of change of this rate through either creating dollar balances or erasing them and it does this through what is called open market operations with this great roundtable of primary government dealers I mentioned before.

So, the fed through the buying and selling of securities can either create dollar balances as it has done hand over fist in the past several years, or it can make those that... those dollar balances vanish through operations of the opposite side kind. By buying securities and paying for them with money didn't exist before the Fed conjures money, materializes it out of thin air. It buys securities, it buys treasury bills, treasury notes and bonds, mortgages, with money that didn't exist until it, the Fed, hit the keystroke on the computer and that is how they make money. It is quite an astonishing piece of work. The Fed isn't alone, the European Central Bank in two actions – the first one being in December, the second was a few weeks ago – the European Central Bank conjured more than seven hundred billion Euros into existence. They materialized them. They didn't exist until European Central Bank tapped the computer key.

Don't you wonder what these things are worth? I do. The Fed has become the well that is by way of preface to the Fed's principal functions and I would like to proceed by explaining how it came to do this. I think with some historical background you will have a greater appreciation of how radical and indeed, from the point of view of the founders, unimagined the correct techniques of operation of the Fed. The Fed virtually has overridden the price mechanism for interest rates. It has interposed itself between the buyers of money and the sellers of money. It, the Fed, has as it were, nationalized the nation's money and bond market. Hardly anyone made a peep.

So the institution envisioned by the founders was intended to function passively. It was designed to forestall panics by centralizing the nation's gold reserve and serving as a lender of last resort. It would develop a market in bankers' acceptances, bills of exchange, other commercial paper, it would lend against acceptances and other acceptable collateral. Improving the future before it happened was not one of its legacy lines of work. The Fed would not in fact be a central bank, it would be a kind of a hybrid, it was partially public, partially private. The founders were conventional thinkers of course they would have to be – if visionaries were to write legislation that would never get enacted. These founders believed that the gold standard was a superior form of monetary organization and they believed that the quality of credit much more than the quantity was a controlling factor in central bank policy.

And, if the Fed lent only against the volume of commercial paper brought to it to be lent against, it would create neither too much credit nor too little - that was the idea. There was one behavior modifying intention embedded in these propositions. Credit channeled into commerce was credit denied the New York broker loan market. The founders of the Fed were adamantly against the institution of speculation on Wall Street. That was one of the great motivating forces, which of course throws into the highest, if not the most amusing irony. Our Federal Reserve's work nowadays of manipulating interest rates, of adjusting its regulatory actions so as to sustain in life some of the precarious institutions that almost fail, some of them really would have failed, the biggest ones would have failed had they been left to their own devices. The Fed, from having been the opponent and the institutional bulwark against speculation on Wall Street, has turned out to be under the current regime the salvation of Wall Street.

You know back in Woodrow Wilson's time, Wilson went on the stump in 1912 and he railed against the twelve bankers who control

American economic life, the twelve bankers. Can you remember the book it came out a couple years ago called "Ten Bankers." It was an indictment of the ten bankers who control America, so we've gotten two worse over the past 99 years, I don't call that much progress in decentralization. But, the Fed was meant to be the money-market for producers, for farmers, for merchants, for manufacturers. It has instead turned out to be the great fast friend of the failed speculations on Wall Street. Anyway, almost immediately after the founding after the bill was signed into law, if you please with gold pens, in 1913, events thwarted the founders' intentions. The international gold standard perished in World War I, which began just eight months after the Fed was signed into existence. With America's entry into the war in April 1917, the Federal Reserve began to facilitate deficit finance with credit creation, a preview of the modern age. A modernization marched double time during the war and afterward open market operations got their start in the early 1920's.

Open market operations, as I mentioned, I think a moment ago, open market operations are kind of a monetary technique implemented by the Fed. The Fed has an idea, has an idea about where interest rates should be. To enforce these ideas on the marketplace, it goes to its primary dealers and it buys or sells treasury bills, notes or bonds. What was intended was the Fed would sit there and wait for business. A bank would come knocking at the door and the Fed would say "yes, please come in," and the bank would say, "We have had rather a rushing demand for credit, we haven't got capacity, but we do have some collateral; which, if you were to lend us money against this collateral, we would be able to accommodate our borrowers." And the Fed would say "very well let's see the collateral" and if it was any good the Fed would lend, the Fed would respond to the demands of the marketplace. It would be a part of the marketplace. It would not seek to override it. That was the founding ideal. So, as I say, open market operations got their start in the early 1920's and the stabilization of finance began in the twenties.

Stabilization. Stabilization is a very tricky piece of business. How often do you hear the chairman of the Fed extolling the virtues of price stability. That is indeed one of the legislative [inaudible], the Fed is meant to stabilize prices and promote full employment. And if the price level rises significantly or falls a little bit, the Fed has taken upon itself to intervene to drag it back into dead center, a level of stability. This to me is one of the signal errors of the present day, but

I'll get to that in a moment. Let me go on and tell you how this thing evolved.

So, the Fed during the twenties invoked many of the same arguments brought forward today on behalf of inflation targeting, and the Fed resisted those pleas with many of the same objections produced today on behalf of central bank discretion. Benjamin Strong who was the head of the Federal Reserve Bank of New York, who was kind of the miracle working Alan Greenspan of his day, would field these requests or demands by the economists of this time that the price level must be stabilized, there must be no sag in prices. As there turned out to be moments in the twenties. Later more perceptive economists asked this, they said "tell us in a time of the most transforming and dramatic advances in technology, the time of great, great strides in productive method and declines in the cost of production, why shouldn't prices fall, why should there not be everyday lower and lower prices?"

We Americans spend most of our weekends looking for them and the Fed spends much of its work week, Monday through Friday, trying to resist them. What's wrong with more things for the same amount of money? I mean Wal-Mart has made not a bad business of this idea, what's wrong with it? Well the Fed resisted it. So this pre-war gold standard, the great international classic gold standard of the hundred years ending in 1914, never was put back together again and in the 1920's the New York Fed used monetary statistics more than monetary gold movements as a guide to policy. So much for one of the pillars of the original Federal Reserve ideal. And the depression knocked down the others.

In particular, [inaudible] in the Depression era was the end of something called double liability in bank shareholdings. Today the Fed is one of the most aggressive and hovering of the bank supervisors in America. We have several. We have the FDIC and the office of the comptroller of the currency. These regulators singularly failed to detect the weaknesses in the financial structure before 19... 2007 and they are extra dutiful today, perhaps imagining things aren't there rather than seeing things that are. Before 1935 if a bank failed, the shareholders of that bank got a capital call. The courts insisted that they, the stockholders, put up funds with which to pay off the creditors including the depositors. It was their bank, it wasn't the taxpayers' bank, it wasn't the government's bank, it was their bank. If the bank failed, the stockholders should put the money up. That was capitalism. Gradually and by degree since the early 1930's it seems to me we have evolved a system of socialized finance,

socialized in one direction chiefly, to the capitalists go the swings to the upside and to we the people come the costs of the downside increasingly in this country. Those who take risks don't bear risks and it will certainly be a part of the Ron Paul agenda next year that those who take risks will also bear them.

I have a good friend named Paul Isaac on Wall Street who speaks to the Fed's role in regulation and Paul has devised what I think is a very sensible way forward in regulation and I want to share it with you because I think that it has, I think it ought to have serious legislative study. It is an idea that the basic notion behind the idea, the proposal, is that yes, our bankers do love money. That is true. Perhaps they love it too much, but why not harness that very love in the public interest. Now in regulation we have drafted rules as thick as the old Encyclopedia Britannica when it was still printed. They have got us to that state of affairs in which some of the biggest banks in New York City would have been failures, certainly are wards of the state in the financial crisis characterized by decline in GDP of no more than say three percent. It's one of the truly shocking failures of professional finance in the entire history of this country.

How did we come to this pass? Our financiers can't be much dumber than their forbearers who didn't fail for example the 1920-21 depression. There was not a single major bank failure despite nominal GDP being down by more than twenty percent, peak to trough in eighteen months. Nominal GDP down more than twenty percentage points, not one single major bank failure. This time, nominal GDP down a couple or a few percentage points, Citicorp a ward of the state. How did it happen? Well perhaps it happened because of the socialization of risk, because of the detachment of taking risk from bearers so here is the legislative proposal to amend our approach to bank regulation put forth by my good and very, very smart friend Paul Isaac. Paul's idea is instead of hovering, instead of micro-management, instead of sidewalk superintending, what we do is we say this; we pass a law that says that the government will have the right to claw back that portion of the compensation paid out by a failed bank in excess of ten times the average wage in manufacturing for the seven full calendar years before that bank hit the wall. Any salary paid out to any officer of any failed institution over ten times the average manufacturing wage that would be around four thousand dollars, anything over four thousand dollars, that gets claw back for seven full years before the bank failed. Now that means that no one can take a lot of risks, get paid a bonus, and leave the firm and consider himself free and clear. This reinstitutes the notion of

capitalism and harnesses the financial motivation of our capitalists and would be capitalist and aspirational billionaires, it harnesses what makes them tick in the public interest. It is a more or less free market approach and a just approach it seems to me to the knotty problem, which we are not through voluminous regulation of how we restore something like market discipline to our wholly unmanageable, it seems, banks.

You realize that there's a bank in Tuscany, in Italy. Monte de...I can't think of its full name now, it was founded more than 500 years ago and it has recently had to do something it has not had to do in the first of five hundred years of its existence which is to - the family that, the foundation that controls its affairs has to sell some stock because it got into debt. So the failure of professional finance, the failure of institutional big finance is universal and it seems to me it falls to a capitalist country to introduce a capitalist solution so that's my perhaps...that's Paul Isaac's good idea.

So, I submit to you that in the first twenty years of the Fed's existence it changed its operating methods in ways that, if the founders could be brought back to life today, its founders could be invited to inspect the handiwork of 1913 they would die all over again of shock. But these changes were put in place in the first twenty years of the Fed's existence. So let us fast forward 75 or so years to the present-day and review the Fed's actions and the theory behind the actions and I welcome a question or two. The Fed's principal approach to its job seems to me to be one of overriding markets and suppressing prices.

The most visible and to me worrying expression of the Fed's approach to the world was the December announcement by Chairman Bernanke, indeed by the FOMC, by the Federal Open Market Committee, that the Fed would most likely hold its federal funds rate, this rate that controls or influences, would hold at zero through late 2014. Chairman Bernanke, is it going to rain on Tuesday? How can they know that, how can they possibly know what conditions might be in 2014? Yesterday in the credit markets there was a huge sell-off in treasuries. I know it's happening today. But there are little signs of revolt in the money markets and in the credit markets against these dicta, especially the quite extraordinary evident conviction of the Fed that it knows what is good for us for the next two years. Those who have been on Wall Street for a long time and who have made some money being on Wall Street for a long time have basically taken away one lesson, which can be reduced to one phrase, that phrase being: "don't be so sure." And yet the Fed in its innocence or its arrogance

has taken upon itself as they call it, to repress financial activity, to impose its will on the marketplace and to virtually, if not literally to, guarantee that things will remain as they are for two more years. It's quite unprecedented. So the sound doctrine of 21st century central banking, what passes for sound doctrine, includes such things as this so-called "financial repression," this fancy phrase for control and manipulation of interest rates, the levitation of stock prices through various techniques the Fed employs, and this frosted glass term "quantitative easing" - all these things fall under a single heading which is the single heading of overriding the price mechanism.

Finally, it will be said the Fed does say, its defenders and apologists say that those who would seek to reinstate the price mechanism for example, under the classical gold standard which, was activated in the marketplace and by market forces – these apologists contend that that is an anachronism. That we must look forward, that we can't look back. I propose to you that the Fed's methods and techniques of control are themselves anachronistic. That command and control of the interest-rate lever, that influences if not directly controls so much of our financial activity. That, that is anachronistic, that the gold standard and that the price mechanism is of a piece with these collaborative social networks some of them known as Facebook others known simply as markets. We are in a day and age of wiki-everything and yet the Fed persists in meeting six or eight times a year, I guess eight times a year, and issuing a press release which through the modification of a single phrase, the interjection of a single adjective can result in hundreds of billions of dollars worth of gains and losses for those who are so exposed or those who knew that nuance was coming. It strikes me that the system in place is a relic of the kind of Italy 1953, whereas the system that was lost in 1914, that oddly enough was one that anticipated wiki-finance as it's practiced in many other departments of our economic lives. So that's my two cents literally on the Fed. I wound up when I was speaking, I said as to little Grant's and big Fed, I'm going to leave it at this. I'm going to quote in closing and I'm going to quote the opening lines of the editorial in a provincial Irish newspaper in the fateful year 1914, and these lines were: "we give this solemn warning to Kaiser Wilhelm, the Skibbereen Eagle has its eye on you."

I let him know that *Grant's Interest Rate Observer* will be watching him. But, anyway we have a few minutes of questions, I think and I would be delighted to take a crack if you have anything to ask on how they do what they do or why the heck they do it that way, please do. Try me.

QUESTIONS & ANSWERS

QUESTION: You talked a lot about how the Fed injects money into the economy, [inaudible] interest on reserves to extract [inaudible] do you think that's enough of a policy tool to combat whatever inflationary pressures are coming down the road?

GRANT: I think the question concerns the Fed's ability to manipulate the interest rate it now pays on idle balances that are lying fallow at the various Federal Reserve banks, especially that of New York. It's like a trillion dollars plus now is sitting there earning one-quarter of one percent, which these days passes for a mighty fancy rate of interest. And could the Fed not raise that rate and thereby extinguish idle balances before they can do mischief in the economy?

Okay, I think the question is not so much whether the Fed has the tools, they use this word tools, I think they do have the wherewithal to erase, extinguish, what have you, these credit balances, they do. But do they have the flexibility or the judgment. Most successful investors and speculators on Wall Street are aghast at the Fed's pledge to keep rates at zero through 2014. I mean, the financial markets seemingly were created to make monkeys out of human beings who would try to anticipate them and second-guess them. I mean, it is so hard and so interesting. But what the successful investor does is always to say what if I'm wrong? That is... that's the first thing you learn. And the Fed has given self no way out, so I have no doubt the Fed could, if it so chose, take timely action to do what it ought to do. It will not be clear until much later what it ought to have done and the Fed, don't forget, I mean, the Fed saw nothing coming in 2006, I mean nothing. The Fed had no intimation that the biggest failure in the history of professional American finance was at its doorstep. They would simply not listen. Why would they listen now? Are they any better now, if they're the same people doing the same econometric forecasting?

I just don't think that human affairs are susceptible to the kind of techniques that the Fed employs in money and banking to make things work. I think that the very approach is simply... is failed.

QUESTION: It really is quite remarkable how many people sort of instinctively realize that if the government sets the price for, you know, milk or cheese, or whatever, there would be mass distortions and chaos in the markets, but with the interest rate, you know, they give them free rein to do that. So my question is in regards to the next step, once the Federal Reserve is out of the picture and you have

free banking, would it be... would you support 100% reserve free banking or fractional reserve free banking?

GRANT: I would support institutions that meet a need in the marketplace and that are accountable to their stockholders. It seems to me that the best approach to this, to the question of the structure of banking is variety and is the individual decisions of owners. There were examples, there's a wonderful book by Bray Hammond, Bray Hammond was the author and he wrote a book on the.. on money and politics from the American Revolution to the Civil War . It's a terrific history of banking in the day and age before, you know, federal regulation. And he describes some of the systems that evolved spontaneously, there's one in New Orleans the bankers evolved, it was a model of conservatism and imagination and not least solvency. There was one in Massachusetts earlier call the Suffolk System, which is kind of a spontaneously evolved central banking arrangement. I would be in favor of choice and variety. I don't think 100% reserves are necessary, I think that there no doubt is a market for that for people who were risk averse to the point of wanting that.

But, I think that a good banker can do with less than 100 percent and good bankers ought to be allowed to succeed and they ought to be allowed to fail if they prove not to be good bankers.

QUESTION: But now, with the issue of fiduciary media, with fractional reserve banking, isn't that exactly what causes the business cycle to begin with?

GRANT: I think the business cycle is a feature of the human animal as much as it is of the fiduciary media. People will buy at the top; they will sell at the bottom. We can't help ourselves. We get excited collectively. No doubt some of this has been germinated by monetary activity. I have no doubt also that in the late 1990s that the last several hundred or thousand points on the run-up in the great NASDAQ bull market was the consequence of cheerleading from the Federal Reserve. But then it was a ... there more to it than that... it was a great technological revolution and people were just carried away by it. So I think that I'm not some... I'm not such a believer in the mechanistic properties of central banking to actually finally and definitely be the cause of these cycles. I dare say that in a banking arrangement suitable for the Garden of Eden, we'd still have booms maybe busts too.

QUESTION: In third world countries... you mentioned that they sort of nationalized the bond markets, and when I think of that I think of third world countries where Chavez nationalizes something or GM gets bailed out by the government. The stockholders in those

two instances, except if the government ruled court and you get the money back but the stockholders lose their capital. Would this nationalization of the bond market when the federal government bailed out the banks in 2008 with TARP, did any of the bank stockholders lose their capital?

GRANT: Oh, yeah.

QUESTION: The same people still own the banks?

GRANT: Well, let me clarify this word nationalization. I use it a little figuratively in the sense that the government by dictating the level of rates and by managing the expectations on the future course of rates has taken a lot of the volatility and a lot of the market... the market's own initiative from the discovery of interest rates. So, and I call this a kind of a nationalization. The Fed has fixed interest rates it has manipulated the term structure of rates, what we call the yield curve, therefore figuratively speaking it has nationalized it.

Now, indeed bank stockholders were roughed up terrifically during the liquidations of 2008, early 2009. A lot of people lost everything, I mean these... Citicorp became virtually a penny stock. Down from like forty dollars a share, I forgot what the levels were, it's called Citibank, a 40 dollar stock was a 40 cent stock, it was that kind of washout. So yeah, plenty of people got hurt. But you get... there's... there still was a big disconnect between ownership and responsibility. In New York City there are two institutions that were founded in the second decade of the nineteenth century. One was Citicorp, which today is Citigroup; the other was Brown Brothers Harriman. Brown Brothers Harriman is a general partnership in which the general partners are liable for their share of the debts of the firm, up until their entire net worth. So if Brown Brothers fails, the creditors of that firm can go after you the general partner, not just your stock holdings in Brown Brothers or your options in Brown Brothers, they can go after your house, your car, your Matisse, your Labrador Retriever, everything. So guess which one didn't fail in 2008? Well, Brown Brothers didn't fail, it was very carefully stewarded by these general partners who have so much to lose and nothing much to gain by being reckless.

So they hold this Isaac idea, my friend Paul Isaac's idea, this claw back. It is meant to inculcate the ideals or the culture of a partner... of a general partnership into these limited liability corporations. And as I say, until 1935 there was this very salutary rule that if the company failed you the stockholder and not us the taxpayers got the capital call. So again I reiterate that what I, what my program is, what the program of little *Grant's Interest Rate Observer* is for

American finance is capitalism and it is the market mechanism. It is the price mechanism and capitalism. And therefore it is a forward-looking and twenty-first century program rather than a backward-looking and anachronistic one.

I didn't meant to give a campaign speech but I heard myself giving one.

QUESTION: It would seem that if the Fed wanted its policy to go as well as it plans it to, that they would be more transparent and close the gap between the public's expectations and what actually happens, but I think that the Fed is resisting being more transparent. [inaudible]

GRANT: Yeah, I think the Fed can't stop talking. I don't know how much more transparent it can be, it comes out and gives you a press release as soon as the meeting's over and it gives you the minutes some years later, as painful as they are for the incumbents to read, I mean, you read the minutes of 2006 as the housing bubble peaked, they were joking about how house prices would never go down. I think the Fed, the Fed up until 1994 I think would not put out a press release, you had to guess, there was a whole industry of guessing what the Fed was going to do based upon perturbations in the federal funds rate. Then they issued press releases and then they got more loquacious. Now they won't shut up. So I think, is that what you were driving at?

QUESTION: Well, they still don't release the numbers for the FOMC meetings, am I right?

GRANT: I'm sorry?

QUESTION: They don't actually list the numbers for what they do on the open market.

GRANT: Right, right, right, right.

QUESTION: Do you think that would help at all?

GRANT: No, it's, it's just more light on the same bad process in my opinion. You know, there was an interesting book written by a guy named Charles Goodhart, C.A.E. Goodhart who was a very senior guy at the Bank of England. Before that he was a scholar and he wrote this book during his professorial days. It was a history, this book was, of the New York Money Market from 1900-1913, those fourteen years inclusive before the Fed was founded. And Goodhart found two interesting conclusions, he found one, that never before or since has the banking system of the United States been sounder than it was in those thirteen years notwithstanding the panic of 1907. That was one conclusion.

The second conclusion was that because the fed funds rate of that day, they called it the call money rate, because it dove and it sunk and it flew and it was all over the place, a highly volatile rate, the very volatility of this rate made the financiers honest, they couldn't borrow too much because they couldn't predict the cost of their debt. And if the chairman were here, Chairman's Bernanke, he's a famous baseball fan, I'd say, "Chairman, if you were pitching, and if you told the batter that you were going to throw cheese, it's a baseball term for a high fastball, nothing but fastballs for the oh, two years, and by the way, right down the middle just dig in;" how would that be as opposed to moving around the plate? So what the Fed has done to the baseball game of finance it has told everybody, okay, everybody, dig in, zero percent for as far as the eye can see. Have a blast. And this naturally, paradoxically I guess, creates the very waves of speculative lending and borrowing that seem to have gotten us in the soup before, that's building again now.

QUESTION: [inaudible]

GRANT: No, I don't, no. I'd say that let the market set rates and let the Fed not say a damn thing.

QUESTION: I guess I have two questions that are very short. One is that you spoke very benevolently about the intentions of the founders of the Fed. If they could see what has become of it they would roll over in their graves. But there are a great many people that think that the founders were not so benevolent and that is witnessed by secret meetings at Jekyll Island and all of that. Would you concede that there could be a gap between the stated intentions of the people who conceived this system that we currently have and what their actual intentions were?

GRANT: Could be, I --yes, there could be. Compared to what we have now, a program set in place legislatively, let's get away from intentions because I don't know what they were. I do know that many people regard them as malign, but if you look at what they said in the debates, if you look at what the legislative... legislation, if you read Carter Glass' adventures in constructive finance, what you see is the most to me is a kind of a benign, they wanted a gold standard, they wanted a passive discount window approach to the money markets, they wanted the fed to stay out of Wall Street, I mean that seems kind of okay.

Let me read you, this'll take a second, let me read you a line from a guy named Parker Willis, who was the first Secretary of the Federal Reserve Board. He was writing, was Willis in 1946 or so; his heart was broken by what had happened twenty years since the founding of

the Fed. And here's what he said: "Central banks would do wisely to lay aside their inexpert ventures in half baked monetary theory, meretricious statistical measurements of trade and hasty grinding of axes of speculative interests with their suggestion that by doing so they are achieving some sort of vague stabilization that will in the long run be for the greater good." That was Parker Willis. And he was in on it. I mean, that to me is, that's pretty sound stuff so, anyway, your second question.

QUESTION: If you operate under the assumption that what is going to happen in terms of central banking and government policy from around here for the foreseeable future is just keep doing another version of what they're doing, what would you foresee would be the inevitable consequences?

GRANT: Good copy. Good copy for me. I think you can see the liniments or the outlines of the next financial crisis forming right now as a consequence of the intervention to forestall the effects of the previous financial crisis. For example, there's a great pouring of funds into the junk bond market into the speculative grade corporate bond market so companies that would otherwise not be able to finance are able to finance rather easily now. There's a marginal drug store company called Rite-aid you've seen certainly and it competes against much better financed competitors such as Walgreens. Now, Rite-Aid has not made profit in five years, it is spending more on interest expense than it is on refurbishing its somewhat tatty stores, and it's able to borrow at nine percent for ten or twelve, I forget what the exact terms were, but it had to pay fifteen percent last fall then Fed comes in and says we're going to put the funds rate at zero for two years. Now it does it at nine percent--new lease on life. Well that's good for the employees of Rite-aid, it's not good for the entrepreneur who had his or her sights set on doing something better than Rite-aid if only that ridiculous dying enterprise would get out of the way.

So by preserving the structure of things as they are, with every good intention, our masters at the Fed are penalizing the unseen, the unimagined that could have happened with the failure of institutions that ought not to be around. So these life support operations bring us closer to Japan. Ben Bernanke keeps on saying about the risks that we become like Japan, that's not deflation. That's how you get to be like Japan, is by prolonging the established order of things through financial manipulation. What is wanted is American dynamism we've had that.

You know I mentioned this depression of 1920-21 a while ago. This is a case study. Chairman Bernanke can't stop talking about the Great Depression. Every other phrase is... has to do with what we must not do again like they did in the thirties. The previous depression began in January 1920, ended in August of 1921, it was ugly, violent, down twenty nine or so percent nominal GDP, wholesale prices down forty percent, four-oh percent, if you please. The Fed raised rates in response - eight percent from six percent. The Treasury balanced the budget, the depression ended.

Now that's not to say that's the way to cure a depression but it is to say that you don't have to anesthetize the patient with continued doses of so-called stimulus. You don't have to run interest rates to zero to get us out... why did the depression of 1920-21 ever end if you have to have zero percent rates to end a depression?

So I... the Fed to me, I mean all these research titles I read to you, but how about something in the Fed, how about an office or a... one effort in applied financial history, how about an enterprise within the Fed to say, "what did work in the past, what are we doing that never has worked. Let's use experience rather than these bowers, these perfumed bowers of quadratic equations and linear algebra." You know it's the stuff is, fine for the guy who didn't get into NASA after all, who didn't get a job with NASA, but the Fed to me is not working. It is one big institutional mission creep is the Fed. Anyway, that's enough. One more?

QUESTION: Just one quick question. Have you observed a trend, have you observed any growing skepticism from professionals in finance?

GRANT: Oh yeah, they hate it. I had, yes, I think they don't respect it because of this... Friedrich Hayek had kind of a fancy phrase, did this great economist, called the pretense of knowledge. In Brooklyn we'd say, are you kidding, how do you know that? But the Fed exhibits this insolence, this pretense of knowledge by such things as saying "we're going to... our econometric models indicate that for the next two years the wholesale clearing rate should be zero percent." So they said, so people are thunderstruck on Wall Street by this rookie error. Nobody who is solvent on Wall Street has a view like that, I can guarantee it, nobody who is solvent. Certainly nobody who's middle aged.

QUESTION: Just a quick question. Do you think this will just drag on and on, or will there be a triggering event where we have a... somewhat of a collapse, or can the Fed keep this up?

GRANT: I mean, as I have aged I have become rather less apocalyptic. I, if you asked me this twenty years ago, I would be certain that there would be collapse and there might be, but to me, yeah, I'd say it's America's a bit like major league baseball. Try as they might to destroy it, they just can't. So I have every, and besides that, next year, Ron Paul's going to be president. So, Lydia, thank you.

MODERATOR: Our next lecture will be on “what is the Fed's future?” So we will be exploring that last question in a little bit more detail. That won't be until May I believe, but we will keep you posted on details. If you would please join me in another round of applause for Jim Grant.

VI. WHAT IS THE FED'S FUTURE?

DR. ROGER W. GARRISON¹⁵
PROFESSOR OF ECONOMICS
AUBURN UNIVERSITY

MODERATOR: Ladies and gentlemen, good afternoon and welcome to the final in our three part series on the Federal Reserve System. I'm Lydia Mashburn, policy director for Chairman Paul's Subcommittee on Domestic Monetary Policy. On behalf of the Congressman's office, thank you for joining us today. In the first two parts of the series, we learned why the Fed was created and what the Fed does. In the late nineteenth and early twentieth century there were a series of banking panics, which led to cries for reform. Unfortunately, the real problem of government intervention in the banking system was not addressed and as government tends to do they've responded to a government created problem with more government and our central bank. So we then learned how our central bank conducts monetary policy how the fed attempts to navigate the booms and busts of the business cycle by providing money and credit to the economy when it's sluggish and contracting money and credit when it's overheated... or so the story goes.

The Fed, as our economic mandarin, however fails to see that it's responsible for those very booms and busts in the economy that we suffer from. We have seen especially in the last few years how the Federal Reserve has indeed not been as successful as we are led to believe in managing the economy and today we are going to learn just how bad of a record they have and where it is taking us and hopefully a few recommendations to brighten the outlook on our monetary future. Dr. Roger Garrison is going to be answering today's question: "What is the Fed's future?" He is Professor Emeritus at Auburn University. He is the author of "Time and Money: The Macroeconomics of Capital Structure." Over his long academic career, he has been studying Keynesian economic modeling, which actually informs nearly every aspect of our modern understanding of monetary policy and how we can supposedly control our economy and

¹⁵ [The video of the lecture may be found at:
<http://www.youtube.com/watch?v=IdX60JgPTmA.>]

manage our economy through monetary policy. Dr. Garrison, I think he's deftly illustrated in his own modeling the consequences of monetary policy on the market place and as I hope we will see today, we'll see what those consequences really mean, and what they mean for the Fed and what they should mean for us going forward into the future with our Federal Reserve System and our own monetary structure. So without further ado please join me in welcoming Dr. Roger Garrison.

GARRISON: Yeah, thank you Lydia. Well the future of the Fed and the necessity for reform. I could just as well have titled this talk "Why the Time is Right for Monetary Reform." With this unending sequence of booms and busts and particularly with the characteristics of this latest downturn, the housing crisis, the Fed has painted itself into a corner or maybe I should say printed itself into a corner. With interest rates at zero they've been at zero for over three years now and will be in zero for the foreseeable future. I think the Federal Reserve has announced through 2014 is for zero rates. This is not the sign of a healthy economy and so therefore time for reform now.

The reform I'm talking about is not going to be a new way to target interest rates or it's not going to be a new way to measure the money supply, but rather I'm looking at polar alternatives and we can present them here. One is government money and the central bank and that's what we have now and the second is private money and decentralized banking. So this is a radical nature of the reform that I'm proposing. As I develop my arguments, what I want you to pay attention to is the interest rate and the role of the interest rate in a market economy and the role of the interest rate at the Federal Reserve. They're at war with one another, as we'll see. So if I subscript this, I can't read it, I hope you can off the screen but this is interest rate the central bank in which interest rates serve as a policy tool for the central bank. Essentially, the central bank has commandeered the interest rate to serve as its own policy tool, which means it can no longer work as it should be working in the market economy. If you look at the private money and decentralized banking, that's a system in which the interest rates allocate resources, what does that say in conformity with people's preferences and decisions? In other words, it's a market-determined rate not a policy-determined rate.

The big difference between the two is that the market will give you sustainable growth while the central system will give you boom and bust and throughout this lecture I use the word "sustainable" a number of times, but in a macroeconomic context and this is certainly

an Austrian economic theory, sustainable just means no booms and busts okay? You don't have a boom that contains the seeds of its own undoing and goes bust that's what we mean by sustainable growth. Much of the discussion today, much of the analysis will take the form of a contrast between Keynesian economics in which it's recommended that the interest rate be a policy tool to guide the economy and to dampen booms and busts, it does quite the opposite of course, and Hayek who is the Austrian economist and argues against interest rate manipulation and argues instead that in a market economy the interest rate will seek its own level and that level will give us a sustainable growth rate in the economy.

So, this is a study in comparative frameworks and you'll see what a contrast there is between the Keynesians on the one hand and the Austrians on the other. I start out with the Keynesians and recognize that the central bank and government money is the handmaiden of Keynesian policy-making. Fiscal policy of course, it comes into play here too but more often than not the monetary policy is supporting fiscal policy by creating the money with - for the government to spend. The framework is called the circular flow framework and we'll discuss that shortly we'll see pictures of it shortly. But before we do that, I want to look at the policy tools that the Fed currently has. It's called the Federal Reserve's dual mandate as spelled out by legislation largely in the Humphrey-Hawkins 1978 dual mandate. I'm going to show you all three of them. Stable prices as one although stable doesn't necessarily mean constant in fact it doesn't for Ben Bernanke and others. Maximum employment those are the two that you hear a lot of talk about. Those are the two that get discussed at every policy meeting by the Fed, but there's a stealth mandate in the legislation too and it's sustainable economic growth and we'll see why it's stealth.

It's not so much of a mandate as a nagging concern okay? There's a nagging concern that maybe policy actions taken with respect to the first two items in the mandate aren't consistent with achieving that third mandate. So, it doesn't get discussed very much. Let's look at the targets here. Stable prices. Conventionally that's taken to mean a two percent rate of inflation. Now if my talk today was a more nusty-boltsy talk about the day-to-day operations of the Fed, I would take issue with the notion that we need a two percent inflation but we've got bigger fish to fry here today and so I'm gonna pass that by. How do you get your two-percent inflation? Well, you use the policy tool namely the federal funds rate of interest, the rate that the Fed has substantial control over. This is the rate that they have down to

zero or very near zero right now and of course when we talk about the interest rate as a tool, what we're really talking about is the money that needs to get pumped out into the economy to drive the interest rate down to zero. Which, as we'll see, is quite a little bit of money.

So our focus is narrowly on the interest rate, but more broadly on the monetary expansion that is needed to bring interest rates down to where the Fed wants it. That's the policy tool. Now let's look at the maximum unemployment or maximum employment. The target implicitly is five to six percent rate of unemployment. Typically this is discussed not so much in terms of the unemployment rate but in terms of what's called the GDP gap, you know how far is GDP now actually from where potentially it could be and if those two things differ though, it's because there's unemployment. And so we can list that target as the unemployment rate. Well now what tool do they use to hit that target? Well, that's the same one. It's the same policy tool, it's the fed funds rate. the problem is that sometimes the fed funds rate needs to go one way to hit the maximum employment target, it needs to go the other way to hit the inflation target so that's always a big problem and it's been handled in different ways as we'll see shortly.

Now I'll say a little bit about sustainable growth but I can't say too much because the Fed certainly doesn't say too much. And the implicit target on growth is what? Not too high and not too low. Well, we're not sure what that is and as we'll see later on in this lecture we might as well start now. But the Fed claims, as Greenspan often claimed, that you don't know if you're in a bubble until it bursts. That was his claim made during the housing bubble; that was the claim made during the dot-com bubble. You just don't know; you can't tell until it bursts and when it bursts then, "oh, you're in a bubble." So, what I'll suggest here is that another way of saying that is— that you don't know whether you're fostering sustainable growth or not because those are two ways of saying the same thing. If you've got sustainable growth, then you're not in the bubble. If you don't know whether you're in a bubble, then you don't know whether you have sustainable growth and so it's a nagging concern.

They don't have a policy "tool" - I put tool in quotes here just to say the only tool that will work is the market rate of interest. You have to let interest be set in the market and that will give you sustainable growth. But, that's not something that the Fed can do because it's controlling interest rates and instead you heard just a lot of whistling in the dark about whether the growth is sustainable or not, okay.

Now, at the risk of traumatizing some of you people who have had a course in macroeconomics—how many have had a college-level course in macroeconomics...so you know what this is all about, the circular flow framework? And I want to present it in such a way to give it the best contrast between the Keynesians and the Austrians. And it goes like this. You have business firms that's just a facilitator, it facilitates the interaction between the different sectors of the economy between consumers and investors and workers. And then down below here you have those groups; workers, investors, consumers and so on and you know how the circle works. It turns out the workers supply labor and other resources, this is a common expression of Keynes: “labor and other resources.” But he pretty much forgets those other resources and argues strictly in terms of labor. So, labor is supplied to the firm. Well fine, they get paid for it—it's called income and that's half of the circular flow.

If you look at the other side there, it is at the firm that labor is used to produce goods and services which is offered for sale to investors or to consumers and they pay for that and it's called expenditures, okay. There's expenditures, okay. Now what I want to use the circular flow for—look at the labor side, if there's a change in labor, at least if it's in the downward direction, a change in labor income, that's because there's unemployment. Wage rates tend not to fall and you get unemployment. So over there, we want to look for unemployment. On the other side we have expenditures if you have changes over there at least if it's on the upside then you get inflation so that's a part of the thing to look for inflation.

One thing we see already is that the interest rate hasn't made its entrance. There's no interest-rate. But we can get the interest rate in but it's a policy tool and there it is. There's the Federal Reserve and its policy tool and if it has interest rates high looks like about six percent it's going to be a pretty sluggish economy you're probably going to have unemployment. If it gets the interest rates low there'd be a more vigorous economy but then you get inflation. So let's get this thing started see, there see, my circular flow actually circulates but it's circulating pretty slow and so sure enough unemployment's on the rise. What do the policy makers do with it? What do they do for that? Well lower the rate, boy you learn well, when you lower the rate you switch it over there you get a very vibrant economy and unemployment goes down. Unfortunately, inflation goes up alright. Now you noticed I label those two percent and six percent as “brake” and “gas” that's in honor of Milton Friedman who complained all during the 1960's and 1970's that the Federal Reserve hit the brake,

hit the gas, hit the brake, hit the gas and gave us ups and downs in the economy. And in fact, now we've got inflation high that would be the late 1970's when G. William Miller was chairman of the Fed. And he got inflation up to the double digits and they finally got rid of him, Jimmy Carter did, called in Paul Volcker and Volcker had the solution on how to deal with the inflation. What was it? Okay, it was go back to high interest rates. And of course that gave you the other result again. So that's the 1960's and 1970's where we had a lot of hit the gas, hit the brake was followed by another period.

This is called the Taylor Rule, how many of you have heard of the Taylor rule? You know something about the Taylor Rule? Okay. And it goes like this: don't just hit one then the other back-and-forth that's a losing proposition. What you need to do is figure out this—how to split the difference and how to set an interest rate that does something for both of those problems. And so the idea is split the difference between fighting unemployment and fighting inflation. It's what I've come to call and I'll show you this later but I use the term here “learning by doing” process but it gave rise to what came to be called the “great moderation.” This was a term coined in 1999 by Charles Nelson, but was popularized in 2004 by Ben Bernanke when he was one of the governors, not the chairman, of the Fed. So, the great moderation and that was a period where they weren't quite so bad at hitting the brake and hitting the gas.

So, let me show you a chart to see how that plays out. What we're looking at is the growth rate of GDP. And squint your eyes and look at the chart to see if you can see that great moderation. Yeah, if you look at that boxed in area a little bit, yellow area whatever it is, it looks like the variation isn't quite as bad as it was before. Although there's some pretty bad things you see first—you see the savings and loan crisis, although that was predominately a problem with the FDIC rather than the Federal Reserve. You see the dot-com bust. And then finally you get outside the box and you see the housing crisis. So that has to be the end of the great moderation; there's nothing moderate about the housing crisis.

Now, it's interesting to learn how Taylor came up with his rule, he didn't write the article until 1993 and that's well into the period that's called the great moderation. And what he did is look at data, look at what the Federal Reserve was actually doing starting with about 1985 and he wrote an equation that described what the Fed was doing. Did they raise rates or lower rates depending on what unemployment was and what inflation was and how did they trade off one against the other and choose the rate and he wrote an equation

that fitted those decisions. And, he said this is the equation that shows what the Fed has been doing. It was just descriptive. Okay, fine. And so he managed to turn his into an art and the way he did it is to tell the Fed, “look if you're happy with what you're doing, then here's how to keep doing it, just apply the Taylor Rule and then you'll be doing the same thing you've been doing for the last several years.” Now the Fed didn't ever explicitly adopt the Taylor Rule but implicitly it did, okay.

Now the problem is – and this is where the “learning by doing” comes in – that the doing part is once every six weeks when the Federal Open Market Committee meets. And then that yellow block there is about a hundred and eighty four doings but the learning comes much less frequently, just every time there's a crash, okay. So you have a lot of doing, before you get learning and so I think we can put that across the screen here. There's a little bit of learning there, little more learning there and then a big lesson there okay, which says for the whole period there, they really weren't doing so hot but they didn't figure that out until the end. And again, there's another episode of you don't know that you're doing the wrong thing until it goes bust. You don't know you're in a boom until the bust. But, you do know that those interest rates you're setting are not market rates, they're not market rates. And we also know there's a political bias to have them lower rather than higher, so it's not at all surprising that you get still more boom-bust episodes and this one was a particularly bad one – the housing crisis. We'll have more to say about that later. Okay so it's time to stop that stuff, okay. And, we need something else so let's look at private money and decentralized banking.

Here I call it the “save zone for the Hayekian system” as described by what I've come to call “capital-based macroeconomics.” I use that term in “Time and Money” and it tends to have caught on some in the literature which I am pleased about. And, it's not that I don't like to use the word Austrian. I do use it sometimes, the Austrian theory, it's Mises and Hayek. In fact, I probably have a picture of them here somewhere, is it right... there they are... okay, Mises and Hayek. Mises wrenched this theory into existence a hundred years ago, it's an old theory and Hayek developed it in the late twenties and through the thirties and so deserves to be called an Austrian theory. But, I learned, at least at Auburn University, it confused the students. They either thought it was the economics of Austria or some of them thought it was Australia, so I thought “well, okay capital-based macroeconomics, we'll go with that.”

Now I've got sequence one. I'm going to have sequence one and sequence two in honor of Hayek and his methodological maxim. He said this to Keynes, "Before you can figure out what might go wrong in the economy you first have to understand how it could ever go right." Just saying that sounds right doesn't it? But Keynes rejected that maxim, as have a lot of other economists. So sequence one is showing how the economy can work right with the market rate of interest, alright. And then sequence two is just a corollary, really. It's a corollary. It's what happens when the rate of interest is not controlled by the market. Well things go wrong so let's look at this first sequence and we'll see how it works. The interest rate's determined by the market, there's a supply of savings it turns out. It's upward sloping like all, most other supplies and the demand for loanable funds is the business community borrowing in order to invest. And, if interest rates are allowed to seek their own level, then of course you have a market clearing interest rate. But, let's think for just a minute about what this means when you save.

You know you memorize it in college that savings equals investment in equilibrium, savings equals investment. But what does that mean? You know what savings means— people go to work and they produce things, they produce output they get paid for, it's called income, they spend part of that income on the output they created collectively and they save the rest. Well saving the rest represents the unconsumed output. It's what you produced during the period but didn't consume. And it's that unconsumed output that can be used by the business community to enhance the productivity of the economy and they borrow your savings in order to take command of that unconsumed output. So, that's the equivalence that you need, you need that unconsumed output, real output in order to build the productive capacity of the economy. So that's why economic growth, sustainable growth requires that – that rate of interest is telling the truth about how many resources there are out there for businesses to take command of, okay. Otherwise, they may undertake too many business projects and discover they can't complete them all, okay. In fact, that's the essence of the Austrian theory.

Now, suppose people become more future-oriented and – sometimes I think I have to say that apologetically, because Keynes argued that no, no, no, no, people are creatures of habit, they don't just decide to save more. Well, maybe they do to pay for their children's education or to pay for travel after retirement, pay for the retirement center, whatever it is, you know. So, if they do then look what happened you have a shift of that supply curve to the right. It

drives down the interest rate and increases the level of saving and investment. Okay so what we have here is more saving is available because people have decided to save more. The interest rate is lower which entices the business community to borrow the saving and it also, this is important, it particularly stimulates long-term projects and for two reasons: One is that long-term projects have a disproportionate cost of interest payments. If you've got to borrow money to fund that project, it is going to take a long time to finish it. Then you got to be paying interest while you're working on the project. So, for that reason long-term projects are favored. And also partly because people are saving now, but they're saving up for something. You're going to have more spending power in the future and so you want your future output to be able to go further in the future, which you get by having long-run projects. So that's the way that interest-rate guides the allocation of resources okay.

Now and you can see the resources are freed up to undertake these long-term projects because people are saving they're not consuming as much as what they have produced.

Now let's look at the structure of production. This is the capital part of capital-based macroeconomics. It has a distinct time element in it. In other words, we don't have a circular flow, we've got a means-ends framework with the production process going through a number of stages until it emerges as consumable output. Hayek introduced that as a triangle like that showing five stages of production just for pedagogical reasons. That first stage to the left doesn't amount to much because you're just getting started, there's just some early stage in the production process, that's why it has a small height, but the output of that stage feeds in as input to the next stage and the output of the next stage feeds in as input all the way up until the end in which case the output is consumable output, alright. That's Hayek's structure of production. So you can think of early stage as a product development. Looks like this guy knows what he's doing but it's going to be a long time before that shows up as consumable output. It's a long term.

Now there, that's short term, that's inventory management. And that guy looks like he knows what he's doing too, he needs a few customers I think, but he's got the store stocked. Now, so those two things of course both can be going on at the same time it's just that the early stage is aimed at a more distant point in the future. But, you can think of goods and services working their way through the stages of production. Let's see if we can do something like that. Watch the resources, goods, and process move through the stages of

production. There see, goes something like that. Now, this is a theory, I think I mentioned, this that was developed in 1931 by Hayek and that was the last year that Henry Ford made the Model A, kind of sad. But, I use the Model A as an example here because if you know anything about Henry Ford he owned all the stages. You know, he had iron ore fields and everything else between there and finished output. So if Hayek had wanted to, he could show production of Model As with this same-- goes like this-- there they are. But you get the idea how it works.

Now we put these two things together and we show what happens in the market economy when people decide to save more. I'll step up the pace a little bit, might be running short of time. When people save more they send two messages to the market: one is interest rates lower which means favors long-term projects, two is current consumption is down which means that last stage those last few stages are disfavored, okay. So, let's watch that again. You've seen it once already you know what it looks like and then see how that affects separately the individual stages and that structure of production. It goes like this, okay and you can see why because, if people are saving more now, then it means they're not consuming as much. If they're not consuming as much you don't have to stock as much at retail so your investment in inventory, in retail is going to go down. Alright, but at the same time that low interest rate makes it more profitable to undertake long-term projects which can then be sold to these people who are saving up that money.

So that's the market at work for you and for me. That's how markets work, that's what Hayek meant when he said first we have to see how things go right, if they do go right, and then we can talk about how things might go wrong.

So, that takes me to sequence two --looks the same doesn't it? Okay. But here we're getting something very different, but it's significant that it almost looks the same. That instead of people saving more we have a central bank pumping money through credit markets shifting that supply of credit to the right but without really affecting anybody's saving. The sequence I'm using here, the example I'm using is what we call a political business cycle theory. In other words, the interest rate is what it is, it's not changing but the central bank decides to lower it maybe for political effect. An example would be Arthur Burns in 1972 helped Nixon get re-elected by lowering interest rates and that same Arthur Burns though four years later didn't help Gerald Ford, who of course lost. In an interview, it was pointed out that this is what Burns had done and Burns was asked to

explain why didn't he help Ford like he helped Nixon. And Burns says, "He didn't ask me." Ford didn't ask. We see another instance of this when Greenspan helped Clinton get re-elected in 1996, but four years earlier he didn't help Bush forty-one at all and there's still bad blood between those two because ...

So, anyhow we've got a different kind of a process here. Let's see if we can detect the difference. We're going to create money and pump it out through credit markets. So when that happens it looks like there's more saving but there isn't. There's just more credit and in fact saving goes the other way, the saving curve is just where it was before and with the interest rate lower people save less. So you drive a wedge between saving and investment that's probably what that says and so you've got a disequilibrium. And, in fact, if you look at that horizontal line that goes through those two disequilibria points it looks kind of like a price ceiling doesn't it? Remember price ceilings in class in which case you say, "oh, there's a big shortage of credit." And the only reason the shortage doesn't show up is because it's literally papered over by the central bank who creates some money to lend that larger amount to investors, but that also means then that that's an unsustainable boom. It festers, it's not a shortage that has an immediate impact. It's an artificial boom that festers until eventually it turns into busts because there aren't enough resources to support that much investment.

Okay, let's look at—here I'm just showing you investors go down on their demand curve, savers down along their supply curve and the difference is the money created.

They could make good on the difference. Look at the structure of production, it's torn at both ends too. It turns out that the lower interest rate will stimulate long-term projects but they can't all be finished because there aren't enough resources to finish them. The reduction in saving and therefore increase in consumption will send some resources to the late stages so you get a distorted triangle which essentially contains the seeds of its own undoing. This will eventually collapse. Mises even had the terminology for this, he called "beefing up of early stages," malinvestment in other words. It doesn't reflect real saving, it reflects Federal Reserve policy and the upper reaches he called overconsumption. People are buying more even though there are less resources available than before. Now when the Fed looks at this they don't look at the capital part because they don't know anything about the Austrian theory, they're just looking at the saving and investment and interest rate and so they see the economy going in the dumper because the economy crashed and their reaction is

guess what: to lower interest rates. So, they lower interest rates further and end up locking in the malinvestment big-time, the housing market this time. Rather than letting the housing market liquidate itself it kept more resources in housing than had any justification at all.

Now I have a few other, how much time do I have, a little bit or not? Five minutes? Okay. So I'm just going to clip through this because I'm not going to ask you to read this, I'm not going to give you time to read it, but this is different economists Axel Leijonhufvud claiming that our recent cycles are Austrian and not Keynesian. The same for Steve Hanke. I like that one because he looks so stern I can't look that stern. Hanke can, and he has a little synopsis of the of the housing bust and says that it was an Austrian affair. I like this guy's title "ignoring the Austrians got us into the mess" now I do want to show this one and then I'll quit.

I want to show you why the recent boom-bust was so much worse than the dot com boom-bust that typically it's not just a political business cycle it starts out as an increase in demand for loanable funds because of innovations like the digital revolution. If you have a digital revolution like we had in the 1990's you'll get an increase in the demand for loanable funds to take advantage of the innovations. And you can see what that does, that calls forth saving. People slide up that saving curve and that finances the innovations, but the Fed won't leave that alone. The Fed sees the interest rate rising and will drive it back down so it increases the supply of loanable funds. What does that do, that knocks that saving in the head and it leverages investment so you're back to an unsustainable boom that was the dot-com boom and bust. It wasn't quite so bad because it really was the welfare enhancing development underlying the boom, namely the digital revolution. It was great.

Now things are different with the housing boom and bust because what underlay that wasn't innovation it was a distortion of housing markets. It was subsidizing risk taking – Fannie Mae and Freddie Mac. And so the initial distortion, not welfare enhancing, was distorting housing markets. Now, if that's all that happened that would've shifted resources out of other sectors into housing. But those other sectors would've been hurting and so the Fed made good on that by, guess what, increasing the money supply. So you have a double whammy. You have the Fed now increasing the money supply when, in fact, it was the supply of loanable funds which was brought about by guaranteeing mortgages in the first place. So you have a double decrease in interest rates. That's why interest rates were so low. In

fact there, I'm showing even if that low interest rate of saving is driven clear to zero which it was during the boom. I'll do a little bit of stock taking and then with that interest rate of zero we're on life support and we could see that interest rate too low for too long that was during the housing boom. And then the interest rate shot up because the Fed realized it had messed up and then when the crash came, of course it lowered it to zero which means that essentially the economy's on life support. I think maybe I'll stop here and take questions although I've got more charts I could throw at you.

Yes.

QUESTIONS & ANSWERS

QUESTION: Thank you very much for your critique of the present system. I'm just wondering have you seen a study by Carpenter and Demiral which shows empirically that the Fed doesn't really have any control over the system at the moment, that the banks lead and the Fed follows?

GARRISON: I haven't seen that report, but I think that's true. But the reason it's true is because the central bank has already pumped the banks full of reserves, the reserves are just astronomically high. And if you remember your monetarism from your macro course, the way that the Fed controlled the money supply or controlled the economy was on the assumption that banks would be fully loaned-up that they wouldn't hold excess reserves, okay. And now they're holding tremendous amounts of excess reserves. You played right into my hands, I think I've got a.. there, there are those excess reserves one and a half trillion. In fact, it looks better on the axis you see that this excess reserves down to zero and then boom, you know that's the excess reserves. And with those reserves, then he lost control of things but that's another reason it's time for reform.

QUESTION: Yeah, this basically shows that the money multiplier, which a lot of economists have been assuming from their textbooks, has been inapplicable since at least the late 1950s.

GARRIONS: That's right.

QUESTION: Follow up question related to that. In your model you have savings equal investments, but in the present banking system, every new bank loan or bank purchase creates a new deposit, it doesn't transfer a previous deposit. So how does that affect your model when you apply it to the current situation?

GARRISON: I'd have to think about that, I think that if you're talking about a situation where there is a change in the reserve ratio then you get that, you get that kind of a result--

QUESTION: Going back to this, this shows that the change in reserve ratio has no effect when there's only \$20 billion in reserves and now there's \$1.6 trillion in reserves [inaudible]

GARRISON: That's right, that's right, you're certainly correct about that. I will say about when you look at this chart on the board, Bernanke has said a number of times that he is confident about his exit strategy, have you heard that comment made? And what that means, most of you probably know this but what that means, he's confident that he can suck those reserves out of the banking system if they actually start lending them out. He's confident about his exit strategy. At a conference not long ago where several of the Federal Reserve presidents participated, I asked one of them how can he be confident about his exit strategy? This is uncharted territory and the answer was that "Oh, being confident is part of his job description." And so I've decided that his strategy is to pretend to be competent but he doesn't know what he's going to do if banks start lending that money out. Yeah.

QUESTION: They do have a new policy tool to pay interest on excess reserves. Do you think that's effective enough to...[inaudible]

GARRISON: No, as... In fact this came in with the TARP legislation. That not only on those reserves sitting in the banks, but the central bank is paying them to hold those reserves point two five percent and the idea is that, if they start to lend them out, then Bernanke can reel them back in by offering to pay them more for holding the reserves. But that's got positive feedback in it, hasn't it? Because if he pays them more, then what he pays them become more reserves. So where does that story end? I don't know. It looks like that could just be explosive so I don't get it—don't get how anyone could be confident about that. Anybody else?

QUESTION: So, the current Fed isn't doing what it's supposed to do, but what would be your recommendations for a different monetary arrangement? Do you favor some sort of tightly constrained by fiscal rule central bank or do you favor a gold standard or free banking?

GARRISON: I favor free banking. In fact I've got a chart that probably, it's at the end so I won't pull it up, but it essentially is decentralize the business of banking and allow for competitive banks. I would predict if you have private banks issuing their own notes that the only way they're going to get them accepted is by tying those banknotes to hard money, most likely gold, okay. Could be silver, but that... so the gold or silver would serve as a redemption medium. And if somebody, some bank can issue notes and have them circulate and not have that, I don't know how they would do it, but it is more of a

prediction than part of the creation of the reform. The reform would just be competitive banking; the prediction is that successful banks are going to have to redeem their notes in gold. But let me go over here . Yes.

QUESTION: Can you briefly sketch how you would get from theory to practice and how it would actually work out in the economy?

GARRISON: Yes that's the big problem and the only thing that makes it even half way realizable, at least more realizable now than it was in the past, is just because the alternative, namely pressing on with the Federal Reserve is increasingly a bad choice okay. That's really the big thing. It may be the only thing we have going in our favor. One of the obstacles is that gold has a very stable value if it's used as a medium of exchange okay. If you're on a gold standard, then that is a very stable standard. But if you're on a paper standard like we are now, then gold is not at all stable. It becomes object of speculation, but the speculation isn't about the value of gold it's about the trouble that the paper standard's in. So how to overcome that I don't know how do you switch from, from gold being a hedge against a bad paper standard to gold being the standard, that's very difficult. It's also difficult even for one country to switch to a gold standard while other countries are not on it. When we had a gold standard it was the whole western world so I can't be optimistic there, I can just tell you those are the problems

QUESTION: You talked about your preference for free banking and banks issuing their own notes. Presently about 97% of the money supply, considering the Fed has 2/3 of its notes overseas, is electronic and about 99% of transactions by value are electronic, so would you [inaudible] are you talking sort of figuratively when you say notes, do you mean notes or their electronic equivalent?

GARRISON: Well yeah electronic equivalent but I don't think there's going to be an end to hand-to-hand and currency I think that's here to stay. But yeah you're certainly right that the electronic component could be handled privately as well. It doesn't require a centralized governance.

QUESTION: So to stop the multiplication of the electronic equivalent of each bank-funded purchase would you consider that those deposits be treated as private property and the bank acts as a fiduciary for customers instead of a creditor-debtor relationship?

GARRISON: See, I think the way that you're conceiving of that problem is that somehow when private banking would be analogous to the... the private bank would have problems analogous to what the central bank has now and I don't think that's so. I think the problems

you're seeing with the central bank are of its own creation and are unique to a central bank. And I think, if you have a system of private banking, then each bank is a check on the other to keep any one of them from getting out of hand. And that if, if a bank does over expand in a private environment, a private bank environment, then I think it would do it itself in and not do the economy in. It's only when you have a monopoly bank that it does the economy in with booms and busts.

QUESTION: So you're basically saying there'd be no fractional reserve banking, it'd basically be 100% reserves?

GARRISON: No, no I don't think that's right. I don't think it would and I know there's some people in the Austrian school that do think that fractional, that 100% reserves should be mandated. But, I don't think that's the case. I think that the banks will be a check on each other to keep... to not over issue. Larry White has written a lot on this, with George Selgin, on free banking and shows the competitive dynamics that prevent private banks from over issuing in any sort of way that a central bank can over issue. Yeah.

QUESTION: Doing that on a national scale and doing that on an international scale seem to be two very different things. If we were to tomorrow begin to undertake that sort of transition, it's always seemed to me that one of the problems with that, is that if there are a bunch of other central banks in nations that we are trading so much with, that they could still cause many of the same problems because of the way that currency exchange rates flowed and because of how much trade goes on between nations, especially now more than ever. How exactly would you recommend to somehow protect against that, can you protect against that?

GARRISON: No, yeah, I'm not even sure what protecting against it would mean. But, like I mentioned earlier, one of the problems is having a country go on a gold standard when it's the only country on the gold standard, that tends not to work. When we had a full-bodied gold standard before World War I, it was the whole western world on the gold standard. And that worked out quite nicely thank you. But for one country to go it alone is very difficult, but of course other central banks are in trouble too. So, it's more likely. I hate to be dark about this, but it's more likely that competitive banking will rise up out of the ashes of central banks rather than having some legislated smooth transition from central banking to private banking.

MODERATOR: I think there were two more questions. And then we'll...

GARRISON: And then we'll eat.

QUESTION: Do you think or when do you think the US dollar will lose its status as the world's reserve currency?

GARRISON: Well, that's a hard one and I used to think anytime now, but of course the euro is in bad trouble too. The euro is sort of a second choice, but it's in bad shape too and I've heard the US dollar described as the healthiest horse in the glue factory. So, the dollar seems to be holding on but mainly because the euro is in bad shape too.

QUESTION: Well, we're seeing reports from the IMF switching to a basket of currencies as a world reserve currency, China, [inaudible], two other ones, it was not the euro. Have you seen...

GARRISON: Yeah, I can believe it wasn't the euro, now I have heard about that I haven't studied it, but a basket of currencies as a world reserve-- it might be a better alternative than either dollars or euros.

QUESTION: It seems like in the modern systems, so much of our savings is now not determined by rational, forward-thinking decisions, it's more what my insurance company tells me my rate is, and whatever my employer match is, our retirement savings. So a huge chunk of savings is not shifting based on perceptions about the future so much anymore. Does that dampen some of the market adjustments with respect to, as seen in your capital...

GARRISON: Not... I agree with what you pointed out about how saving has gotten institutionalized to that point, but like any market adjustments happen at the margin. So it's at the margin where changes in price or changes in interest rate will affect your decisions and it maybe, for instance, that even now despite the institutional impact on your savings, that with the interest rate down to one percent you just decide to consume more and that means you're saving less than you otherwise would. That's the kind of adjustment at the margin that the market depends on and not only infra-marginal aspects of it, although still what you say could ... I'm not saying it's no concern but the market still works as long as you can have marginal adjustments. Okay. Thank you.

MODERATOR: I want to thank everybody for coming to this final lecture on the Federal Reserve if you missed any of our prior lectures they are available on the Congressman's YouTube page. The first one is "Why was the Fed created?" with Professor George Selgin, which Dr. Garrison did mention him and his paper with Larry White. That paper's also very interesting if you really like to read economic academic papers. I know there are a few of us in this room that do that. The second one was "What does the Fed do?" with Jim Grant

that's also on our YouTube page and then this one will be posted as well. So, thank you again for coming and please join me in another round of applause for Dr. Garrison.

*P*ART 3.

THE GREAT ENABLER

VII.
**THE GREAT ENABLER: THE RISE OF THE
FEDERAL RESERVE AND THE GROWTH OF
GOVERNMENT**

HON. RON PAUL¹⁶
REPRESENTATIVE, 14TH DISTRICT OF TX
CHAIRMAN, SUBCOMMITTEE ON
DOMESTIC MONETARY POLICY & TECHNOLOGY
U.S. HOUSE OF REPRESENTATIVES

MODERATOR: Good afternoon ladies and gentlemen, I'm Lydia Mashburn, Policy Director for Chairman Paul's Subcommittee on Domestic Monetary Policy. So today's lecture is going to be "The Great Enabler: The Rise of the Federal Reserve and the Growth of Government. Congressman Paul has sponsored six of these Tea Talks, but this is the first one that he's actually presenting himself. So delighted you all could be here today for his lecture. We also have a special guest today to introduce our speaker. He is one of the leading advocates for limited government in the Senate. He is the sponsor of the Audit the Fed bill in that chamber and he is the junior Senator from the Commonwealth of Kentucky. So without further ado, please welcome, to introduce Dr. Paul – Dr. Paul.

SEN. PAUL: Thank you, thank you, glad everybody could come out today and we've been trying to have a lot of different speakers and we've had some different intern speakers throughout the summer but I was excited to be able to get my dad here today and looks like a crowd. We've had a good crowd and a good turnout so thanks for coming out today. You know many people read many things about my dad, but I think there are a couple things that could sort of summarize who he is. One, lobbyists don't bother to come to his office. If you work in his office, one of the extraordinary things is the lobbyists don't even bother to come by and I think that's a good thing. He's decided how he's going to vote; he's decided how the voters in his district want him to vote and what he wants to do with this, with this time and with his energies here. One of the reporters from the Wall Street Journal wrote when he came back in 1996, they reported that his refusal to compromise was legendary and I think that's something

¹⁶ [The video of the lecture may be found at:
<http://www.youtube.com/watch?v=ehh77k0rgPs.>]

that folks will remember about my dad, is that throughout the years, many times he stood alone. Whether it was voting alone against things that his party was supporting or the opposite party. In fact, I think many would say he voted on principle regardless of which party introduced it. It's important that we have folks who are willing to do that, because we have too much of what I call empty partisanship up here; people who were simply for something just because their party's for it or against something just because the other party presented it. And I think what you'll find if you listen to my father today, you'll find that what you get is something that is beyond partisanship and without any further ado, I'd like to introduce my father Ron Paul.

REP. PAUL: Thank you. Thank you very much I appreciate you coming out and I appreciate Rand coming over. You know Senators are very busy and he might have to leave, but he might not want to hear this talk again, he's probably heard it ten, fifteen, twenty times, so he may decide to leave. But, you know they were kidding me a whole lot when we were sworn in last January. You know we were sworn in together and somebody, I think it was Cavuto asked me, he said, "boy, what does it feel like to, you be in the House and your son is now a Senator?" And I told him, I said, "if he does a real good job in the Senate, someday he might even make it to the House of Representatives." But I don't think he's working on that project, he's working on being a very good Senator.

But today we're going to talk about the Fed and those of you who have attended some of our other meetings on this, we talked a lot about monetary policy and the Fed. And it is a bit of irony, because as I leave here, I'll go to the floor, we're going to vote on the Audit the Fed bill and that wasn't - this wasn't that planned that way because we didn't know when the bill was coming up. So, ironically, we will visit here with you, those who have been interested in this issue as well as we'll have the Audit the Fed bill up. It's under suspension, which means that that we have to have two-thirds of the vote and that's even more of a challenge, but I believe we can do that. We have 272 co-sponsors, but the actual vote will come tomorrow, it comes tomorrow after lunch and it'll be something well watched and a lot of people already have declared. You know since I am leaving the Congress at the end of the year, that and they use the word futile, futility he's been doing this for all these years and he won't get this bill passed, the President won't sign the bill, nothing good has come of it.

Well, I look at it on the positive side. I compare it to ten, twenty, thirty years ago and nobody cared at all about this issue, but

inevitably I always believed that it would be a big issue. I always believed inevitably that it would become a big issue. It's getting bigger all the time, it's going to get a lot bigger because we embarked on a grand experiment in 1971 and it was the breaking down of the last vestige of a gold standard, worldwide gold standard. And we embarked on something different, than ever happened before and that was a paper standard worldwide run by a single currency, which was the United States Dollar. In 1945, when the Bretton Woods was set up, which was a pseudo gold standard. A real gold standard would be gold coins; redeemable currency and the monetary authorities would always be held in check. So in 1945, when they announced "oh we don't need to have gold coins we don't - we won't even allow the people to own gold," the American people weren't allowed to own gold. But, even at that time, the famous Austrian journalist and economist Henry Hazlitt who befriended Mises when he came to this country made a prediction, he says "this isn't going to work either." You know he said the Bretton Woods wouldn't work and he was right and it finally broke down in 1971. But the same type of economists, the Austrian free market economists in the 1970's, not only did they predict the event of 1971, at that time they predicted that this would lead to nothing but trouble. Big government, big spending, huge debt, and the longer it lasts the bigger the problem will be. And that was when in the early 1970's I decided to speak out, not because I had much thought about coming to Congress, because, quite frankly, I thought talking about the Federal Reserve and the gold standard was a little bit esoteric. But it's not esoteric at all when you realize that if you have a concern about personal liberty, if you have concern about needless war, if you have concern about runaway welfare spending, you can't ignore the Federal Reserve.

So, I was anxious to speak out and I ran the first time in 1973 and the person I ran against, I didn't win that time, but the gentleman I ran against resigned and I won a special election. So it was sort of one of those things in politics, it's being in the right place at the right time. It wasn't so much that in the 1970's anybody really, really cared or was thinking about it, but events have transpired over all these years. And if you can look at economic charts, look at them from 1971 on, they're unbelievable of what happens. When you see the size of government, the problems that we have, the inflation rate the value of the dollar, it's all like this and then things go exponentially.

And I think the greatest threat comes when you have a government that endlessly finances through counterfeit money. It's

an attack on personal liberty so there's a lot of reasons to be interested in the Federal Reserve and studying the Federal Reserve. There are economic reasons, there are historic and constitutional reasons, there are moral reasons, but it's the growth of government that is the really big – the big issue. And when you look at it, it has – the American people have been so complacent. So, we have had a society for these many decades where the people actually want bigger government.

People always complain about the Congress and they should, I've done a little bit of that myself, but believe me, Congress reflects the people's views. The reason we are going to debate the Audit the Fed bill isn't because all of a sudden there's an enlightenment, a desire here in the Congress to have monetary reform, it's because the people of this country found out that it was an important issue and they called their Congressmen and they you know indicated that we should have more transparency of the Fed.

And this to me shows that government is a reflection of what the people want and, even in an extreme case, when people really, really get sick and tired of dictators they usually get rid of them. Even the kings of old were limited to the support of the people. Sometimes it's frustrating it doesn't move more quickly. But, the attitudes are changing and I think this is very, very good because there are so many individuals, especially young people today now, high school kids and college kids coming in and telling me about studying and reading about the Fed. And I tell them, I said, “how old are you?” And some are fourteen and sixteen and I said I didn't even have the vaguest idea about what was going on when I was your age, but this to me is very encouraging.

And this is why of course there's a lot more attention. But, we're in a crisis now because we have facilitated the growth of big government. If a country wants to go to war – in our country, we're supposed to have a declaration of war. We're supposed to have the people behind it and we're supposed to know who the enemy is, and what has to be achieved to win the war. But, inevitably throughout history even in the old days, they almost always financed wars with inflation, you know they'd either steal money or clip coins or dilute the metal. Today, we just print the money and certainly since World War II a tremendous amount of monetary inflation. So, if you happen to be on the side of saying we have way too many wars and we go to wars carelessly, not only do we have to restrain our Executive Branch, we have to restrain the Congress for financing these wars

and also we have to restrain the Federal Reserve's willingness to finance the war.

If you did not have a Federal Reserve either to finance the wars, or the welfare state what would happen? All of a sudden interest rates would go up it would go up, up, up and the politicians would have to say "hey, we can't borrow everything out of the economy, interest rates are too high" and it would be a natural restraint. But, when the Federal Reserve can fool the people for a long time and say, even if there's no savings we'll pretend there's savings, we'll pretend that capital, the capital that you need to make investments can come out of a computer. And they've been doing this for a long time but the crisis I think that were in the midst of is probably not even fifty percent of the way through because nothing has changed. Monetary policy hasn't changed, spending hasn't changed we're doing the same thing. We're spending and monetizing and expand the size of government, the debt is increasing and this really, there's no attempt at all to cut anything.

The Republicans pretend they're going to cut, the Democrats don't even pretend. And you know, and the spending continues so there, there's a pretense of course but if there is a cut, like this whole program of sequestering money and spending. Well guess who's opposed to following the rule that was passed by both Houses, you know Democrats and Republicans? They're the ones who want to eliminate it and there's no way that they're going to go through with that. They're going to spend more money because if you don't put more and more money into the military then they say "you're, oh, you're not supporting the troops and you're unamerican and you don't want to have a strong national defense level" and the truth is essentially opposite of that.

So, the spending it looks like it hasn't slowed up. So how does this all come to an end if the Fed is the facilitator that allows this to continue. How does it end? They're going to keep doing it and they are doing it, interest rates are really low so the world governments and other banks are taking the money. It's going to end when price inflation rears its ugly head, it's really much higher than the government admits and interest rates start to rise and foreigners won't take our dollars so easily. And then the end stages of a currency destruction can come rather rapidly. It's been slipping and sliding in the value of the dollar. I mean if you measure purchasing power and however you want to measure, it's been slipping for a long, long time. But currencies at the end go very rapidly because confidence is lost. But nobody knows when that comes. One thing in

Austrian economics, they can project trends pretty well. They can have basic economic laws that say you know, if you print a lot of money, the money's going to lose some value, you know really a complex law that says that. But if - but one thing you can't predict is saying I know that in the fall of 2008 everybody's going to know there is a financial crisis. That is not predictable because there's a subjective element into people's confidence level. But be assured that this is far from over.

And if you want smaller government you have to look at the Federal Reserve. If you think welfare spending is out of control then you have to look at the Federal Reserve. If you want to control special-interests you have to look at the Federal Reserve because many; whether on the right, they might support deficits and the Federal Reserve to finance wars; on the left it might be, oh well we have to help the poor people, we can't cut anybody off food stamps, this would be horrible, horrible, we'd rather have the deficits and we will just monetize the debt. But there will be a limitation on that and I think that is what's coming and then there will have to be a revamping of this. But overall, what a whole generation has decided is not only what the Federal Reserve should do and what the nature of money should be. What we have to decide as a people is what should the role of government be and this is where we fail. Our consensus now is still that the role of government ought to be that we're the policeman of the world. And that it's to manage our personal lives because they're in all of our personal lives day-in and day-out, instructing us on what kind rules and regulations that make us better and also the government is necessary for a fair distribution of all income and it doesn't work.

So, if you decide that if you want a more traditional role for government, if you want to talk about what we had in our early history, what the Constitution says, the government is supposed to protect our liberties. Matter of fact the word "safety" isn't even in the Constitution. The government isn't there to make you safe and comfortable and have an income. It's to give you liberty, assuming you'll take care of yourself better than anybody else. And this is...I believe what the founders thought is that safety is an important issue, but you as an individual have a responsibility, your family has a responsibility, community has a responsibility and then they gave us the 2nd Amendment and that was supposed to help also.

But, we have assumed now that the government somehow or another can have a safety net up to take care of the poor and protect us from all harm. Now the motivation to protect the poor is a good

motivation, but one thing that we as a country have forgotten is that if you have humanitarian instincts and you want to make sure the poor are taken care of, then you'd better defend liberty and free markets and sound money, productivity. This is the system that takes care of the maximum number of poor and when we had a lot more freedom we had the largest middle class in the history of the world. Today the middle class is shrinking and guess what? All those programs designed to help the poor; what is happening? They're losing their jobs and they're losing their houses, housing programs, print the money, everybody can qualify for a house and then force banks to even make bad loans and it looked great. The price of houses going up, borrow more money looked like a perpetual money machine until the crisis, the predictable crisis hit.

And guess what? Those individuals who overextended in the financial markets, those who got involved in derivatives and wild speculation and then they literally go bankrupt. Oh, they're too big to fail and we have to save the country and guess what? They got the bailout secretly, you know, from the Federal Reserve, a little bit from Treasury, but mostly secretly from the Federal Reserve and that didn't help the poor people. Matter of fact, I think most welfare programs end up helping the wealthy more than the poor, but it's a tougher political argument to make because it's much easier to say whoever needs it. Need a house; I'll give it to you. If you need free education; I'll give it to you. If you need food stamps; I'll give it to you. If you need medical care; I'll give it to you. It's for free. And you can get reelected under those circumstances. So that is quite a bit different than civic responsibility for ourselves, which is what was supposed to happen in a free society. So that reassessment of what the role of government ought to be would have to come even before you can curtail the Federal Reserve System.

But the act of printing money is counterfeit, it's an immoral act and it's something that we should look at it in that way. It's certainly unconstitutional. There's no authority in the Constitution to have a central bank. There is authority in the Constitution for the Congress to have oversight and have control of the money supply and it does nothing.

Today we have a combination of...we have a combination of a secret Federal Reserve dealing with private banks, who collude with private banks, to set interest rates at the same time they collude with the Executive Branch. They claim, they say, "well, we can't have an audit of the Fed because it would make it political." Well how could it be more political if the Treasury Department from the Executive

Branch gets together with the Federal Reserve and bails out their friends and then they want it kept secret? And they say “well, it'd be chaotic if we had this come out,” yeah it'd be chaotic for those people who've been ripping us off. That's why they don't want to have it. They talk about... I want transparency and they talk about independence; independence to them means secrecy. And that's what they don't want.

But this country now has awakened, not only transparency in monetary policy, but it's a very popular position to have more transparency, so it's bad that the government has gotten so big. The fact it's secret makes it even that much worse, so it's transparency that we want. We don't want secrecy because that's when the special interests get bailed out then they're too big to fail, let's take care of them. Oh, what if we'd have taken half that amount of money, we probably could have paid off all our mortgages of the people who lost their houses. Not that I advocate that, but you know in comparison it's still protecting the powerful special interests.

That is the biggest delusion of people who are good at heart and believe that we have to help the people in poverty and take care of the poor, is that they don't realize that they're really helping the very, very rich. And that raises the question, you know we've had a tea party movement you know these last several years to address some of these problems, but we also have this Wall Street... Occupy Wall Street. And Occupy Wall Street are considered, well, they're the leftists, and they don't know what they're talking about, but actually they're half right on it. Because they're right in that there is a one percent or more that don't deserve it because they made their money off being on the inside track of the Federal Reserve, the banking system, and they make money off the system. They made money building weapons we don't need. And if that one percent, or if there's a large number of very rich people that couldn't have gotten rich on their own, then they should be condemned and the whole process should be changed. That to me is quite a bit different than if you have a Steve Jobs who's very, very wealthy and he made his money you know only by selling us stuff that we wanted. If you buy stuff that you like and you want it and you make somebody rich you both benefit. But this whole idea that we have to attack rich people I think is dangerous at the same time. We should not, you know, take the attitude that we have to defend everybody who's rich no matter how they made it, if they made it with special deals with the government. And right now, I think the majority of the super-rich are on the inside track and the whole system of money and banking

has always benefited the very wealthy and that's why we have to be as objective as possible.

But I want to, you know, finish up on my opening remarks, because I do want to get some questions. But we're living in a different age; we're living in an age when this whole crisis is being resolved and will have to be resolved. I do not believe that we will gradually work our way out of it. Although, I think it will end rather badly because we don't seem to have much desire to cut the spending.

I always try to have a process where we can work our way back. Medical care you can have medical savings accounts, always legalize a freedom option. You could do this all on education too, if they take away homeschooling and private education and force everybody into a government school and dictate the curriculum that's bad news for us. In money, you can do the same thing. I don't, even though I have a book "End the Fed;" I wouldn't end the Fed tomorrow if I could because it would be even more chaotic. But what you need and deserve is the right to opt out and you have – you should have the right to use your freedom in the midst of the chaos that we have; which means that you ought to have the Constitutional right to use gold and silver as legal tender and we'd have to repeal legal tender laws. We would have to take taxes off gold coins and silver coins and not put people in prison for doing that. So, I think if we always have a freedom option, time and effort would work our way out of this. Historically though, most of the time it ends badly and I'm afraid that we're moving in that direction.

But the most important thing is that a whole generation of individuals know what the right thing is because there will be, whether it comes quickly, calamitously or just how it happens, the rebuilding is crucial. So, right now I think we've made tremendous progress in so many millions of people now understanding that the Federal Reserve is important. And that means the repairing of this is going to be quite a bit different, because I think in the next few years it's going to be clear that there's something deeply flawed with this notion that we have twelve people in a private room secretly creating money out of thin air and passing it out, to take care of all the special interests and they get hysterical if we say that the Constitution says the Congress has the right of oversight.

I just am convinced that's it's coming to an end and I believe that is good. Even though times will get much tougher I'm actually very optimistic that the educational activities in this country has been fantastic. You're so far ahead of where I was in the 1950's and 1960's, desperately seeking to figure this stuff out with no Internet and no

free-market think-tanks. They're all available now, the information is out there spreading like a wildfire and I don't think it's going to be put to sleep. No matter what I do, if I go down home in January and you never hear another word from me, it's not going to stop. There's no way it's going to stop because there'll be somebody, somewhere, possibly even in this room – somebody's going to get up and pick up the banner and say “This is a worthy cause; sound money is equivalent and is necessary to have a free society,” and I encourage you to do so. Thank you very much.

QUESTIONS & ANSWERS

REP. PAUL: Thank you and I think I got my allergies a little bit under control. Okay, questions. When you ask questions make them as loud as you can for me.

QUESTION: You were talking about having Congress control money. What would, given their nature, what would keep them from openly and transparently destroying the currency?

REP. PAUL: I don't really want the Congress to do what the Fed's doing, and some people see that. Some people want that, they want the Congress to print the money and send it out to the people they like and they'd be more inclined to maybe give it to the mortgage holders or the farmers or the small businessman and say “oh, this is much better and we're not going to let the Fed do it because we'd pay interest to the Fed and get the banks involved and the bond dealers involved.” But no, I don't want the Congress to print money either, but see we did have a pretty good period when we didn't have a Federal Reserve.

This argument has been going on since Jefferson and Hamilton, Hamilton wanted a central bank, Jefferson did not. They had a national bank for twenty years and Jefferson got rid of it. Then they did it again and Jackson got rid of it. Then we had a period of time, especially in the latter part of the nineteenth century that we didn't have a central bank and then 1914, 1913-14 came and it was very bad. The Congress' responsibility is to guarantee the value of the coinage, you know the weights and measures. It's in the section of Congress that talks about honest weights and measures and that's what they should do. They need to make sure that coins are of an honest weight. But no, they don't have the right to create money out of thin air. They have, governments have an obligation not to break contracts and counterfeit money. Matter of fact, in 1792 they passed a coinage act that said that anybody who counterfeited money could get the death penalty. That's how, how strongly they felt about this. So I don't want the Congress counterfeiting money. I don't want

individuals because it's fraud, nor do I want the Federal Reserve to do this. But the money supply under those conditions probably increases around two-three percent a year and as long as you have free market pricing, prices of goods and services and exchanges between those goods and services are free...

The one other mistake they made back then was they fixed the ratio of gold to silver and that was difficult because then depending on which price was best it would drive out one metal and not the other. You'd want to use the other metal. But no you don't want the Congress printing the money; you want the Congress to live up to the law of the land which means no counterfeiting.

QUESTION: Yes sir, thank you so much for coming to talk to us today and for your lecture. I want to know what you think would have happened immediately after the 2008 financial crisis were we on the...

REP. PAUL: A little bit louder.

QUESTION: What do you think would have happened after the financial crisis if we were on the gold standard and we couldn't pump a bunch of liquidity into the market?

REP. PAUL: Okay, if we'd have been on the gold standard, you wouldn't have had the crisis. So, the crisis came from the paper money system and the bubble that the Federal Reserve creates by lowering interest rates lower than they should be sending false information that there's too much debt and too much malinvestment. That comes from the Fed. But then the question is, what if they didn't bail them out? Maybe, because it'd be hard to say you're automatically on the gold standard that instant you know but the – if you didn't bail out, it would've been a bit of havoc, you know there'd have been a bunch of bankruptcies and, but that's what the correction is supposed to be doing. It's when you delay the correction and the liquidation and getting rid of debt and malinvestment, when you don't get rid of it, you just prolong the agony. This is the reason why Japan's been in the doldrums for a couple decades and while we've been – we went fifteen years in the depression and World War II it was just because the debt wasn't – took so long to liquidate the debt and we're not liquidating debt. We're just transferring it from the people who deserve to go bankrupt and giving it to the taxpayer, either by diluting the value of the money or raising people's taxes. And we own the debt now rather than you know the big banks and the financial institutions. But to say “oh yeah, just let them go bankrupt, it wouldn't be a big deal,” it would've been a big deal. But it would've been a big deal for the people who it should have been a big

deal for, not the average person. But the average person now is that individual losing their jobs and in losing their mortgages and they're in a lot worse shape because of it.

In 1933, it was by executive order that Roosevelt just called in the gold and said you're not allowed to own gold anymore. I mean you think that would cause a rebellion. But people were complacent and went along with it. In 1971, Nixon, I can remember clearly because it was a dramatic evening. It was on a Sunday evening that they made the announcement that they would quit and, up until 1971 we were required to honor the dollar at \$35 an ounce to foreigners, but not to Americans. So he just said "no, no more, I'm not going to do it"-In a way, he declared bankruptcy. We're bankrupt, we couldn't honor our commitment, but he did that by executive order. He put on wage and price controls, he put on a ten percent tax – tariff – on all imports and amazingly the stock market soared the next day thinking that this was a wonderful thing.

But in the IMF, was changed at that time, the IMF was used to work on the imbalances between currencies and trade policy, but that all fell apart because there were fixed exchange rates back then. And so, the whole role of the Federal Reserve changed.

It was 1976, then Congress got around to writing laws to sort of accommodate, you know, what they had done, but the 1970s were very bad. The 1970s came as a consequence of LBJ's comments and his policy of the 1960s, saying guns and butter we can fight the Vietnam War, we can give welfare to everybody, and take care of everybody. But then the consequence came, that we no longer had the dollars at \$35 an ounce, we had to admit that. They made that announcement and the 1970s were terrible. I mean it was when they admitted there was stagflation, there was high inflation rates, interest rates went to 21 percent and unemployment was even higher than now. Today we have problems that are probably worse, but a lot of it is hidden. I was just thinking that, you know, if you had everybody that's on disability, and also disability as well as getting food stamps and unemployment benefits, and you had to stand in line, in the bread line like they did in the depression, everybody would know how bad things are. But now it's done with dignity, you don't have to wait in line but it also means that you're just still building a bubble. You're still kidding yourself, but, because you have to get back to production, but no they did all that in 1971 without the Congress very much involved.

But this is the fault, this is the problem we have, is Congress has reneged on their responsibility. How do we go to war? We don't go to

war because the people have a sentiment to go to war and their Congress has an up and down vote on war. No, we either ignore or tell the President to do what he wants or the President makes a decision say “oh, I'll get my instructions from the UN or NATO.” So, whether it's monetary policy or foreign policy and so much of domestic economic policy, it's out of control and, unfortunately, it seems like regardless of which party is in charge the process continues.

QUESTION: [inaudible]

REP. PAUL: She asked what would be the process to restore a gold standard. Today it'd be difficult. I made a suggestion in the talk that the first thing you do is you legalize it and let the market help decide when we can go back to a gold standard. It would be best to be international, but if we wise up someday, somebody in the not too distant future will have a gold standard. It may be India or somebody or China, because they're buying the gold in the west and European countries and others are selling gold and the gold is going east. But they could, we could do it. We could lead the way, but you know it's rather dramatic. It's not likely to happen because it would require living within our means. We can't print money anymore, so that means no deficits and the other thing it requires is that the people have to believe the politicians. So, if I'm representing the politicians and the government and I come in and say “okay, we've decided to have our gold standard and all we have to is – the dollar is going to be backed by gold at \$2000 an ounce and everything's going to be okay and we'll not – we'll always balance our budget and there'll be no excessive spending and we're going to back off on these wars,” nobody would believe this.

Now, the best example of this under different conditions was in 1875. See they suspended the gold standard during the Civil War because once again you know war comes, “gotta have money, no more gold,” so they suspended the gold standard but times were different then and they decided to go back to a gold standard. In 1875, they had a resumption act and they had a - designed a three-year period to transition back to gold. And the price of gold was much higher than \$20 an ounce and they said we're going to quit printing money. We're not going to run up these deficits and they withdrew some greenbacks and they withdrew them all. And by the time the three years was up, gold in the marketplace was \$20 an ounce and they didn't go back to carrying gold in their pockets or anything, but they were back on the gold standard. Anybody who wanted to turn in a certificate back then,

you had gold certificates, you could turn it in and get an ounce of gold for it, or an ounce of silver or whatever.

So it's this attitude of big government, it's pretty hard if you want to finance a government that we shouldn't have with a gold standard. When you want, what you'd have to do is decide that the role of government should be different should be protecting our liberties and not to run a welfare state and police the world. Maybe it'll be when the total collapse of the economy and the currency comes that that's when hopefully somebody'll wake up and say, "you know, well we have to have a sound money and when we follow the advice of the founders."

QUESTION: I was wondering what you thought that Mitt Romney or Gary Johnson might do for sound money, either one of them?

REP. PAUL: Well I don't know exactly. I do know that yesterday, I had somebody told me that Mitt Romney announced that he was supporting an audit the fed bill and I would say that Gary Johnson would support that too. I've never had a conversation with either one of them about the gold standard, but I don't think that, I don't imagine they give a lot of thought to it because we're not quite there yet. I'm trying to push people in that direction, but I don't think they're on the verge of it, endorsing or condemning the gold standard.

QUESTION: There's a funny anecdote in your book "The Revolution" about how you went to Alan Greenspan and got his gold standard paper signed by him. I was wondering if you ever, since that book was printed a few years ago, had a follow up conversation with him about the gold standard after the Committee hearing?

REP. PAUL: No. He's referring to an article that Greenspan wrote for a newsletter that I was receiving back in the 1960's, *The Ayn Rand Objectivist Newsletter* and Greenspan was really good. He was hardcore and he said paper money was confiscation of wealth. It would lead to huge debt. I mean he was saying everything an Austrian economist would say and so I knew that he was coming before the Committee and we were supposed to go in and say hello and get a picture if we wanted. So, I dug out my original copy of that and it was a little green booklet, maybe one or two people that remembers that. So, I took it in and I said, "do you remember this?" And he said, "oh yeah, I remember this." And I said, and then I opened it up to the page where this very, very great article – it's not hard to find that article on the Internet – Greenspan and the gold standard and objectivism or Ayn Rand or something it'll come up rather quickly. And he says "Oh yeah, I remember this," so I said,

“Would you autograph this for me?” So he put his signature on that great article and I said, “You want to write a disclaimer on there?” He said “No, I read it recently and I endorse everything,” which didn't make any sense because if he had endorsed it, he did everything opposite of that, but no I never had any more conversations on that.

He did [inaudible] Murray Rothbard, a great Austrian economist, knew Greenspan pretty well because Rothbard was in the Ayn Rand circles for a while and they had crossed paths. But, Rothbard has a book. Now, if you want to really understand the business cycle, at least want to help me the most to sort out Republicans and Democrats and intervention and inflation, read Rothbard's book “America's Great Depression” and that will really explain to you why we had the depression and why it took so long to get out of it. And Bernanke studied the Great Depression and he even apologized to Milton Friedman for saying that the Federal Reserve was responsible for the Depression, which most Austrians agree that is true. But he said it was because they didn't print enough money and, of course, the Austrians believe that the bubble of the 1920's created the problems, the excessive debt and the malinvestment and that set the stage. But the prolongation was because they kept propping it up; they didn't want prices to go down, they didn't want wages to go down, and they did everything like they're doing now but today it's probably much worse.

QUESTION: [inaudible]

REP. PAUL: Do I think the dollar's losing its status as the reserve currency world? Yes. It's less used now than it used to be and it eventually will disappear. Somebody else will pick up. When that happens, I don't know that, but eventually that because it just can't last forever this way. If it would be true that we kept the reserve standard and that we could print the reserve standard of the world, none of you would ever have to work again. I mean why wouldn't we just print the money. And we're in a way doing this. We print it, look at all we buy from China, so everybody gets angry at China, but they're taking this paper and sending us stuff. But of course we end up with debt. So, it's not viable for them; it's not viable for us. I think that China might do it; I think they would like to they're working in that direction. I think that it may be a group of countries. I believe it will be in the Far East, it may be India and Singapore and maybe Malaysia and China, they might get together and establish it. It may be a retaliation by nations that are considered more Muslim, you know just because they, they're involved with oil and other things like this they might be able to do it. And if they're buying gold, so I think

you'll live to see the day when the dollar will not be the reserve standard of the world, but that will be a rocky test on exactly what happens. But what could happen is, let's say that we wake up with realization, maybe then we would devise monetary reform that people would accept the dollar, you know, if it was guaranteed and convertible into gold but right now that's not likely to happen.

QUESTION: [inaudible]

REP. PAUL: People hold dollars, and we print dollars and then they hold them. They're holding huge amounts of cash. We just print the cash, we spend it overseas. They just keep it and they circulate it because, right now, it's still better than the rest of the currencies. So, if one country did this, our standard of living is going down; no, it's systematically going down. This country's a lot poorer than it was ten years ago and it would get a lot worse if another country did this and we lost the status. It would be very, very harmful to our economy—we would be much poorer.

QUESTION: [inaudible]

REP. PAUL: The Constitution prohibits the States from issuing currency, but it also tells the States that they can only use gold and silver as legal tender. So, if they lived up to that mandate and because we do have American gold coins and silver coins, they should be allowed to use them. And they should say, “well, we're only going to use gold and silver coins,” the Constitution tells us to do this but they had a lot of trouble with the States. One of the reasons why they had the Constitutional Convention is many States did issue their own paper currency and they did abuse it, so there is a prohibition against the States just issuing paper money. But to use US gold and silver coins I think this would be beneficial.

I think education - educationally that's why I like to see all these resolutions, you know, coming up in the various States. Because it's calling attention to it and that is what is required. Education is the most important thing that we do and like I said before, this is the reason we're having Audit the Fed bill on the floor this afternoon, is through the education of many people who said to their Congressmen, “Support the bill.”

QUESTION: Why do think that younger people are so much more willing to recognize the problems of the Fed and monetary policy and they're holding their positions?

REP. PAUL: She asked why young people might be more interested in the Federal Reserve. But, generally speaking, I think young people have a more open mind just in general. They're not locked in and stereotyped. As people work within the system and

they go decade after decade, they learn to be more flexible to work within the system. It's sort of like, you may know somebody like this, that they'd run a real hardcore campaign and they're going to be hardcore and they're going to come to Washington and change, and then they get here and they don't vote that way. Anybody ever hear of anybody like that? But they get here and they feel more comfortable because, "Oh, I gotta blend in, I gotta be part of the process, I can't be separate, I can't be by myself" and they can't get on the Committee unless they do it. And they can't get benefits and so it goes on and on and so they learn to work within the system. I think people, the longer they've been in business, they say "Oh yeah, the Federal Reserve is a little different, but I'm not going to buck it."

You know young people are much more open to ideas. I think also, young people know that there's a problem out there that they're inheriting, they had nothing to do with. I mean if you happen to not endorse all these wars going on— you can't ignore it. I mean, but in the last ten years of it, between three and four trillion dollars in debt because of these wars. And you might have a friend, or a neighbor, or a relative that either's getting hauled over there constantly, or has been injured or killed and then young people seem to respond to that because they are - that's a burden that's put on your shoulders. Exactly why they became more fascinated with the - that's the general philosophy that young people became interested, but it's the reason they got particularly involved and interested in the Federal Reserve... It might've been the financial crisis that got their attention, but I think it's part of the process. This material has not been available readily, like it has been lately. We have the crisis and it's hard not to know what's going on in this day and age with the information we get from the Internet. Anyway, I don't have a full explanation for that but I'm very pleased with it.

QUESTION: [inaudible]

REP. PAUL: He asked about auditing the amount of gold we have. And that - the last audit and it was a pretty thorough one, was probably fifty, sixty years ago, in the 1950's they did it. In 1982 there was a - in 1981 we had the Gold Commission. There were seventeen of us on the Gold Commission to study the role of gold, so I proposed that we have an audit of the gold with this commission. It was some members of Congress on it, but there were other members too and there was a vote. There were seventeen members of the commission, and fifteen voted not to audit the gold. Two of us voted, said "yeah, we ought to count the gold." The gold is listed on the balance sheet of the Federal Reserve, so I would think that the way I interpret the bill to

audit the Federal Reserve you could also find out about the gold. But no, they haven't done it and it is pretty important. It would be...for many, many years I would keep saying to myself "They can't be that bold, do you think so, they would actually steal our gold?" Today, I say, "Yeah probably. " I used to have to struggle with this whole idea that our leaders would actually lead us into war and do things that actually you know set the stage for it, like lie about things, you know, whether it's the Gulf of Tonkin or you know lie about what's happening in Iraq and some of the things that – controversy that led up to World War II, I just – that was so horrendous to me I just couldn't accept that. But I'm more likely to think that.

I've seen it too often that they do, so that's an argument that yes, they may well have done something with the gold. But, you know if any one of us would walk in there, we look at these vaults, they say "see, there is the gold, count the bricks" you know and be satisfied. It takes a lot more, you need assayers, assays. But you'd have to look at the records too, what if we loaned the gold out? There's been a lot of central banks loaning gold and using it as assets and the subject of gold came up on this issue of Greece. They said "look, we're not going to loan Greece any more money unless they produce some asset for it" and they were talking about using the gold. But the answer is, there's been no recent audit of the gold and it certainly should be, especially if we get to that point where we want to go back on the gold standard. I think we have time for another question or two. Here we go.

QUESTION: What are your plans after you leave office to continue the great freedom movement you've helped create?

REP. PAUL: Well, I know one thing, that I won't be twiddling my thumbs. I'll have something to do and hopefully I can write another book, whatever good that'll do. And also I have an educational foundation. I really think education is the most important thing, changing people's minds is much, much more important than being a politician. So, when people of your age so often will come and say "oh, how do I become a Congressman," I say, "don't plan on it, don't even think about it." If it comes along fine, but the most important thing is to understand free-market economics, the principles of individual liberty, the principles of a non-interventionist foreign policy, and understanding monetary policy and somebody'll make good use of those individuals. So, I will continue with the education.

We'll also have this organization called Campaign for Liberty, which helped energize a lot of people to wake up Congress, you know about the Federal Reserve and other issues. So, I will do that. I plan to do some traveling. I've had a lot of invitations, not only in this

country, but overseas and I have haven't gone very far. I sort of resented the idea I had to go and get you know permits from the Congress in order to go someplace. There's a lot more restrictions. If I wanted to go to Europe and speak at a University and they would pay my way – I'm not allowed to take an honorarium, but they would pay my way – I gotta jump through more hoops than if I go on a junket and get on a, you know, a US Air Force private airplane and they pick you up and take you over there. Nobody pays any attention. They're much more worried that you had somebody outside the government pay it. The taxpayer, let them pay for it, and you can travel. So I was, I didn't take for the years I've been here, I never took a junket and looks like I'll make it the next four months without taking one. But, I may take some private trips because, right now, this whole issue of money and finance, this is not— it might be a bigger deal in Europe right now when you think of the crisis. Matter of fact, today I had a long interview with a German newspaper because, you know Germany is sort of under the gun, they're the richest country over there, they can bear the burden of bailing out Greece and Spain. So it's a big issue and they are paying attention to this. So, anyway I think it's time that I go to the floor shortly but thank you very much for coming and study hard.

MODERATOR: Thank you all for joining us today. If you are interested in learning more about these issues, of course the internet is your playground, but also there are the number of tea lectures that the Congressman sponsored on the basic principles of money, as well as the Federal Reserve, that are posted to his YouTube page. They had some excellent scholars come and present to other crowds, so if you're able to look at those I would encourage you to do that. Again, thank you for coming. I'd also like to thank Senator Paul for having been here and giving the introduction. So, if we could get one more round of applause for the Senator.

CHAIRMAN vs. CHAIRMAN
AT THE SEMI-ANNUAL
HUMPHREY-HAWKINS HEARING

I.
RON PAUL QUESTIONS BEN BERNANKE

HEARING ON
MONETARY POLICY AND THE STATE OF THE ECONOMY
COMMITTEE ON FINANCIAL SERVICES
U.S. HOUSE OF REPRESENTATIVES

WEDNESDAY, MARCH 2, 2011

WITNESS

Bernanke, Hon. Ben S., Chairman, Board of Governors of the
Federal Reserve System

*T*RANSSCRIPT¹⁷

The committee met, pursuant to notice, at 10 a.m., in room 2128, Rayburn House Office Building, Hon. Spencer Bachus {chairman of the committee} presiding.

[...]

Chairman BACHUS. This hearing will come to order. We meet today to receive the semiannual report to Congress by the Chairman of the Board of Governors of the Federal Reserve System by Chairman Ben Bernanke on the conduct of monetary policy and the state of the economy. Without objection, all members' written statements will be made a part of the record.

For the purpose of an opening statement, I will recognize the gentleman from Texas, Dr. Paul. Prior to that, we want to welcome you, Chairman Bernanke, to the committee. I want to personally commend you for your stand that we need to address the national debt and the deficit. I know that makes your job much harder and presents challenges in managing our monetary policy.

Dr. Paul, you are recognized at this time for 1½ minutes.

Dr. PAUL. Thank you. It has been said ever since the crisis hit that one of the causes has been that interest rates were kept too low for too long, and that is more or less a consensus. Now, the treatment over these last couple of years has been to lower interest rates even longer and keep them low for a much longer time.

We were told yesterday that we shouldn't expect any permanent increase in price inflation, that it will be temporary and modest and the CPI is under control. If we look at the free market economists, we find out that the measurement of the CPI the old-fashioned way is going up at 9 percent and the true money supply as measured by the

¹⁷ [The full hearing record, Serial No. 112-11, is available from the Committee on Financial Services at: <http://financialservices.house.gov/uploadedfiles/112-11.pdf>]

Austrian economists is going up at 24 percent. So I would suggest that we still have a lot of inflation in the system. It is going to get much worse.

The excuse for the prices going up right now is that we have growth. So I guess the answer will be to destroy growth. And that is generally the case. What we have done in the past, we have growth, and the Keynesian economists always claim because of growth, prices go up. But prices don't go up when you have growth in the electronics industry, so it is hardly an excuse to purposely diminish growth, which is generally done. But all kinds of blame are placed, whether it is on the Middle East, the weather, labor, prices, speculation; all these things. That is the reason prices go up.

Rarely, if ever, would we see the admission that the real cause of price inflation, which is a deadly threat to us right now, is the Federal Reserve System and our monetary policy.

[...]

Chairman BACHUS. Thank you, Ranking Member Frank.

Dr. Paul, chairman of the Monetary Policy Subcommittee.

Dr. PAUL. Thank you, Mr. Chairman. Let me just say a word about the deficit. The spending and the deficit was a concern of mine in the early 1970s because I foresaw that after the breakdown of Bretton Woods, we would have endless spending, endless deficits, endless financial bubbles. And we have had that. As to whether or not we have military Keynesianism, we do. And I reject that as well as I reject domestic monetary economic Keynesianism. And until we put the two together and reject them, we are going to continue with these problems.

But the reason why I don't think it is a Federal Reserve job to lecture the Congress, even though I agree Congress is at fault, is they spend too much money. Congress at times will say the Fed is at fault. Congress and the Fed are symbiotic. They have a symbiotic relationship because the Congress spends and they know there is a moral hazard involved here because they know that if interest rates go up, the Fed accommodates them. So the Fed really facilitates this spending. And until we realize this, I think the Fed is involved with our deficit and encourages this as well as the Congress. But it is true, Congress' initial responsibility ought to be to cut the spending, because this deficit is exploding, inflation is exploding, and interest rates are going to go up. So we are going to have one heck of a problem here in the near future.

But I want to ask a question dealing with monetary policy because it used to be that was the key to this hearing. Today, economic management, central economic planning, and everything is up for grabs. The monetary policy, of course, it was stated that the job of the Fed is to give stable prices and full employment. But if you look at the last 3 or 4 decades, there is nothing stable about it.

Unemployment today, if we are honest with ourselves, if we look at all the people who no longer look for work, it is over 20 percent. To pretend it is going down and everything is rosy, I think we are deceiving ourselves to think that is happening. So I would say it is a total failure.

One other reason I would like to suggest and get your comments on is how can you manage monetary policy, which means to manage the dollar, if we don't have a definition of a dollar? I can't find in the Code what a dollar is or a Federal Reserve note. And everybody knows a Federal Reserve note is a dollar, you create a note, which is a promise to pay, and that is another dollar. So the more debt you have, the more dollars you have.

But I would like to know if you know whether there is a definition of a dollar and when it became known that a dollar was a Federal Reserve note. I want a definition of money. That seems to be the real job. We want a measurement of value. And this is a reason I believe that we made a big mistake by declaring fiat money, paper money would be our measurement of value. There is no way to maintain a true measurement of this.

If you look at what the stock market—if you bought the stock market in the year 2000, the index, it would have taken 44 ounces of gold. In 1980, it would have taken 1.5 ounces of gold. Today, it is back down to 8 ounces. So in true value, the stock market is in a crash. You say, oh, no, gold is not money. And you and I will have a disagreement on whether gold is money or not. But the Fed holds gold, the Treasury holds gold, the central bank holds gold. My opinion doesn't matter either because it is history. It is the marketplace. Gold is the true long-term measurement of value.

So how can you run your operation without a definition of the dollar, and what is your definition of a dollar?

Mr. BERNANKE. You raise some important points, Congressman. Our mandate is maximum employment and price stability. My definition of the dollar is what it can buy. Consumers don't want to buy gold. They want to buy food and gasoline and clothes and all the other things that are in the consumer basket. It is the buying power of the dollar in terms of those goods and services that is what is important,

and that is what I call price stability. The fact is that after the 1970s, where there was a lot of instability, and inflation was very high, since Chairman Volcker in the early 1980s, and I know you have talked about your relationship with him, brought inflation down, that inflation in the United States has been low and stable around 2 percent for some time. In fact, it has been 2 percent over the last 5 years, despite everything else that has been going on.

Moreover, in terms of the unemployment part of the mandate, it is certainly true unemployment is unsatisfactory now. My own view is that is largely due to the financial crisis, which, in turn, had a lot to do with problems in both the private markets and in the supervisory and regulatory regime. But putting that aside, over the period of the last 25 years or so, stability of unemployment has been much greater than it was in previous decades. So there has been improvement.

Chairman BACHUS. Thank you, Dr. Paul. I appreciate that.

[Rep. Paul's time for questioning concluded.]

STATEMENT
FOR THE RECORD

HON. RON PAUL
REPRESENTATIVE, 14TH DISTRICT OF TX
CHAIRMAN, SUBCOMMITTEE ON
DOMESTIC MONETARY POLICY & TECHNOLOGY
U.S. HOUSE OF REPRESENTATIVES

Mr. Chairman,

Every day we hear stories about rising prices. Whether it be food, gasoline, or clothing, the cost of living is going up, and not just for Americans, but for people around the globe. The Federal Reserve's program of quantitative easing has taken some of the blame for this, and rightly so in my opinion. This program, known as QE2, sought to purchase a total of \$900 billion in US Treasury debt over a period of 8 months. Roughly \$110 billion of newly created money is flooding into markets each month, markets which are still gun-shy after the events of the last few years. Banks still hold underperforming mortgage-backed securities on their books, and are hesitant to loan out further money, holding well over a trillion dollars on reserve with the Fed. Is it any wonder, then, that this new hot money is flowing into commodities around the world?

Cotton is up over 170% over the past year, oil is up over 40%, and certain categories of food staples are seeing double-digit price growth. Yet while the Fed takes credit for the increase in the stock market, it claims no responsibility for the increases in food and commodity prices. What is always lost on economists is that inflation is at root a monetary phenomenon. As the money supply increases, more money chases the same amount of goods, and prices rise. There may be other factors that contribute to price rises, such as famine, flooding,

or global unrest, but these effects on prices are always short-term, not long-term. Consistently citing rising demand or bad weather while ignoring monetary policy is a cop-out. Governments throughout history have sought to blame price increases on bad weather, speculators, and a whole host of other factors, rather than acknowledging the effects of their inflationary monetary policies.

We must also remember that those policymakers who exercise the most power over the economy are also the least likely to understand the effects of their policies. Chairman Bernanke and the other members of the Federal Open Market Committee were convinced in mid-2008 that the economy would rebound and continue to grow through 2009, even though it was clear to many observers that we were in the midst of a severe economic crisis.

These policymakers are also the last to feel the effects of inflation, in fact, they benefit from it. Inflation, that is an increase in the money supply, results in a rise in prices, but those who use this new money first, such as government employees, contractors, and bankers are able to use this new money before prices begin to increase, while those further down the totem pole have already had to deal with price increases before they see any of this new money.

For too long the Federal Reserve's monetary policy has led to higher prices and a decreased purchasing power of the dollar. It is well overdue that this Committee exercise increased oversight and scrutiny of the Fed's actions, and I look forward to further Committee action to rein in the Fed.

II.
RON PAUL TO BEN BERNANKE:
“IS GOLD MONEY?”

HEARING ON
MONETARY POLICY AND THE STATE OF THE ECONOMY
COMMITTEE ON FINANCIAL SERVICES
U.S. HOUSE OF REPRESENTATIVES

WEDNESDAY, JULY 13, 2011

WITNESS

Bernanke, Hon. Ben S., Chairman, Board of Governors of the
Federal Reserve System

*T*RANSCRIPT¹⁸

The committee met, pursuant to notice, at 10 a.m., in room 2128, Rayburn House Office Building, Hon. Spencer Bachus {chairman of the committee} presiding.

[...]

Chairman BACHUS. This hearing will come to order. We meet today to receive the semiannual report to Congress by the Chairman of the Board of Governors of the Federal Reserve System on the conduct of monetary policy and the state of the economy.

[...]

Chairman BACHUS. I now recognize the subcommittee chair, Mr. Paul, and also acknowledge that he has announced that at the end of this term, he will be leaving Congress, and I am sure that came as quite a disappointment to the Federal Reserve.

Mr. FRANK. Mr. Chairman, would you yield briefly, can I join because Mr. Paul and I have worked in opposition on some issues, and together on some others. He has been an extraordinarily valuable Member, and I will miss him. Could I also note, Mr. Chairman, that you have the honor of I think presiding for the first time in American history over a committee that has three declared Presidential candidates. I hope we will not soon have to have Secret Service replacing our Capitol policemen at the door, but I will miss Mr. Paul.

Chairman BACHUS. And one of them is here today.

¹⁸ [The full hearing record, Serial No. 112-46, is available from the Committee on Financial Services at: <http://financialservices.house.gov/uploadedfiles/112-46.pdf>]

Dr. PAUL. I thank the chairman for yielding. Somebody had told me that announcement would put a smile on Chairman Bernanke's face.

Chairman BACHUS. And his staff, they are all smiling.

Dr. PAUL. But I thank the chairman for yielding and I welcome Chairman Bernanke. The country today has become very aware of how serious our problems are. I think everybody understands that it is very, very serious. It is critical, and from my viewpoint, I think the country is literally bankrupt, and we are not quite willing to admit that. But these are overwhelming problems that we do face. Unfortunately, from my viewpoint, I think we have more going on here on who to blame for the problems and who is going to benefit by blaming. I see it a little bit differently because I see it as a failed policy, a policy of central economic planning, and that has not been going on just with this Congress and this President. It has been going on for quite a few decades. I think that is what we have to address.

Literally, the Congress appropriates the money and is a big blame. But also, the special interests have tremendous influence, and they are to blame, but also we have citizens groups who always want handouts and special benefits. They have some blame to assume as well. But also it is these wars that continue to go on, the undeclared war, the consonance of wars. Nobody can even tell us exactly how many wars we are in today and when the next one is going to start or when the last one is going to end. And then all of this spending and pressure.

Then we also have the Fed to deal with, too. And I see the Fed as a problem because I see so much of this other spending would not have gotten out of hand if we did not have a monetary system where the system provides the funds. We do not have to be responsible because we can always say, it is up to the Fed. If we did not have the Fed buying up our debt, interest rates would rise and everybody would yell and scream, but you know what it would do? It would put pressure on us here in the Congress to do something about it. But I see the monetary system and the Federal Reserve System as a facilitator for all these special interests, and for a good many decades, we have been able to get away with this. But we are not getting away with it anymore because we have run out of steam. We have run out of jobs. We have run out of productive capacity.

Our Tax Code is all out of whack. The entitlements are out of control. Our good jobs are going overseas. We chase capital away, we have a deliberate policy of a weak currency. Weak currency chases away capital. So I see this has all added up to give us this crisis, and

unfortunately we are still looking for who to blame for this. You cannot find one individual or one Administration. You have to blame the policy, and unfortunately central economic planning, whether of the Soviet style or whether of the style of the interventionist where we do it through congressional activity as well as central banking, the central economic planning is always flawed because it is never as smart as the market. That is why I object to the idea that we are knowledgeable enough to set interest rates and know what the money supply should be because that is information that should come from the market. When it does not come from the market, it is a failed policy and leads to the type of crisis we are now suffering from.

Chairman BACHUS. I thank the subcommittee chair. At this time, I would like to recognize the ranking member of the Subcommittee on Monetary Policy, Mr. Clay, for 3 minutes.

Mr. CLAY. Thank you, Mr. Chairman. I, too, want to say that I will miss my colleague, Dr. Paul. Perhaps he will remain in this town in some capacity.

[...]

Chairman BACHUS. Thank you, Mr. Chairman, and thank you, ranking member. At this time, I recognize Mr. Paul, the subcommittee chair, for 5 minutes.

Dr. PAUL. Thank you. I thank you, Mr. Chairman. We hear that in the future we are going to have a better economy, and everybody hopes so, but it is hard to believe, it is hard for me to believe, anyway, because I look back on our past 3 years, and what Congress has done and what the Fed has done, we have literally injected about \$5.3 trillion, and I do not think we got very much for it. The national debt went up \$5.1 trillion. Real GDP grew less than 1 percent. So I do not think we have gotten a whole lot. Unemployment really has not recovered. We still have 7 million people who have become unemployed, and one statistic that is very glaring, if you look at the chart, is how long people are unemployed. The average time used to be 17 weeks. Now it is nearly 40 weeks they stay unemployed. So nothing there reassures me.

And also when we talk about prices, we are always reassured there is not all that much inflation, and we are told that they might start calculating inflation differently with a new CPI. Of course, we changed our CPI a few years back. There is still a free market group that calculates the CPI the old-fashioned way. They come up with a figure in spite of all this weak economy that prices have gone up 35

percent, 9.4 percent every year. I think if you just went out and talked to the average housewife, she would probably believe the 9 percent rather than saying it is only 2 percent.

So I would say what we have been doing is not very reassuring with all this money expenditure. But my question is related to the overall policy. Spending all this money has not helped, and yet many allies that would endorse so much of what has been going on, whether it is the Fed or the Congress, they recognize that consumer spending is very, very important. And they concentrate on that. But the \$5.1 trillion did not go to the consumers, it went to buying bad assets, it went to bailing out banks, it went to bailing out big companies, and lo and behold, the consumer did not end up getting this. They lost their jobs and they lost their houses and mortgages, and they are still in trouble.

But my question is, if you took that \$5.1 trillion and said that consumer spending is good, you could have given every single person in this country \$17,000. Why is it the program of both the Congress and the Fed to direct the money to the people who have been making a lot of money instead to the people who, if you argue that the consumer needs to spend the money, I obviously do not advocate this, but I would suggest that maybe it could have worked better—it could not have worked any worse. But what is the reason we directed it towards the banks and the big corporations too-big-to-fail and we do not pay that much attention to the consumer, if it is true, and I do not know if you agree with that or not that consumer spending is an important issue?

Mr. BERNANKE. It is an important issue, Congressman, but you are mistaken in saying that the Federal Reserve has spent any money. You say \$5 trillion. We have lent money. We have purchased securities. That is not buying, that is not dissipating the money. We have gotten all the money back. As an article over the weekend by Allan Sloan showed, in fact, the Fed has been a major profit center for the U.S. Government. We have turned over profits in the last 2 years of \$125 billion. We are not costing any money in terms of budget deficits or anything like that.

In terms of what we were trying to do, the reason the Federal Reserve was founded a century ago was to try to address the problems arising from financial panics which did, by the way, occur in an unregulated environment in the 19th Century. We provided liquidity and short-term loans to help financial systems stabilize. We did that not because we particularly care about the managers or the shareholders of financial firms.

Dr. PAUL. I hate to interrupt, but my time is about up. I would like to suggest that you say it is not spending money, but it is money out of thin air. You put it into the market and you hold assets, and the assets are diminishing in value when you buy up bad assets.

But very quickly, if you could answer another question because I am curious about the price of gold today is \$1,580. The dollar during these last 3 years was devalued almost 50 percent. When you wake up in the morning, do you care about the price of gold?

Mr. BERNANKE. I pay attention to the price of gold, but I think it reflects a lot of things. It reflects global uncertainties. I think the reason people hold gold is as a protection against what we call tail risk, really, really bad outcomes. To the extent that the last few years have made people more worried about the potential of a major crisis, then they have gold as a protection.

Dr. PAUL. Do you think gold is money?

Mr. BERNANKE. No, it is not money; it is a precious metal.

Dr. PAUL. Even if it has been money for 6,000 years, somebody reversed that and eliminated that economic law?

Mr. BERNANKE. It is an asset. Would you say Treasury bills are money? I do not think they are money either, but they are a financial asset.

Dr. PAUL. Why do central banks hold it?

Mr. BERNANKE. It is a form of reserves.

Dr. PAUL. Why do not they hold diamonds?

Mr. BERNANKE. It is tradition, a long-term tradition.

Dr. PAUL. Some people still think it is money. I yield back. My time is up.

[Rep. Paul's time for questioning concluded.]

STATEMENT
FOR THE RECORD

HON. RON PAUL
REPRESENTATIVE, 14TH DISTRICT OF TX
CHAIRMAN, SUBCOMMITTEE ON
DOMESTIC MONETARY POLICY & TECHNOLOGY
U.S. HOUSE OF REPRESENTATIVES

Mr. Chairman,

An aphorism in common use today states that the definition of insanity is repeating the same thing over and over and expecting a different result. I cannot think of a better way to describe the Federal Reserve's conduct of monetary policy over the last three years. Business cycles are caused by monetary expansion, and the bust phase of the cycle is the natural consequence of malinvestment caused by the Fed's creation of easy credit. Each time this country falls into recession, the Federal Reserve has resorted to further monetary expansion in order to pull the country out of its economic malaise. This monetary policy always results in a new and bigger boom, followed by an even bigger bust. Now we find ourselves in the midst of the mother of all business cycles. We have seen the monetary base explode with trillions of dollars of newly created money, with Wall Street fat cats receiving bailout after bailout, while ordinary Americans increasingly find their standard of living decreasing.

Assertions that the government's interventions have returned a profit for taxpayers are ludicrous. The federal government's deficit spending is subsidized by the Fed, which purchases newly created Treasury debt with money created out of thin air. The Fed receives tens of billions of dollars of taxpayer dollars in interest payments on

those debt holdings, uses part of the interest to fund its operations, and then returns the rest of the money to the Treasury. This indirect taxpayer funding of the Fed's operations, in which the Treasury receives less money than it paid out, is called a "profit." With regard to the TARP bailout loans, the only reason so many banks are able to repay is because the Fed has purchased so much Treasury debt from the banks, who hold those new funds as excess reserves. The Fed pays interest on those excess reserves, allowing the banks to repay their TARP loans with interest, which is then characterized as profit. So money is created out of thin air to purchase Treasury debt, and is created out of thin air again to pay interest on the money that was just created out of thin air. It is easy to make a profit when one has this ability to create unlimited amounts of new money.

Total spending on all the bailouts, stimulus packages, and quantitative easing has come to over \$5.3 trillion, and what does Chairman Bernanke have to show for this? What have these trillions of dollars in spending actually accomplished? Real GDP has increased by only \$105 billion since the beginning of 2008. If the Fed were really concerned with stimulating consumption, it could have just as easily loaded this money into helicopters and dropped it over American cities. \$5.3 trillion is nearly \$17,000 for every man, woman, and child in this country. Where would the average American be with an extra \$17,000 in his pocket? That would have stimulated consumption far more than what the Fed has done by shoveling trillions of dollars to the politically-connected big banks who either hold that money as excess reserves or loan it out at interest to the taxpayers whom the Fed will not deign to assist.

The latest job numbers have further underscored the fact that the economy, rather than recovering, is still mired in the depths of a serious recession. The Fed has failed in its Congressionally-mandated mission of maintaining stable prices and ensuring full employment and has failed to achieve its own goal of returning to adequate levels of economic growth. Chairman Bernanke has even gone so far as to admit that "we don't have a precise read on why this slower pace of growth is persisting." Seven million fewer people are employed now than at the beginning of 2008, while the population has increased by nearly eight million. Just to return to pre-crisis levels of employment will take several years. In fact, the only reason that the official unemployment rate is only 9.2% is that so many Americans have given up looking for work and have dropped out of the labor force.

The dollar has lost nearly 50% of its value against gold since 2008 and continues to deteriorate against major currencies. While the Fed

claims that inflation has averaged 2% or less over the past few years, economists who compile alternate data conclude that the CPI has increased over 9% per year. Americans feel inflation keenly, despite the pronouncements of leaders who have been proclaiming for the past year that the recession is over and the economy is improving. Commodity prices continue to rise, food is becoming more expensive, and everything the Fed does has the goal of ensuring these continued high prices.

It is painfully obvious that the economy is not recovering, so what will Chairman Bernanke do now? Consumers, investors, and taxpayers wait with bated breath, unsure of what the Fed's next step is. Will the Fed continue its policy of quantitative easing, forcing more devalued dollars into the system, or will it finally acknowledge that the first step to recovery is allowing bad debt to liquidate, insolvent financial firms to go under, and housing prices to return to more reasonable levels? Treasury Secretary Geithner has recently admitted that “we don't have the ability, because of the overhang in housing, and the problems in the financial system, to engineer artificially a stronger recovery.” I certainly hope that Chairman Bernanke will take this statement to heart when he plans his next move.

A sound economy is an impossibility without sound monetary policy. Rather than defend the integrity of the dollar and the people who depend on it to purchase the necessities of life, the Fed has done its darnedest to devalue the dollar and continue the same inflationary policies that got us into this mess in the first place. Until the Fed acknowledges the role that loose monetary policy plays in creating booms and busts, eschews further bailouts to insolvent financial institutions, and ceases its attempts to prop up the housing market, I fear that the economy will continue to implode.

III.
RON PAUL vs. BEN BERNANKE

HEARING ON
MONETARY POLICY AND THE STATE OF THE ECONOMY
COMMITTEE ON FINANCIAL SERVICES
U.S. HOUSE OF REPRESENTATIVES

WEDNESDAY, FEBRUARY 29, 2012

WITNESS

Bernanke, Hon. Ben S., Chairman, Board of Governors of the
Federal Reserve System

*T*RANSSCRIPT¹⁹

The committee met, pursuant to notice, at 10 a.m., in room 2128, Rayburn House Office Building, Hon. Spencer Bachus {chairman of the committee} presiding.

[...]

Chairman BACHUS. This hearing will come to order. We meet today to receive the semiannual report to Congress by the Chairman of the Board of Governors of the Federal Reserve System (the Fed) on the conduct of monetary policy and the state of the economy. Pursuant to committee rule 3(f)(2), opening statements are limited to the chair and ranking minority member of the full committee and the chair and ranking minority member of the Subcommittee on Domestic Monetary Policy and Technology for a period of 8 minutes on each side.

[...]

Chairman BACHUS. All right, at this time Mr. Paul, your thorn in the flesh, is recognized for 3 minutes.

Dr. PAUL. Thank you, Mr. Chairman, and welcome, Chairman Bernanke. I guess over the last 30 or 40 years I have criticized the Fed on occasion, but the Congress deserves some criticism, too. The Federal Reserve is a creature of the Congress, and if we don't know what the Fed is doing, we have the authority and we certainly have

¹⁹ [The full hearing record, Serial No. 112-103, is available from the Committee on Financial Services at: <http://financialservices.house.gov/uploadedfiles/112-103.pdf>.]

the authority to pursue a lot more oversight, which I would like to see.

So although the Fed is on the receiving end, and I think rightfully so when you look at the record, the Fed has been around for 99 years, a few years before you took it over, and 99 percent, 98 percent of the dollar value is gone from the 1913 dollar. So that is not really a very good record. And I think what we are witnessing today is the end stages of a grand experiment, a philosophical experiment on total fiat money. Yes, they have been debasing currencies for hundreds, if not thousands of years, and it always ends badly. They always return to market-based money, which is commodity money, gold and silver. But this experiment is something different than we have ever had before, and it started in 1971, where we were actually given an opportunity in many ways to be the issuer of the fiat currency, and we had way too many benefits from that than people realized.

But it has gone on for 40 years and people keep arguing from the other side of this argument that it is working, it is doing well, and yet, from my viewpoint and the viewpoint of the free-market economists, all it is doing is building a bigger and bigger bubble. And the free-market economists were the ones who predicted the NASDAQ bubble, the housing bubbles, but we never hear from the Keynesian liberal economists and the central bankers saying watch out, there is a bubble out there. There is too much credit, too many problems there. There is a housing bubble. We have to deal with it. Usually, we get reassurance from the Fed on that.

But I believe that there is a logical reason for this, because the Federal Reserve is given a responsibility to protect the value of the dollar. That is what stable prices are all about. We don't even have a definition of a dollar. We ask about the definition of a dollar; oh, it is whatever it buys. Every single day it buys less than the next day. To me, it is sort of like building an economy and having economic planning, like a builder had a yardstick that changed its value every single day. Just think of the kind of building you would have. This is why we have this imbalance in our economic system.

But it was a system designed to pyramid debt. We have a debt-based system. The more debt we have and the more debt that the Federal Reserve buys, the more currency they can print, and they monetize this debt. And no wonder we are in a debt crisis. It is worldwide. I think it is something we have never experienced before. And I think the conclusion would be a vindication either for sound money, or if you win the argument and say yes, we are great managers, we know how to do it, we want the credit for the good

times, and we want the credit for getting us out of those good times, I think within a few years, we are going to know. Of course, I am betting that the market is smarter, commodity money is smarter, nobody is smart enough to have central economic planning. So I am anxiously waiting for this day, for the conclusion, because reforms have to come. They are already talking about—when you see Robert Zoellick talking about monetary reforms, and talking about gold, the time has come for serious discussion on monetary reform.

Thank you, Mr. Chairman.

Chairman BACHUS. Thank you, Dr. Paul, for that statement.

[...]

Chairman BACHUS. Dr. Paul?

Dr. PAUL. Thank you, Mr. Chairman. Mr. Bernanke, if you don't mind, would you tell me whether or not you do your own shopping at the grocery store?

Mr. BERNANKE. Yes, I do, sir.

Dr. PAUL. Okay, so you are aware of the prices. This argument that the prices are going up about 2 percent, nobody believes it. In the old CPI, it says prices are going up about 9 percent so they believe this. People on fixed incomes are really hurting. The middle class are really hurting because their inflation rate is very much higher than the government tries to tell them, and that is why they lose trust in government. But this whole idea about prices and debasement of currency, if you loaned me \$100, and 2 years from now I gave you \$90 back, you would be pretty upset. But we pay that money back and it is worth 10 or 15 or 20 percent less, and nobody seems to be able to do anything about it. It is very upsetting. But it is theft if I don't give you your full \$100 back and you loan me \$100. I am stealing \$10 from you. So somebody is stealing wealth and this is very upsetting. But in January, at one of your press conferences, you said that—you sort of poked a little bit of fun at people to downplay the 2 percent inflation rate, but if you say it is 2 and I say it is 9, let's compromise for the sake of argument; it is 5 percent. You said that it doesn't hurt you unless you are one of those people who stick the money in the mattress. But where are you going to put it? Are you going to put it in a CD and not make any money at all? So this doesn't make any sense. It doesn't encourage savings. And it just discourages people.

But I do want to make a point about prices, because prices go up. That, to me, is not the inflation. It is one of the bad consequences of the inflation which comes from the increase in the money supply. And

that is one of the bad effects. But you took over the Fed in 2006. I have a silver ounce here, and this ounce of silver back in 2006 would buy over 4 gallons of gasoline. Today, it will buy almost 11 gallons of gasoline. That is preservation of value. And that is what the market has always said should be money. Money comes into effect in a natural way, not in edict, not by fiat by governments declaring it is money.

But why is it that we can't consider, the two of us, an option? You love paper money. I think money should be honest, constitutional, it is still on the books, gold and silver legal tender. Why don't we use it? Why don't we allow currencies to run parallel? They do around the world. One of my options, as much as I would like to do something with the Fed, I say the Fed is going to self-destruct eventually anyway when the money is gone. But why wouldn't we legalize competing currencies? Why couldn't people save, put this in a mattress, and get 4 or 5 times as much of the value in a few years. So the record of what you have done in the last 6 years is to destroy the value of real money, of paper money, at the same time real money is preserved.

But a competing currency—we already have a silver eagle. It is legal tender for a dollar, and some people say well, it is legal tender. It is a dollar. It is on the books and they use it and they get into big trouble. The government comes and closes them down. You can get arrested for that. But what would be wrong with talking about parallel currency, competing currencies? This is something that Hayek talked about, something that I think would be a compromise and that we could work along those views.

Mr. BERNANKE. First of all, it is good to see you again, Congressman Paul. Just one word on inflation. Of course, those numbers are constructed by the Bureau of Labor Statistics, not by the Fed. They are independently constructed, and I think they are done in a very serious and thoughtful way.

On alternative currencies, nobody prevents you from holding silver or gold if you want to. It is perfectly legal to do that, and it is also perfectly fine to hold other currencies, euros or yen or whatever else. So in that respect, you can do that and I would be happy to talk to you about—

Dr. PAUL. But Mr. Chairman, that is not money. When you pay taxes to buy a coin or you have capital gains tax, when it is not— if you have to settle a lawsuit, it is always settled in depreciating Federal Reserve notes. It is never settled in the real contract. So that is nothing near money when it is illegal to use it. But to do it, you

would have to repeal the legal tender laws. You would have to legalize this. You would have to get rid of the sales taxes, you would have to get rid of the capital gains taxes. People even in Mexico, they are talking about this. They are trying to have competing currencies. They have been wiped out too many times with inflation, and wiped out the middle class. They are allowing people to start to save in a silver currency.

So I hope we move along in that direction because there shouldn't be any overwhelming changes all of a sudden that there could be a transition so people could vote on it. Maybe they will give up on the Federal Reserve note and vote for real money.

Mr. BERNANKE. I would be very happy to talk to you about it.

Dr. PAUL. Thank you very much.

Chairman BACHUS. Thank you.

[Rep. Paul's time for questioning concluded.]

STATEMENT
FOR THE RECORD

HON. RON PAUL
REPRESENTATIVE, 14TH DISTRICT OF TX
CHAIRMAN, SUBCOMMITTEE ON
DOMESTIC MONETARY POLICY & TECHNOLOGY
U.S. HOUSE OF REPRESENTATIVES

Mr. Chairman,

Thank you for holding this hearing on monetary policy and the state of the economy. I believe that now, more than ever, the American people want to hold the Federal Reserve accountable for its loose monetary policy and want full transparency of the Fed's actions.

While the Fed has certainly released an unprecedented amount of information on its activities, there is still much that remains unknown. And every move towards transparency has been fought against tooth and nail by the Fed. It took disclosure requirements enacted within the Dodd-Frank Act to get the Fed to provide data on the its emergency lending facilities. It took lawsuits filed by Bloomberg and Fox News to provide data on discount window lending during the worst parts of the financial crisis. And it will take further concerted action on the part of Congress, the media, and the public to keep up pressure on the Fed to remain transparent.

Transparency is not a panacea, however, as a fully transparent organization is still capable of engaging in all sorts of mischief, as the Federal Reserve does on a regular basis. Ironically, one of the Fed's more egregious recent actions, adopting an explicit inflation target, was hailed by many as another wonderful example of transparency. Yet if you think about what this supposed 2% inflation target actually is, you realize that it is an explicit policy to devalue the dollar and

reduce its purchasing power. Two percent annual price inflation means that prices rise 22% within a decade, and nearly 50% within two decades.

Indeed, if you look at the performance of the consumer price index (CPI) under Chairman Bernanke's tenure, prices have risen at a rate of 2.25% per year. Many, perhaps even most, economists would consider this a modest rise, an example of sober, cautious monetary policy. Some economists of Paul Krugman's persuasion might even argue that this is too tight a monetary policy. However, 2.25% is not too far off from the Fed's new 2% target.

Now look at the performance of the US economy since February 1, 2006, the date Chairman Bernanke took the mantle from Alan Greenspan. Trillions of dollars have been wasted on bailouts, stimulus packages, and other feckless spending. Millions of Americans have lost their jobs and have lost hope of ever regaining employment. The national debt has risen to more than 100% of GDP, as the federal government continues to rack up trillion-dollar deficits, aided and abetted by the Fed's policies of quantitative easing and zero percent interest rates. And we are supposed to believe that a 2% inflation rate, similar to what has prevailed during the worst economic crisis since the Great Depression, is the cure for what ails this economy.

This explicit 2% target also fails to take into account that whatever measure is used to determine price inflation, be it CPI, core CPI, PCE, etc., will always be chosen with an eye towards underreporting the true rate of inflation and price rises. Pressure will be exerted on those calculating the price indices, so as not to alarm the public when prices begin to accelerate. One need only look at what is taking place in Argentina today, where the government publishes an official CPI figure that is often less than half that reported by private sources.

A similar situation exists in this country, where economists calculating CPI according to the original basket of goods have determined that price inflation has increased 9.5% per year since 2006, rather than the 2.25% reported by the government. Even the government's own data reports price rises of nearly 7% per year since 2006 on such consumer goods as gasoline and eggs. Bread, rice, and ground beef have increased by nearly 6% per year, while bacon and potatoes have increased nearly 5% per year. This means that in a little over half a decade, prices on staple consumer goods have increased 30-50%, all while wages have stagnated and millions of Americans find themselves out of work and without a paycheck. Of

course, government officials claim that price increases do not affect the average American because they can always buy hamburger instead of steak, or have cereal instead of bacon. But the American people can see how they are suffering because of the Federal Reserve. The government's claims that the official statistics show no reason to be concerned about inflation is Marxist—as in Groucho, who famously said: “Who are you going to believe, me or your own eyes?”

The Federal Reserve continues to keep interest rates low in the hopes of boosting lending and consumption. But keeping interest rates at zero discourages saving, particularly as the rate of price inflation continues to rise. Why stick money in a savings account earning 0.05% if it is guaranteed to lose at least 2% of its value every year? And this is a guarantee, as the Fed has promised a 2% rate of increase in price inflation, while also guaranteeing a zero percent federal funds rate through 2014. Retirees living on fixed incomes, dependent on savings, or on interest income from investments will see their savings drawn down as they are forced to consume principal. Young people, hard hit by the recession and struggling to find jobs, will fail to see the virtue of thrift. Saving or investing is an exercise in futility, as parking money in the bank or in CDs will guarantee a loss, while investing in stocks, bonds, or mutual funds will net at best paltry gains, and at worst massive losses in this continuing weak economy.

The longer the Federal Reserve keeps interest rates low and discourages savings and investment, the more societal attitudes will change from being future oriented to present oriented. The Federal Reserve and its policies already served to stimulate and prioritize consumption over saving, creating the largest debt bubble the world has ever known. The extended zero interest rate policy only serves to promote more consumption and debt now, eviscerating thrift and savings—the true building blocks of prosperity. This present-oriented mindset has become pervasive especially among politicians, putting the government in dismal financial shape as Congressmen and Presidents over the years have taken to heart Louis XV's famous saying: “Après moi, le déluge.” If the American people follow the same path in their own lives, this country will be ruined. Capital will be depleted, infrastructure will fall into disrepair, and the United States will be a mere shadow of its former self. It is well past time to end the failed monetary policy that encourages this mistaken preference for cheap money now.

IV.
**RON PAUL'S FINAL QUESTIONS TO
BEN BERNANKE?**

HEARING ON
MONETARY POLICY AND THE STATE OF THE ECONOMY
COMMITTEE ON FINANCIAL SERVICES
U.S. HOUSE OF REPRESENTATIVES

WEDNESDAY, JULY 18, 2012

WITNESS

Bernanke, Hon. Ben S., Chairman, Board of Governors of the
Federal Reserve System

*T*RANSCRIPT²⁰

The committee met, pursuant to notice, at 10 a.m., in room 2128, Rayburn House Office Building, Hon. Spencer Bachus {chairman of the committee} presiding.

[...]

Chairman BACHUS. I thank the ranking member. Before recognizing Dr. Paul for his statement, I want to note that this may be his last committee meeting with the Chairman of the Federal Reserve. And throughout his time in office, Dr. Paul has been a consistent and strong advocate for sound monetary policy, and his leadership on the committee especially during these hearings when we've had the Federal Reserve chairmen up here before us have certainly made the hearings more interesting and provided several memorable YouTube moments.

Mr. FRANK. Mr. Chairman. Could I get unanimous consent just to say that, having served a long time with Ron Paul, with whom I agree on a number of issues, I am very pleased that I was able to serve one term with his as the Chairman because there were times during our joint service when despite his seniority, I thought he would never get to it. So I am glad he finally achieved that chairmanship that he should have had long ago.

[...]

Chairman BACHUS. Dr. Paul for three minutes.

Dr. PAUL. Thank you, Mr. Chairman. Welcome Chairman Bernanke. Appreciate your comments, chairman and the ranking

²⁰ [As of December 2012, the record for this hearing remained open waiting on written responses from Chairman Bernanke to questions submitted in writing by Members.]

member. I am delighted to be here today, but I just want to refresh a few people's memory. I was first elected to Congress in 1976 in April in a special election. And the biggest bill on the docket at that time was the revamping of the IMF. There was a major crisis going on from the breakdown of the Bretton Woods agreement, and they had to rewrite the laws. They wanted to conform the laws with what they had been doing for five years. And that was a major piece of legislation. But it was only a consequence of what was predicted in 1945, because when 1945 established the Bretton Woods, it was predicted by the free market economists it wouldn't work, it would fail. And this whole idea they could regulate exchange rates and deal with the balance of payments, it totally failed.

And so they had to come up with something new. And 1971-76 is that transition period. And those same economists at that time said this was an unworkable system, too, and it would lead to a major crisis of too much debt, too much malinvestment. It would be worldwide. It would be worse than anything because it would be based on the fiat dollar globally, and many of the problems we have domestically would be worldwide. And that certainly has been confirmed with the crisis that we are in, and it has not been resolved yet. We are still floundering around, and we still have a long way to go.

I have, over the years, obviously been critical of the what goes on in monetary policy, but it hasn't been so much the Chairman of the Federal Reserve, whether it was Paul Volcker or Alan Greenspan or the current chairman, it has always been the system. I think they have a job that they can't do because it is an unmanageable job. And it is a fallacy, it is a flawed system, and therefore we shouldn't expect good results, and generally, we are not getting results.

Policies never change. We say the same thing. No matter what the crisis is, we still do more of the same. If spending and debt was the problem, spending more and in greater debt and have the Fed just buy more debt doesn't seem to help at all. And here we are doing the same thing. We don't talk about the work ethic and true production and true savings and why this excessive debt is so bad for us. We talk about solving a worldwide problem of insolvency of nations, including our own, by just printing money, creating credit.

And now the Fed, in the last four years, tripled the monetary base, and it has \$1 trillion more money sitting there, and the banks are sitting with trillions of dollars. And just the creation of money doesn't restore the confidence that is necessary. And until we get to the bottom of this and restore the confidence, I don't think we are

going to see economic growth. This whole idea that you have the job of managing money, and we can't even define the dollar, nobody has a definition of the dollar. It is an impossible task.

So I have hoped in the past to try to contribute to the discussion on monetary policy and the business cycle and why it benefits the rich over the poor, and so far, my views have not prevailed. But I have appreciated the opportunity, and I appreciate this opportunity to have served on the Banking Committee.

[...]

Chairman BACHUS. Thank you. Dr. Paul for five minutes.

Dr. PAUL. Thank you, Mr. Chairman. I had a question prepared, but I think I better follow up on the question you asked Chairman Bernanke dealing with the audit of the Fed. Because when the Fed talks about independence, what they are really talking about is secrecy, not transparency. And it is the secrecy that I don't like and that we have a right to know about.

What the GAO cannot audit, and I believe it would be the position of the chairman, is it cannot audit monetary policy, and you expressed yourself on monetary policy. It would not be able to look at agreements and operations with foreign central banks and governments and other banks, or transactions made under direction of the FOMC, discussions or communications between the Board and the Federal Reserve System related to all those items.

So it really, it is really not an audit without this. It is still secrecy. And why this is important is because of what happened four years ago. It is estimated that the amount of money that went in and out of the Fed for the bailing out overseas was \$15 trillion. How did we ever get into this situation where Congress has nothing to say about trillions and trillions of dollars of bailing out certain banks and governments through these currency swaps?

And the Chairman has publicly announced that he is available, there is a crisis going on in Europe, part of this dollar crisis going on that has been building. It is unique to the history of the world of monetary policy. And we stand ready. Who stands ready? The American taxpayer, because we are just going to print up the money. As long as they take our dollars, we will print the money and we will bail them all out and we are going to destroy the middle class. The middle class I shrinking. The banks get richer, the middle class, they shrink, they lose their houses, they lose their mortgages.

The system is biased against the middle class and the poor. So I would say that is—if we protect this amount of secrecy, it is not good policy and it is not good economics at all, and it is very unfair. But my question is, Mr. Chairman, whose responsibility is it under the Constitution to manage monetary policy? Which branch of government has the absolute authority to manage monetary policy?

Mr. BERNANKE. The Congress has the authority, and it has delegated it to the Federal Reserve. That is a policy decision that you have made.

Dr. PAUL. Yeah, but they can't transfer authority. You can't amend the Constitution by just saying we are going to create some secret group of individuals and banks. That is amending the Constitution. You can't do that, and all of a sudden allow this to exist in secrecy. And whose responsibility is it for oversight? Which branch of government has the right of oversight?

Mr. BERNANKE. Congress has the right of oversight. And we certainly fully accept that, and we certainly fully accept the need for transparency and accountability. But it is a well-established fact that an independent central bank will provide better outcomes. If you want to go—there is no Constitutional reason why you couldn't, why Congress just couldn't take over monetary policy. If you want to do that, I guess that is your right to do it. But I am advising you that it wouldn't be very good from an economic policy point of view.

Dr. PAUL. Yeah, but if it is allowed to be done in secret—this is the reason why I want to work within the system. What I want to say is Congress ought to get a backbone. They ought to say we deserve to know, we have a right to know, we have an obligation to know because we have an obligation to defend our currency. It is the destruction of the currency that destroys the middle class. There is a principle in free market banking that says if you destroy the value of currency through inflation, you transfer the wealth from the middle class and it gravitates to the very wealthy. The bankers, the government, the politicians, they all love this. It is a fact that the Federal Reserve is the facilitator. You couldn't have big government—if everybody loves big government, love the Fed, because they can finance the wars and all the welfare you want. But it doesn't work, and it eventually ends up in a crisis. And it is a solvency crisis, and it can't be solved by printing a whole lot of money.

So I think the very first step is transparency, and for us to know. We have a right to know. And you may be correct in your assumption, at least I am sure you believe this, but maybe I should be talking to the Congress that we should stand up and say, yes, we demand to

know. Trillions and trillions of dollars being printed out of thin air, and bailing out their friends. They stand ready to do it. The crisis is just in its, as far as I am concerned, my opinion is it is in the early stages. It is far from over. We are in deep doldrums, and we never change policy. We never challenge anything. We just keep doing the same thing.

Congress keeps spending the money. Welfare expands exponentially. Wars never end. And deficits don't matter. And when it comes to cutting spending, Republicans and Democrats get together and say, oh, no, we can't really cut. And if we do cut, we just cut proposed increases.

Mr. FRANK. Mr. Chairman, regular order. Regular order, Mr. Chairman.

Dr. PAUL. And you stand there and facilitate it all.

Chairman BACHUS. Thank you, Dr. Paul.

[...]

Chairman BACHUS. Thank you. Mr. Jones?

Mr. JONES. Mr. Chairman, thank you very much. And, Mr. Bernanke, thank you for being here.

I want to say, two of my worst votes in 18 years, the Iraq war—and we didn't have to go to Iraq—and the second, the repeal of Glass-Steagall. And if I was not going to yield my time, I would ask you about reinstating Glass-Steagall. I think I will write you a letter with that question, sir.

But at this time, because he is one of my dearest friends and I supported him for the Republican nomination to be President of the United States, I yield my time to Dr. Ron Paul.

Dr. PAUL. I thank the gentleman from North Carolina.

I wanted to make a very brief statement about our previous discussion about the Audit the Fed bill. That bill has nothing to do with transferring who does monetary policy. It is strictly a transparency bill. Monetary policy reform I believe will come, but that is another subject. This is just to know more about what the Federal Reserve is doing.

Mr. Chairman, one of your key points that you have made through your academic career as well as being at the Fed has been the need to prevent deflation. Would you agree with that?

Mr. BERNANKE. Generally, yes, sir.

Dr. PAUL. Right. And you argue that the Depression was prolonged by the Federal Reserve not being able to reflate. So, in

that sense, I think you really have achieved—you have had the chance—you were put in a situation that you alone didn't create. It is, as far as I am concerned, the system created it and other managers helped create this. And there was this, what I see as a natural tendency to deflate and liquidate and clear the market. And under your philosophy, you say we can't allow this to happen, we have to prevent it. And I would say you have done a pretty good job, you know. The monetary base has been tripled, and in the last 12 months I think M1 has grown about 16 percent, M2 over 9 percent. So it seems to be like the monetary system, the monetary numbers are still growing.

But the—pricing houses, you know, everybody knows there is a bubble. I like to believe that the free market economists knew about it and predicted it; others did not. But the prices soared up, everybody knows there was a bubble, and then they collapsed. When those prices of houses collapse, do you call that deflation?

Mr. BERNANKE. No. deflation is the prices of current goods and services. So inflation doesn't capture house prices. It includes the house or the rental—

Dr. PAUL. Okay. And I think one of the problems even getting a full-fledged discussion out is sometimes the definition of words, about what inflation and deflation means. Because, as far as I am concerned, deflation is when the money supply shrinks, and inflation is when the money supply expands. But just about everybody in the country, especially the financial markets, and the way I think the conventional use of inflation is the CPI. And I think it is, you know, a lousy measurement. Because if it is the money supply increase, if prices going down of houses is not deflation, I wonder why it is that inflation is measured by the CPI going up rather than the money supply going up.

Our argument is that once you distort interest rates and increase the supply of money, you end up with this gross distortion that is demanding some correction. So I would—I have worked on this for years, and we are not going to solve it today. The definitions would be much better if we—if prices of houses going down is not deflation, then CPI going up shouldn't be inflation.

But we have had trouble five years. The monetary system, you say this is not the all-end—end-all. You can't solve every problem with monetary system—monetary policy. We have had this for five years, and we are still in a mess.

Is there ever a time—let's say we go five more years and we have the same problems but much worse—is there ever a time you might

say, I have to reassess my philosophy on monetary policy, or do you think it will be the same no matter what kind of crisis? Can you foresee any kind of problem that we would have that you would reassess your assumptions?

Mr. BERNANKE. I can't conjecture what specifically, but of course, yeah, I am evidence-based. I look and see what happens and try to draw conclusions from that. Certainly.

Dr. PAUL. Well, the definitions, obviously, to me are, you know, very, very important. And if we don't come to this conclusion and we use these terms—inflation demands corrections, and the market wants to correct. So this is why we believe that we are going to have perpetual doldrums and finally have a big one.

Do you consider this recession that we are facing today something that is significantly different since 1945? Much worse and different in any way?

Mr. BERNANKE. Yes, because of the financial crisis, yes.

Mr. FRANK. Regular order.

Chairman BACHUS. Thank you. Thank you. Thank you, Dr. Paul. That was a double dose you got. So that was pleasantly unexpected, I guess.

[Rep. Paul's time for questioning concluded.]

*Q*UESTIONS
FOR THE RECORD

FROM CHAIRMAN RON PAUL TO
CHAIRMAN BEN BERNANKE

Question 1:

What items constitute the "Other Federal Reserve assets" line item in Table 1 of the weekly Federal Reserve Statistical Release H.4.1 Factors Affecting Reserve Balances of Depository Institutions and Condition Statement of Federal Reserve Banks? Please provide as detailed a categorized list as possible?

Answer:

"Other Federal Reserve assets" ("other assets") include assets denominated in foreign currencies; premiums paid on securities bought; accrued interest on other accounts receivable; Reserve Bank premises and operating equipment less allowances for depreciation; and, until recently, float-related as-of adjustments.²¹ Until January 2009, "other assets" also included the currency swaps with other central banks. For reference, the Board of Governors' Credit and Liquidity Programs and the Balance Sheet public website presents a summary of the H.4.1 statistical release with an interactive guide (<http://www.federalreserve.gov/monetarypolicy/bstfedsbalancesheet.htm>).

Question 2:

²¹ As one part of an effort to simplify the administration of reserve requirements and thereby reduce burden on the banking sector, the Federal Reserve eliminated as-of adjustments on July 12, 2012. Additional information about reserves simplifications can be found at <http://www.federalreserve.gov/newsevents/press/other/20120405a.html>.

The "Other Federal Reserve assets" line item increased from approximately \$40 billion in early 2009 to roughly \$100 billion in early 2010, remaining at that level throughout 2010. What were the causes for the increase in the "Other Federal Reserve assets" line items over the 2009-2010 period?

Answer:

You noted that between 2009 and early 2010, "other assets" increased. Indeed, between January 28, 2009, and the present, "other assets" have increased by roughly \$150 billion. The increase primarily reflects an increase in unamortized premiums on securities held in the Federal Reserve's System Open Market Account portfolio. The Federal Reserve purchases securities in the open market at market-determined prices. The market price of a security can be expressed as the face value of that security plus a premium or a discount, depending on whether the market price of the security is above or below the face value on the date of purchase. On the H.4.1 statistical release, we report the face value of the securities, and the premium or discount at the time of purchase is separately reported under "other assets." This accounting treatment has been in place for decades.

Since early 2009, the Federal Reserve has engaged in large-scale asset purchases in an effort to ease overall financial conditions and to provide support for the economic recovery. Because the market prices of most of the securities that were purchased were greater than the face value of those securities, "other assets" have increased reflecting the accumulation of premiums as our holdings of securities have increased.²²

Question 3:

The "Other Federal Reserve assets" line item has nearly doubled since early 2011, increasing from roughly \$100 billion to almost \$200 billion. What is (are) the cause(s) for this increase in the "Other Federal Reserve assets" line item?

Answer:

Please see the response to question 2.

²² The Federal Reserve publishes the details of all of its securities holdings on the public website of the Federal Reserve Bank of New York (http://www.newyorkfed.org/markets/soma!sysopen_accholdings.html).

Question 4:

Is the increase in the line item "Other Federal Reserve assets" related in any way to the dollar swap lines with foreign central banks or to other assistance to foreign central banks, commercial banks, or governments?

Answer:

The central bank liquidity swaps that the Federal Reserve has with other central banks have been reported separately since January 2009. As a result, the increase in "other assets" since then is not related to those swaps, nor is it related to assistance to foreign institutions.

Question 5:

The central bank liquidity swap lines when first drawn upon in 2007 were published in the H.4.1 release with the "Other Federal Reserve assets" line item before being broken out into a separate line item in early 2009. Are there some specific facilities, asset types, or other categories that could be given their own line item now that the "Other Federal Reserve assets" line items had grown so large?

Answer:

Although the security premiums at the date of purchase are largely a technical accounting item, we are considering whether to report the premiums on securities separately from other items included in the "other assets" category.

STATEMENT
FOR THE RECORD

HON. RON PAUL
REPRESENTATIVE, 14TH DISTRICT OF TX
CHAIRMAN, SUBCOMMITTEE ON
DOMESTIC MONETARY POLICY & TECHNOLOGY
U.S. HOUSE OF REPRESENTATIVES

Mr. Chairman, I thank you for calling this hearing today on monetary policy and the state of the economy. For the past few years the Federal Reserve has received criticism from all sides of the political spectrum, and rightly so, for its unprecedented intervention into the economy and its bailouts of large Wall Street banks and foreign central banks. Yet this criticism risks losing sight of the most insidious result of the Fed's actions, which is to enable the growth of government.

For nearly the first 40 years of its existence, the Fed operated as an adjunct of the Treasury Department, tasked with purchasing government debt in order to keep the government's borrowing costs low. Even after gaining its vaunted "independence" from Treasury in 1951, the Fed never shrank from enabling the growth of government. The extraordinary monetary policy of the last four years has reaffirmed that the Fed, its protestations to the contrary notwithstanding, is only too willing to enable growing government spending and massive fiscal deficits.

For centuries, banks have received special privileges from government in exchange for funding the government's wars. The creation of the Federal Reserve System in 1913 formalized and centralized this arrangement in the United States. From the very beginning, the Fed was intended to provide a more liquid market for federal government debt, enabling the growth of big government.

What we've seen over the last century is nothing less than the remaking of American government, thanks in large part to the Fed. Its loose monetary policy gave rise to:

- (1) the welfare state, encouraging dependency on government largesse and destroying the work ethic and family life of lower-income Americans;
- (2) the warfare state, allowing the U.S. government to involve itself in wars of aggression around the world; and
- (3) the regulatory state, the mammoth bureaucracy that relentlessly grinds away at the rights of the American people.

Little more than a decade ago, Fed economists were wringing their hands over the prospect that the federal government might pay off the national debt. Nothing could be worse for the Fed, because the Fed's monetary policy operations require the existence of government debt. Treasury debt is purchased from or sold to banks on the open market in order to influence interest rates. Without government debt, the Fed would have no idea how to conduct monetary policy. From a free market perspective this would be wonderful, as it is Fed monetary policy which largely creates the booms and busts of the business cycle. Unfortunately, the federal government has run up the national debt to unprecedented levels over the past decade, and the Federal Reserve has been right there, monetizing that debt to ensure that none of it goes unsold.

While the desire of foreign countries and private investors to purchase Treasuries was drying up, the Federal Reserve was only too willing to step in and enable the government to continue its deficit spending. The Fed's balance sheet exploded as it purchased over one trillion dollars in Treasury debt over the past few years. And before it did that, the Fed also purchased over a trillion dollars of overrated mortgage-backed securities from Wall Street banks, giving those banks the cash they needed to purchase Treasury debt of their own. Were it not for the Federal Reserve's actions, the federal government would not have been able to run trillion-dollar deficits for the past several years.

In fact, had the Federal Reserve never been created, the federal government never would have been able to run up a \$16 trillion debt. No market actor would lend money to such a major debtor at such low interest rates. The only reason that banks are willing to buy Treasury debt at such low interest rates is because they can easily resell that debt to the Fed.

Without the Fed, interest rates would rise to such levels that the federal government would have no choice but to curtail its expenditures and focus only on doing what is truly necessary. With market discipline allowed to prevail, the size of the federal government would be drastically smaller. If Congress were really serious about limiting the size of government, it would eliminate the most important enabler of government profligacy by ending the Fed.

THE RELATIONSHIP OF MONETARY POLICY AND RISING PRICES

THURSDAY, MARCH 17, 2011

WITNESSES

Lehrman, Lewis E., Senior Partner, L.E. Lehrman and Company
Grant, James, Editor, Grant's Interest Rate Observer
Salerno, Joseph T., Professor of Economics, Lubin School of
Business, Pace University

*B*ACKGROUND

The Subcommittee on Domestic Monetary Policy and Technology held a hearing entitled “The Relationship of Monetary Policy and Rising Prices” at 10:00 a.m. on Thursday, March 17, 2011 in Room 2128 of the Rayburn House Office Building.

At the time of the hearing, the massive injections of liquidity into the economy by the Federal Reserve through its policies of quantitative easing had given rise to fears that inflation would rise as the economy recovered. Inflation is destructive because it distorts the capital structure of the economy, eats away at savings, and redistributes wealth arbitrarily from lenders and savers to debtors. Many feared that efforts by the Federal Reserve to stimulate the economy and increase employment could touch off an inflationary spiral similar to that of the 1970s, or worse, a hyperinflation such as that during Weimar Germany—concerns that continue today as the Fed’s accommodative monetary policy persists.

This was a one-panel hearing with the following witnesses:

- Mr. Lewis E. Lehrman, Senior Partner, L.E. Lehrman & Co.
- Mr. James Grant, Editor, Grant’s Interest Rate Observer
- Professor Joseph T. Salerno, Pace University, New York

Defining and Measuring Inflation

Inflation is defined as an increase in the supply of money, with its primary effect being a rise in the prices of goods and services as more money chases the same amount of goods and services. Popular parlance has conflated the effects of inflation with the cause, so that inflation in common usage refers to a general rise in prices, not the monetary expansion that causes those price rises. Inflation as popularly defined has become so persistent in the economy that

economists refer to “inflation expectations,” i.e., the expected rate of price increases that individuals expect. The cumulative effect of this price inflation has resulted in prices that have increased tenfold since the end of World War II.

The most common method of measuring this price inflation is through the Consumer Price Index (CPI), or sometimes the “core” CPI, which excludes energy and food costs. The Federal Reserve references the core CPI, as one measure of inflation, because it alleges that energy and food prices can be subject to temporary shocks from weather, political disturbance, or some other calamity that would cause prices to rise in the absence of monetary disturbances. Because food and energy costs account for as much as 25 percent of an average family’s expenses, many economists have argued that core CPI is not the best way to measure inflation. Some have suggested that an index more heavily weighted towards food and energy costs would be a better measure of inflation, since most Americans spend their money largely on food and energy consumption. Others have argued that “headline” (i.e. overall) CPI is the best predictor of future inflation, noting that headline CPI was well over the Fed’s “comfort range” of about 2 percent before each of the last two recessions while the core CPI was below 2 percent.²³

Monetary Policy and Inflation

The Federal Reserve uses monetary policy in an attempt to control the pace of economic growth. The Federal Reserve was given a dual mandate in the Humphrey-Hawkins Act to maintain both price stability and maximum employment. This dual mandate assumes the existence of the Phillips curve, i.e. an inverse relationship between the unemployment rate and the rate of price inflation. Hence the Federal Reserve attempts to perform a balancing act between unemployment and inflation. As unemployment rises, the Federal Reserve pumps more money into the economy; as price inflation rises, the Federal Reserve pulls money out of the system, at the expense of higher unemployment. Although the 1970s saw the emergence of stagflation, the existence of both high price inflation and high unemployment, the Federal Reserve continues to believe in this tradeoff between price inflation and unemployment, and conducts its monetary policy accordingly.

²³ In early 2012, the Fed announced for the first time an explicit inflation target of 2%. The Fed stated that its main metric of reference was the Personal Consumption Expenditures (PCE) index, which measures the goods and services purchased by households and nonprofit institutions.

When the Federal Reserve injects money into the economy it normally does so through open market operations. It creates new bank credit and uses that to purchase securities, normally Treasury securities, on the open market. Banks can then pyramid new loans on top of this newly-created credit they have received from the Federal Reserve. The injection of new credit has the effect of pushing down interest rates. Since interest rates have been lowered, it becomes cheaper for businesses to borrow money and they engage in longer-term, more capital-intensive projects. As more and more credit makes its way into the economy, and because credit is a money substitute, prices begin to rise. In response, the Federal Reserve often attempts to pull credit out of the system by selling securities back onto the open market in an attempt to raise interest rates and curb price inflation. As former Federal Reserve Chairman William McChesney Martin, Jr., once stated, the Federal Reserve's job is to "take away the punch bowl just when the party is getting good."

Inflation, Zero Interest Rate Policy, and Quantitative Easing

The difficulty with the Fed's approach is that the Federal Reserve lacks the necessary ability and knowledge of when to loosen and tighten monetary policy. Because consumption and investment decisions are made by millions of people whose desires change on a weekly, daily, or even hourly basis, any monetary policy pursued by an entity such as the Federal Reserve will necessarily be based on outdated data with a significant time-lag, will not reflect consumer preferences, and will result in an interest rate that is either lower than the natural market rate (thereby artificially stimulating economic activity) or higher than the market rate (thereby artificially depressing economic activity). Thus the monetary policy pursued by the Federal Reserve will result in an economic boom followed by a bust. Attempting to balance economic activity is a Sisyphean task.

Some economists have pointed out that after the Dot-com boom of the late 1990s the Federal Reserve held interest rates too low throughout the 2000s, despite a rise in measured inflation. By keeping interest rates so low for so long, the Federal Reserve created the real estate bubble. When the Fed started raising interest rates to avoid overheating the economy, it burst the housing bubble it created. The Federal Reserve's holding of interest rates near zero since the end of 2008 and its recent bouts of quantitative easing have sparked a similar round of asset bubbles, which may likely lead to a deeper and more prolonged recession.

At the time of the hearing, the Federal Reserve had signaled that it would continue to maintain an accommodative monetary policy, a position that puzzled many economists, given that GDP had been growing modestly for more than a year and that job growth in the private sector had occurred over the past several quarters, even though the overall jobless rate remained uncomfortably high, at 9 percent. Despite a fall in the unemployment rate to 7.7% in November 2012, the Fed has maintained its position of keeping interest rates near zero until the middle of 2015, or until the unemployment rate declines to 6.5%, while purchasing up to \$85 billion in securities per month.

Many economists remain concerned about the amount of liquidity that the Federal Reserve has injected into the economy. At the end of 2012, the Fed's balance sheet stood just shy of \$3 trillion with an expectation of growing \$85 billion per month for the foreseeable future; in September 2008 the Federal Reserve's balance sheet was less than one-third that size, at roughly \$900 billion. Although the Federal Reserve claims to have plans in place to remove that liquidity from the economy at a time it deems appropriate, the scale of the task dwarfs anything the Fed has attempted before. The risks for an inflationary event persist and the Fed's actions have already fueled what appears to be a new bubble in the bond market.

*T*RANSCRIPT

The subcommittee met, pursuant to notice, at 10:03 a.m., in room 2128, Rayburn House Office Building, Hon. Ron Paul {chairman of the subcommittee} presiding.

Members present: Representatives Paul, Jones, McHenry, Luetkemeyer, Huizenga, and Schweikert.

Chairman PAUL. This hearing will come to order.

I want to welcome our three witnesses today, and they will be further introduced when they are ready to give their testimony.

The ranking member, Mr. Clay, is going to be coming later, but he has advised me that we can go ahead and start the hearing.

So I will start with an opening statement and those who want to give opening statements can do so, as well. I will advise that we will have some votes, probably in about 20 minutes or so, and we might have to take a 30-minute break. But we will deal with that when the time comes.

I consider these hearings very important. A few weeks ago, we had hearings on the Federal Reserve's relationship to the unemployment problem, and the Fed has been given two mandates: one, to keep low unemployment, which they haven't done a very good job of; and two, to maintain price stability. And the evidence is mounting that they haven't been doing a very good job with maintaining price stability either.

Most people refer to rising prices as inflation and that is the conventional wisdom. But many of us concentrate on things other than just rising prices and seeing rising prices as a symptom of the basic problem, which means that when a money supply has increased, the value of that currency goes down and inevitably it will lead to rising prices, unfortunately not uniformly, which means that some people suffer more than others.

But the one thing that is done when prices rise is that a lot of scapegoats are found. And this has been traditional throughout history.

As a matter of fact, as long ago as 40 centuries, 4,000 years ago, the very first known price controls occurred in ancient Egypt. They put on price controls because prices were going up and they didn't want to deal with the real issue, which was the monetary issue. And that is a modern phenomenon too. The United States has done this during wartime periods, during wars in the 20th Century as well as another time in the 1970s, saying that if we can just control prices, we will take care of the problem.

So they are always looking for something to blame for the rising prices. Sometimes it is energy. In the 1970s, it was energy, and boycotts caused rising prices. Even today, the Middle East crisis is causing prices to go up and it does have an influence, but it is not the whole cause.

Any type of crisis will contribute to rising prices. Sometimes labor is blamed for the inflation of prices and sometimes it is weather. Sometimes the blame is placed on the speculators. Once prices start rising, well, if the speculators are doing it, they are buying too much stuff and they are hoarding and they become the scapegoats.

Also, business people, when they make profits, can be accused of contributing to the price inflation. And sometimes, we just blame foreigners for not managing their currencies quite well and causing our prices to go up.

But one of the most bizarre arguments by the conventional wisdom of those at the Federal Reserve, and other places, is that it is excessive growth. We are having too much growth these days and therefore we have to slow it up. And literally, that is what they do.

If they have an inflationary period and they are concerned about rising prices, I think if we just kill the economy, yes, it will. Decrease demand and you will have price adjustments. But that is a heck of a way to solve the problem, which is the monetary problem.

But growth, in itself, doesn't cause higher prices. If you have a healthy economy, you are more likely to lower prices with excessive growth.

We had tremendous growth in the electronics industry—telephones and computers and TVs. In spite of the monetary inflation, we still saw prices drop.

So this whole idea that you have to slow up the economy in order to keep prices down, in order to stimulate growth of the economy, all

you have to do is print money, I think people are starting to realize that is a hoax and it is coming to an end.

The definition of inflation, by many of us, is the increase in the supply of money. Ludwig von Mises, the great Austrian economist, argued this case clearly. And I used to think it was just semantics, but he argued that it was more than that. It was deliberate, so that we in charge—the monetary people in charge didn't want to address the subject of money and why they are responsible, rather than these other issues.

I consider this very, very important because it is so unfair. If governments and central banks increased money, prices went up and wages went up and profits went up all equally, I guess no big deal, but why do it, if that is what is happening?

What happens, though, is some people benefit at the expense of others. And I think it is a reasonable assumption to say, which many have said in the free market school, that if you destroy a currency, you will destroy the middle class. A sound currency encourages the middle class. And I believe that the inflation of prices, when prices go up, are most damaging to the poor and low- to middle-income people because they suffer the consequences much more so than those who can protect themselves. And therefore, it is a tax on the poor and the middle class. They tend to lose their jobs and get the higher prices. So to me, it is very, very important that we address the subject.

And now, I would like to yield to the vice chairman of the subcommittee, Walter Jones from North Carolina.

Mr. JONES. Mr. Chairman, thank you very much. And to the panel that is here today, thank you. I think I agree with the chairman that I don't—as a centrist in my philosophy, as it relates to the people in my district, I really believe this is a critical and very important hearing because the relationship between monetary policy and rising prices brings me to my brief statement.

I do the grocery shopping in my family. I have been married for 46 years, and I have been doing the grocery shopping that whole time. I found this editorial in the Wall Street Journal that I think tells why this is an important hearing today—it says I cannot eat my iPad—the subtitle was “Federal Reserve bombs in Queens.” So let me just say that. But this is one of the comments in the article: “Come question time, the main thing the crowd wanted to know was why they are paying so much more for food and gas?”

Keep in mind, the Fed doesn't think food and gas matter in its policy calculations because they aren't part of core inflation. In other

words, food and gas, in the eyes of the Fed, are not part of the core inflation.

So Mr. Dudley tried to explain that other prices are falling: “Today, you can buy an iPad 2, that costs the same as an iPad 1 that is twice as powerful. You have to look at the prices of all things.”

Then from the crowd, someone quipped, “I can’t eat an iPad.” Another attendee asked, “When was the last time, sir, that you went grocery shopping?”

So, this hearing today is extremely important and I am delighted to be part of it and I look forward to the question period. But I want to see it end with one comment. I have my staff email my district every time that we are going to hold a hearing, Mr. Chairman. And when we hold a hearing, I bring to this debate, this hearing, comments from my district.

I just want to mention one and then I will close:

“I have been retired from Ma Bell for 22 years and my pension has only increased once. We did get a small cost of living too, but a couple of years ago, that stopped. For people like us, in this situation, we are getting drained. The way things are going, my wife and I will have to hope to die before we cannot afford to live.”

That is why this is a very important hearing, and I thank you, Mr. Chairman, for the time you just allowed me.

Thank you, sir.

Chairman PAUL. Thank you very much.

Mr. Huizenga, do you care to make a statement?

Okay. There are no other opening statements, so we will now proceed to the testimony. I will introduce the three witnesses, and then we will proceed. Lewis Lehrman will be the first one to give his testimony. Mr. Lehrman is an active proponent of the gold standard and former member of President Ronald Reagan’s Gold Commission. After serving as president of Rite Aid in the 1970s, Mr. Lehrman ran for governor of New York on the Republican and Conservative party ticket. In addition to being a senior partner in his investment firm, Mr. Lehrman continues to remain active in a number of political and civic causes.

Next, we will hear from James Grant. Mr. Grant is a noted investor and publisher of Grant’s Interest Rate Observer. A former columnist for Barron’s, he is the author of five books on finance and financial history. He has appeared on numerous television programs and his writings have been featured in numerous publications, including The Wall Street Journal, the Financial Times, and Foreign Affairs.

And finally, we will hear from Professor Joseph Salerno, who is a professor of economics at Pace University in New York. He is also vice president of the Ludwig von Mises Institute in Auburn, Alabama, and has written extensively on monetary policy and theory, banking, and comparative economic systems. He received his MA and Ph.D. in economics from Rutgers University.

So we will proceed, and Mr. Lehrman, you can give us your statement.

All of your written statements will be made a part of the record, so we ask that you give us a 5-minute summary.

Proceed.

STATEMENT OF LEWIS E. LEHRMAN²⁴
SENIOR PARTNER
L.E. LEHRMAN AND COMPANY

Mr. LEHRMAN. Mr. Chairman, and distinguished members of the subcommittee, I want to thank you for the time. I want to thank my colleagues, Mr. Grant and Mr. Salerno, who have carried on the most distinguished research in monetary history, monetary theory, and monetary policy.

Since the expansive Federal Reserve program of quantitative easing began in late 2008, oil prices have almost tripled. Gasoline prices have almost doubled. Basic world food prices, such as corn, sugar, soybeans, and wheat have almost doubled. The Fed credit expansion from late 2008 through March 2011 created almost 2 trillion new dollars on the Federal Reserve balance sheet alone.

This new Fed credit triggered, as the chairman was just suggesting, a commodity and a stock boom, because the flood of new credit could not be fully absorbed by the U.S. economy, then in recession.

Indeed, Chairman Bernanke recently suggested that quantitative easing aimed to inflate U.S. equities and bonds directly, thus, commodities, of course, indirectly.

But some of the excess dollars raced into the foreign exchange markets, calling a fall on the dollar on foreign exchanges.

Now with quantitative easing, the Fed seems to aim at depreciating the dollar.

Foreign mercantilist countries such as China purchased these depreciating dollars on the foreign exchanges, adding them to their official reserves. Issuing an exchange, they are pegged undervalued

²⁴ [The prepared statement of Mr. Lehrman can be found on page 272.]

currencies. This new money is promptly put to work, creating speculative bull markets and booming economies in China. The emerging market equity and economic boom of 2009 and 2010 was the counterpart of sluggish economic growth in the United States during the same period.

But in the year 2011 and 2012, we will witness a Fed-fueled economic expansion in the United States. Growth for 2011 in the United States will, I believe, be about 3.5 percent or more, unless there is an oil spike. Another oil spike, combined with even greater catastrophe in Japan.

The consumer price index, the so-called CPI, will be suppressed because unemployment keeps wage rates from rising rapidly. The underutilization of physical and industrial capacity keeps producer prices and finished prices from rising as rapidly as they otherwise would. Thus, the flood of new Fed credit has shown up first in commodity and stock price rises.

But commodity and stock inflation inevitably engenders social effects. Two generations of inflationary, monetary, and fiscal policies have been a primary cause of the increasing inequality of wealth in American society.

Bankers and speculators have been and still are the first in line, along with the Treasury, to get zero interest credit from the Fed. The bankers were also the first to get bailed out. Then, with the new money, they financed stocks, bonds, and commodities, anticipating, as in the past, a Fed-created boom.

A very nimble financial class, in possession of cheap, near zero interest credit, is able, at the same time, to enrich themselves and to protect their wealth against inflation. But middle-income professionals and workers on salaries and wages and those on fixed incomes and pensions are impoverished by the very same inflation that subsidizes bankers and speculators.

So if the problem is an unstable dollar, inflation and deflation, boom and bust, what is the solution? I remember Senator Robert Kennedy saying once, "If you do not have a solution, you do not have a problem."

The solution is a dollar convertible to gold at a fixed value. This is the necessary Federal Reserve discipline, to secure the long-term value of middle-income savings and pensions and to backstop the drive for a balanced budget.

The gold standard would terminate the world dollar standard by prohibiting foreign official dollar reserves. Thus, the special access of

the government and the financial class to limitless Fed and foreign official credit would end with the gold standard.

Equally important, the gold standard puts control of the supply of money into the hands of the American people as it should in a constitutional republic.

If the Fed creates more dollars than the people at home and abroad desire to hold, they can exchange excess paper for gold at the fixed value, requiring the Fed to slow down credit creation in order to maintain the statutory gold convertibility of the dollar.

To accomplish this monetary reform, the United States can lead: first, by announcing future convertibility on a date certain of the

U.S. dollar, the dollar itself to be defined then in statute as a weight unit of gold, as the plain words of the Constitution suggests; second, by convening a new Breton Woods Conference to establish mutual, multilateral, gold convertibility of the currencies of the major powers at a level which would not, lower nominal wages; and third, to prohibit by treaty, the use of any currency but gold, as official reserves.

The gold standard is not perfect. But it is the least imperfect monetary system tested in the only laboratory we human beings have available to us: the laboratory of human history.

The dollar as good as gold is the way to restore America's financial self-respect and to regain its role as the equitable leader of the world.

Thank you, Mr. Chairman, and members of the subcommittee.

Chairman PAUL. Thank you.

We will go next to Mr. Grant.

**STATEMENT OF JAMES GRANT²⁵
EDITOR, GRANT'S INTEREST RATE OBSERVER**

Mr. GRANT. Mr. Chairman, good morning. I have the honor of testifying—thank you.

The original Federal Reserve Act said nothing about zero percent interest rates, quantitative easing, inflation targeting, stock price manipulation or indeed, paper money.

The law, rather, projected an institution, “to provide for the establishment of the Federal Reserve Banks to furnish an elastic currency to afford means of rediscounting commercial paper, to establish a more effective supervision of banking in the United States, and for other purposes.”

We should have known.

²⁵ [The prepared statement of Mr. Grant can be found on page 291.]

“For other purposes” was the operative phrase. Mission creep is endemic to bureaucracy, of course, but few government departments have crept, indeed galloped, faster, further toward a more unhelpful direction than our own Federal Reserve.

Central banking has elited into a kind of central planning.

And to top it all, the Fed has unilaterally added a third mandate to the two Congress conferred on it some years ago. The “Bank of Bernanke” is today the self-appointed booster of stock prices.

Now, the progenitors of the Fed, notably Senator Carter Glass of Virginia and the economist H. Parker Willis, had no time for Wall Street. They were rather devoted to commerce and agriculture and to decentralization of finance.

It would sorely grieve those two to discover that in their absence, the Fed’s zero percent funds rate has simultaneously served to starve savers and to fatten speculators.

It should likewise grieve us, the living.

There is something deeply and fundamentally wrong in American finance.

According to Chairman Bernanke, himself, in private testimony before the Financial Crisis Inquiry Commission in November of 2009, 12 of this country’s largest 13 national institutions were at the risk of failure in the fall of 2008.

In our Great Recession, nominal GDP was down top to bottom by no more than 4 percent or less.

In our Great Depression, 1929 and 1933, nominal GDP was down by 46 percent, that is to say the economy was virtually sawed in half, yet most banks did not fail.

The predecessor to today’s Citigroup was notably solvent. You do wonder if only one 21st Century American financial institution could stand up to anything like the Depression of yesteryear, well not eager to find out, the Fed insisted once, no truck with even the statistical absence of inflation, let alone with outright deflation.

Still less of course, with the Depression, so it boons its balance sheet and it presses its interest rate to the floor. That is not of course the end of the story. The dollar is thereby materialized, the interest rate thereby suppressed, have unscripted consequences.

They inflate prices and investment values, and because prices and values are the traffic signals of a market economy, the Federal Reserve unintentionally becomes the cause of crashes and pileups on our financial streets and highways. Some of these accidents, notably the 2007, 2009 residential real estate debacle are the monetary equivalent of a chain reaction on a foggy California freeway.

The trouble with our monetary Mandarins is that they believe impossible things. They have persuaded themselves that a central bank can pick the interest rate that will cause the GDP to grow, payrolls to expand, and price to levitate by just 2 percent a year, no more mind you, as they measure it.

It is impossible, experience and common sense both attest, yet they hold it to be true. Today's dollar, it is weightiness uncollateralized by anything except the world's faith in us. That too seemingly in history's judgment would be an impossibility yet here it is.

Yet that faith justifiably is today fading. William F. Buckley famously and persuasively said that he would rather be governed by the first 400 names in the Boston phone directory than by the faculty of Harvard.

Unaccountably, this Congress has entrusted the value of the dollars that we own, we transact, to an independent committee dominated by monetary scholars. In one short generation, we have moved to the Ph.D. standard from the gold standard.

I submit, Mr. Chairman, it is past time to reconsider.

Chairman PAUL. I thank the gentleman, and we will go on to Professor Salerno.

**STATEMENT OF JOSEPH T. SALERNO, Ph.D.²⁶
PROFESSOR OF ECONOMICS, LUBIN SCHOOL OF BUSINESS
PACE UNIVERSITY**

Mr. SALERNO. Chairman Paul and distinguished members of the subcommittee, I am very honored to be here.

The old argument has come back into vogue that modern inflation is desirable to prevent the far greater evil of deflation. This has been given a scientific sounding name of "inflation targeting."

In the past decade, this view has been promoted both by former Federal Reserve Chairman Greenspan and current Federal Reserve Chairman Bernanke. But this view is based on a fundamental confusion. It confuses deflation with depression, which are two very different phenomenon. Falling prices are, under most circumstances, absolutely benign and the natural outcome of a prosperous and growing economy. The fear of falling prices is not the phobia, a deflation phobia which has no rational basis in economic theory or history.

Let us look at the experience of the past 4 decades with respect to the products of the consumer electronics and high tech industries. For

²⁶ [The prepared statement of Professor Salerno can be found on page 297.]

example, a mainframe computer sold for \$4.7 million in 1970 and probably is the size of this room, while today, one can purchase a PC that is 20 times faster for less than \$1,000. The first hand calculator was introduced in 1971 and was priced at \$240, and by 1980, similar hand calculators were selling for \$10 despite the fact that the 1970s was the most inflationary decade in U.S. history.

The first HD TV was introduced by Sony in 1990 and sold for \$36,000. When HD TV began to be sold widely in the United States in 2003, their prices ranged between \$3,000 and \$5,000. Today, consumers can purchase one of much higher quality for as little as \$500.

In the medical field, the price of Lasik eye surgery dropped from \$4,000 per eye in 1998 when it was first approved by the FDA to as little as \$300 today.

No one, not even a Keynesian economist, would claim that the spectacular price deflation in these industries has been a bad thing for the U.S. economy. Indeed, the falling prices reflect the greater abundance of good which enhances the welfare of American consumers.

Nor has price deflation in these industries diminished profits, production or employment. In fact, the growth of these industries has been as spectacular as the decline in the prices of their products. But if deflation is a benign development for both consumers and businesses in individual markets and industries, then why should we fear a fall in the general price level, which of course is nothing but an average of the prices of individual goods?

The answer given by theory and history, is that a falling price level is the natural outcome of a dynamic market economy operating with a sound money like gold.

Under a gold standard, prices naturally tend to decline as technological advance and investment in additional capital goods rapidly improve labor productivity and increase the supply of consumer goods while the money supply grows very gradually. For instance, throughout the 19th Century and up until World War I, a mild deflationary trend prevailed in the United States.

As a result, an American consumer in the year 1913 needed only \$0.79 to purchase the same basket of goods that required \$1 to purchase in 1800. In other words, due to the gentle fall in prices during the 19th Century, a dollar could purchase 27 percent more, in terms of goods, in 1913 than it could in 1800.

Contrast this with the current-day consumer who once paid \$22 for what a consumer in 1913 paid only \$1 for.

The secular fallen prices under the classical gold standard did not impede economic growth in the United States, in fact deflation coincided with the spectacular transformation of the United States from an agrarian economy, in 1800, to the greatest industrial power on earth by the eve of World War I.

Ironically, while Chairman Bernanke just reaffirmed again a few days ago that the Fed will persist in its inflationary policy of quantitative easing to ward off the imaginary threat of falling prices, signs of inflation abound.

I will skip over, in my testimony, the review of inflation in the commodity markets which was given by Mr. Lehrman. But let me just add that as a result of skyrocketing prices of agricultural products such as corn, wheat, soybeans, and other crops, the price of farm land in the United States has been soaring, particularly in the Midwest, where land prices increased at double-digit rates last year and regulators now are fearing a bubble.

And just today it was reported that wholesale food prices in the United States rose by 4 percent last month, the most in 46 years. That is since the stagflationary 1970s.

Not only does Chairman Bernanke seem unfazed by these inflationary developments, but what is more astounding, he appears to welcome the rapid increase in stock prices as evidence that QE2 is working to right the economy. He seized on the Russell 2000 index of small cap stocks, which has increased 25 percent in the last 6 months, stating, "A stronger economy helps smaller businesses."

In other words, despite the stagnant job creation and sluggish growth of real output, Mr. Bernanke has declared Fed policy a success on the basis of yet another financial asset bubble that threatens again to devastate the global economy. This would be farcical if it were not so tragic. But what else can be expected from a leader of an institution whose very rationale is to manipulate interest rates and print money.

And I will just end on the following. Just today, hot off the presses, USA Today reported substantial evidence that a new tech bubble is starting to grow. Facebook is estimated to be worth \$75 billion on private markets and is reported to be bidding against Google for a \$10 billion purchase of Twitter.

Over the last year, there have been 48 tech IPOs, which is 28 percent of all deals. And the stock prices of these tech IPOs have jumped 19 percent on their first day of public trading.

Thank you.

Chairman PAUL. Thank you. There are votes on the Floor, so we are going to take a recess, but we will be back shortly.

{recess}

Chairman PAUL. The committee will come back to order[.]

[QUESTIONS & ANSWERS]

[A]nd we will go into the question session right now. I will start off by taking 5 minutes for that.

I do want to welcome once again, the three witnesses and I appreciate very much you being here, and talking about a very important subject. Not only for our business climate and our employment, but also for all Americans who suffer the consequences of rising prices. This hearing has been set up mainly to sort out the relationship of monetary policy and why prices go up.

A lot of people, as I mentioned in my earlier statement, would like to blame everything else and try to avoid the Federal Reserve completely. But I do want to start off with a question about the opposite of what people call inflation, and it was touched upon in the testimony, and that is the deflation.

Deflation of course, for some of us, would mean that the money supply is shrinking as it did in the 1930s but other worry about prices going down and there is—I guess there are some people who justifiably worry about it especially when they are overextended and they have to pay their debts. But overall, if we are on a sound monetary system, if we are on a commodity standard it may well be that prices would go down.

I would like to ask Professor Salerno to distinguish between these two, between deflating the money supply and prices going down and who then would best benefit if prices actually dropped?

Mr. SALERNO. If we use deflation to mean falling prices, it is the mechanism by which people are benefitted, even on a fixed income, when we have increases in productivity, increases in productivity result from technological progress and more savings and investment in the economy. So workers become much more productive, more goods are produced in a given hour, and at the same wages their standards of living go up because their dollars become more powerful in exchange.

If you prevent this drop in prices, then many people who were not involved in the original increase in productivity, people who are in other industries or people, especially on fixed incomes, people on pensions, and insurance policies, will benefit from the falling prices. Their real incomes go up.

Chairman PAUL. Thank you. I want to ask Mr. Lehrman a question about the long-term effects of gold. You brought up the subject of gold and some of the advantages. There have been studies done with gold and stability of prices over long periods of times. Even with an imperfect gold standard, do we not have a fairly good record of stability in prices when it wasn't a Fiat currency?

Mr. LEHRMAN. We do, Mr. Chairman. If you will permit me to wave a piece of paper at you, in my testimony, I have charted the price of gold or the value of the dollar—was all that heard before?

We do have the history of the general price level under the gold standard and I have prepared in my written testimony a chart which shows that since the end of the gold standard, that is to say the class of gold standard in 1914 on the eve of the First World War, the value of the dollar as measured by the CPI, adjusted for the available statistics, before 1920, has fallen to \$0.05. The value of an ounce of gold in March, well on March 15th, or I should say even March 17th, today, 1910, was \$20 per ounce of gold.

On March 15th or March 17, 2011, one century later, the price of gold is approximately \$1,400 per ounce. So the price of gold is, as it were, the reciprocal of the fall in the value of the dollar over the same period.

During the history of the American Republic from let us say the Constitution of 1788, 1789, we can chart the price level quite accurately. And in my testimony I submit such a chart, with Coiny Jack of 1792, essentially Alexander Hamilton's, Coiny Jack, the 1792, which made the dollar convertible to precious metal, primarily under the circumstance that the silver is first but by 1834 we were on to the gold standard.

If you take the price level under the gold standard, from 1834, and of course make the exception for the Civil War which went on for a very long period was a convertible of suspension. But if you take from 1834 until 1914, you will find under the gold standard that the general price level or the CTI as we would say today was exactly in the same position.

In other words, over the long run, near a century, there was neither a fall in the general price level, siflation, as Professor Salerno might describe, nor was there any general inflation. So that is—in testing monetary theory, or even economic theories we have only one laboratory, it is the laboratory of human history.

And in the laboratory of human history, we find that the gold standard, proven by the price level stability from 1834 until 1914 for

example, that the gold standard provides virtual stability in the price levels on the average level of general prices.

Chairman PAUL. I thank the gentleman and we will go on now to Mr. Luetkemeyer for his 5 minutes.

Mr. LUETKEMEYER. Thank you, Mr. Chairman. Mr. Grant, you made an interesting statement during your testimony that, "The only thing holding up our dollar was the faith in it." Would you elaborate just a little on that, I have some agreement with you on that. And that I think that our whole system right now seems to be held together by the confidence that we will be able to pay something back and forth versus the actual collateralization, the actual asset backing of the actual—there being some value there.

I think—it would appear to me that the whole system is held together by just the confidence between you and I, that we can do business versus the actual asset that is there.

Could you elaborate a little bit on your statement and whether you think that is the right perception or not?

Mr. GRANT. Yes, Congressman, I do. To a degree, every monetary system is faith-based. One must have confidence in the quality of the metal, if there is collateral behind the currency.

Never, I think until the present day, has the world been on a system of pure paper. The dollar is the Coca Cola of monetary brands. It is a remarkable achievement in that it is today treated as good money, the world over, though the cost of production is essentially nothing.

And this is a pretty flattering expression of confidence by the world in America and its institutions. However, faith must be continually refreshed. It is not perpetual. I think that the very size of this so-called quantitative easing program has crystallized doubts as to the nature of the currency and of its underlying value.

In the language of modern finance, the dollar is a derivative. It used to derive its value from the collateral behind it, mainly gold. In 1971, if you were a foreign official institution, you presented your \$35 to the Treasury and said you would prefer to have an ounce of gold and you got it.

Over the past 40 years that has been of course, out the window. And so the dollar is in the language of modern finance, a kind of a nonsequitur; it is a derivative without an underlying asset.

Sometime recently, a reader of the Financial Times wrote to the editor and said, "Sir, the scales have fallen from my eyes. I think I finally understand the meaning of quantitative easing. I think I

finally get it. What I no longer understand is the meaning of the word money.”

I think the very size and the audacity and the physics of the project of materializing \$600 billion effortlessly has captured the imagination and the doubt of the American people, and indeed of the world’s money-holding population.

May I close with, to me, the greatest crystalizing, clarifying line about money in American literature, and it happens to be from a novel. It is a Laura Ingalls Wilder novel called, “Farmer Boy.” And this is a story of a boy growing up in Upstate New York, hard scrabble, dairy country, in which—campaigned for governor, he carried all of this country, by the way, with a huge majority.

But Alonzo, this child turns up at the county fair and he asks his father very definitely for a nickel and his father miraculously materializes \$0.50 from his pocket and he says to the kid, not wanting to let the moment pass without the moral instruction, he says, “You know what this is?” And the boy actually can’t think of anything to say. And the father says, “It is money, do you know what money is?” And the boy again, is silent. And the father says, “Money is work.” And for the past 40 years, money has been a concept. It has been the project of a Ph.D., and I think the world would like it to be work.

Mr. LUETKEMEYER. Okay, along those lines, obviously the key too is considering it to erode the confidence in our dollar and right now the dollar is sort of the gold standard around the world. What happens if our dollar goes away or like some other people are trying to look to a different currency. How does that impact out country, in your view?

As no longer being the standard—

Mr. GRANT. I think we have to answer the question. I think we have to consider our unique privilege in creating a currency that is treated as good money the world over and which only we can lawfully create. This is called the Reserve Currency Privilege and both Professor Salerno and Mr. Lehrman have written really important stuff on this. But the nature of our franchise, of American franchise is that we import, we pay with our dollar bills created at essentially no marginal cost.

These dollars we ship effectively to Wal-Mart suppliers in Asia, the dollars wind up, because the suppliers don’t need it, on the balance sheet of the central banks of our Asian creditors. The Asian creditors turn right around and buy Treasury securities.

So it is as if the dollar has never left the 50 States. So that is what we have and if the world were to lose this astounding confidence in the institution of the Federal Reserve we would lose that franchise, this privilege of seignorage, this reserve, this—what was the last term they—exorbitant privilege.

Mr. LUETKEMEYER. Exorbitant privilege.

Mr. GRANT. And we would quickly find that we, like Paraguay and other nations not uniquely blessed with a reserve currency would have to suffer a lower standard of living.

Mr. LUETKEMEYER. Okay. Thank you very much. Thank you, Mr. Chairman.

Chairman PAUL. Congressman, I wonder if I may just add a couple of numbers to the question?

Mr. LEHRMAN. May I interrupt?

Chairman PAUL. Yes, you may, but I wanted to advise the members if they would like, there will be a second round of questioning, also.

Yes, go ahead Mr. Lehrman.

Mr. LEHRMAN. Mr. Grant's comment is so compelling, and I think the numbers themselves are illuminating. The official reserves of foreign central banks held in custody at the Federal Reserve System itself, published in the balance sheet of the Federal Reserve every Thursday evening at 4:00, those official reserves now amount to \$3.5 trillion invested in U.S. Government securities, primarily in

U.S. Treasuries, the residual in Federal agency securities.

That just gives you a quantitative estimate of the mechanism that Mr. Grant just described. The best way also, if I might say, to think about this is that this is the credit provided to our government, to the Treasury in deficit by the purchases by foreign central banks who are mostly mercantilists wanting to maintain undervalued currencies. This is the credit provided to our U.S. Government.

Until we end the official reserve currency system and, I might add, the unlimited discretion of the Federal Reserve to buy \$600 billion worth of U.S. Government securities in a mere 8-month period, until we end that, all efforts to control the deficit will be unavailing.

All of the great conscientious efforts of so many of the Congressmen, especially freshman Congressmen, Republicans and I believe some Democrats too, all of them will be unavailing. We have gone through 40 to 50 years of every President declaring that he was going to reduce spending and the deficit, even President Reagan, a great President, wound up with deficits running somewhere between 3 percent and 7 percent output.

The reason is that the U.S. Government grows through the deficit spending which is authorized and then it is financed in combination by the Federal Reserve System and the official reserves which are accumulated and reinvested in U.S. Treasury by foreign governments making limitless credit available. When limitless credit is available event to an individual, over a very long period of time, we can be assured that they will make use of it.

Chairman PAUL. Thank you.

Now, to Mr. Schweikert, from Arizona.

Mr. SCHWEIKERT. Thank you, Mr. Chairman. That limitless credit as an individual would be an interesting concept.

Can I go—something I have ultimately wanted to ask and if our two—the two trading partners that actually buy most of our debt which is China and Japan, what happens—what sort of cascading effect, at all if there is, let us say Japan right now; bless them with their disasters and things they are facing, begins to have fairly substantial steps up in inflation. All we were seeing, regionally, rather aggressive inflation in areas of China, what potentially does that do in our inflation indexes?

And could we actually start from the right and go left?

Mr. SALERNO. I think the big danger is that if Japan needs extra imports and so on as their economy slows down in reaction to this disaster, and they begin to offload reserves of American currency which are actually government securities, there could be a cascading effect as it puts downward pressure on the U.S. dollar. And if China does the same thing, then we are at the situation where there—the only thing that the U.S. Government can do to finance this deficit is to borrow from the American people.

Mr. SCHWEIKERT. But that is also our bond prices functioning, start having to move up to be able to sell the product. That was actually going to be the second half of my question.

But even just—let us say there was just a national inflation step-up within Japan and China. What do you see from just that in the price of the products being imported and exported?

Mr. SALERNO. To the extent that China keeps its exchange rates with us, their prices would actually become higher in relation to us and we would actually have an increase in our exports and a decrease of imports from China. So for mercantilists, that would sort of be a good thing.

So given the system of exchange rates that we have today, there would not be a huge impact on the U.S. price level of those developments. Although, the problems in Japan if their economy slows down,

that would put an upward tick on world prices and there would be some effects on consumer prices here in the United States.

Mr. GRANT. Agreed.

Mr. SCHWEIKERT. No, no I appreciate brevity.

Mr. LEHRMAN. Agreed, Congressman.

Mr. SCHWEIKERT. Okay, now going back in the other direction. What if we actually start to see the nation of China, which is the second biggest buyer of our debt, now they have to start to begin to finance their own reconstruction so they no longer are participating as much in the U.S. debt market so now we have lost one of our customers. So we start to tick up our own bond rates.

What do we face?

Mr. LEHRMAN. Do we go from right to left? There are at least two alternatives. One would be that despite Japan not absorbing U.S. dollars in exchange for exports and then adding them to their official reserves, that other emerging countries who have absorbed enormous amounts of dollars in their banking systems and then into their official reserves, which have risen even more dramatically than Japan, in the last 10 years, that they too would absorb whatever Japan no longer absorbs.

I might add that Japan had been out of the market for absorbing

U.S. dollars and then investing them in U.S. Government securities in custody of the Fed for a good long while until recently, as the yen strengthened and they of course wanted to lower its value in order to maintain their valued export industries.

The other possibility is that there was no other emerging country or major country willing to absorb the residual of the securities and were the United States balance of payments to remain the same, all fairly large assumptions, the dollar would then fall on the foreign exchanges until there was intervention by countries who did not want the dollar to become increasingly competitive in the export markets or until the Federal Reserve reduced the volume of credit they were issuing talk in the market especially the subsidizing of banks and the U.S. Treasury and deficit.

For a concrete example of that, that is exactly what Paul Volcker did in 1981, 1982. He imposed the most Draconian credit contraction in American history since the Great Depression, or least comparatively with all other recessions. He put the Fed's fund rate up to 20 percent the prime rate hit 21 percent.

Unemployment in New York State that Jimmy referred to, in 1982, which was my year on the campaign, the unemployment rate in New York hit 11.2 percent. The unemployment nationally, in 1982,

under the Volcker credit contraction policy hit almost 11 percent nationally, higher than at any time during the so-called Great Recession.

So that these two options, namely a great fall in the dollar with no residual buyer of excess foreign dollars in the foreign exchange markets, combined with Federal Reserve contractions, presents us with two unattractive alternatives.

Mr. SCHWEIKERT. Mr. Chairman, without objection, can I have another 60 seconds?

Mr. GRANT. Briefly, the more birthday candles I blow out, the less certain I am about cause and effect with bond prices and interest rates. Paradox seems to govern many of these markets. For example, the difficulties, the tragedy in Japan has forced the yen not downward but upward as the Japanese repatriate assets from abroad to finance the holes in their income statements and balance sheets. To attempt to suppress the rise in the yen the Japanese buy more dollars. They help to finance our deficit even in the midst of their travail and our interest rates have been going down since 1981. For 30 years, bond prices ostensibly have been rising and interest rates falling.

I think probably that no matter what happens with respect to the dollar, no matter what happens with regard to these hearings or with the congressional approach to monetary policy, the chances are that the next 30 years would see more likely interest rates rising and falling. Interest rates have tended to rise and fall in generation length intervals since the late 19th Century.

Mr. SALERNO. Foreign confidence in the dollar is precarious. So that if there is a drop in the dollar as the foreign demand for the dollar falls, I think what you are going to see is a cascading effect. There is already talk among China and Brazil and the president of the IMF of moving towards this sort of a gold-based reserve currency or a currency that has basket weight entities.

But at that point, I think then it could be a vicious circle in which it feeds on itself, the dollar drops, if the Fed doesn't contract the money supply what you will get is an explosion upward of import prices, no more cheap shopping at Wal-Mart. And it is so precarious, but a few years ago there is evidence that—now that drug dealers are beginning to offload their \$100 bills, 80 percent of the \$100 bills that are printed in the United States are not in the United States, they are financing drug deals they are hedging against inflation.

And they are beginning to stop using them and they are replacing them with EUR 500 notes. So that is just sort of the first step.

Mr. SCHWEIKERT. Mr. Chairman, forgive me, but should I be worried about that?

Chairman PAUL. I think we all should be, and we should have been a long time ago.

Mr. SCHWEIKERT. Something about when the drug dealers have attended their monetary economic classes I—we are in trouble. But please, I interrupted.

Mr. SALERNO. No, that is what I was going to say.

Mr. SCHWEIKERT. Thank you, Mr. Chairman.

Chairman PAUL. I would like to talk a little bit about the measurement of price inflation. The government depends on this CPI, there is an old CPI and a new CPI. John Williams has spent some time as a free market person, trying to keep us honest about what the CPI is really doing. And of course traditionally, when the government makes reports, they talk about core CPI and they drop off those unessential things like food and energy and it seems like the markets very frequently accept whatever they say.

“Oh, inflation is only 2 percent; prices are only going up at the rate of 2 percent.” Of course, eventually, I think the numbers catch up, even with the government. In the 1970s, he did admit that prices were going up at a 15 percent rate.

But my question is, talk a little bit about the difference about the CPI, how good is it, how accurate is it? Is it—does John Williams have a good point there, saying that the revamping of it—what do you all look at if you want to know how prices are going up? I know we all look at the CPI and the PBI and it seems to have the immediate effect, but where do you put your most importance, what price measurement do you use?

All three of you, could you give me your comment?

Mr. SALERNO. Varese's once said that the housewife who just checks a few prices in the supermarket and keeps track of them is much more scientific than the arbitrary price indexes that are used by economists and statisticians. But I tend to look at something called median CPI which is calculated by the Cleveland Fed. It is not perfect and it shares some of the same problems as the CPI itself. But also I like to look at the raw prices of goods and what has happened over time, to them.

I do want to mention that these adjustments are just ridiculous. We have a substitution bias adjustment which, if the price of prime beef goes up, they don't include that increase; they reduce that and they say, “Well, people can eat chicken at a lower price.” So the full increase is not reflected.

They have hedonic adjustments, if a car gets two-side airbags, “The increase in the price of the car has to be reduced by the fact that it is a higher quality now.” And new technology adjustments, the iPad as someone talked about, when that comes into play, that is a deflating force. Despite the fact that other prices are going up at a certain rate, that rate is reduced for that reason.

Chairman PAUL. Are there any other comments?

Mr. LEHRMAN. I think it may be Mr. Williams’ research, Mr. Chairman, I am not sure, I cannot quote the author for certain, but in his research on the CPI, he used the methodology that was in force in 1980. And if one were to use the methodology in force in 1980 without the hedonic adjustments, without the substitution effects and so much of the changes which have occurred, that the price level is increasing at approximately 8 percent by that methodology as opposed to the methodology presently adopted by the Bureau of Labor.

And for purposes in our investment business, we pay no attention whatsoever to these fictitious Ph.D.-created mechanisms otherwise known as the CPI. Even the PPI leaves much to be desired up until—for the longest period of time, up until the Second World War, which was a period, certainly before the Great Depression, of the greatest economic growth the world had ever experienced, it was the Industrial Revolution. It was the Wholesale Price Index, which was used to measure the level of prices.

The CPI and the PPI themselves aren’t innovations. So looking at commodity prices, looking at equity prices which themselves are articles of wealth in the market and are excluded from the CPI, means to anybody who is involved in business, corporate capital allocations, or if you will, in long-term investing, one has to ignore the publication on a monthly basis of the CPI and PPI and look at the actual prices in the market which serve as indicators of the cost of production of producing another article of wealth to the market.

Chairman PAUL. Would it not be true that if they would use the CPI, wouldn’t some groups of people suffer more by rising prices, and other groups be more protected? Everybody is not going to be penalized the same way, even if we did look at those numbers. The average person might spend their money differently. If your income is \$25,000 a year, the inflation rate might be much more painful than if you were making a couple of hundred thousand a year.

Mr. GRANT. Or depending on your age, it—a younger person spends a great deal of his or her money on consumer electronics, that personal CPI is plummeting. He or she is in clover. It seems to me,

and Professor Salerno will know whereas I am surmising, but it seems to me that the ancients posited that inflation is not too much money chasing too few goods, inflation is too much money, that which the money chases is variable. In one cycle, it might chase skirts at retail, and in another cycle, it might chase the Russell 2000 Stock Index.

And I think the complacency of our masters, the Fed, with respect to inflation, has to do with their overlooking this most basic concept about inflation.

Mr. LEHRMAN. Conversely, if I may, with the—with respect to the younger generation and the amount of money they spend on technology, with ever falling prices, you have the entire world of emerging markets, not to mention middle-income families and poorer families in the United States driven from subsistence level to starvation by basic food prices. The milk price has doubled in the past year and a half. Food prices, we know, have risen, depending upon the supermarket, anywhere from 15 percent to 20 percent in basic foods.

So, I believe that the political turmoil for example in North Africa, indeed all around the world, and some of the protests, the intensive protests about issues which in the past, in the United States have been received without quite the kind of ferocious protests, I think are related to the frustration that middle-income and poorer families all around the world are feeling.

As the political class is indifferent to what the effect of the commodity price is, the basic food and food prices have done to those on subsistence or near subsistence level, as they feel ever more the threat of starvation.

Chairman PAUL. Mr. Schweikert.

Mr. SCHWEIKERT. Mr. Chairman, actually—is it pronounced “Lehrman?”

Mr. LEHRMAN. Yes, sir.

Mr. SCHWEIKERT. Actually, heading in that same direction, just—and I know this is a bit of a lark, and there are other components that go into that food price. While our farm policies in this country subsidize certain commodities crops—or make them more expensive around the world. I once sat down with some agricultural economists who basically said U.S. agricultural policy kills people in Sub-Saharan Africa. So when you talk about the food prices, particularly what we see around the world, and some of the protests breaking out, what is a combination of just purely organic inflation and also government policy.

Mr. LEHRMAN. Government subsidies in the agricultural sector, as you suggest Congressman, are themselves very controversial. In the end, if I can make it brief, it is a question of, compared to what?

The common agricultural policy of the European Union causes, for example, corn prices and wheat prices and they too are great producers and exporters, to be about twice or more the level of basic agricultural prices in the United States because the United States farmer is the most efficient producer of all basic food goods and high-protein goods such as meat products, in the world.

So, that the elimination of subsidies in the United States, it is true, might make the production, the total output of farm goods sometimes—in some areas in which we export 50 percent of our own output to the world at very cheap prices relative to the rest of the world, those subsidies might reduce the prices, but it is also true I think that the profitability of the industry would change and the supply therefore would contract in the U.S. market in general and thus make less of our output in the farm sector available for export to countries: (A) which do not product sufficient food to feed their population; or (B) have to buy much more expensive goods subsidized at much higher rates of subsidy from the European Union.

Mr. SCHWEIKERT. Mr. Lehrman, I know we are not doing agriculture, but isn't there also, the flip side of that domestic agriculture in these foreign countries is also suppressed because we import a cheaper product than they can actually produce it domestically?

Mr. LEHRMAN. If I understand the question, are they able to import U.S.—

Mr. SCHWEIKERT. No, no, yes, often our commodity hits the country often at a price that is sometimes below what they would domestically produce. And so therefore all—

Mr. LEHRMAN. That is correct and that is because we produce it so cheaply in this country relative to the rest of the world.

Mr. SCHWEIKERT. And therefore, if we hit any price bumps or those things there they have no domestic agricultural safety net?

Mr. LEHRMAN. They do not, in some countries, most countries have a—most countries that are well advised have a food sufficiency strategy, the Chinese being a particular and a good example of this. Whereby believing that they always have to be prepared for a war, that—and this used to be the United States' policy, that food sufficiency in time of war, total war, was absolutely indispensable since only a blue water navy could fully protect the sea lanes in order to import food in the event it was blockaded by the enemy.

Mr. SCHWEIKERT. Mr. Chairman, may I ask unanimous consent for another minute or 2 minutes?

Chairman PAUL. Granted, yes.

Mr. SCHWEIKERT. Now, back to what I was actually really hoping to ask. Okay, if I was a market observer and I have a fixation of watching bonds and bond futures, but I think one of those over there said as his birthdays move along he sometimes isn't sure what those numbers really mean. If you were me and you are trying to watch the financial markets, where do I go to see a tell of both my future on interest rates and a tell of my future in inflation? Let us start from the far side and come back.

Mr. SALERNO. I think the tell on inflation is the long-term bond markets which will crystalize inflationary expectations in the longer-term bonds. And I think contrary to what Chairman Bernanke and the Fed believed when they engaged, when they undertook QE2, long-term bond rates did not fall they went up. And that because of the expectations that were stimulated, of an inflation in the future.

Mr. GRANT. With respect, I think that there is no long-term tell on anything, especially inflation, especially interest rates. Two examples from history, one in 1946, April, the long-dated U.S. trades at an astonishingly low 2.2 percent, 2.2 percent. At that time, the CPI was running in double-digits when General Marshall delivered his famous Marshall address at Harvard the next year, the CPI was even higher, close to 20 percent, bond yields rather lower, but Marshall was looking backwards. He was looking at the Depression and not forward to the prospects of a full generation of inflation and rising interest rates, observation number one.

Observation number two is, in the spring of 1984, bond yields are quoted at 14 percent, 14 percent and the CPI is at 4 percent, the market was looking backward to the experience of the tumultuous and wholly profitless period, 35 years of a bear market in bonds, rising interest rates, 1946 to 1981.

So the bond market to me is like an—it is like a badly trained waiter, looking at his shoes, looking left, not meeting your eye. He is—the bond market is an arbitrage market, that is it is priced, principally, I submit, off of the cost of financing a portfolio of bonds and not with regard to a possible scenario for the future.

The stock market is meant to look forward, the bond market I think is rather present minded.

Mr. LEHRMAN. Observation three, agreed on all the propositions that Mr. Grant just put forward. The one exception, I believe, on forecasting, would be that when an economy is fully employed, all

resources—labor, capital, savings—are fully mobilized, the banking system is fully committed to full output and we are the authorities then because prices were advancing to establish wage and price controls then I think as the—as you the observer or the bond investor or speculator, you could bet on a rising level of interest rates and thus a falling bond market in the future.

And the example I would cite would be the infamous example of President Nixon deploying the Federal Reserve to pump up the money supply in 1971 on the verge of the 1972 elections. Having—on August 15, 1971, declared the dollar no longer convertible to gold. And in 1972 with the effects of the vast inflation which were developing as a result of the Fed policy, imposing wage and price control.

We know what happens after that.

Mr. SCHWEIKERT. Mr. Chairman, can I ask that there be no more cursing like that. Those are dirty words.

Chairman PAUL. Which words?

Mr. SCHWEIKERT. Wage and price controls.

Chairman PAUL. Oh.

Mr. SCHWEIKERT. Mr. Chairman, would you allow me just because there is one. In the whole sort of discussion of tells and inflation and my fear of a classic sort of cascading event, it is sort of the miniature version of a black swan; we float much of our U.S. debt, very short term. Our WAM is, I think, actually somewhat dangerously short. If we start to hit some ticks on the short end of the curve, what—does that create a ratcheting affect both on interest rates and therefore inflation or should I just stop worrying about it?

Mr. GRANT. No, you should really worry.

Mr. LEHRMAN. You should worry substantially. The average maturity of the U.S. Treasury debt is approximately 4 years which is very short for a country which is approaching a level of direct debt equal to total national output. We are at the level of interest rates now subsidized by the Federal Reserve, despite their marginal rise, as Professor Salerno suggested, we are at the level of interest rates to rise close to market rates which are typical of full employment.

The level of debt service payments would rise by an order of magnitude, consume that part of the Federal budget, the total Federal budget which today is almost unthinkable and could be only as little as 4 or 5 years away.

And all of the talk about cutting \$100 billion of spending would be consumed by the fact that the level of interest rates had risen from several hundred billion to as much as \$700 billion, \$800 billion. So

the political leaders of our country, the Congress, need to worry very much about a rise in the level of interest rates from their present subsidized level to market interest rates associated with a more fully employed economy.

Mr. GRANT. Think about how this might just look in retrospect. We are sitting here in 2011, we have a Federal Reserve that is suppressing money market interest rates, it is funds rate notoriously is zero. We are running \$1.5 trillion a year, public deficit we are running deficit on current account of 3 percent to 4 percent, 5 percent, depending on the fiscal quarter, of GDP. We are enjoying generation low market interest rates and the measured rate of inflation as they measure it is comfortable.

That is the moment—and one can imagine looking back on this moment saying, couldn't we see that this was Nirvana that nothing better was going to be coming down the pike. In fact, as Mr. Lehrman has suggested, market interest rates were going to revert to something like normal. So if the long-dated Treasury bond goes from 3.25 percent to 6 percent, and if money market interest rates go from zero to 3 percent, or 4 percent that presupposes an immense increase, as has been suggested, in the cost of financing these debts, these are the good old days with respect to interest cost.

Mr. SCHWEIKERT. Anything else to be shared?

Mr. SALERNO. I agree with both Mr. Grant and Mr. Lehrman.

Mr. SCHWEIKERT. All right. Thank you for your tolerance, Mr. Chairman.

Chairman PAUL. You are welcome. Thank you.

I have a couple more additional questions that I want to touch on before we adjourn. The opposition, those people who believe in a monetary system quite different than you describe, the people who believe in Fiat money and the creation of money out of thin air, do they deliberately have a purpose for dealing with the debt? We know that the debt won't be paid, do they actually believe that it is a proper policy to liquidate the debt by just reducing the debt by devaluing the money because real debt goes down?

If you have a \$14 trillion debt and you can get inflation going again, because I sense when I talk to individuals at the Federal Reserve that they would sort of like inflation to come back.

Do they ever actually in their writings describe that this is one way you can handle the debt? And likewise, is there ever an argument by those who believe in that system that this is one way you can lower real wages without lowering nominal wages? If there is a correction it is necessary, wages, maybe they should go down.

But nobody can quite accept the idea of, we are going to lower your wages, but we will lower the real wage by inflating the currency. Do we have evidence that they actually use that as a policy? Would anybody care to answer that?

Mr. SALERNO. In academic writings, increasingly they are talking about adjusting wages through the device of inflation. As far as the debt is concerned, it is hard to know people's motives but the standard argument is that we owe much of it to ourselves and increasingly more to the rest of the world but that we would still, as a reserve currency, we can pay the rest of the world off by simply printing money to pay those debts.

They don't go on and say that in fact what we are really doing is repudiating the debt over time.

Chairman PAUL. I have trouble, politically, as others would, to describe our position about what to do when a bubble forms. Those of us who believe in sound money don't create the bubbles; they come from the excessive amount of credit that is created.

But when the crisis hits and the bubble bursts, we can do a lot of things like we have done in the last 2 years—we just turn off the printing presses and the spending and hope that is going to take care of it. Others would argue that we just do nothing like we did in 1921. How do we handle this politically, because right now it is virtually impossible to talk to—people are saying, let us just not do anything. Any suggestions on how you present this to people who want to and feel compelled to do something?

Mr. GRANT. I have a modest suggestion speaking as a non-politician. I would suggest, as an interim step before the promulgation of a new gold standard, let us say as an interim step to that, I would suggest to the Congress, respectively, that the Congress admonishes the Federal Reserve to speak in plain language, in plain English. For example, “quantitative easing” should be called money printing. “Quantitative easing” should not be allowed in the official discourse.

Similarly, the chairman used the phrase “portfolio balance channel” to convey the Fed's intentions to manipulate stock prices higher. In place of “portfolio balanced channel,” I would suggest the Congress admonish the Fed to use the term “thimble rigging,” an ancient Wall Street term, or a little more clinically, “manipulation.” So if we talk about money printing and manipulation, the public will understand what is afoot. These three-dollar words signify nothing, and I think that Congress should outlaw them.

Mr. LEHRMAN. I wish not to assail the motives of any man. But I would say, directly, in answer to your question, Dr. Paul, that it is

not, I think, correct to blame or to assign motives to those who are manipulating the monetary system. We live in America, in a world of institutions that were created over time and created a set of facts and circumstances in which men and women find themselves operating.

The academics believe that the Federal Reserve System should be a form of the GOSS plan; it should be sort of general manager of the national economy if not the world economy. But they have been trained to think that way. In the economics department of almost every graduate school, this is the way they are trained to think. They are either neo-Keynesians or they are members of, if you will permit me to say it, the discredit moniterus school.

So that it is sufficient to say that the system is flawed, it is imperfect that the Federal Reserve manipulates interest rates as well as the money supply. That foreign officials, the governments are financing the Treasury, creating inflation, without attributing base motives to the individuals who are operating in a set of institutions which were bequeathed to them sort of by chance or by historical developments rather than by any satanic design.

Mr. SALERNO. From an academic perspective, Keynesian economics and even the moniterus have no place for bubbles in their theories. They deal with the effect of the money supply on current production and employment, and so on. So that when Chairman Greenspan made a statement that—in the early part of the last decade, there is no bubble, you wouldn't know if there was one and if there was one we wouldn't do anything about it because it would cause recession.

Most macroeconomists agreed with him. Now, that is starting to change and they are starting to cast around for some sort of an explanation of bubbles. But what they have seized on now is irrationalities in the markets which certainly from the off stream perspective, it is not true. What we look at is the manipulation of the interest rate by the Fed, there is a ready explanation for the creation of bubbles.

Chairman PAUL. I had a Federal Reserve Board Chairman testify before the committee that the gold standard had some merits but it was unnecessary because central bankers have now learned how to manage a Fiat currency in a manner in which it would mimic the gold standard. Would anybody care to comment about where the flaw is in that thinking?

Mr. LEHRMAN. I am anxious to comment on that, Dr. Paul. Under—and I must say Mr. Greenspan made the same insipid remark. Mr. Greenspan and Mr. Bernanke will have to then explain why it was that two of the greatest booms in American history, and

two of the greatest panics and busts in American financial history, occurred under their 25-year watch.

We have the just unparalleled boom in the U.S. equity market focused on the Internet stocks of the late 1990s and a collapse under Mr. Greenspan's tutelage of not only the stock market but a fall in the economy and a rise in unemployment. This is not what Mr. Greenspan, I think, believes would be the characteristics of an economy regulated with a stable price level, under the gold standard.

And equally, Mr. Bernanke himself, who was the Vice Chairman of the Fed under Mr. Greenspan, would have to explain the near catastrophic boom generated by the Federal Reserve in the real estate market in the United States among other markets. The great panic and the bust which have then led to Mr. Grant's quantitative easing one, two and—

Mr. GRANT. Money printing.

Mr. LEHRMAN. —money printing, one, two, one and two. So that this is just an—it is incredible that a responsible academic economist from Princeton or one preceding him, from NYU, could have the temerity to suggest.

All of their 25 years presiding over the U.S. monetary system is a witness to the contrary.

Mr. GRANT. I would say something a little bit different, and I would echo Mr. Lehrman's earlier observation that gold standard is the least imperfect system, but it is not people-proof. Long before the Federal Reserve was conceived, let alone enacted, we saw plenty of booms and busts. We got rich we got poor, there was a terrific boom in Great Plains farm land in the 1880s, Moody's hadn't even been invented.

For a really fouled-up economy, you don't need anything except people; that goes without saying. But what the gold standard did was to introduce an element of reciprocal movement in money from one country to the next, in one country that participated in the gold standard to the next.

So I think the telltale feature of our present day landscape that shows you how far we have come from the gold standard is the existence of the 3 trillion and counting dollar bills on the balance sheets of our mercantilist counterparts, counterparties, in Asia.

That never happened, it couldn't have happened in the gold standard because creditors and debtors exchanged cash to clear trades.

The failure of AIG is so instructive in this respect. AIG, this immense insurance company with this ever so brilliant financial prod-

ucts group, didn't do one thing. It didn't mark its positions to market. Finally came the day of judgment and it argued with Goldman Sachs about what these things were worth, AIG said 100 cents on the dollar, Goldman Sachs said not close, Goldman Sachs won that debate and AIG failed.

As with AIG and Goldman Sachs, so it is today with the United States and its Asian trading partners. We never clear our trades. Our dollars go there, and they come right back here. We run 25 consecutive years of debts on a current account and there will be for us, as there was for AIG, a moment in truth in which we must settle.

Mr. SALERNO. I just want to add that the statement that you quoted by the Fed Chairman shows a complete innocence of any familiarity with the history of monopolies. The Federal Reserve has a legal monopoly of printing money. In history, every monopolist that has been granted a legal monopoly has used it.

Now, they could use it for motives they believe are altruistic. You can use it to cure unemployment or think you can use it for that. Or to keep interest rates low. But the point is, even if Mother Teresa was reincarnated and was given this monopoly, she would use it to print money to feed poor people, but the effects would be exactly the same: bubbles; manipulated interest rates; and inflation.

Mr. LEHRMAN. I want to demur. I think Mother Teresa would be a sound money lady.

Chairman PAUL. I want to thank our very excellent panel for participating in this very important hearing.

I have a couple of announcements before we adjourn. Without objection, all members' opening statements will be made a part of the record. The Chair notes that some members may have additional questions for these witnesses which they may wish to submit in writing. Without objection, the hearing record will remain open for 30 days for members to submit written questions to these witnesses and to place their responses in the record.

This hearing is adjourned.

{Whereupon, at 11:55 a.m., the hearing was adjourned.}

STATEMENTS

STATEMENT FOR THE RECORD
HON. RON PAUL
REPRESENTATIVE, 14TH DISTRICT OF TX
CHAIRMAN, SUBCOMMITTEE ON
DOMESTIC MONETARY POLICY & TECHNOLOGY
U.S. HOUSE OF REPRESENTATIVES

There is perhaps no topic as important to the average American today as rising prices. Whether we consider food, gasoline, or clothing, the cost of living is increasing significantly. At a time of high unemployment, rising prices trap American families between a rock and a hard place. While rising prices colloquially are referred to as “inflation”, true inflation is defined as an increase in the money supply, and all other things being equal, an increase in the money supply leads to a rise in prices. Inflation is and always has been throughout history a monetary phenomenon, and its destructive effects have ruined societies from the Roman Empire to Weimar Germany to modern-day Zimbabwe.

Blame for the most recent round of price increases has been laid at the feet of the Federal Reserve's program of quantitative easing, and rightly so in my opinion. This program, known as QE2, sought to purchase a total of \$900 billion in US Treasury debt over a period of 8 months. Roughly \$110 billion of newly created money is flooding into markets each month, markets which still have not fully recovered from the financial crisis of the last few years. Banks still hold billions of dollars in underperforming mortgage-backed securities on their books, securities which would render numerous major banks insolvent if they were “marked to market.” These nervous banks are hesitant to loan out further money, instead holding well over a

trillion dollars on reserve with the Fed. Is it any wonder, then, that the Fed's new hot money is flowing into commodity markets?

The price of cotton is up more than 170% over the past year, oil is up over 40%, and many categories of food staples are seeing double-digit price growth. This means that food, clothing, and gasoline will become increasingly expensive over the coming year. American families, many of whom already live paycheck to paycheck, increasingly will be forced by these rising prices into unwilling tradeoffs. Rising prices lead to consumers purchasing ground beef rather than steak, drinking water rather than milk, and choosing canned vegetables over fresh. Clothes are worn until they are threadbare, in order to conserve money that keeps food on the table and pays the heating bill. While some might argue that this new frugality is a good thing, frugality is virtuous only when it results from free choice, not when it is forced upon the citizenry by the Fed's ruinous monetary policy.

While the Fed takes credit for the increase in the stock markets, it claims no responsibility for the increases in food and commodity prices. Even most economists fail to understand that inflation is at root a monetary phenomenon. As the supply of money increases, more money chases the same amount of goods, and prices rise. There may be other factors that contribute to price rises, such as famine, flooding, or global unrest, but these effects on prices are always short-term, not long-term. Consistently citing rising demand, bad weather, or energy supply uncertainty while never acknowledging the effects of monetary policy is a cop-out. Governments throughout history have sought to blame price increases on bad weather, speculators, and a whole host of other factors, rather than acknowledging the effects of their inflationary monetary policies. Indeed, tyrants of many stripes have debased their nations' currencies while denying responsibility for the suffering that results.

The unelected policymakers at the Fed are also the last to feel the effects of inflation, in fact, they benefit from it, as does the government as a whole. Inflation results in a rise in prices, but those who receive this new money first, such as government employees, contractors, and bankers are able to use it before prices begin to increase, while those further down the totem pole suffer price increases before they see any of this new money. By reducing the purchasing power of the dollar, the Fed's monetary policy also harms savers, encouraging reckless indebtedness and a more present-oriented pattern of consumption. Hard work and thrift are punished, so economic actors naturally respond by spending more, borrowing

more, and saving less. After all, why save rapidly depreciating dollars?

We must also remember that those policymakers who exercise the most power over the economy are also the least likely to understand the effects of their policies. Chairman Bernanke and other members of the Federal Open Market Committee were convinced in mid-2008 that the economy would rebound and continue to grow through 2009, even though it was clear to many observers that we were in the midst of a severe economic crisis. Chairman Greenspan before him was known for downplaying the importance of the growing housing bubble, even while it was reaching its zenith. It remains impossible for even the brilliant minds at the Fed to achieve both the depth and breadth of knowledge necessary to enable centralized economic planning. As Friedrich von Hayek stated in his Nobel Prize address:

The recognition of the insuperable limits to his knowledge ought indeed to teach the student of society a lesson of humility which should guard him against becoming an accomplice in men's fatal striving to control society - a striving which makes him not only a tyrant over his fellows, but which may well make him the destroyer of a civilization which no brain has designed but which has grown from the free efforts of millions of individuals.

WITNESS TESTIMONY

WRITTEN TESTIMONY OF LEWIS E. LEHRMAN SENIOR PARTNER L.E. LEHRMAN AND COMPANY

I. Monetary policy, the Federal Reserve, the Budget Deficit, and Inflation

Since the expansive Federal Reserve program of Quantitative Easing began in late 2008, oil prices have almost tripled, gasoline prices have almost doubled. Basic world food prices, such as sugar, corn, soybean, and wheat, have almost doubled. Commodity and equity inflation, financed in part by the Fed's flood of excess dollars going abroad, has profound effects on the emerging markets. But in many emerging countries, food and fuel make up 25-50% of disposable income. Families in these countries can go from subsistence to starvation during such a Fed-fueled commodity boom.

The Fed credit expansion, from late 2008 through March 2011 -- creating almost two trillion new dollars on the Fed balance sheet -- triggered the commodity and stock boom, because the new credit could not at first be fully absorbed by the U.S. economy in recession. Indeed, Chairman Bernanke recently wrote that Quantitative Easing aimed to inflate U.S. equities and bonds directly, thus commodities indirectly. But some of the excess dollars sought foreign markets, causing a fall in the dollar on foreign exchanges. With Quantitative Easing the Fed seems to aim at depreciating the dollar. In foreign countries, such as China, financial authorities frantically purchase the depreciating dollars, adding to their official reserves, issuing in exchange their undervalued currencies. The new money is promptly

put to work creating speculative bull markets and booming economies.

The emerging market equity and economic boom of 2009 and 2010 was the counterpart of sluggish growth in the U.S. economy during the same period. But the years 2011 and 2012 will witness a Fed-fueled economic expansion in the United States. Growth for 2011, in the United States, will, I believe, be above the new consensus of 3.5% -- unless there is an oil spike, combined with even greater catastrophe in Japan. The Consumer Price Index (CPI) will be suppressed because unemployment keeps wage rates from rising rapidly; the underutilization of industrial capacity keeps finished prices from rising rapidly. Inflation has shown up first in commodity and stock rises.

For Congress the irony could be that euphoria -- always caused by renewed, gradual inflation -- may set in once again, disarming potential budget and monetary reforms.

But commodity and stock inflation inevitably engenders social effects, not only financial effects. Inflationary monetary and fiscal policies have been a primary cause of the increasing inequality of wealth in American society. Bankers and speculators have been, and still are, the first in line, along with the Treasury, to get the zero interest credit of the Fed. They were also the first to get bailed out. Then, with new money, the banks financed stocks, bonds, and commodities, anticipating, as in the past, a Fed-created boom. The near zero interest rates of the Fed continue to subsidize the large banks and their speculator clients. A nimble financial class, in possession of cheap credit is able, at the same time, to enrich themselves, and to protect their wealth against inflation.

But middle income professionals and workers, on salaries and wages, and those on fixed income and pensions, are impoverished by the very same inflation that subsidizes speculators and bankers. Those on fixed incomes earn little, or negative returns, on their savings. Thus, they save less. New investment then depends increasingly on bank debt, leverage, and speculation. Unequal access to Fed credit was everywhere apparent during the government bailout of favored brokers and bankers in 2008 and 2009, while millions of not so nimble citizens were forced to the wall, and then into bankruptcy. This ugly chapter is only the most recent chapter in the book of sixty years of financial disorder.

Inequality of wealth and privilege in American society is intensified by the Fed-induced inflationary process. The subsidized banking and financial community, combined with an overvalued

dollar -- underwritten by China -- have also submerged the manufacturing sector, dependent as it is on goods traded in a competitive world market. In a word, the government deficit and the Federal Reserve work hand in hand, perhaps unintentionally, to undermine the essential equity and comity necessary in a constitutional republic. Equal opportunity and the harmony of the American community cannot survive perennial inflation.

If the defect is inflation and an unstable dollar, what is the remedy?

A dollar convertible to gold would provide the necessary Federal Reserve discipline to secure the long term value of middle income savings, to backstop the drive for a balanced budget. The gold standard would terminate the world dollar standard, by prohibiting official dollar reserves, and the special access of the government and the financial class to limitless cheap Fed and foreign credit.

The world trading community would benefit from such a common currency -- a non-national, neutral, monetary standard -- that cannot be manipulated and created at will by the government of any one country. Thus, dollar convertibility to gold must be restored. But dollar convertibility to gold must also become a cooperative project of the major powers. Gold, the historic common currency of civilization, was during the Industrial Revolution and until recent times, the indispensable guarantor of stable purchasing power, necessary for both long-term savings and long-term investment, not to mention its utility for preserving the long-term purchasing power of working people and pensioners. The gold standard puts control of the supply of money into the hands of the American people, as it should in a constitutional republic. Because excess creation of credit and paper money can be redeemed by the people for gold at the fixed statutory price, the monetary authorities are thus required to limit the creation of new credit in order to preserve the legally guaranteed value of the currency. As President Reagan said: "Trust the people."

To accomplish this monetary reform, the U.S. can lead, first, by announcing future convertibility, on a date certain, of the U.S. dollar, the dollar itself to be defined in statute as a weight unit of gold, as the Constitution suggests; second, by convening a new Bretton Woods conference to establish mutual gold convertibility of the currencies of the major powers -- at a level which would not pressure nominal wages; third to prohibit by treaty the use of any currency but gold as official reserves.

A Century of Decline in the Dollar's Value

March 15, 1910
One ounce gold = \$20.00

March 15, 2011
One ounce gold = \$1,396.60

Figure 3

A dollar as good as gold is the way out. It is the way to restore American savings and competitiveness. It is the way to restore economic growth and full employment without inflation. Gold convertibility is the way to restore America's financial self-respect, and to regain its needful role as the equitable leader of the world

II. The Monetary Problem and its Solution in Historical Perspective

As a soldier of France, no one knew better than Professor Jacques Rueff, the famous French central banker and economist, that World War I had brought to an end the preeminence of the classical European states system; that it had decimated the flower of European youth; that it had destroyed the European continent's industrial primacy. No less ominously, on the eve of the Great War, the gold standard -- the gyroscope of the Industrial Revolution, the proven guarantor of one hundred years of price stability, the common currency of the world trading system -- the monetary standard of commercial civilization -- was suspended by the belligerents.

The Age of Inflation was upon us.

The overthrow of the historic gold standard, led, during the next decade, to the great inflations in France, Germany, and Russia. The ensuing inflationary convulsions of the social order, the rise of the speculator class, the obliteration of the savings of the laboring and middle classes led directly to the rise of Bolshevism, Fascism, and Nazism -- linked, as they were, to floating European currencies, perennial budgetary and balance of payments deficits, central bank money printing, currency wars and the neo-mercantilism they engendered.

Today, one observes -- at home and abroad -- the fluctuations of the floating dollar, the unpredictable effects of its variations, the new mercantilism it has engendered, and the abject failure to rehabilitate the dollar's declining reputation. Strange it is that an unhinged token, the paper dollar, is now the monetary standard of the most scientifically advanced global economy the world has ever known.

The insidious destruction of the historic gold dollar -- born with the American republic -- got underway gradually, in the 1920s, during the inter-war experiment with the gold-exchange standard and the dollar's new official reserve currency role. It must be remembered that World War I had caused the price level almost to double. But after the war, Britain and America tried to maintain the pre-war dollar-gold, sterling-gold parities. Designed at the Genoa Convention of 1922, the official reserve currency roles of the

convertible pound and dollar collapsed after 1929 in the Great Depression -- a collapse which helped to cause and to intensify the worldwide deflation and depression. Then, Franklin Roosevelt in 1934 reduced the value of the dollar by raising the price of gold from \$20 to \$35 per ounce.

But it must be emphasized that it was in 1922, at the little known but pivotal Monetary Conference of Genoa, that the unstable gold-exchange standard had been officially embraced by the academic and political elites of Europe. It was here that the dollar and the pound were confirmed as official reserve currencies to supplement what was said to be a scarcity of gold. But there was no true scarcity, only overvalued currencies after World War I. Professor Rueff warned in the 1920s of the dangers of this flawed gold-exchange system designed "to economize gold." He predicted again in 1960-61 that the Bretton Woods system, a post-World War II gold-exchange standard, flawed as it was by the same official reserve currency contagion of the 1920s, would soon groan under the flood weight of excess American dollars going abroad. Rueff in the 1950s and 1960s forecast permanent U.S. balance of payments deficits and the tendency to constant budget deficits, and ultimately the suspension of dollar convertibility to gold. His prescience was borne out by the facts.

After World War II, Professor Rueff saw that because the United States was the undisputed hegemonic military and economic power of the free world, foreign governments and central banks, in exchange for these military services and other subsidies rendered, would for a while continue to purchase, (sometimes to protect their export industries,) excess dollars on the foreign exchanges against the creation of their own monies. But these foreign official dollars, originating in the U.S. balance of payments and budget deficits, were then redeposited by foreign governments in the New York dollar market which led to inflation and excess consumption in the United States. This same process engendered inflation in its European and Asian protectorates which purchased excess dollars against the issuance of their own currencies. In a word, official reserve currencies jam the indispensable, international settlements and adjustment mechanism. Moreover, these purchases of dollars by foreign central banks have the simultaneous effect of creating inflation in these foreign countries and undervaluing their currencies relative to the dollar. Incipient mercantilism was only one pernicious result of the dollar's overvalued, official reserve currency status. The decline of the great U.S. manufacturing center was another.

Incredibly, during this same period of the 1960s, the International Monetary Fund authorities had the audacity to advocate the creation of Special Drawing Rights (SDRs), so-called “paper gold,” invented, as International Monetary Fund officials said, to avoid a “potential liquidity shortage.” At that very moment, the world was awash in dollars, in the midst of perennial dollar and exchange rate crises. Professor Rueff remarked that the fabrication of these SDRs by the International Monetary Fund would be “irrigation plans implemented during the flood.”

The post-World War II gold-exchange standard (Bretton Woods) came to an end on the Ides of March, in 1968, when President Johnson suspended the London Gold Pool. After a few more crippled years, Bretton Woods expired on August 15, 1971. The truth is that Monetarists and Keynesians sought not to reform Bretton Woods, as the true gold standard reform of Jacques Rueff intended, but rather to demolish it. The true gold standard had become passé among the intellectual, economic, and political elites because of their confusion over the difference between the gold standard and the gold-exchange standard -- the collapse of the latter, *not* the former -- having intensified the depression. I shall give you just one example of the obtuseness of the political class of the 1960s and 1970s, which happened at the height of one major dollar crisis. A friend of Professor Rueff, the American banker and policy intellectual, Henry Reuss, Chairman of the Banking and Currency Committee of the United States House of Representatives, went so far as to predict, with great confidence and even greater fanfare, that when gold was demonetized, it would fall from \$35 to \$6 per ounce. (I am not sure whether Congressman Reuss ever covered his short at \$800 per ounce in 1980.)

President Nixon, a self-described conservative, succeeded President Johnson and was gradually converted to Keynesian economics by so-called conservative academic advisers, led by Professor Herbert Stein. Mr. Nixon had also absorbed some of the teachings of the Monetarist School from his friend Milton Friedman -- who embraced the expediency of floating exchange rates and central bank manipulation and the targeting of the money stock to create a stable inflation rate. Thus, it was no accident that the exchange rate crises continued because the underlying cause, inflation, continued. On August 15, 1971, after one more violent dollar crisis, Nixon defaulted at the gold window of the western world, declaring that “we are all Keynesians now.” In 1972, Nixon, a Republican, a so-called free market President, imposed the first peacetime wage and price

controls in American history -- encouraged by some of the famous "conservative" advisers of the era.

In President Nixon's decision of August 1971, the last vestige of dollar convertibility to gold, the final trace of an international common currency, binding together the civilized trading nations of the West, had been unilaterally abrogated by the military leader of the free world.

Ten years later at the peak of a double digit inflation crisis, the gold price touched \$850. At the time, Paul Volcker, Chairman of the Federal Reserve declared that the gold market was going its own way and had little to do with the Fed's monetary policies. Volcker then engineered a draconian credit contraction leading to near 11% unemployment and a decline in inflation. At that time, Professor Wallich declared that the gold market is but "a side show." Secretary of the Treasury William Miller, and a short-lived Fed Chairman, who had been selling United States gold at about \$200 in 1978, announced solemnly that the Treasury would now no longer sell American gold. Presumably Secretary Miller, an aerospace executive, meant that whereas, more than one-half the vast American gold stock had been a clever sale, liquidated at prices ranging between \$35 and \$250 per ounce -- now, in the manner of the trend follower, Secretary of the Treasury Miller earnestly suggested that gold was a "strong hold" at \$800 per ounce.

On January 18, 1980, Fed Governor Henry Wallich, a former Yale Economics professor, explained Federal Reserve monetarist policies in an article appearing in the *Journal of Commerce*:

"The core of Federal Reserve...measures," basing "control upon the supply of bank reserves," he said, "gives the Federal Reserve a firmer grip on the growth of monetary aggregates..."

As subsequent events showed, the Federal Reserve promptly lost control of the monetary aggregates. The bank prime rate rose to 21%, inflation to double digits.

Professor Rueff's experience as a central banker had taught him from hard experience what his five volumes of monetary theory and econometrics demonstrated. That is, no central bank, not even the mighty Federal Reserve, can determine the quantity of bank reserves or the quantity of money in circulation -- all conceits to the contrary notwithstanding. The central bank may influence indirectly the money stock; but the central bank cannot determine its amount. In a free society, only the money users -- consumers and producers in the market -- will determine the money they desire to hold. In a reasonably free society, it is consumers and producers in the market who desire and decide to hold cash balances, and also to change the

currency and bank deposits they wish to keep; it is central banks and commercial banks which can supply them.

During the past forty years, the important links between central bank policies, the rate of inflation, and the variations in the money stock have caused much debate among the experts. It is still generally thought by neo-Keynesian, and some monetarist economists and central bankers, that the quantity of money in circulation, and economic growth, and the rate of inflation can be directly coordinated by central bank credit policy. May I now firmly say that, to the best of my knowledge, no one who believes this hypothesis, and, as an investor, has systemically acted on it in the market, is any longer solvent. But I do confess, that the neo-Keynesian and monetarist quantity theories of money still hang on -- even if its practitioners in the market cannot. In the end neo-Keynesian and monetarist economists at the Federal Reserve were ultimately required to accommodate to a reality in which, for example, during 1978, the quantity of money in Switzerland grew approximately 30% while the price level rose only 1%. The quantity of money, M-1, grew in 1979 about 5% in the United States while the inflation rate rose 13%. The Fed learned that the CPI inflation rate cannot be precisely associated with the quantity of money in circulation.

If then, a central bank cannot determine the quantity of money in circulation, what, in Rueffian monetary policy, can a central bank realistically do? To conduct operations of the central bank, there must be a target. If the target is both price stability and the quantity of money in circulation, one must know, among other things, not only the magnitude of the desired supply of money, but also the precise volume of the future demand for money in the market -- such that the twain shall meet. It is true that commercial banks supply cash balances, but individuals and businesses -- the users of money -- generate the decisions to hold and spend these cash balances. Thus, the Federal Reserve must have providential omniscience to calculate correctly, on a daily or weekly basis, the total demand for money -- assuming the Fed could gather totally reliable statistical information -- which it cannot; and even if the Fed's definitions of the monetary aggregates were constant -- which they are not.

Jacques Rueff, himself the Deputy Governor of the Bank of France, clarified this fundamental problem in the form of an axiom: Because the money stock cannot be determined by the Federal Reserve Bank, nor can it determine a constant rate of inflation, the monetary policy of the central bank must not be to target the money supply or the rate of inflation. The Federal Reserve Bank simply

cannot determine accurately the manifold decisions of the public to hold money, for individual and corporate purposes, in order to make necessary payments and to carry precautionary balances. Therefore, the leaders of the European central bank and the Federal Reserve System, all central banks cannot and should not try to determine the quantity of money in circulation.

But, if the true goal of the central bank were long run stability of the general price level, the operating target of monetary policy at the central bank must be simply to influence the supply of cash balances in the market, such that they tend to equal the level of desired cash balances in the market. To attain this goal, the central bank must abandon open market operations and simply hold the discount rate, or the rediscount rate, above the market rate -- when, for example, the price level is rising -- providing money and credit only at an interest rate which is not an incentive to create new credit and money. Indeed, if the target of monetary policy is long run price stability, the central bank must supply bank reserves and currency only in the amount which is approximately equal to the desire to hold them in the market. For if the supply of cash balances is approximately equal to the desire to hold them, the price level must tend toward stability. If there are no excess cash balances, there can be no excess demand, and, thus, there can be no sustained inflation. There also can be no sustained deflation, caused by scarcity of cash balances, because the target of monetary policy is a stable price level and, in these circumstances, the central bank supplies the desired cash balances.

An effective central bank policy, therefore, must reject open market operations. Professor Rueff shows further that, in order to rule out inflation, and unlimited government spending, the government treasury must be required by law to finance its cash needs in the market for savings, away from the banks. That is, a government treasury, in deficit, must be denied the privilege of access to new money and credit at the central bank and commercial banks, in order also to deny the government the pernicious privilege of making a demand in the market without making a supply -- the ultimate cause of inflation. That is, since the Federal Reserve creates new money and credit to finance the Treasury deficit, but the Treasury creates no new goods and services, total money demand will exceed supply at prevailing prices. Prices must rise. At first, commodity and equity prices advance. Then the general price level rises gradually. This exorbitant U.S. government financing privilege, a function of total Fed discretion and of the dollar's reserve currency

status, is a necessary cause of the balance of payments deficit and persistent inflation. It is also a fundamental cause of unlimited budget deficits and bloated big government. So long as new bank credit is available to the government, so long will the budget deficit persist and grow.

One can see that the monetary theory and policy of Jacques Rueff finally does come to grips with, indeed it modifies, the famous Law of Markets of Jean Baptiste Say, building of course on Say's insights, but perfecting the flawed Quantity Theory of Money. Jacques Rueff reformulated the quantity theory of money, definitively, in the following proposition: aggregate demand is equal to the value of aggregate supply, augmented (+/-) by the difference between the variations, during the same market period, in the quantity of money in circulation and the aggregate cash balances desired. This is a central theorem of Rueffian monetary economics. Rueff demonstrated that Say's law does work, namely, that supply tends to equal demand, provided, however, that the market for cash balances must tend toward equilibrium. Any monetary system, any central bank, which does not reinforce this tendency toward equilibrium in the market for cash balances destroys the first law of stable markets, namely, overall balance between supply and demand -- a necessary condition for limiting inflation and deflation.

It is conventional wisdom that Milton Friedman and the Monetarists try to regulate the growth of the total quantity of money and inflation through a so-called money stock rule designed to constrain the central bank monopoly over the currency issue. In practice, the Federal Reserve has failed, and will fail, to succeed with such a flawed, academic, and impractical rule. Professor Friedman, himself, humbly admitted failure in a remarkable 2003 interview. The much simpler, more reliable, market-biased technique -- proven in the laboratory of history -- as Professor Rueff demonstrated, would be to make the value of a unit of money equal to a weight unit of gold, in order to regulate, according to market rules, the same central bank monopoly. But academics have argued for a century that a monetary "regulator," such as gold money, absorbs too much real resources -- by virtue of the process of gold production -- and is therefore, in economic terms, too costly.

Whatever the minor incremental mining cost of a gold-convertible currency, it is a superior currency stabilizer, as history shows. The empirical data also show that it is a more efficient regulator of price stability in the long run. The gold standard was no mere symbol. It was an elegantly designed monetary mechanism -- carefully

orchestrated over centuries by wise men of great purpose -- who developed convertibility into a supple and subtle set of integrated financial and credit institutions organized to facilitate rapid growth, quality job creation, a stable price level, above all, social stability amidst free economic institutions. Thus did the free price mechanism and the international gold standard become the balance wheel of rapid economic growth during the long-lasting Industrial Revolution. Who can deny that two generations of floating exchange rates, pegged undervalued currencies like the Chinese Yuan, and discretionary central banking, have burdened the world with booms, panics, and busts, producing immense inflation and uncertainty costs, much greater than the comparatively modest cost of mining gold?

Therefore, in order to bring about international price stability and long run stability in the global market for cash balances, the dollar and other key currencies must be defined in law as equal to a weight unit of gold -- at a statutory convertibility rate which insures that nominal wage rates do not fall. Indeed, nothing but gold convertibility, without official reserve currencies, will yield a real fiduciary monetary standard for the integrated world economy.

At the end of the first decade of the new millennium, the world requires, a real monetary standard, a common non-national monetary standard, to deal with the monetary disorder of undervalued, pegged, currencies and manipulated floating exchange rates -- the diabolical agents of an invisible, predatory mercantilism. Despite all denials, the currency depreciations of today are, without a doubt, designed to transfer unemployment to one's neighbor and, by means of an undervalued currency, to gain share of market in manufactured, labor intensive, value-added, world traded goods. If these depreciations and undervaluations are sustained, floating exchange rates combined with the twin budget and trade deficits will, at regular intervals, blow up the world trading system. Great booms and busts, inflation and deflation, social instability must ensue.

To head off the mercantilism of present floating exchange rates, and the consequences of exchange rate disorders caused by official dollar reserves, an international monetary conference is indispensable. The present high rates of unemployment and perverse trade effects, associated with floating exchange rates, require an efficient and stable international monetary reform. Not least because floating exchange rates re-price entire national production systems at unpredictable intervals. Such monetary perversity cannot be sustained. A European Monetary Union may be necessary; but it is not sufficient.

Now we see clearly, what before we saw in a glass darkly -- the dollar's official reserve-currency status still gives an exorbitant credit privilege to the United States. Professor Rueff spoke of American "deficits without tears," because the American budget deficit and balance-of-payments deficits were -- they still are -- almost automatically financed by the Federal Reserve and the world-dollar reserve-currency system -- through the voluntary (or coerced) buildup of dollar balances in the official reserves of foreign governments. These official dollar reserves were, and still are, immediately invested by foreign authorities, directly or indirectly, in the dollar market for United States securities, thus giving back to the United States, at subsidized rates, the dollars previously sent abroad as a result of the persistent United States balance-of-payments deficit and budget deficits. This is the subtle mechanism by which excess American domestic consumption and budget deficits are financed. To describe this awesome absurdity, Professor Rueff invoked the metaphor of the King's overworked tailor, yoked permanently to fictitious credit payments by His Majesty's unrequited promissory notes. Despite his purchases, His Majesty's cash balances and euphoria kept rising, blinded as he was to his ultimate, debt-induced insolvency.

There is not sufficient time to dwell on all the intricacies of the superior efficacy of the balance-of-payments adjustment mechanism grounded in domestic and international convertibility to gold. But it can, I think, be shown that, in all cases, currency convertibility to gold, without official reserve currencies, is *the least imperfect monetary mechanism*, both in theory and in practice, by which to rule out currency wars, to maintain global trade and financial balance, a reasonably stable price level, and economic growth -- while ensuring budgetary equilibrium. This proposition has been proven in the only laboratory by which to test monetary theory -- namely, the general history of monetary policy under paper and metallic regimes, and, in particular, the history of the international gold standard. [See Table 1]²⁷

Whereas, by contrast, when one country's currency -- the dollar reserve currency of today -- is used to settle international payments, the international settlement and adjustment mechanism is jammed -- for that country -- and for the world. This is no abstract notion. An example from the past: during the twelve months of 1995, one hundred billion dollars of foreign exchange reserves were accumulated by foreign governments which were directly invested in

[²⁷ The original testimony read: "(See chart in appendix)." That chart has been labeled Table 1.]

U.S. Treasury securities held in custody at the New York Federal Reserve Bank -- thus financing the more modest U.S. current account and U.S. budget deficits of the time. Between March 10, 2010 and March 9, 2011, foreign governments monetized \$415 billion dollars in the form of U.S. securities held in custody at the Fed. This is only a fraction of the \$3.5 trillion of official dollar reserves, held in custody at the Fed, accumulated by March, 2011, over two generations. This accumulation of foreign dollar reserves is a gigantic mortgage on America. It is the infernal mechanism by which the government budget deficit and balance of payments deficits are financed. Along with the Fed, foreign dollar reserves are sufficient today to finance domestic over-consumption in the United States at below market interest rates.

It is essential to understand the nature of this ongoing process of currency degradation -- because the dollar's reserve-currency role in financing the U.S. budget and balance of payments deficits certainly did not end with the breakdown of Bretton Woods in 1971. The perennial and extraordinary U.S. budget and balance of payments deficits still persist because there is, today, no efficient international monetary mechanism to forestall the American deficits. Indeed, Professor Rueff argued that if the official reserve role of the dollar -- i.e., the world dollar standard -- were abolished, and convertibility restored, the immense U.S. budget and current account deficits must end -- a blessing not only for the United States, but for the whole world. This is so because the Fed and the Treasury would be bound by statute and treaty to maintain the gold convertibility of the dollar. It is true that both law and international treaty may be violated, but they do create the only barriers to the license of rogues.

The reality behind the "twin deficits" is simply this: the greater and more permanent the Federal Reserve and foreign reserve facilities for financing the United States budget and trade deficits, the greater will be the twin deficits and the growth of the U.S. Federal government. All congressional, administrative, and statutory attempts to end the United States deficits have proved futile, and will prove futile, until the crucial underlying flaw -- namely the absence of an efficient international settlements and adjustment mechanism -- is remedied by international monetary reform inaugurating a new international gold standard and the prohibition of official reserve currencies.

Broadly speaking, at least three essential steps toward convertibility could be taken by America and other great powers.

- (1) The U.S. president should request the Federal Reserve

System to cooperate with, say, a Group of Ten to stabilize the value of key currencies at levels consistent with balanced international trade among national currency areas. That is to say, exchange rates should be stabilized at approximately their purchasing power parities, based largely upon comparative unit labor costs of standardized world traded goods. To do this, indexes of purchasing power can be agreed upon within the Group of Ten and, thus, an optimum and fair value determined for mutual convertibility of national currencies. But how should the value of the gold monetary standard be determined? The optimum value of the gold parity should reflect a gold price correctly positioned within the hierarchy of all prices; that is, a price proportional to its underlying cost of production. This dollar price of gold, or more properly, the defined gold weight of the monetary standard, must be set above the average of the marginal costs of production of gold mines operating throughout the world. This price would provide for steady output of the gold monetary base (about an average of 1.5% to 2% increase per year over a long run, as centuries of available monetary statistics show). Such a gold price would also prevent any decline in the average level of nominal wages -- avoiding, for example, the British problem of underemployment in the 1920's caused by an overvalued pound. Under existing conditions, during the present market period, I have estimated, based on empirical data, that the optimum convertibility price of gold is not less than \$2,000 per ounce. (March, 2011)

- (2) The President should recommend to the Group of Ten, that convertibility regimes take effect at a fixed date in the future, subsequent to the international monetary conferences and agreements made there, perhaps an interval of three to four years. Gold-convertible currencies should become the monetary standards of Europe, of the United States, of the world, just as the gold standard should become the common money of world trade and finance in Asia and elsewhere.
- (3) To simplify, if the United States government, or any other key country, then creates excess money and credit, under conditions of gold convertibility, it will be forced in a relatively short period to change, because market participants will exchange paper currencies for gold, or gold for paper, to

bring the quantity of money in circulation into balance with the desire of the public to hold these cash balances.

- (4) In a constitutional republic such as the United States the sovereign people should control the supply of money through the limiting mechanism of gold convertibility of the dollar. As President Reagan said, "Trust the people." Moreover, domestic monetary reform in the United States, and elsewhere, would also mean that only gold and domestic, non-government, secured, self-liquidating securities, convertible at maturity to gold, could serve as collateral, or backing for new currency issues such as, for example, Federal Reserve Notes. Standard gold coins, minted according to the statutory standard, should be generally circulated in the market to be held by all working people, so as to guarantee that neither the monetary standard, nor the wages and savings of working people, will be arbitrarily abridged by inflationary governments. Such a regime, among other purposes, eliminates the advantage of nimble speculators over middle income people and those on fixed incomes.
- (5) The new international monetary system would rule out, by enforceable treaty obligations, official reserve currencies which so plagued the entire financial history of the twentieth century and the first decade of the twenty-first. Existing official dollar-reserves could be consolidated and refunded and then gradually amortized over the long term (even to a certain extent refunded through the rise of the official value of gold above the last official revaluation (\$42.22 per ounce). This is not unlike the consolidation plan deployed by the first United States Secretary of the Treasury, Alexander Hamilton, to refund the national and state debts after the revolutionary war.

This was and is the Rueff plan, brought up to date to deal with the exigencies of the present facts and circumstances. May I say, it is an intellectual scandal that such a solution is today regarded as impractical. For if we and our former adversary, Russia, can share capsules in space, why can the United States and its trading partners not agree to restore monetary convertibility, the indispensable condition for stable currencies, world economic growth, and free trade?

By pinning down the future price level by gold convertibility, the immediate effect of international monetary reform will be to end

currency speculation in floating currencies, and terminate the immense costs of inflation hedging. Gold convertibility eliminates the very costly exchange of currencies at the profit-seeking banks. Thus, new savings will be channeled out of financial arbitrage and speculation, into long-term financial markets.

Increased long-term investment and improvements in world productivity will surely follow, as investment capital moves out of unproductive hedges and speculation -- made necessary by floating exchange rates -- seeking new and productive investments, leading to more quality jobs. Naturally, the investment capital available at long term will mushroom, inspired by restored confidence in convertibility, because the long run stability of the price level will be pinned down by gold convertibility -- as history shows to be the case in previous, well-executed monetary reforms of the past two hundred years. Along with increased capital investment will come sustained demand for unemployed labor, at quality wages, to work the new plant and equipment.

The world now awaits a far-seeing leader to carry out the international monetary reform proposed by the great monetary statesman of the twentieth century, Professor Jacques Rueff.

Lewis E. Lehrman

[EXCERPT FROM JOHN D. MUELLER'S

REDEEMING ECONOMICS: REDISCOVERING THE MISSING ELEMENT]²⁸

America needs: A dollar that is, once again, an honest dollar, a dollar as good as gold.

Both American and world history show that only proper monetary reform -- specifically, restoring the international gold standard without official reserve currencies -- will end chronic episodes of inflation (or deflation), U.S. international payments deficits, and endless Federal deficit spending.

A brief monetary history of the United States. The stability of the U.S. dollar has varied widely in its history. This variation is

²⁸ [The excerpt was included as part of Lehrman's testimony with the indentifying footnote: "John D. Mueller, *Redeeming Economics: Rediscovering the Missing Element* (ISI Books, 2010) Table 16-1." -Ed.]

explained by two factors: the monetary standard chosen for the dollar, and whether other countries have simultaneously used securities payable in dollars as their own monetary standard.

The United States has alternated between two kinds of standard money: inconvertible paper money and some precious metal (first silver, then gold). The dollar was an inconvertible paper money during and after the Revolutionary War (1776–92), the War of 1812 (1812–17), the Civil War (1862–79), and again from 1971 to the present. The dollar was effectively defined as a weight of silver in 1792–1812 and 1817–34, and as a weight of gold in 1834–61 and 1879–1971. The dollar was not used by foreign monetary authorities as a monetary reserve asset before 1913, but has been an official “reserve currency” for many since 1913, and for most since 1944.

Applying these two criteria divides the monetary history of the United States into distinct phases. We can compare the stability of these monetary regimes by examining the variation in the Consumer Price Index (as reconstructed back to 1800) by two simple measures: long-term CPI stability (measured by the annual average change from beginning to end of each monetary standard) and short-term CPI volatility (measured by the standard deviation of annual CPI changes during the period). Weighting these criteria equally, the classical gold standard from 1879-1914 was the most stable of all U.S. monetary regimes (as the table below shows).

The first chart shows why ending the dollar’s official reserve currency role would end chronic U.S. payments deficits. In 1980 U.S. residents owned net investments in the rest of the world equal to about 10 percent, but by 2009 had become net debtors equal to about 20 per cent, of U.S. GDP. Meanwhile U.S. net official monetary assets -- official monetary assets minus foreign liabilities -- declined by almost exactly the same amount, while the books of the rest of American residents remained in balance or slight surplus.

This comparison proves that the entire decline in the U.S. net investment position has been due to Federal borrowing from foreign monetary authorities.

As the second chart shows, the same process caused the commodity-led inflations that triggered each of the recessions of 1974-75, 1979-80, 1990-91, and 2007-9. The chart compares the annual rate of inflation of CPI nondurable goods -- mostly food and energy prices -- with a ratio of the main factors affecting them: the lagged “World Dollar Base,” or total supply of “high-powered” dollars, divided by a proxy for the current demand for high-powered dollars:

U.S. currency and commercial bank reserves times current world oil production.

In each case, voters blamed the President: Richard Nixon, Gerald Ford, Jimmy Carter, George H.W. Bush, George W. Bush, or Barack Obama. Thus, any presidential candidate who does not wish to become a by-word must restore the first principle of successful presidential economic policy, by defining the dollar again as a weight of gold and ending by treaty the dollar's role as chief official reserve currency.

U.S. Consumer Price Index, Long-term stability and short-term volatility, By period and monetary system: 1800–2009	Long- run stability (average annual change)	Short-run volatility (standard deviation annual change)	Memo: Maximum price change (High vs. low)	Stability rank (weighing both criteria equally)
1800–1834: Domestic silver standard (interrupted 1812–17 by domestic paper standard)	-1.5%	5.2%	76%	4
1834–1861: Domestic gold standard	-0.4%	3.5%	36%	2
1862–1879: Domestic paper standard	+0.1%	8.8%	74%	3
1879–1914: International gold standard	+0.2%	2.2%	20%	1
1914–1944: Interwar international gold-dollar-sterling standard	+1.9%	7.2%	99%	5
1944–1971: Bretton Woods international gold-dollar standard	+3.1%	3.1%	130%	4
1971–2009: International paper dollar standard (1971–1981 1981–2009)	+4.5% (+8.5%) (+3.1%)	2.8% (+2.7%) (+1.2%)	432% (125%) (137%)	4

WRITTEN TESTIMONY OF
JAMES GRANT
FOUNDER & EDITOR
GRANT'S INTEREST RATE OBSERVER

"What Should the Federal Reserve Do Next?" was the headline over the roundup of expert monetary opinion on the op-ed page of the Sept. 9 *Wall Street Journal*. The experts couldn't seem to agree. Buy Treasurys by the boatload, one counseled. Do nothing of the sort, urged another. Hew fast to the Taylor Rule, John B. Taylor, himself the author of the very rule, modestly proposed (i.e., fix the federal funds rate at one-and-a-half times the inflation rate plus one-half times the shortfall of GDP from potential, plus one). The half-dozen authorities shared not much common ground except to ignore the principles on which the dollar was defined in 1792 and those on which the Federal Reserve was enacted in 1913. The burden of this essay is that they thereby missed the point.

The trouble with living authorities on money and banking is the ideas they absorbed in school. For instance, that a central bank can calibrate the rate of debasement of the currency it prints by adjusting the speed of the digital press. Or that the Federal Open Market Committee can pick the interest rate that will cause the GDP to grow and payrolls to swell and prices to levitate by 2% per annum, give or take a basis point. Such things are impossible.

Say that the Fed built bridges rather than manipulated interest rates, and that, in 2008, its bridges fell down. The world would want to know why. Maybe we aren't engineers, the people would say, but we know a heap of rubble when we see it. And if an inquest determined that the Fed had built its bridges with plywood instead of reinforced concrete--a clever updating of the fusty old operations manual, some bright light on the board staff had determined--even a layman would see that "progress" is sometimes retrogression.

So it is in money and banking. With a little help from our friends, we are about to make the case that there has been no net progress in doctrine and policy since 1914, when the lights went out on the true-blue gold standard. Some will smile. The pure paper dollar, these scoffers say, is but a lighter, sleeker, more intelligent variant on the old, gold-backed model. But you could only issue so many gold-backed dollars, the supply being constrained by the scarcity of the collateral. There now being no check on the volume of issuance, dollars pile up in the vaults of America's creditors. It falls to them to say "uncle,"

and say it they will one day, we are certain. They will then be queuing up to exchange intrinsically worthless paper for tangible value. May the readers of *Grant's* beat them to the punch.

In the theory and practice of interest-rate manipulation, too, we have fallen off the shoulders of giants. Under classical doctrine, developed in England and deemed best practice in this country into the administration of William Howard Taft, commercial banks existed not to "create credit" but to facilitate and liquefy the credit that two parties to a business transaction created when one said to the other, "I'll pay you in 30 days." There was an exquisite economy of motion in the old methods--no central authority deemed it necessary to buy up \$1 trillion or so of public securities or to scoop up every available residential mortgage to stave off disaster in the housing market. Somehow, the economy functioned without econometricians.

Though the Fed's monetary and credit bridges collapsed two years ago, few have demanded a fundamental accounting of the ideas that undergird Chairman Bernanke's \$2.2 trillion balance sheet and inform his interest-rate policy. Maybe it's as simple as the fact that the living authorities don't know, and the dead ones can't talk. Then, again, some of the ancients wrote books. Henry Parker Willis (1874-1937) is one such posthumous expert, and it's him we call on now.

Present at the monetary creation, Willis consulted for the authors of the Federal Reserve Act. He was first secretary of the Federal Reserve Board and right-hand man to Sen. Carter Glass of Virginia, the so-called father of the Fed and co-author of the Glass-Steagall Act of 1933. "The Theory and Practice of Central Banking," published in 1936 and long out of print, was his swan song. Possibly, he died of a broken heart.

The Fed--*his* Fed--had gone off the rails almost as soon as it opened its doors for business in 1914, Willis lamented. The central bank he envisioned was a kind of balance wheel in the engine of the American money market. The Reserve Banks would turn commercial IOUs into cash according to the demands of the season and the cycle, in that fashion making the currency elastic. Critically, the Fed itself would not create credit. It would, rather, liquefy the bills that a vendor would extend to his customer--the self-liquidating kind of commercial credit that allows the economic wheels to turn. In the founders' conception, the Fed would operate passively through the discount window, not actively through open-market operations. That is, it would accommodate the needs of the community, not determine what those needs should be. It would no more intervene to rescue the American residential real estate market than it would to steer the

GDP or manipulate the rate of rise of the core Personal Consumption Expenditures index (as if anyone could reliably calculate it, which Willis doubted).

Alan Greenspan was 10 years old the year Willis published; Ben S. Bernanke was minus 17. Still, the lineaments of the modern command-and-control approach to monetary management were all too much in evidence. The Mark I gold standard had died in World War I, and with it had gone the classical English central banking technique of discounting commercial bills. Discretionary open-market operations--buying and selling government securities in the open market--were the new, new thing. "Central banks. . .," wrote Willis, wagging a finger at the young fellows, "will do wisely to lay aside their inexpert ventures in half-baked monetary theory, meretricious statistical measures of trade, and hasty grinding of the axes of speculative interests with their suggestion that by so doing they are achieving some sort of vague 'stabilization' that will, in the long run, be for the greater good." It may interest Willis's ghost to learn that, although "inflation targeting" became the darling of the monetary-policy intellectuals in the years leading up to the 2008 crisis, the "stability" it thereby seemed to achieve turned out to be singularly unstable.

To the *Journal's* timely question, "What Should the Federal Reserve Do Next?" numerous economists have proposed myriad nostrums. Among the scariest of these brain waves was one proffered last week by the chief economist of Citigroup. Writing in the *Journal's* European edition, Willem Buiter suggested that the Fed explore techniques to impose a federal funds rate of less than zero percent. "To restore monetary policy effectiveness in a lower interest rate environment when confronted with deflationary or contractionary shocks, it is necessary to get rid of the zlb [i.e., zero lower bound, meaning a zero-percent funds rate] completely," Buiter wrote. "This can be done in three ways: abolishing currency, taxing currency and ending the fixed exchange rate between currency and bank reserves with the Fed. All three are unorthodox. The third is unorthodox and innovative. All three are conceptually simple."

Still simpler is the old doctrine that the moderns have pushed aside or never learned in the first place, and to which if the Citigroup front office had adhered, might have spared the bank the indignity of a \$4 stock price. Thus, commanded the ancients: Anchor the dollar to the precious metals, raise liquidity to the top of the list of banking virtues and understand the process by which commercial credit comes into the world (hint: not by bankers' pens). The first of these rules to

live by was, to Willis and his contemporaries, as clear as the law itself. Under the Constitution, the 1792 Coinage Act and the 1900 Gold Standard Act, the dollar was defined as a weight of silver and gold. The verdict of monetary history resoundingly seconded the wisdom of the lawmakers: Paper currencies unbacked by anything except the issuing politicians' good intentions invariably lost their value. Regrettably, that was not the end of the discussion. The economists were busily chipping away at the semiautomatic workings of the pre-1914 gold standard. Better, they contended, a managed system of their own devising. Willis mocked the eggheads: "The 'new era' in central banking theory," he wrote, "may thus be said to have taken form as a view that it was possible for central banks to 'manage' the level of prices and, incidentally, the business situation by issuing more or less currency (or credit). . . ." Hopefully more than analytically, Willis predicted that these demonstrably false notions were on their way out. In fact, they were on their way in.

The idea of liquidity, too, had had a hard time of it in the 1920s. A liquid asset, as Willis and his peers defined it, was a short-dated commercial IOU--a money-good industrial purchase order, for example. Banks had no business owning any asset that did not, upon its maturity, generate a cash payment. Leave bonds, mortgages and other long-lived capital instruments to the savings banks and insurance companies, Willis preached. Commercial banks were put on this earth to facilitate the exchange of goods, not to "create" credit or finance speculation. But in the Harding and Coolidge years, a new theory came to the fore. Banks need not confine themselves to the gospel of so-called real bills, the theorists held. It was not strictly necessary that a banking asset be "liquid" (as defined). All would be well if an asset were "shiftable," i.e., salable in the continually functioning, deep and liquid capital markets of the day. Willis cringed at the heresy but had the sour pleasure of seeing it exploded in the Great Depression. Though bankers and economists had endlessly debated the matter, hard experience finally told the tale: "In this case, as in so many other economic disputes, however," Willis wrote, "the test is furnished not by the usual or 'normal' experience, but is afforded by the action or experience with regard to bank portfolios during special trial or difficulty. Particularly is such a test applied in times of panic followed by depreciation when the security markets suffer most from long-period fluctuations and when unemployment and business derangements give large scope to fluctuation in volume of trade."

Holders of frozen assets in the long, hard financial winter of 2008-09 will warm to the words that followed: "[D]uring the depression following the panic of 1929, banks have lost relatively little through the 'freezing' of their bona-fide commercial paper, while they have suffered heavily through inability to dispose of their long-term capital obligations or from deterioration of such obligations when sold at a sacrifice," Willis recorded. "In a word, recent experience is positively against the acceptance of the doctrine of shiftability in place of that of liquidity as a canon of banking soundness." Reading Willis, one is led to wonder how often the same lesson must be absorbed. Evidently, once a generation.

And, in a panic, what duty did a central bank owe to the institutions that chose shiftability over liquidity? "There is no more reason for violating the canons of conduct of central banking in a time of 'panic' than there is at any other time," Willis answered. "No central bank can, by the mere exercise of its credit-granting power, make something out of nothing, or save other banks from the disastrous consequences of their past policy. When a central bank does so it merely tends to make a bad matter worse."

The story of the evolution of American finance since the publication of "The Theory and Practice of Central Banking" has been the comprehensive rejection of every theory and practice Willis advocated. Commercial banks have seemed to apply themselves to the pursuit of illiquidity while the Federal Reserve has devoted itself to the black arts of central planning. As for the dollar, it is a claim on nothing except the competence of the public servants who somehow failed to anticipate--having so signally helped to cause--the greatest credit calamity of the past 70 years.

"What Should the Federal Reserve Do Next?" Less, we say. Withdraw from the business of macroeconomic management. Acknowledge the essential error of the doctrine of interest-rate manipulation. Confess to the obvious flaws in the paper-currency system. Renounce debasement under the pseudo-scientific name of "quantitative easing."

"What Should We the People Do Next?" is another question. Inflation usually proceeds by stealth--in the 1950s and 1960s, "creeping inflation" was the phrase. There is, however, nothing stealthy about Chairman Bernanke. He could not be more forthright. Inflation is his policy, and money printing, a.k.a. quantitative easing, is his method. Gold is one refuge from this design, though there is safe harbor in cheap stocks and undervalued real estate, too. As for

bonds, they are promises to pay dollars, the definition of which the bondholder entrusts to the man who intends to cheapen them.

David A. Stockman, paid-up subscriber and former director of the Office of Management and Budget, points out that Willis's name does not even appear in the index of Bernanke's "Essays on the Great Depression." Monetarists like the late Milton Friedman brushed aside Willis's quaint (to them) attachment to the doctrine that credit has its origins not with a bank loan officer, but with the businesspeople who anticipate each other's cash in the process of production.

"The ironic point," Stockman observes, "is that H. Parker Willis and the English banking tradition did not believe in macro-management of the aggregate economy. They thought that the free market would take care of itself as long as trade bills were not artificially and precipitously liquidated in a money panic. Stated differently, they thought that the job of the central bank was to liquefy the commercial banking system, not to levitate the GDP. So in embracing the quantity theory of money, Mr. Capitalism and Freedom ["Capitalism and Freedom" was a Friedman best seller] laid the planking for central planning by the Fed. Yes, Friedman said that such macro-management of the aggregate economy should proceed not from discretionary tinkering by the Open Market Committee, but based on a fixed rule. As we can see, his wayward disciple, Professor Bernanke, has done just that. He is running the U.S. economy based on *his* rule."

**WRITTEN TESTIMONY OF
JOSEPH T. SALERNO, Ph.D.**

PROFESSOR OF ECONOMICS
LUBIN SCHOOL OF BUSINESS
PACE UNIVERSITY

Since it began operations in 1914 the Federal Reserve System (“the Fed”) has presided over a relentless decline in the value of the U.S. dollar. Prices increased in 83 of the 97 years of the Fed’s existence. Over the last 60 years, beginning in 1950, prices rose in 58 of them. As a result the cumulative loss of the dollar’s buying power during the Fed’s existence has been staggering. For example, today a consumer pays \$22.13 to purchase a basket of goods comparable to a basket that a consumer in 1913 would have paid \$1.00 for. This means that since 1913 the dollar has lost 95 percent of its purchasing power and that today’s dollar is worth roughly a nickel in terms of the pre-Fed dollar of 1913. The Fed’s performance in safeguarding the value of the dollar has been particularly abysmal since 1971, when President Nixon closed the “gold window” and completely unshackled the Fed from the remaining restraints of the gold standard. Since then the price level has more than quintupled, so that today’s dollar retains only 19 cents of the purchasing power of the 1971 dollar.

Now the view held by Chairman Bernanke and other mainstream macroeconomists is that the Fed was chastened and enlightened by the disastrous consequences of the inflationary monetary policy that it pursued in the 1970s. According to this view the enlightened monetary policy that the Fed began to follow in the 1980s was responsible for the so-called “Great Moderation” from 1984 to 2004. During this period, price inflation was stabilized at moderate levels and the economy grew more steadily while unemployment remained low. But this story conveniently ignores the October stock market crash of 1987, the sudden collapse of the S&L industry in 1989-1990, and the high-tech bubble of the late 1990s that culminated in the stock market collapse and the recession of 2001. But even the claim that inflation remained moderate during this period is dubious when viewed from a longer run perspective. For if we take 1984 as the beginning of the “The Great Moderation,” average consumer prices have more than doubled and the dollar has lost 52 percent of its purchasing power since then. And this is accepting at face value the dubious method of calculating official CPI indexes.

Now, some economists have responded to this criticism of the Fed’s performance by arguing that “money is neutral in the long run.”

Their point is that average wages and salaries, which are the prices of labor services, rise roughly in proportion to inflation *in the long run*. So, if prices are 20 times higher now than they were in 1913, well then so are incomes twenty times higher, and therefore, no one is really worse off in terms of their real standard of living. There are serious problems with this argument but I will mention only one here.

The key point is that prices and wages do not all increase at the same time during inflation. When the Fed initially expands the money supply, not everyone receives a share of the new money immediately. There is no Friedman-Bernanke helicopter that spreads the money evenly throughout the country. New money and credit is always injected into the economy at specific points through bank loans and government purchases and subsidies. Some firms, financial institutions, and households necessarily receive the new money before others in the economy. The money incomes of these groups rise before prices go up, enhancing their ability to purchase real goods and services and increasing their standard of living. As these first recipients of the new money increase spending on investment and consumption, prices begin to rise and inflation sets in. The rest of the entrepreneurs and laborers, who did not initially receive the newly created money, suffer a decline in their living standards because they must pay rising prices for the goods they purchase while their selling prices and wages remain unchanged. Eventually, as the new money works its way through the economy—and this may take months or even years—their product prices and wages finally adjust to the depreciation of the dollar. In the meantime, they suffer an arbitrary and unseen inflation tax that redistributes part of their real income and wealth to those who have privileged access to the new money created by the Fed—for example, subsidized agribusiness, defense contractors, the creditors of financial institutions bailed out by the Fed and so on.

Furthermore, if inflation is a continuous process as it has been in the U.S. since World War Two, then many wage-earners and entrepreneurs find their living standards permanently depressed as their wages and sale prices persistently lag behind the rising prices they must pay. And of course, those living on fixed incomes such as pensions and life insurance annuities suffer a cruel and relentless decline of their living standards that is never reversed.

So, it is indeed true that in the long run inflation results in average wages and other productive incomes rising in rough proportion to average prices. But this statistical correlation conceals

the true devastation wreaked by inflation. The rapid decline of the purchasing power of the dollar, especially since 1971, has involved a massive and surreptitious transfer of real income and wealth from productive laborers, entrepreneurs and investors to those privileged corporations and financial institutions that are the recipients of government largesse and bailouts. Additionally, in orchestrating this inflationary process, the Fed has repeatedly driven the interest rate below its natural market level, misleading investors and entrepreneurs and causing disastrous asset market bubbles, unsustainable business investments and the creation of jobs that are not consistent with consumer preferences. It is the arbitrary manipulation of the interest rate by the Fed that has caused the financial meltdowns and recessions that the U.S. economy has suffered over the last four decades.

One of the arguments in favor of inflation that has recently come into vogue again is that moderate inflation is desirable to prevent the far greater evil of deflation. In the past decade, this view has been promoted by many mainstream economists, most notably former Fed Chairman Greenspan and current Fed chairman Bernanke. But this view is based on a fundamental confusion. It confuses deflation with depression, which are two very different phenomena. Falling prices or deflation is, under most circumstances, absolutely benign and the natural outcome of a prosperous and growing economic. The fear of falling prices is thus a phobia, a “deflation-phobia,” which has no rational basis in economic theory or history.

Let me explain. As technology advances and saving increases in a progressing economy, entrepreneurs and business firms are given the means and the incentive to invest in new methods of production, which in turn enables them to lower their costs and expand their profit margins. In a given market, the natural result is an increase in the supply of the good and more intense competition among its suppliers. Assuming no change in the money supply and continuing technological innovation, this competitive process will drive the production costs and price of the good ever downward. Consumers will benefit from the falling price because their real wages will continually increase as each dollar of income commands an increasing quantity of the good in exchange.

This is not merely abstract theoretical speculation but is precisely the process that occurred in the past four decades with respect to the products of the consumer electronics and high-tech industries, such as hand calculators, video game systems, personal computers, HDTVs, and medical lasers. Thus, for example, a mainframe

computer sold for \$4.7 million in 1970, while today one can purchase a PC that is 20 times faster for less than \$1,000. The first hand calculator was introduced in 1971 and was priced at \$240, which is \$1,400 in terms of today's inflated dollar. By 1980, similar hand calculators were selling for \$10 despite the fact that the 1970s was the most inflationary decade in U.S. history. The first HDTV was introduced in 1990 and sold for \$36,000. When HDTVs began to be sold widely in the United States in 2003 their prices ranged between \$3,000 and \$5000. Today you can purchase one of much higher quality for as little as \$500. In the medical field, the price of Lasik eye surgery dropped from \$4000 per eye in 1998, when it was first approved by the FDA, to as little as \$300 per eye today.

Now no one, not even a Keynesian economist, would claim that the spectacular price deflation in these industries has been a bad thing for the U.S. economy. Indeed the falling prices reflect a greater abundance of goods which enhances the welfare of American consumers. Nor has price deflation in these or other industries diminished profits, production and employment. In fact, their growth has been just as spectacular as decline in the prices of their products and has been caused by it. But if deflation is a benign development for both consumers and businesses in individual markets and industries than why should we fear a fall in the general price level, which of course is nothing but an average of the prices of individual goods? The answer given by theory and history is that a falling price level is the natural outcome of a dynamic market economy operating with a sound money like gold.

Under a gold standard, prices naturally tend to decline as ongoing technological advances and investment in additional capital rapidly improve labor productivity and increase the supplies of consumer goods while the money supply grows very gradually. For instance, throughout the nineteenth century and up until World War I, the heyday of the classical gold standard, a mild deflationary trend prevailed in the U.S. As a result, an American consumer in the year **1913** needed only **\$0.79** to purchase the same basket of goods that required **\$1.00** to purchase in **1800**. In other words, due to the gentle fall in prices during the nineteenth century, a dollar could purchase 27 percent more in terms of goods in 1913 than it could in 1800.

Contrary to our contemporary deflation-phobes, the secular fall in prices under the classical gold standard did not inhibit economic growth in the U.S. In fact deflation coincided with spectacular transformation of the United States from an agrarian economy in 1800 to the greatest industrial power on earth by the eve of World

War One. If we examine the data more closely, we find that the years from 1880 to 1896 included the decade of the most rapid growth in U.S. history. Yet, during this period, prices fell by almost 30 percent, or by 1.75 percent per year, while real income rose by about 85 percent, or roughly 5 percent per year. More generally, a 2004 study of 73 episodes of deflation from sixteen different countries dating back to 1820 indicates that only 8 of the 73 episodes of deflation involved recession or depression. It also indicates that 21 of the 29 depression episodes involved no deflation. The authors of this study, Andrew Atkeson and Patrick J. Kehoe conclude, "In a broader historical context, beyond the Great Depression, the notion that deflation and depression are linked virtually disappears." Even when the Great Depression is included in the data, they find that link between falling prices and negative economic growth is economically insignificant.²⁹

Ironically, while Chairman Bernanke just affirmed again a few days ago that the Fed will persist in its inflationary policy of quantitative easing to ward off the imaginary threat of falling prices, signs of inflation abound. The prices of consumer food staples have risen by 6 percent over the past year, with the prices of beef, bacon, butter and lamb rising by 10 percent or more. The U.N. index of grain export prices has risen by 70 percent in the past year and stands at its highest level in 21 years. Gasoline prices have surged 49 percent in the last six months. According to IMF statistics, commodity prices are up by 33 percent in the past year; metals prices by 40 percent; energy prices by 30 percent; crude oil prices by 31 percent; and commodity industrial inputs by 40 percent.³⁰ As a result of skyrocketing prices of agricultural products such as corn, wheat, soybeans and other crops, the price of farmland in the U.S. has been soaring, particularly in the Midwest where land prices increased at double-digit rates last year and regulators fear that a bubble is forming.

Not only does Chairman Bernanke seem unfazed by these inflationary developments, but, what is more astounding, he appears to welcome the rapid increase in stock prices as evidence that QE2 is working to right the economy. When it became apparent that the Fed's \$600 billion buying program for treasury bonds had failed to reduce long-term interest rates as intended but caused them to rise

²⁹ Andrew Atkeson and Patrick J. Kehoe, "Deflation and Depression: Is There an Empirical Link," *American Economic Review Papers and Proceedings* 94 (May 2004): 99-103.

³⁰ Commodity data is from Index Mundi available at <http://www.indexmundi.com/commodities/>

instead, Mr. Bernanke desperately sought another sign that QE2 was working. While he denied that the Fed was responsible for rapidly rising commodity prices, he credited Fed with re-igniting the stock market boom. Oddly, he seized on the Russell 2000 index of small cap stocks, which has increased 25 percent in the last six months, stating “A stronger economy helps smaller businesses.” In other words, despite the stagnant job creation and sluggish growth of real output, Mr. Bernanke has declared Fed policy a success on the basis of yet another financial asset bubble that threatens again to devastate the global economy. This would be farcical were it not so tragic. But what else can be expected from the leader of an institution whose very rationale is to manipulate interest rates and print money.

U.S. CONSUMER INFLATION: ITS CREATION BY THE FEDERAL RESERVE, ITS CURRENT UNDERESTIMATION BY THE FEDERAL GOVERNMENT

In the near-century since the creation of Federal Reserve in 1913, the U.S. dollar has lost virtually all of its purchasing power, as shown by consistent measurement of consumer price inflation and as reflected in estimates of growth in the broad money supply. Nonetheless, when individuals and businesses have had reasonably accurate information available as to the extent of ongoing inflation—as was the case into the late-1970s—they have been able to take actions to mitigate financial damage to their businesses, income or investment returns.

Starting in the 1980s and 1990s, though, the U.S. government changed inflation-reporting methodologies, so to as to reduce—deliberately and artificially—the level of reported ongoing inflation. Driven by the needs of politicians to reduce federal spending on programs such as Social Security, by stealth, the altered inflation accounting not only reduced government outlays for annual cost of living adjustments tied to government inflation measures, but also misled the investing public as to income and investment returns that

would stay ahead of inflation. These areas are reviewed in this brief missive.

Historical Inflation

Putting the current environment into historical perspective, the accompanying two graphs [Figure 4 & Figure 5] measure the level of consumer prices since 1665 in the American Colonies and later the United States. The first shows what appears to be a fairly stable level of prices up to the founding of the Federal Reserve in 1913 (began activity in 1914) and to Franklin Roosevelt's abandoning of the gold standard in 1933. Then, inflation takes off in a manner not seen in the prior 250 years, and at an exponential rate when viewed using the Shadow Government Statistics (SGS)-Alternate Measure of Consumer Prices in the last several decades. The price levels shown prior to 1913 were constructed by Robert Sahr of Oregon State University. Price levels since 1913 either are Bureau of Labor Statistics (BLS) or SGS-based, as indicated.

The magnitude of the increase in price levels in the last 50 years or so, however, visually masks the inflation volatility of the earlier years. That early volatility becomes evident in the next graph, where the CPI history is plotted using a logarithmic scale. Seeing such detail is a particular benefit of using such a plot, although the full

Figure 4

scope of what is happening may be lost to those not used to thinking log-based. The pattern of the rising CPI level, however, still looks rather frightening even in the modified form. Nonetheless, since inflation ideally is something that is flat over time—not necessarily compounding like the population and related series that grow with it—I do not have any issue with using a non-log scale for the visual impact of what is happening.

Persistent year-to-year inflation (and the related compounding effect) did not take hold until post-Franklin D. Roosevelt. Additionally, the CPI level reflects purchasing power lost over time for those holding dollars, which is cumulative, and which has reached extremes during the last century.

Indicated by the visible detail in the second graph are the regular periods of inflation—usually seen around wars—offset by periods of deflation, up through the Great Depression. Particular inflation spikes can be seen at the time of the American Revolution, the War of 1812, the Civil War, World War I and World War II (which lacked an ensuing, offsetting deflation). As a result, consumer prices at the time of the Fed's founding in 1913 were about the same as they had been in New Amsterdam (today's New York City) in 1665.

Log-Scale Consumer Inflation -- American Colonies/ United States 1665 to 2011, CPI vs. SGS Alternate

Sources: ShadowStats.com, Robert Sahr, BLS

Figure 5

The inflation peaks and the ensuing post-war depressions and deflationary periods, tied to the War of 1812, the Civil War and World War I, show close to 60-year cycles, which is part of the reason some economists and analysts have been expecting a deflationary depression in the current period. There is some reason behind 30- and 60-year financial and business cycles, as the average difference in generations in the United States is 30 years, going back to the 1600s. It seems to take two generations to forget and repeat the mistakes of one's grandparents.

Allowing for minor, average-annual price-level declines in 1949, 1955 and 2009, the United States has not seen a major deflationary period in consumer prices since before World War II. The reason for this is the same as to why there has not been a formal depression since before World War II: the abandonment of the gold standard and recognition by the Federal Reserve of the impact of monetary policy—free of gold-standard system restraints—on the economy.

The gold standard was a system that automatically imposed and maintained monetary discipline. Excesses in one period would be followed by a counterbalancing flight of gold from the system and a resulting contraction in the money supply, economic activity and prices.

Faced with the Great Depression, and unable to stimulate the economy, partially due to the monetary discipline imposed by the gold standard, Franklin Roosevelt used those issues as an excuse to abandon gold and to adopt close to a fully-fiat currency under the auspices of what I call the debt standard, where the government effectively could print and spend whatever money it wanted to create.

Roosevelt's actions were against the backdrop of the banking system being in a state of collapse. The Fed stood by twiddling its thumbs as banks failed and the money supply imploded. A depression collapsed into the Great Depression, with intensified price deflation. Importantly, a sharp decline in broad money supply is a prerequisite to significant goods and services price deflation. Messrs Greenspan and Bernanke are students of the Great Depression period. As did Mr. Greenspan before him, Mr. Bernanke has vowed not to allow a repeat of the 1930s money supply collapse and a resulting severe deflation.

Where the Franklin Roosevelt Administration abandoned the gold standard and its financial discipline for the debt standard, twelve successive administrations have pushed the debt standard to the limits of its viability, as seen now in the continuing threat of systemic collapse. At present, it is the Obama Administration that has to look at abandoning the debt standard (or risk hyperinflation) and starting fresh. Yet, the Administration and many in Congress have taken recent actions showing the lack of political will to address the nation's long-range insolvency, hoping to push off the day of reckoning as far as possible for the economic and systemic solvency crises. They likely do not have that much time.

The effect of the post-Roosevelt policies has been a slow-motion destruction of the U.S. dollar's purchasing power, per the following table, since the gold standard was abandoned in 1933. With the dollar's purchasing power down by 95.7% (based on the CPI-U), by 98.5% (based on the SGS-Alternate) and by 99.7% (based on broad money supply creation) since 1933, equivalent or greater purchasing power loss was seen against the precious metals, down by 98.9% versus gold, and down 98.7% versus silver. That means that holding equivalent assets in the precious metals, since 1933 (in 1933 it became illegal to own gold privately in the United States, but it became legal again in the early 1970s after Nixon closed the gold window; holding silver was legal throughout the full period), more than preserved the purchasing power against the losses from CPI inflation, and fully preserved the purchasing power against the losses from SGS inflation.

Please note in the above table that gold and the Swiss franc were held constant by the gold standard versus coins in 1914 and 1933. The data are from the Federal Reserve Board, the Bureau of Labor Statistics, Kitco, "A Monetary History of the United States 1867-1960" (Milton Friedman and Anna Jacobson Schwartz, 1971), and from ShadowStats.com data and calculations.

Loss of U.S. Dollar Purchasing Power (Through October 2012)³¹

Versus	Since January of			
	1914	1933	1970	2002
Swiss Franc	-81.7%	-81.7%	-77.7%	-44.2%

Table 2

The preceding table [Table 2] shows the loss of purchasing power of the U.S. dollar against various inflation measures, precious metals and the broad money supply.

Consumer Price Index Has Been Reconfigured Since the Early-1980s, So As to Understate Inflation versus Common Experience.

As a direct result of methodological changes made to the consumer price index (CPI) during the last three decades, the CPI no longer measures the impact of consumer inflation as seen in common experience. It presents multiple problems and disservices to the public. Consider:

- The CPI no longer measures the cost of maintaining a constant standard of living.
- The CPI no longer measures full inflation for out-of-pocket expenditure.

³¹ Please note in the above table that gold and the Swiss franc were held constant by the gold standard versus coins in 1914 and 1933. The data are from the Federal Reserve Board, the Bureau of Labor Statistics, Kitco, "A Monetary History of the United States 1867-1960" (Milton Friedman and Anna Jacobson Schwartz, 1971), and from ShadowStats.com data and calculations.

- With the misused cover of academic theory, politicians forced significant underreporting of official inflation, so as to cut annual cost-of-living adjustments to Social Security, etc.
- Use of the CPI to adjust retirement benefits, private income or to set investment goals impairs the ability of retirees, income earners and investors to stay ahead of inflation.
- Understated inflation used in estimating inflation-adjusted growth has created the illusion of economic recovery in reported GDP.

Real-World Experience and Public Perceptions versus Academic Theories and Political Gimmicks.

In 30 years as a private, consulting economist, I have noted a growing gap between government reporting of inflation, as measured by the consumer price index (CPI), and the perceptions of inflation held by the general public. It has been my experience that the general public believes inflation is running well above official reporting, and that the public's perceptions tend to mirror the inflation experience that once was reflected in the government's CPI reporting.

The growing difference in perception versus reality primarily is due to changes made over decades as to how the CPI is calculated and defined by the government. Specifically, changes made to the definition of CPI methodologies in recent decades have reflected theoretical constructs offered by academia that have little relevance to the real-world use of the CPI by the general public. Importantly, these changes generally are not understood by the public.

What the Public Looks for in an Inflation Measure.

Individual use of a CPI measure generally is tied to personal financial decisions or planning, in terms of wage or income growth/adjustment, contract or benefit price adjustments and/or in terms of targeting financial returns that will stay ahead of inflation.

Accordingly, I contend that individuals look to the government's CPI as a measure of the cost of living of maintaining a constant standard of living, as well as measuring that cost of living in terms of out-of-pocket expenses.

While the CPI at one time was the measure desired by the public, government efforts turned the CPI away from measuring the price changes in a fixed-weight basket of goods and services to a quasi-substitution-based basket of goods, which destroyed the concept of the CPI as a measure of the cost of living of maintaining a constant standard of living.

The use of hedonic quality modeling in adjusting the prices of goods and services has destroyed the concept of the CPI as a measure of out-of-pocket expenses.

The Way It Was.

Measurement of consumer inflation traditionally reflected measuring the cost of maintaining a constant standard of living, as measured by a fixed-basket of goods. Maintaining a constant standard of living, however, is a concept not popular in current economic literature, and certainly not within the thinking or the lexicon of the Bureau of Labor Statistics (BLS), the government's statistical agency that estimates and reports on consumer inflation.

The changing costs of maintaining a constant standard of living were measured by pricing out a fixed-basket of goods and services—same components, same weighting—period after period. Whatever the percentage change was in the cost of that basket of goods, that is how much income would have to rise in order for someone to maintain a fixed- or constant-standard of living over the given period. At least it was a reasonably consistent approximation of same.

Tracking changes in the cost of a fixed-basket of goods was the approach to estimating inflation, going back to at least the 1700s (see the opening graph),³² and prior to 1945, the fixed-basket CPI tracked by the U.S. government actually was known as the Cost of Living Index.³³

In the first half of the 20th century, though, the concept of a “constant level of satisfaction” evolved in academia, as a “true cost of living” concept. The general argument was that changing relative

³² Fixler, Dennis, Bureau of Labor Statistics, “The Consumer Price Index: underlying concepts and caveats,” *Monthly Labor Review*, December 1993.

³³ Schmidt, Mary Lynn, Bureau of Labor Statistics, “Comparing market basket changes and the CPI,” 1995.

costs of goods would result in consumer substitution of less-expensive goods for more-expensive goods. Allowing for a substitution of goods within the formerly fixed-basket, the maximization of the “utility” of money held by consumers would allow attainment of “constant level of satisfaction” for the consumer. This type of inflation-measure is more appropriate for the GDP concept—where it is used today—measuring shifting weightings with actual consumption, rather than the fixed weightings needed to assess the costs of maintaining a constant standard of living.

Where the substitution-based approach was viewed as impractical for a consumer price index, the fixed-basket approach remained the preferred inflation measure.³⁴ The academic thinking in this area remains divided, even today.³⁵

The constant-level-of-satisfaction approach was contrary to the concept of measuring the cost of maintaining a constant-standard-of-living. In the extreme current circumstance, where the average household cannot stay ahead of even the official CPI inflation rate, consider that shifting household preferences from more-expensive to less-expensive products is forced by limited income. Maintaining a constant-standard-of-living means being able to consume the same goods in the same quantity, without having to trade-off living quality versus price.

While the average consumer may not be able to maintain his or her current standard of living at the moment, it still is of significant value to know what is needed in income growth to offset the living-standard loss from actual inflation.

The Way the Politicians Wanted It.

In the early-1990s, political Washington moved to change the nature of the CPI. The contention was that the CPI overstated inflation (it did not allow substitution of less-expensive hamburger for more-expensive steak). Both sides of the aisle and the financial

³⁴ Ulmer, Melville T., “On the Theory of Cost of Living Index Numbers,” *Journal of the American Statistical Association*, Vol. 41, No. 236 (December 1946), pp. 530-542.

³⁵ National Research Council, *At What Price? Conceptualizing and Measuring Cost-of-Living and Price Indexes*, (2002).

media touted the benefits of a “more-accurate” CPI, one that would allow the substitution of goods and services.

The plan was to reduce cost of living adjustments for government payments to Social Security recipients, etc. The cuts in reported inflation were an effort to reduce the federal deficit without anyone in Congress having to do the politically impossible: to vote against Social Security. The changes afoot were publicized, albeit under the cover of academic theories. Few in the public paid any attention.

Katharine G. Abraham, then commissioner of the Bureau of Labor Statistics, laid out her recollections in an August 1996 paper:

“Back in the early winter of 1995, Federal Reserve Board Chairman Alan Greenspan testified before the Congress that he thought the CPI substantially overstated the rate of growth in the cost of living. His testimony generated a considerable amount of discussion. Soon afterwards, Speaker of the House Newt Gingrich, at a town meeting in Kennesaw, Georgia, was asked about the CPI and responded by saying, ‘We have a handful of bureaucrats who, all professional economists agree, have an error in their calculations. If they can’t get it right in the next 30 days or so, we zero them out, we transfer the responsibility to either the Federal Reserve or the Treasury and tell them to get it right.’”³⁶

A further comment was noted in a 2008 *San Francisco Chronicle* article, “In the 1990s, for example, Republicans wanted to make changes in calculating inflation along the lines recommended by a special commission, including more use of quality adjustments. By lowering the official inflation rate, such changes promised to reduce the annual cost-of-living adjustments for Social Security and other federal programs.

[Katherine] Abraham, the Clinton bureau [of Labor Statistics] commissioner, remembers sitting in Republican House Speaker Newt Gingrich’s office: “He said to me, If you could see your way clear to doing these things, we might have more money for BLS programs.”³⁷

Federal Reserve Chairman Alan Greenspan and Michael Boskin, the chairman of the Council of Economic Advisors, were very clear as

³⁶ Abraham, Katharine G., Bureau of Labor Statistics, “Statistics Under the Spotlight: Improving the Consumer Price Index: Statement,” Paper presented at a meeting of the American Statistical Association, Chicago, Illinois, August 6, 1996.

³⁷ Zuckerman, Sam, “Government’s economic data misleading, he says,” *San Francisco Chronicle*, May 25, 2008.

to how changing or “correcting” the CPI calculations would help to reduce the deficit. As described at the time by Robert Hershey of the *New York Times*:

Speaker Newt Gingrich, Republican of Georgia, suggested this week that fixing the [CPI] index, with its implications for lower spending [Social Security, etc.] and higher revenue [tax bracket adjustments], would provide maneuvering room for budget negotiators ...

Alan Greenspan, chairman of the Federal Reserve, is among the other Government officials who have spoken optimistically about financial benefits of a more accurate [CPI] index ...

[E]conomists believe one of the most important [CPI upside biases] is when consumers shift their buying patterns in response to changing prices, substituting one product for another. The [CPI] index is based on a fixed market basket of goods and services. But, for example, if the price on an item like steak gets too expensive, consumers may switch to hamburger.³⁸

The Boskin Commission Report, December 4, 1996, actually used steak and chicken for its substitution example. The examples used in arguing for changing the CPI clearly were tied to prices rising and resulting consumer demand shifting to a lower-quality product. Simply put, that was the destruction of the cost-of-maintaining-a-constant-standard-of-living issue and was the primary consideration of those seeking to change the CPI, although other issues would come into play. The drive here was as to get a lower inflation reading, irrespective of whether the data were “more-accurate.”

SUMMARY OF REAL-WORLD NEEDS VERSUS THEORETICAL CONSTRUCTS OF ACADEMIA

Maintaining Constant Standard of Living (Fixed-Basket Inflation) versus Substitution in CPI:

- Since the 1700s consumer inflation has been estimated by measuring price changes in a fixed-weight basket of goods, effectively measuring the cost of living of maintaining a constant standard of living.

³⁸ Hershey, Robert D., Jr., “Panel Sees a Corrected Price Index as Deficit-Cutter,” *New York Times*, September 15, 1995.

- Allowing substitution of lower-priced and lower-quality goods in the basket (i.e. more hamburger when steak prices rise) lowers the reported rate of inflation versus the fixed-basket measure.
- BLS introduced: Geometric weighting—a purely a mathematical gimmick that automatically reduces the weightings of goods rising in price, and vice versa—it has no demonstrated relationship to consumer substitution of goods based on price changes. It was explained as a surrogate for a substitution measure.
- BLS introduced: More frequent re-weightings of the CPI index from every ten years to every two years, which moved the CPI closer to a substitution-based index, but the change was not considered a change in methodology.
- BLS introduced: Ongoing re-weightings of sales outlets (discount/mass-merchandisers versus Main Street shops), also moving closer to a substitution-based index and creating other constant standard of living issues.

Out-of-Pocket Expenses versus Nebulous Quality (Hedonic) Adjustments:

- Traditionally, what a consumer pays out-of-pocket for goods and services reflected adjustments for quality changes that could be directly quantified in a monetary sense.
 - Quality adjustments that can be measured directly in price are legitimate, such as measuring the price differential of an eight-ounce candy bar that is reduced in size to six-ounces but remains priced and packaged in the same sized box as the eight-ounce version.
- BLS expanded quality adjustments to include the concept of “hedonic” quality adjustments, altering the pricing of

goods and services for nebulous quality changes that could not be priced directly and that often are not viewed or recognized by the consumer as a desired improvement.

- Where the effect here on the pricing of goods and services cannot be quantified directly from a pricing standpoint, the pricing impact is estimated by computer statistical modeling—hedonic adjustment modeling—that has little if any relevance to real-world experience.
- Where the quality of the product is deemed by the government to have improved (the usual circumstance), prices in the CPI calculations are adjusted lower to offset the higher quality.
- Usually, though, the purchasing consumer only has the option of paying out-of-pocket the full price for the product, again with little or no concept of the quality improvement being acquired and/or having no chance to opt out of paying for the improvements.
 - In an early example, the government mandated the use of a gasoline formulation that purportedly would improve auto emissions. That added ten cents per gallon to gasoline costs, but that cost was excluded from CPI calculations. The person filling his or her gas tank, however, felt the actual out-of-pocket expense.
 - The government later abandoned excluding government-mandated “quality” improvements, such as gasoline additives, from inflation calculations, but the principles here are exactly the same for industry-generated “quality” improvements that are not optional to consumers.
 - Textbooks, for example are modeled, where one pricing factor in the hedonic quality model is whether or not there are color pictures in a book.

Unless the student is an art student, the concern usually is not over colored pictures, but rather along the lines of “What is my out-of-pocket cost for textbooks this semester?”

- New computer features usually are deemed quality improvements, with a downside price adjustments made in the CPI for the changes, even though a consumer may not want or use the features.
 - The consumer still has to buy those features and pay full cost out-of-pocket, irrespective of what government determines those products are generating in purported hedonic quality benefits that the consumer is not considering or using.
 - I contend that significant feature changes should be treated as a new product introduction, or otherwise ignored.
- If the use of the hedonic process were legitimate here, it would be applied to all goods and services, but a CPI, so based, soon would come meaningless to the public (as already has happened with the CPI-U).
 - For example, there has been no pricing adjustment (upside in this case) to the costs of air travel for the destruction of travel convenience with the advent of the TSA, or from the downward spiral in U.S. air traveler comfort and convenience resulting from the effects of mergers and acquisitions, and from increasing flight delays due to economizing on aircraft maintenance.
 - Consumer concerns are for his or her out-of-pocket expenses. What am I paying for my textbooks this semester; what am I paying out-of-pocket to fly from New York to Chicago; or what am I paying out-of-pocket for a

computer, even if I am looking just to use limited functions but have no choice but to buy unwanted features?

Net Reduction in CPI-U Inflation from Changes in Methodology
As Reflected in the CPI-U-RS versus CPI-U Series (1980 to 2011)

Year	Average CPI-U-RS Dec 97=100	(1) CPI-U-RS Yr/Yr	Average CPI-U '82-4=100	(2) CPI-U-RS Yr/Yr	(1)-(2) Change in Annual Inflation*	Cumulative Annual Inflation Shortfall

Table 3

What The Changes Did to Reported Inflation.

The substitution-related alterations to inflation methodologies were made beginning in the mid-1990s. The introduction of major hedonic concepts began in the 1980s. The aggregate impact of the reporting changes since 1980 has been to reduce the reported level of annual CPI inflation by roughly seven percentage points, where 5.1 percentage points come from the BLS's published estimates of the effects of the individual methodological changes on inflation, shown in the preceding table and as discussed later. The balance comes from my estimates of the changes not formally estimated by the BLS. The effects are cumulative going forward in time.

With the support of academic expertise affirming the correctness of the new methodologies, the effects of the reduction in the pace of reported inflation and in the related spiking of reported inflation-adjusted economic growth, have been discussed openly at different times. Consider examples from the 1999 *Economic Report of the President Report (Report)*.³⁹

“A final reason for the slowing of reported price indexes has been methodological changes to both the CPI and the indexes used in the national income accounts. In general, these changes have reduced the measured rate of inflation. For the CPI, methodological changes made from 1995 through 1998 reduced the rate of inflation by about 0.44 percentage point. Changes to be introduced in 1999 and 2000 will reduce it by an additional 0.24 percentage point.” Again, these are cumulative changes going forward.

The *Report* continued, describing the benefits of reduced inflation rate reporting in adding to reported GDP growth, “The BEA [Bureau of Economic Analysis] has also recently switched [1997] from using the CPI to using the producer price index (PPI) to deflate physicians' services and the services of government and for-profit hospitals. ... Because the PPI measures of these prices have been increasing less than the comparable CPIs, the changes reduce the rate of increase of the chain-weighted price index for GDP and raise real [inflation-adjusted] GDP growth. These changes, in addition to those passed

³⁹ “Inflation: Flat or Falling,” *Economic Report of the President 1999*, pp. 87-95.

through from the CPI, will have cumulated to raise the annual growth rate of real GDP by 0.29 percentage point by 2000.”

That cumulated GDP growth rate boost for those several years really should have been 0.54-percentage point, accounting for new hedonic adjustments.⁴⁰

Keep in mind that the CPI changes of 0.68% were an aggregate for those years and need to be carried forward—added back in—on a cumulative basis if one wanted to remove the effects of the methodological from future data. Against the aggregated 0.68% reduction in the reported inflation, the BLS's related CPI-U-RS series shows an aggregated reduction in the reported inflation of 0.7%, as discussed in the next two sections.

Measuring the Methodological Impacts Going Back and Forward in Time.

The BLS has created a CPI-U-RS (RS stands for research series) that is designed to restate inflation history as if all the current substitution and hedonic adjustment methodologies always have been in place. Limited effects of the artificially lowered historical inflation can be seen with the following graph.

⁴⁰ “Comparing growth in GDP and labour productivity: measurement issues,” OECD, December 2007.

Median Household Income (1967 Dollars)

CPI-U vs CPI-U-RS, (ShadowStats.com, BLS, Census)

— Deflated by CPI-U-RS

Figure 6

The narrow red line shows median household income, deflated by the CPI-U-RS, as having been much stronger than the series shown by the thicker blue line, which was deflated by the higher inflation in the traditional CPI-U [Figure 6]. The CPI-U versus the CPI-U-RS is detailed in the table.

While the difference between current methodologies, going in back in time, may appear small, that is because the recent years of the CPI-U since 2000 already include the bulk of the changes, so largely they are identical in terms of year-to-year change between the CPI-U and CPI-U-RS. In the earlier years, the changes average less than half of a percent, but those changes reflect the incremental decline in annual inflation triggered by the various methodological changes.

Reverse engineering the CPI-U-RS to as to reconstruct the CPI-U, as if the various changes had not been made, requires carrying forward the effects of the changes on a cumulative basis. The cumulative effect is seen in the last column of the table.

SGS-Alternate Consumer Inflation Measures.

What we have done in creating the SGS-Alternate Consumer Inflation Measures is to reverse engineer the CPI-U-RS series, adding in estimates of the inflation effects of factors not otherwise estimated by the BLS, such as more-frequent (two-years versus ten-years) reweighting of the CPI series.

The two SGS series are based on the methodologies in place as of 1980 and separately as of 1990 (further detail and graphs available at www.Shadowstats.com. The estimated lost inflation is added back in, over time, as described in the methodology (1980-based) published each month in the *Commentary* that covers the CPI reporting:

The SGS-Alternate Consumer Inflation Measure adjusts on an additive basis for the cumulative impact on the annual inflation rate of various methodological changes made by the BLS (the series is not recalculated). Over the decades, the BLS has altered the meaning of the CPI from being a measure of the cost of living needed to maintain a constant standard of living, to something that neither reflects the constant-standard-of-living concept nor measures adequately most of what consumers view as out-of-pocket expenditures. Roughly five percentage points of the additive SGS adjustment reflect the BLS's formal estimate of the annual impact of methodological changes; roughly two percentage points reflect changes by the BLS, where SGS has estimated the impact not otherwise published by the BLS.

Artificially-Low Inflation Estimates Have Created the Illusion of Recent Recovery.

Separately, to varying degrees, artificially depressed inflation rates have created misleading indications of economic growth in various economic series, including the GDP, industrial production and real retail sales as otherwise deflated by the CPI-U. When an economic series is deflated by the use of understated inflation, the resulting inflation-adjusted series reflects overstated economic growth.

Corrected for the artificial reduction of GDP deflation by roughly two percentage points from hedonic quality adjustments, the GDP shows a pattern of economic collapse into 2009, followed by a period of low-level stagnation, not the full recovery currently reported.

This is discussed in some detail and graphed in *Hyperinflation 2012*, with assumptions discussed in Chapter 5, beginning on page 38, available at www.shadowstats.com.

*H*EARING II.

CAN MONETARY POLICY REALLY CREATE JOBS?

WEDNESDAY, FEBRUARY 9, 2011

WITNESSES

DiLorenzo, Thomas J. Ph.D., Professor of Economics, Sellinger
School of Business, Loyola University Maryland
Vedder, Richard K. Distinguished Professor of Economics, Ohio
University
Bivens, Josh, Macroeconomist, Economic Policy Institute

*B*ACKGROUND

The Subcommittee on Domestic Monetary Policy held a hearing entitled “Can Monetary Policy Really Create Jobs?” at 10:00 a.m. on Wednesday, February 9, 2011, in Room 2128 of the Rayburn House Office Building.

In the aftermath of the financial crisis of 2008-2009, the unemployment rate hit historic highs above ten percent. By the beginning of 2011 they had come down slightly, but were expected by economists to remain persistently high for years to come. In an attempt to boost labor markets the Federal Reserve had maintained a highly accommodative monetary policy stance, continuing to inject huge amounts of liquidity into the financial system even after the immediate effects of the crisis subsided. With unemployment still hovering around nine percent in February 2011, this hearing examined whether the Fed was meeting, or could ever meet, its mandates of maintaining stable prices and high employment. It also explored whether the Fed’s loose monetary policies had implications for long-term employment prospects.

This was a one panel hearing, with the following witnesses:

- Dr. Thomas J. DiLorenzo, Professor of Economics, Sellinger School of Business, Loyola University, Baltimore
- Dr. Richard Vedder, Professor of Economics, Ohio University
- Dr. Josh Bivens, Economic Policy Institute, Washington, D.C. (witness for the Minority)

Monetary Policy

In conducting monetary policy, the Federal Reserve is required by statute to fulfill a dual mandate of price stability and maximum employment. The primary mechanism by which the Fed attempts to

do this is by adjusting the target federal funds rate, the rate at which banks lend to one another on an overnight basis. The Federal Open Market Committee (FOMC) sets a target rate – usually done at meetings about every six weeks – increasing or decreasing the target to try to affect economic activity by influencing the amount of liquid credit in the financial system. In August 2007, the target rate was 5.25 percent. At the time of this hearing, up until the time this anthology went to print, the target rate was set between 0 and 0.25 percent, essentially eliminating the usefulness of the federal funds rate as a monetary policy tool.

In addition to the federal funds rate, the Fed also has the ability to inject liquidity into the system by lending directly to member banks via the discount window and adjusting the amount of money institutions are required to hold as reserves. The Fed has exercised some generally unused authorities and developed new methods of injecting liquidity in the wake of the financial crisis, when it deemed traditional methods insufficient. Late in 2010 the Fed undertook a second round of “quantitative easing,” commonly called “QE2,” buying mostly longer-term Treasury securities in an attempt to lower rates for longer-term bonds since the Fed had already lowered its short-term rate to zero. The various liquidity programs undertaken since the beginning of the financial crisis have exploded the size of the Fed’s balance sheet, from around \$900 billion in August 2008 to over \$2.8 trillion at the time of print.

Unemployment

According to the Bureau of Labor Statistics (BLS), the nation’s unemployment rate stood at or above 9 percent from May 2009 to February 2011, the longest period since World War II. The BLS’ report in early February 2011 stated that the economy created a mere 36,000 new non-farm jobs in January. The jobs numbers were disappointing, as some economists had expected more than 180,000 and most economists believed that the economy needed to add at least 215,000 jobs a month to start making a dent in unemployment.

Even Fed Chairman Ben Bernanke, in a speech on February 3, 2011, said that he believed it would be years before the economy got back to regular employment levels. “Until we see a sustained period of stronger job creation, we cannot consider the recovery to be truly established,” he said.

While the BLS release in early February 2011 showed a 0.4 percentage point drop in the unemployment rate, to 9 percent, there were concerns that it was mostly due, not to more people finding

employment, but rather a shrinking number of potential job seekers because of the severe weather conditions experienced by many parts of the country in January. A broader Labor Department measure, U6 (total unemployed, plus all persons marginally attached to the labor force, plus total employed part time for economic reasons, as a percent of the civilian labor force plus all persons marginally attached to the labor force) put the January 2011 unemployment rate at 17.3 percent, up 0.7 percentage points. A private survey by Gallup put the conventional unemployment rate at 9.8 percent, up 0.2 percentage points. Alternative measures of unemployment that calculate the unemployment rate according to the methods used before BLS' 1994 methodological changes showed an overall U6 figure of 22.2% for January 2011.

Along with generally good trends in other economic data – including a fairly strong corporate “earnings season” – the February 2011 BLS numbers contained some good news: manufacturing picked up, adding nearly 50,000 jobs, and aggregate hours worked rose 0.6 percent, the latter being an indicator that often points to new hiring. Yet some observers said the strong earnings season and relatively high productivity figures may have given employers the impression that they could continue to meet demand for some time without adding new staff.

In December 2010, the Small Business Optimism Survey conducted by the National Federation of Independent Business had fallen 0.6 points and showed little to no improvement in most of its key components. Small businesses play a critical role in the economy and generate around 45 percent of private-sector employment. Small businesses remained pessimistic about the near-term economic outlook. While hiring plans had picked up to their highest level since September 2008, that level still remained at historic lows as of this hearing.

The Dual Mandate and Employment

The Federal Reserve was given a dual mandate in the Humphrey-Hawkins Act of 1978 to maintain both price stability and maximum employment. This dual mandate assumes the existence of the Phillips curve, i.e. an inverse relationship between the unemployment rate and the rate of price inflation. Hence, the Federal Reserve attempts to perform a balancing act between unemployment and inflation. As unemployment rises, the Federal Reserve pumps more money into the economy; as price inflation rises, the Federal Reserve pulls money out of the system, at the expense of higher

unemployment. Although the 1970s saw the emergence of stagflation, the existence of both high price inflation and high unemployment, the Federal Reserve continues to believe in this tradeoff between price inflation and unemployment, and conducts its monetary policy accordingly.

Some economists argue that the Federal Reserve's dual mandate of maintaining stable prices and low unemployment causes an inherent confusion in monetary policy, and that especially in the short term, the two are somewhat in conflict. Most central banks in the world are given a single mandate directed toward price stability or an inflation target. Several times in the last several Congresses, bills have been introduced to eliminate the Fed's dual mandate and revert to a single mandate of stable prices or inflation targeting. The argument is that with stable inflation rates, the economy can grow steadily over the long term and that recessions would be few, short and shallow. Proponents of this approach in the 112th Congress included Congressmen Mike Pence and Paul Ryan.

One of the most prominent proponents of a single mandate has been Dr. John B. Taylor of Stanford University, who in numerous appearances before the Financial Services Committee has proposed that Congress reinstate a requirement that the Fed should report on exactly how it intends to achieve its monetary policy, and if that approach changed, report exactly why. Taylor, who devised the so-called "Taylor Rule" to describe generally how monetary policy should be formulated in normal business cycles, believes that the causes of recent economic cycles are precisely that the Fed has exercised too much discretion in monetary policy.

Similarly, Dr. Allan Meltzer of Carnegie Mellon University noted in the *Wall Street Journal* in early February 2011 that:

[I]n the 1970s, despite rising inflation, members of the Federal Reserve's policy committee repeatedly chose to lower interest rates to reduce unemployment. Their Phillips Curve models, which charted an inverse relationship between unemployment and inflation, told them inflation was the lesser concern. They were, therefore, flummoxed when both inflation and unemployment rose together over the decade.⁴¹

Quantitative Easing

In addition to lowering the effective interest rate target to nearly zero and undertaking a series of other moves designed to restart the economy, the Fed adopted a policy of "quantitative easing," an

⁴¹ <http://online.wsj.com/article/SB10001424052748704709304576124033729197172.html>

approach in which central banks purchase financial assets to spur the economy when the typical monetary policy measures are not working because short-term rates are already at or close to zero. In March 2009, the Fed started its first round of quantitative easing, which consisted of purchasing approximately \$1.2 trillion in Treasury and Agency-backed securities and debt.

Economic conditions, however, did not improve. In particular, the unemployment rate climbed from 8.6% in March 2009 to 9.6% in October 2010. On November 3, 2010, the Fed announced its plan to purchase \$600 billion in longer-term Treasuries, a move popularly known as “QE2” because it was the second effort at quantitative easing since the onset of the financial crisis. These purchases occurred at a rate of approximately \$75 billion per month and were completed in June 2011. As a result of QE2, the Fed’s balance sheet was expected to grow from a level \$2.3 trillion to \$2.9 trillion by the programs end in June 2011, which it reached, and had already hit \$2.5 trillion at the time of this hearing, with little show in terms of higher employment. In its announcement, the Federal Reserve was not concerned with the potential inflationary effects of QE2, noting that because measures of underlying inflation were, in its view, trending lower in recent quarters, further asset purchases should not result in increased inflation.

The views within the Fed on undertaking a second round of quantitative easing were not unanimous: Kansas City Federal Reserve Bank President Thomas Hoenig cast the lone vote against the Fed’s action. And although Fed Governor Kevin Warsh voted in favor of the policy, he noted that increasing the Federal Reserve’s balance sheet would expose it to downside risks, arguing in a *Wall Street Journal* op-ed that the Fed would need to reconsider its stance if risks were to begin to emerge.

The Federal Reserve’s decision to embark on a second round of quantitative easing sparked a political backlash from a number of quarters. On November 17, 2010, Republican Congressional leaders sent a letter to Fed Chairman Bernanke criticizing QE2 because “such a measure introduces significant uncertainty regarding the future strength of the dollar and could result in both hard-to-control, long-term inflation and potentially generate artificial asset bubbles that could cause further economic disruptions.” Other observers criticized QE2 because there had already been a huge amount of liquidity injected into the system, which had not spurred economic growth. Instead of increasing investment and expanding their

payrolls, businesses and financial institutions continued to hoard cash as a consequence of continued economic uncertainty.

Despite the criticisms, Chairman Bernanke stood squarely behind the QE2 effort. In a speech at the National Press Club in early February 2011, he said he continued to view the program as appropriate, and pointed to increases in stock prices and somewhat more robust business borrowing as evidence of QE2's success. Nevertheless, criticism of the program did not abate. And while Chairman Bernanke repeatedly declined to rule out an extension of quantitative easing, Dallas Fed President Richard W. Fisher said that he probably would not support further quantitative easing after the end of QE2.

In September and December of 2012, the Fed announced it would embark on further quantitative easing, purchasing Treasury securities and mortgage-backed securities at a rate of \$45 billion and \$40 billion per month, respectively. Due to the open-ended nature of the programs, some have begun referring to the asset purchases as QE infinity.

*T*RANSCRIPT

The subcommittee met, pursuant to notice, at 10:04 a.m., in room 2128, Rayburn House Office Building, Hon. Ron Paul {chairman of the subcommittee} presiding.

Members present: Representatives Paul, Lucas, Luetkemeyer, Huizenga, Hayworth, Schweikert; Clay, Maloney, and Green.

Ex officio present: Representative Frank.

Also present: Representative Renacci.

Chairman PAUL. This hearing will come to order.

I want to welcome everybody today, our guests as well as our Members.

And I think we will go ahead and introduce our Members now, and those who aren't here, we can do it later on.

Before I introduce our side, the members on this side, I do want to ask unanimous consent for a statement to be inserted into the record from Spencer Bachus. He is not here today. He would have liked to have attended, but he had to attend a funeral.

Also, I would like to just mention those individuals who are here.

First, we have Congressman Lucas from Oklahoma. He is an old hand at this. And I think sitting next to him is Blaine Luetkemeyer from Missouri.

Welcome.

And I think we have a guest who is not a member of the subcommittee, and that is Jim Renacci from Ohio.

As others come in, we can recognize them.

I will defer at the moment here to the ranking member to introduce his Members who are here.

Mr. CLAY. Thank you, Mr. Chairman.

First, let me congratulate you on your election as chairman of the subcommittee. And I look forward to working with you in the 112th Congress.

Joining us today is the overall ranking member of the Financial Services Committee, the gentleman from Massachusetts, Mr. Barney Frank. And I want to thank him for being here today.

Also with us is a fellow Texan of yours, Mr. Al Green, who represents the City of Houston. And thank you for being here.

And, of course, I am William Lacy Clay of Missouri.

Chairman PAUL. Thank you very much.

I do want to also welcome the Congressman and ranking member from Massachusetts. We have worked in the past on many of these issues, to the surprise of some people at times. But I am glad he is attending today.

Mr. FRANK. Thank you, Mr. Chairman. I would add, to the surprise and occasional dismay of other people.

Chairman PAUL. But the reason I said kind words is I expect him to behave today. That is all.

I would like to ask unanimous consent that all the statements of any member can be admitted into the record. If there is no objection, they will be admitted.

Oh, and I do need to ask unanimous consent for Jim Renacci to sit with us today.

No objection is heard.

I would like to go ahead and start with an opening statement, and then I will defer to the other Members who care to make statements, as well.

Today, we are talking mainly about unemployment. And, to me, this is a very significant issue that we all care about. I have not yet met anybody in the Congress or anywhere who thinks we shouldn't do something about it, so it is unanimous. Unemployment is too high, and the goal is to keep unemployment low and employment high. And this would make everybody happy.

But the disagreement seems to come from trying to understand how we got unemployment and what we should do about it. And I have argued that if you don't know exactly why we have unemployment, it is very hard to come up with a solution.

That is the purpose of these hearings, at least initially, to try to understand the ramifications and especially the connection of unemployment to monetary policy. Because people are thinking more about the Federal Reserve policy today than ever before. And everybody does have opinions. Some people think there is too much easy

money and credit and interest rates are too low, and others complain on the other side and say that we need more of it, we need more expansion of credit and we need more spending.

So that is where the disagreements are. But I think there should be a lot of goodwill here in the goal of finding out just what causes our problems and what we can agree on and what we can do about it.

Between 2001 and 2010, we had a population growth of 26 million people. Yet, at the end of that decade, we had 2.3 million less people employed. So these numbers aren't very encouraging. It is terrible that there are 2.3 million people not employed, but I think it might even underestimate the problem since we had such a big population growth.

Just in the last 3 years, or between 2007 and 2010, we had 7 million jobs lost. I do know that we have had some increase in jobs in the last year, but we are still way behind the curve.

But even with the job increase, we here in Washington, the combination of the Fed and what the Congress has done, we probably have pumped in \$4 trillion. And if you look at the new jobs we have created, I would say they are very, very expensive jobs. I imagine we could have given everybody \$60,000 or \$70,000, maybe \$100,000—I haven't done the calculation—just given them the money and they would have been better off. And that, of course, would have satisfied the people who say we have to stimulate spending; the money would be there. But, instead, the money went in different places, and the unemployment rates haven't dropped.

Another problem I see when we deal with the unemployment is sometimes we get confused on how we measure it. The lead figure from the Bureau of Labor Statistics comes up every month, and they tell us that unemployment is 9 percent. And, oh, it is down from 9.5 down to 9; there is a great recovery going on. But the people don't feel that way. The unemployment rate is still very high.

And if you look to some of the private sources of measuring unemployment, you find out that unemployment may well be much higher. Even the government statistics reveal that if you count all the people who are just partially employed or working part-time on weekends, that number can jump to 16 or 17 percent. But then if you include all those individuals who have given up looking for work, there are some who report that the unemployment rate could be 22 or 23 percent, reaching almost the height of the Depression.

So I would encourage all of us to think more seriously about how we measure unemployment, and if this is a real problem, that we ought to do something about defining how to measure unemployment.

I think in this discussion today, certainly we will be thinking about the results, the inefficiency of the Federal Reserve, because they have had a mandate, and the Congress gave them a mandate, and the mandate is that we should have stable prices and high employment. I can produce some statistics, and maybe later on will, to show that prices really aren't all that stable. And, certainly, unemployment reflects a failure. If that is their job, they didn't do a very good job. They haven't been very efficient in producing jobs.

So these are the things we want to talk about and try to resolve and then see what needs to be done. Because, like I said, who wants high unemployment? Nobody wants high unemployment. We want to get people employed. I work from the assumption that there is a direct connection between monetary policy and the business cycle, and, therefore, we should pay more attention to it.

Now I would like to yield to the ranking member, Mr. Clay.

Mr. CLAY. Thank you, Mr. Chairman.

We were all privileged to witness President Obama's stirring State of the Union Address. And part of his uplifting message was an appeal for all of us to find common ground in order to move our Nation forward. That applies here at home and around the world, as well.

But I am amazed that some of my colleagues in the Majority may have taken that concept a little bit too far. I never thought that I would see the day when allegedly conservative members of the Republican Party would side with the People's Republic of China over the best advice of the Chairman of the Federal Reserve. The Republican assertion that the Fed's actions to infuse the money supply in order to hold down interest rates and lower unemployment will somehow harm our currency is absolutely wrong.

The congressional mandate for the Federal Reserve is really a two-sided coin. The Fed has a mission to both maintain stable prices and to foster conditions that promote job growth. If we expect this recovery to continue, we need to support both sides of that equation.

As Chairman Bernanke has testified previously, this recession was unlike other post-war economic downturns. And I am thankful that the President, along with our congressional leadership and in coordination with the Federal Reserve, acted courageously to prevent a second Great Depression and to preserve the American middle class.

Over the last 19 months, with the help of the Federal Reserve's wise monetary policy, corporate profits have soared, financial markets have stabilized and regained much of the value equities that was

lost, and the private sector has created more than 1 million new jobs. And we still have a long way to go, but that is more new job creation than during the entire two terms of the Bush Administration.

While we strive to restore our economic security, fear of future inflation is not today's most important problem. In fact, the core inflation rate is still near 1 percent. The real danger is if we impede the money supply; then deflation is next in the economic chain.

We see real growth and recovery in almost every sector of the economy, in part because of the Fed's actions. Manufacturing is up, orders for durable goods are up, and car sales are better than expected, although too few, which is why we cannot let up now. There is no doubt that the Fed's prudent actions to carefully expand the money supply were appropriate, and they are helping put Americans back to work.

I am not concerned about what the Chinese, the Brazilians, or the Europeans think about our monetary policy, especially when some of those who are complaining the loudest are guilty of manipulating their own currency to hamper American exports, which cost jobs here at home. The current monetary policy supports job creation here in America. Here in Congress, we have no higher priority.

I thank you, and I yield back the balance of my time.

Chairman PAUL. I thank the gentleman.

I would like now to yield to Congressman Luetkemeyer for his opening statement.

Mr. LUETKEMEYER. Thank you, Mr. Chairman. Thank you for holding the hearing. And I am pleased to serve on the subcommittee and glad to see that we are focusing on the most important issues facing our constituents: jobs.

Since 1977, the Federal Reserve has been charged with two principal missions: controlling inflation; and maximizing employment. Despite recent attempts by the Fed, unemployment continues to hover at 9 percent for the 8th consecutive month, and the economy is still struggling, leaving one to wonder if the Fed is capable of affecting either or have they mismanaged the situation.

Then there is the question of whether the Fed should remain to have a dual mandate. And that one has been continually debated since 1977. It is unclear whether this dual mandate does much of anything to promote job growth.

Take, for example, Chairman Bernanke's quantitative easing plan. When first presented with the Fed's plan, Americans were told that this would be the vehicle to keep interest rates low in order to promote job growth and investment. By injecting hundreds of billions

into the American financial system, the Fed sought to promote affordable business investment and economic recovery. This was a bold step, one that could ultimately our recovery by contributing to inflation. It is my hope that the \$600 billion QE2 will promote lending and stimulate growth.

At the same time, I am concerned that the Fed and other Federal regulators seem to be ignoring a key problem: excessive regulation along the lines of a lack of forbearance among examiners. As a former bank examiner, I believe the lack of responsible forbearance practiced by our regulators is imprudent. Time after time, I have heard from Missouri bankers who are troubled by increasing pressure from examiners to shrink their portfolios, even when the loans are performing.

I fully support prudent financial regulatory oversight, but it is not in our best interest to promote economic policy that denies credit for viable projects and forces performing borrowers into insolvency.

Sound monetary policy will play a role in restoring our Nation's economic stability. We need to energize the private sector and get the government out of the way by creating a regulatory environment that protects the American people while promoting economic expansion.

With that, Mr. Chairman, I yield back. Thank you.

Chairman PAUL. I thank the gentleman.

I would now like to yield to the ranking member of the full committee, Mr. Frank, for an opening statement.

Mr. FRANK. Thank you, Mr. Chairman.

And I would begin by saying I agree with the comments just concluded. We have suffered from excessive rigidity on the part of the regulators. We have, on a bipartisan basis, over the past few years, the past year in particular, talked about the problem of mixed messages coming from Washington, of the top regulators saying they want to encourage lending but of our being told by bankers that they are encountering a great deal of excessive rigidity. And we will, I hope, continue to press for a reasonable approach on the part of the bank examiners.

And we also have been engaged in conversations with the accounting board so that banks are not forced to take steps that are artificial and lock in a temporary problem, with a reduction in lending.

But on the subject of today's hearing, I was, as the gentleman from Missouri was, surprised to see many of my Republican colleagues here and former members of Republican Administrations criticizing the Federal Reserve's quantitative easing partly because it

was unfair to foreign countries. As the gentleman from Missouri pointed out, we had people explicitly agreeing with foreign critiques, saying that, among other things, what was wrong with what the Federal Reserve was doing was it was damaging the currencies of other countries. And as he noted, the People's Republic of China, in particular, was helping organize opposition to the Federal Reserve.

Let's be very clear: Being accused of currency manipulation by the People's Republic of China is like getting a lecture on family planning from the Octomom. This is a country which has engaged in very serious and significant and systematic manipulation of its currency to our economic disadvantage.

In fact, with regard to what the Federal Reserve has done, the negative predictions haven't come true. We have not seen inflation. We have not seen a great set of losses. We now know more about what the Federal Reserve is doing. And I know the gentleman from Texas does not think we went far enough in what we did last year in the bill, but we did make several steps that improved the transparency of what the Federal Reserve does. And under the law that we now have in place, no transaction between the Federal Reserve and any private entity will remain secret forever. There will be a publication of every transaction that the Federal Reserve does with any private entity, although, in some cases, with a time lag to prevent there from being market distortion.

But to go back to this, yes, it is true that unemployment is still too high. But when you are dealing with economics, the question is not simply what the reality is but what the reality would have been in the absence of actions, what the economists call the "counterfactual." And I think it is very clear that, as part of an overall approach, what the Federal Reserve has done has helped bring unemployment down below what it otherwise would have been, although not to a satisfactory level.

But it is very clear that, with regard to the charge that it was going to lead to inflation, whether that was going to be very costly to the Federal Government, or that the Federal Reserve would be engaged in activities which it could not unwind, they have all been disproven by the facts. And we do have speculation—inflation may be coming later. But there has not been an inflationary problem. The problem continues to be the lack of employment to catch up with other aspects of growth in the economy.

And I believe that Mr. Bernanke has been doing, with the overwhelming support of the other members of the Federal Reserve, including—remember, this is not just Mr. Bernanke. There have been a

couple of dissents, but the Open Market Committee includes other appointees, and it includes Federal Reserve Bank presidents. They have most recently been unanimous on this. And I think that the effect has been a good one.

And I hope that we will, as a bipartisan approach, tell the rest of the world that any suggestion that America should be constrained in what we do to stimulate jobs in this country will be unaffected by their concerns that it might have some impact on their own currencies, particularly those whose manipulation of their own currencies has been to our disadvantage.

Chairman PAUL. I thank the gentleman.

Now, I would like to yield time for an opening statement to Mr. Lucas from Oklahoma.

Mr. LUCAS. Thank you, Mr. Chairman. And I appreciate the opportunity to offer an opening statement.

I would simply observe, I think, that we all realize that the Fed's, in effect, running the printing presses perhaps is the best policy alternative they have there right now in this situation. But if you believe that price stability ultimately is what the economy needs to be rational and make decisions and grow for the long-term period, then you have to ask the question: By dramatically increasing the supply of money—yes, the volatility, the circulation of the currency, of money through the economy slowed dramatically, so that increased supply has been offset by the reduced activity has provided price stability or close to it. But if the Fed didn't see this mess coming in the beginning, will they see the inflation side in time also? If they didn't see this mess coming, will they see the inflation cycle starting up in time, the recovery in time to turn off the printing press, to shrink the supply, to offset the increased speed of circulation before we get into inflation? I am not sure, based on past history, that their vision in the future is going to be any better than it was in the past.

That, I think, is the question. Not so much what other countries think, but will we, by the printing press, cause more problems in the future than we can overcome?

I appreciate the opportunity to hear our witnesses, Mr. Chairman.

Chairman PAUL. I thank you.

I would like to now yield for an opening statement to Mr. Green from Texas.

Mr. GREEN. Thank you, Mr. Chairman. I thank the ranking member, as well, and I thank the witnesses for appearing. And, of

course, I thank the ranking member of the full committee, the Honorable Barney Frank.

Mr. Chairman, I would like to start on a positive note and say that I concur with you 1,000 percent; we do have to ascertain what the cause was if we are to truly find a conclusion as to how to resolve the problem. We may differ on what the cause is, but I do agree that we have to know what the cause was.

And I would also concur with you that U6 is a good indicator of what the unemployment rate really is when you add all of those who are marginally employed. QE1 and QE2 are important because they have infused capital into the economy. But when we look at the cause and we connect these two, we find that we have to ask ourselves, was the cause a lack of regulation or was it overregulation? I suspect not, in terms of over. Was it a case of regulators not really regulating? Was it the exotic products? If it was the exotic products, why were the exotic products allowed to exist in the first place?

So there are plenty of questions to ask, and I plan to ask some of the witnesses today.

But with reference to the inflation, I believe that the chairman has embarked upon a path that is going to help us have a softer landing than we would have but for the QE1 and QE2. Without them, it is counterfactual, but there are economists that tell us that we would have a landing that may have been a crash, and it may have been devastating for the economy, much more so than where we are now.

I thank you for the time. I look forward to hearing from the witnesses. And I yield back.

Chairman PAUL. I thank the gentleman.

Now I would like to yield time to Congressman Huizenga from Michigan for an opening statement.

Mr. HUIZENGA. Thank you, Mr. Chairman. I appreciate the opportunity. In the interest of time, I have submitted my remarks, as well, and will try to shorten it up. And I appreciate you holding this subcommittee hearing today.

By trade, I am a small-business owner and involved in both real estate and construction. And I now represent a district currently suffering an unemployment rate well above the national average, in Michigan. And one of the hearing's topics—and this particular hearing holds special significance for us back in Michigan.

Earlier this month, the Bureau of Labor Statistics reported that the national unemployment rate fell from 9.4 percent to 9 percent. That does not include the hundreds of thousands who have, frankly,

stopped looking. That equates to 14 million people without a job. While this is a staggering number, in my home State of Michigan we are far worse off: 11.7 percent. And, again, that is not including those who have stopped looking. And in some of the areas in my particular district, along the lakeshore, it is well over double the national average.

As previously mentioned, I am a small-business owner at heart and believe such businesses are the backbone of the U.S. economy and provide more than two-thirds of American jobs. I understand the universal principles of successful business, and it is important that we recognize the appropriate role for government in that process. Simply put, the private sector creates jobs, not the public sector. And that is ultimately where that prosperity lies.

It is clear to all small-business owners that responsible fiscal policy includes reduced government spending and the implementation of friendly tax and regulatory environments. They go a long way in creating an atmosphere for success.

As we are having this discussion on QE1 and QE2, ultimately I believe that they have not proven to be an effective method in creating jobs. And I appreciate today us examining the effects that the Federal Reserve open market operations have on those long- and short-term unemployment rates. And, in addition, I look forward to carefully inspecting what potential role the Fed policies played in such artificial asset bubbles as that of the housing market between 2001 and 2008.

So I look forward to today's, I would guess, robust conversation on the short-term effects. And I appreciate your holding this hearing, Mr. Chairman. So thank you very much. I yield back.

Chairman PAUL. I thank the gentleman.

Now, I would like to yield time to Congresswoman Hayworth from New York, a new member to the committee.

Dr. HAYWORTH. Thank you, Mr. Chairman.

My home district is New York's 19th. It is the Hudson Valley. And we have a large portion of our constituency who have jobs in the financial services sector. And, frankly, all of our citizens are quite directly affected by what the Federal Reserve is doing and has done in the past. So I am honored to be working on this subcommittee, because examining the role of monetary policy in the financial crisis and in our response to it is crucial.

History shows that an independent central bank that is making monetary decisions free of political influence can certainly enhance economic growth. It stabilizes the currency. That is very important.

But that is very different from requiring a central bank to be held accountable for its decisions and to explain why it is making them. And it is certainly incumbent upon us to set that policy for monitoring and holding accountable.

So that is our role here. And we are in service of the far larger goal, as my colleague from Michigan has said, of getting Americans back to work throughout the country. So I look forward to your testimony regarding how monetary policy has affected unemployment. I am sure it has.

And I yield back the remainder of my time. Thank you, Mr. Chairman.

Chairman PAUL. Thank you.

The Congressman from North Carolina, Walter Jones, has arrived. He is the vice chairman of this committee.

Would you like to make an opening statement?

Mr. JONES. No.

Chairman PAUL. We would like to announce and celebrate the notion that Walter is going to have a birthday tomorrow. So we want to wish him a happy birthday.

Mr. JONES. Thank you.

Chairman PAUL. Okay. If we don't have any more opening statements, we are going to go to the guests that we have, those who are going to testify. I want to welcome all three of the individuals here today. And I will read a brief resume of each one, and then we will go to the discussion.

First, on the left, we have Professor Thomas DiLorenzo, professor of economics at the Sellinger School of Business at Loyola University in Baltimore, Maryland, and a senior fellow at the Ludwig von Mises Institute in Auburn, Alabama. He received his Ph.D. in economics from Virginia Polytechnic Institute and State University at Virginia Tech.

Next, will be Professor Richard Vedder, the Edwin and Ruth Kennedy Distinguished Professor of Economics at Ohio University and an adjunct scholar at the American Enterprise Institute. He received his B.A. in economics from Northwestern University and his M.A. and Ph.D. in economics from the University of Illinois. He is the author of, "Out of Work: Unemployment and Government in Twentieth-Century America."

And finally, we will hear from Dr. Josh Bivens, an economist at the Economic Policy Institute in Washington, D.C. He received his B.A. in economics from the University of Maryland and his Ph.D. in economics from the New School of Social Research. Each will be given

time for an opening statement, and their full statements will be put into the record. So I will first now defer to Dr. DiLorenzo.

**STATEMENT OF THOMAS J. DILORENZO, PH.D.⁴²
PROFESSOR OF ECONOMICS, SELLINGER SCHOOL OF BUSINESS
LOYOLA UNIVERSITY MARYLAND**

Mr. DiLorenzo. Thank you, Mr. Chairman, and members of the committee for giving me this opportunity to appear here.

To answer the basic question that has been posed by this hearing, can monetary policy really create jobs, as an academic economist, you are not surprised to hear from me that the answer is “yes and no.”

And the reason why I say “yes and no” is that the history of the Fed has been that it has created boom-and-bust cycles in the economy ever since it began its existence in 1914. And so, during the boom period, of course, it does create jobs, but the jobs that it creates, many of them are unsustainable jobs. I can recall hearing that Home Depot, when they laid off 7,000 people in 1 day, these were jobs that people had invested in, they invested their lives, their careers, and then the rug was pulled out from under them. That is the sort of thing that happens with what we call the artificial boom and bust created by the Fed’s monetary policies.

And the key to it is that the monetary expansion that the Fed creates, it sometimes produces price inflation, but that is not the only problem. Another part of the problem is that it artificially lowers interest rates and induces businesses to engage in especially long-term investments that end up being unsustainable.

In the latest boom-and-bust cycle, that was mostly in real estate and everything related to real estate. But it is not necessarily just real estate. And so, in this latest cycle then, you had people, mortgage bankers and insurance companies and everyone related in every way to housing construction investing years and years of their careers, and then they are out of work; they have to retool.

The lower interest rates are not necessarily an unmixed blessing to everyone because they tend to reduce savings, and savings and investment are the key to productivity growth and job creation. And so, the downside of the Fed policy of lowering interest rates lower and lower is that it deters savings. And savings investment is really the key to having sustainable economic growth and job creation.

The real damage occurs, then, during the boom cycle of the business cycle, where capital is misallocated. Too much of it goes into unsustainable areas, such as real estate in the latest bout here. And

⁴² [The prepared statement of Dr. DiLorenzo can be found on page 394.]

the best part, the good part, if you can say there is a good part to this boom-and-bust cycle, is now the bust is where the adjustments have to take place. And we have to get back to realistic prices, realistic interest rates.

One problem the Fed creates, though, is, with its constant manipulation of interest rates, it really is an attempt at price controls. And I think the economics profession is almost unanimous in opposition against price controls. And interest rates are prices. And so, when the Fed tries to manipulate interest rates, it is really engaging in a policy of price controls. And a lot of people in this room, I am sure, remember what a disaster that was in the 1970s, with price controls on oil and gas.

Now, government policies that bail out businesses, which we have seen, is really a contradiction of an age-old rule of economics with regard to monetary policy. The rule was, in the case of a recession like this, it is a good idea for the Fed to make credit available to sound businesses that have been responsible and made good decisions, but not make more credit available to those businesses who have made bad decisions. And it is better off to let them go bankrupt, out of business, and have those resources be picked up, reallocated by people who will make better use of them. But, of course, the Fed has done exactly the opposite of that in the recent years.

And so, as applied to today's situation, I think a very strong case could be made that the cause of the boom was the Greenspan Fed's low-interest policies. So the Fed did create some jobs with the boom; it is responsible for creating those jobs. But I think it is also responsible for the high unemployment that we now suffer to a very large extent because of the bust that has occurred.

It also has created mismatched unemployment, what economists used to call mismatched unemployment, which I referred to a minute ago, in terms of people investing in jobs and careers that ultimately are not sustainable for a long period of time.

Historically, the Fed, right from the very beginning, as soon as it started in 1914, it doubled the money supply by that date in 1920 and created the Depression of 1920. It was the worst depression in the first year of the Great Depression. And a strong case can be made—and I can refer any of the Members to literature if they would ask me for it, as to where you can read up on how the boom and bust of the 1920s was caused by the Fed, as was, I would even argue, the Great Depression was ignited by the expansionary monetary policy of the Fed, not the restrictive monetary policy of the Fed, that occurred from 1929 to 1932.

I see my time is about up. So, in summary, I will say that the Fed's monetary policies do create temporary but unsustainable increases in employment, while being the very engine of recession and depression, even, that creates unemployment in the long run. And it needs to step back, in my view, and let the market work and create a lot more stability by quitting its attempts to manipulate the price of credit, interest rates.

Thank you very much.

Chairman PAUL. I thank the gentleman.

I would like to now defer to Professor Vedder for his statement.

**STATEMENT OF RICHARD K. VEDDER, PH.D.⁴³
DISTINGUISHED PROFESSOR OF ECONOMICS
OHIO UNIVERSITY**

Mr. VEDDER. Thank you, Dr. Paul.

The one-word executive summary of my answer to the hearing's question, can monetary policy really create jobs, the one-word answer is "no." And I would agree with Dr. DiLorenzo, no, not in the long run, or no, not on a sustainable basis.

A little historical context: The first decade of this century had the lowest rate of economic growth of any decade since the Great Depression. Employment growth was the lowest in 6 decades. Inflation-adjusted equity prices fell sharply.

In large part, I think this reflects a multitude of faulty government policies, certainly on the fiscal side. Federal spending soared, increasingly financed by borrowing. The ratio of national debt to output is at a historic high for a relatively peaceful period. And on the monetary side, we had the worst financial crisis since the Depression, with many iconic financial institutions closing their doors or only surviving because of Federal bailouts. And despite all these huge Federal exertions on both the fiscal and monetary side, we have had the weakest recovery going on now in the lifetime of most persons in this room.

Moreover, I think the huge run-up in the ratio of Federal debt to output will be a significant drag on the economy for many years and may well lead the Fed to monetize this debt or part of this debt, unleashing a wave of inflation that can only undermine our economy.

Turning to the 2008 fiscal crisis, financial crisis, certainly private irrational exuberance may have occurred to some extent. The crisis largely resulted from three types of government policies, failures.

⁴³ [The prepared statement of Dr. Vedder can be found on page 397.]

First, as Tom DiLorenzo indicated, the Federal Reserve for years prior to the crisis pursued an easy money policy, reducing interest rates below levels justified by human behavior and market conditions. This led to the artificial boom in housing prices.

Second, the Feds encouraged imprudent lending practices through such things as the Community Reinvestment Act, HUD policies going back to the 1990s designed to promote homeownership.

Third, Fannie Mae and Freddie Mac, government-sponsored corporations, promoted totally inappropriate lending practices that contributed to the housing bubble and the foreclosure mess. Congress blocked attempts to rein in these companies, no doubt, frankly, because of the campaign contributions these companies made to Members of this body.

I am an economic historian. And both economics and historical experience demonstrate that Federal intrusions into economic activity are counterproductive. Some textbooks even talk about the “policy ineffectiveness theorem.” Aggressive deficit spending and Federal Reserve monetary expansion led to stagflation in the 1970s. Japan went on a huge binge of stimulus spending in the 1990s, and economic growth virtually ground to a halt. The excesses of the European welfare state and its funding are causing crises all over the European Union, from Ireland to Greece. The stimulus plans of the Obama Administration were accompanied by rising, not falling, unemployment. Bailouts and “too-big-to-fail” policies have created a huge moral hazard problem. The Federal Reserve has engaged in huge purchases of government long-term bonds and mortgages to keep interest rates low. But long-term interest rates are not falling, as concerns about potential inflation justifiably have risen.

So, by many indicators, this is the weakest post-war recovery, not because we have tried too little, but because we have tried too much. The Fed and the government have monetary and fiscal time bombs that are threatening both the short-term recovery but, more importantly, long-term financial and economic stability.

So what do you do? I would point out that our economy achieved economic supremacy in the world from 1871 to 1914, a period of the gold standard, near-stable prices, and no central bank. Consumer prices in 1914 were within 10 percent of what they were in 1871. We can learn from that experience.

To restore monetary stability, ideally we would ultimately consider retreating somewhat from the fractional reserve banking system we have, where even moderate declines in confidence potentially lead to devastating consequences. But more immediately, we need to

limit monetary growth. And, given human weaknesses, probably the best way to do this ultimately is having a gold standard or some variant that removes or dramatically reduces the discretion of central bankers.

But on the fiscal side, politicians, unfettered by rules, behave, I would say, like unsupervised alcoholics in liquor stores. We need some sort of constitutional restraints on government fiscal actions. Practically, changes of this magnitude

take time, but, in the short run, however, I think you could start holding the Fed's feet to the fire. Perhaps, for starters, you should establish price stability as the single monetary mandate for the Fed. Perhaps you should repeal the Humphrey-Hawkins Act and privatize or abolish Fannie Mae or Freddie Mac.

After that, you can rest on Sunday.

Chairman PAUL. I thank the gentleman.

We will move on now to Dr. Josh Bivens for his statement.

**STATEMENT OF JOSH BIVENS, PH.D.⁴⁴
MACROECONOMIST
ECONOMIC POLICY INSTITUTE**

Mr. BIVENS. Thank you. I would like to thank the committee and the chairman for inviting me here today.

The subject of this hearing is, can monetary policy really create jobs? I am going to say the answer is a barely equivocal “yes,” and the equivocation just being it can create jobs as long as the economy is performing below potential. And the economy is performing below potential today.

The argument—I am going to start with just a little bit of theory. Of course, theory alone can't end the discussion, so then I will talk about some evidence on monetary policy's effects.

So the theory—sometimes the cause of recessions are pretty hard to reconstruct. Not so in what we are now calling the “great recession.” The bursting of the housing bubble led to home builders waking up, realized they had massively overbuilt, so residential investment collapsed. The 30 percent fall in home prices also erased about \$7 trillion in wealth from household balance sheets, so they predictably radically curtailed their spending.

These initial shocks then cascaded throughout the economy. Businesses stopped investing because customers aren't coming in the door. Why would you build a new factory when the one you have can't even sell what it is producing?

⁴⁴ [The prepared statement of Dr. Bivens can be found on page 402.]

And so, in the jargon—and, for once, the jargon is kind of important—the economy suffered a shock to aggregate demand. The clear fact that this recession was the result of a shock to aggregate demand is key. American workers didn't lose their skills in December 2007. American factories didn't become obsolete in that month. American managers didn't forget how to organize production in that month. Nothing changed about the American economy's ability to supply goods and services. All that changed was the ability of households and businesses to purchase them. The erasure of all the wealth from the housing bubble was a shock to aggregate demand.

So what the Fed tried to do is stabilize economic activity by providing a countervailing spur to demand with the levers they have. The primary lever they have is short-term interest rates. By lowering these short-term rates, or policy rates, the hope is that interest rates up and down the term and risk structure fall in sympathy. That makes it cheaper for businesses to borrow to expand capacity. That makes it cheaper for households to borrow to buy new houses, and durable goods. It also provides a one-time boost to asset prices. And so this decline in policy interest rates is meant to provide a countervailing, positive spur to the aggregate demand that was quashed by the bursting of the housing bubble.

And all this happened as the great recession approached. The Fed started cutting these policy rates in August 2007. They provided extraordinary support to failing financial institutions early in 2008. And about halfway through the great recession, the policy rates they controlled had kind of run out of ammunition. They were sitting at zero.

They could have just stopped there. As the economy was in a complete free fall, as the primary parachute they have available to them obviously wasn't sufficient, they could have stopped there. They didn't. And it is a good thing they didn't. They continued to try to find other ways to provide support to the economy with the quantitative easing programs.

And these interventions worked. If you look at when the Fed introduced the Term Asset-Backed Securities Loan Facility, the day that was introduced, credit spreads on asset-backed securities started to rapidly fall. That was very good for the economy. It meant people could actually get credit again.

Researchers from the San Francisco Fed say that the announcements of both rounds of quantitative easing caused interest rates to fall up and down the term structure. Some of the members of the committee may have noticed that 30-year home mortgages fell to

something like 4 percent in the past couple of months. Some of us in this room may have even refinanced their mortgages. I actually did. It saved me a lot of money, and provided a spur to my spending power. That is very good for the economy. That is one channel that is supposed to work.

Just that channel alone, the ability to refinance, some researchers at JPMorgan Chase have estimated that, if all the mortgages guaranteed by Fannie Mae and Freddie Mac had been able to take advantage of those 4 percent rates we saw a couple of months ago and refinance, that would be a permanent \$50 billion spur to spending potential in the economy. That is just one channel through which monetary policy can help people start spending again, and businesses.

And if you look back, you look at studies of what ended the Great Depression, Christina Romer, eminent economic historian, the former CEA chair for the Obama Administration, she says that monetary easing was a key part of what ended the Great Depression. I would say she is actually criticized in this view by, say, Milton Friedman, probably the most famous conservative economist, only because he thinks the Fed should have done much more, loosened much more to fight the Great Depression.

If you look at Adam Posen, probably the closest observer of what happened in Japan in the 1990s, he points to the fact that Japan actually had a pretty good recovery from 2002 to 2008 when they finally started engaging in the unconventional monetary easing that the Fed has done during the great recession. It was the first time Japan had seen serious growth in decades.

The Japanese case is also instructive because they had a 20-year period where they kept the short-term interest rates that they controlled, the Bank of Japan, near zero. They engaged in lots of quantitative easing. The cumulative inflation rate over those 2 decades was less than 5 percent. The United States has seen inflation of over 5 percent, or close to 5 percent, in a single year in the 2000s. So this idea that monetary easing always leads to inflation, no matter what, is just not supported by the facts.

And so, my time is up, and I just want to say one thing. I would say that the Fed has been by far the policymaking institution most aggressive in its response to the job crisis caused by the great recession. It acted first, it acted most aggressively, and it continues to display a real sense of urgency about the need to support the economy and create jobs.

Thank you for your attention.

Chairman PAUL. I thank the gentleman.

[QUESTIONS & ANSWERS]

We will now go into our question session. Each Member gets 5 minutes to ask questions.

And just to let you know that if the discussion is still going on, we will have a second or even a third round of questions if you are interested in the subject and you want to hang around.

First, I will start off with asking Dr. Bivens a question, because you have talked a little bit about interest rates and how valuable it has been to the economy for the Fed to lower interest rates. But isn't it true that there comes a point where they can't accomplish that, where the effort to lower interest rates doesn't actually lower interest rates?

And we may be even entering that period right now. There is a lot of monetary inflation right now with QE2, and there are signs that bonds aren't doing as well and they may be shifting.

What happens to those who agree with your policy? What do they do if the more they inflate, the higher the interest rate goes? And, in a way, we had that in the 1970s, as well. Then what do you do? What is the policy that is necessary to counteract that when interest rates are going up when you don't want them to go up?

Mr. BIVENS. A couple of things—one, you mentioned the experience of the 1970s. To me, the experience of the 1970s, why interest rates were high was because inflation rates were high. And so, my best guess over the next couple of years—and it is a guess based on a firm historical relationship between how much slack is in the economy and inflation rates—we do not have to worry about spiking inflation in the economy any time in the next couple of years.

So your scenario where the Fed continues to ease, maybe undertakes even another round of quantitative easing and somehow interest rates in the long term start rising, I would say they would need to reassess the policy then. But my read of the evidence so far is that, with each announcement of the rounds of quantitative easing, you have seen a robust fall in interest rates across the risk and term structure, which was exactly the target. And it has filtered through to more spending in the economy.

Chairman PAUL. I thank you.

And I would like to get a comment from Dr. Vedder or Dr. DiLorenzo on that subject.

Mr. VEDDER. Let's first talk about—the QE2 was announced on November 3rd. It is now February 9th. What has happened to the interest rates on 10-year or 30-year Federal Government securities in

that interim? My read of the evidence—and I just look at the interest rate yesterday versus November 3rd—is that the interest rate on 30-year government bonds has risen somewhere between 65 and 70 basis points. The interest rates on 10-year notes has gone up more than 100 basis points. This has not moved down. It is not even staying still. It is going up.

Now, in that period, we are buying, what, \$50 billion of bonds a month? We bought several hundred billion—the Fed now owns a trillion dollars' worth of long-term securities, I believe, or close to it, the better part of that.

To me, that is just the evidence. And it suggests that your concern, Dr. Paul, is correct, that the increased inflationary expectations have overwhelmed the effects, the immediate effects the Fed has when it pushes up bond prices when it buys securities. So I think your concern is valid.

Mr. DiLORENZO. Yes, I agree, that is what we are seeing, is inflationary expectations driving up those interest rates. And it might not be hyperinflation, but we are beginning to see it. And you have seen some of the inflation around the world, too. A lot of the U.S. dollars that are in circulation end up overseas. And I think there is probably a connection between the high food prices that you are seeing in different places around the world with this inflation.

But that is not the only problem that can be created by monetary expansion. It is the misallocation of resources. The Fed is creating a different kind of boom with its quantitative easing. And no one can predict what will happen, but in the next couple of years we could see another bubble. And I think it is likely to be much bigger than the housing bubble was. And then we will really be in trouble.

Chairman PAUL. I would like to ask Dr. Bivens first about his statement on page 7. He says, in short, the Fed saw the economic downturn coming before any other major macroeconomic policymaker body. And there have been a lot of others. What do you do with the free-market Austrian economists? And there were more than a few. How do you dismiss them so easily? Because they did predict it correctly.

Mr. BIVENS. Yes, I would absolutely not say the Fed was the first to see it coming of any economist. I have colleagues who warned in 2002 that home prices were getting too high. I meant to say they were the first major macroeconomic policymaking institution. They acted first.

There are three big arms of macroeconomic stabilization: there is fiscal policy, Congress; there is monetary policy, the Fed; and there is

exchange rate policy controlled by the Treasury. And of those three institutions, the first one to start providing lots of easing to the U.S. economy was the Fed.

Chairman PAUL. Okay. My time is about up, but I just want to go on to the next speaker by quoting Mr. Bernanke, and this was in the fourth quarter of 2007: “We may see somewhat better economic conditions during the second half of 2008. This baseline forecast is consistent with our recently released projections, which also see growth picking up.”

He had no idea that it was coming. He was so reassuring, and he misled so many people. And I just think there is a lot—and if I had more time, I would get other comments, but maybe later on. But it just seems like the Fed was way behind on this whole issue. I would hate to think they were the first ones to warn us. I think they were the last ones to even recognize what was going on.

Okay. And I will now yield to the ranking member, Mr. Clay.

Mr. CLAY. Thank you, Mr. Chairman. And, again, let me commend you for calling this hearing. The causes of unemployment and how government and the private sector can respond to and mitigate this crisis are extremely important. And I thank you for your leadership on this issue right at the start of this Congress.

Dr. DiLorenzo, you belong to the Austrian school. And we don’t have time for a debate on various economic theories. However, the Austrian school is different from mainstream theories in its lack of a scientific method and rejection of empirical data. You don’t use the scientific method and instead employ deductive reasoning. You apply preconceived generalizations to your work. You are kind of asking us to take your word for it.

Without data, without providing verifiable results, it is difficult for others to evaluate the merits of your work, and we must rely on your body of work itself.

Doctor, you are here today representing yourself as an economist. However, it has been difficult for my staff to locate any recent work of yours as an economist. It seems that for the past 15 years or so you have published books, written many articles, and given lectures as an historian.

The lines among the social sciences can sometimes get blurry, and I am not going to quibble about academic distinctions. But if your work was on labor history, historical patterns of unemployment, even the history of the Federal Reserve on monetary policy, I can understand you being here today. But I am a little confused. It seems

to me that the bulk of your work has been in revisionist history about our 16th President, Abraham Lincoln, and the Civil War.

Also—and this is where my confusion deepens to concern—you work for a Southern nationalist organization that espouses very radical notions about American history and the Federal Government. This organization, The League of the South, has been identified as a hate group by the Southern Poverty Law Center.

Now, the Law Center is an organization that I deeply respect, and so naturally this concerns me. The League of the South is a neoconfederate group that advocates for a second Southern secession and a society dominated by European Americans. It officially classifies the U.S. Government as an organized criminal enterprise.

Dr. DiLorenzo, you are listed on their Web site as teaching for their League of the South Institute. A short list of your many articles includes: “More Lies About the Civil War”; “The First Dictator-President”, referring to Abraham Lincoln; “In Defense of Sedition”; “Libelist Leftist Lynch Mobs,” insensitively using a loaded term to refer to academic criticism of a White professor; “Abe the Mass Murderer”; “Hurrah for ‘Sweatshops’”—I guess you could sort of claim that the title at least is somewhat connected or something to do with economics; and “Hitler Was a Lincolnite.”

After reviewing your work and the so-called methods you employ, I still do not understand your being invited to testify today on the unemployment crisis, but I do know that I have no questions for you.

Let me go to Dr. Bivens.

And there are some factual errors in the testimony presented here today that I believe need to be corrected. First, even though it was suggested that it was the excessive expansionary monetary policy of the Fed that caused yet another boom-and-bust cycle that spawned the Great Depression, the facts do not bear this out.

And, according to congressional research, between 1925 and December of 1928, the money supply increased at a very modest rate of 3.4 percent. Even if we look at a larger timeframe from July of 1921 to July of 1929, it grew at a rate of 4.8 percent per year. There is nothing particularly rapid about these rates, much less anything approaching excessive expansion.

Dr. Bivens, can you confirm this for us?

Mr. BIVENS. The exact numbers, no. But they definitely comport with my sense of that period, which is there was no excessive monetary expansion before the Great Depression. And even again, Milton Friedman, conservative economist, if he has a criticism of the Fed during the Great Depression, it is that they did not ease quickly

enough, they did not provide enough monetary support to the economy. So they comport with my sense of what happened during that period.

Mr. CLAY. Thank you for responding.

Mr. Chairman, I yield back.

Chairman PAUL. I now yield to Congressman Jones from North Carolina.

Mr. JONES. Mr. Chairman, thank you very much, and thank you for holding this hearing.

I want to thank the panelists.

And, Mr. Chairman, about a week ago, I decided that the frustration of the American people in the 3rd District of North Carolina, which I represent, was so great and their disappointment in the United States Congress and things we have done—talking about both parties—that I would take it upon myself to say, if you will help me with questions for the panelists for this whole year—I am delighted to be on this subcommittee, by the way—that I will use some of your questions when my time comes.

So, Mr. Chairman, in a week's time, we got over a thousand e-mails from my district. I am going to read two; then I want to get to a point:

“Our Congress Members, for the most part, must be the most financially illiterate group of men and women on the planet. Why would they need a study group on domestic monetary policy and technology to figure out you don't print more money to create jobs that are backed by virtual money, or funny money? I believe we need to fire all these people and get a couple of housewives who have been managing their family budget over the years without credit cards, lines of credit, and other creative ways to rob Peter to pay Paul.”

This is a great example of how frustrated the American people are. That is why I do think this hearing today is important.

Let me read the next one; then I want to get to the question:

“As an owner of small businesses and a family borrower, I have not understood how the Federal Reserve can keep its interest rates at almost zero and then make lendable funds more available to the banks, while at the same time the banks have increased interest rates, decreased lines of credit, and restricted availability of loans to high-rated creditors like my businesses and other households. I can only see that the banks have improved their financial position on the backs of small businesses and families.”

That basically is going to be my question. I am very frustrated; I am sure my colleagues in both parties are, as well. What you hear

back home is this issue of how the banks have been empowered with the Federal Reserve and the other agencies so that they are able to swell their financial state and, at the same time, they are saying to those of us who are creditors, we are going to raise your interest rates on your credit cards, we are going to deny you loans because we have a certain criteria now.

And this is why this country is in deep trouble, and it is going to continue in deep trouble. And that is why I think it is important that we hold these hearings about monetary policy, because the average American is out there strangling to death because of things that we do and don't do here in Washington.

How would you answer the question to that constituent who wrote me that question? Anyone who would like to answer.

Mr. VEDDER. I think your constituent ought to be made a member of the Council of Economic Advisors or something of—it wouldn't be any worse than it is now, maybe a little bit better.

Why are interest rates for the ordinary—why are people not borrowing a lot of money now? Is it because—the reason, of course, is—why are businesses sitting on \$2 trillion in cash, roughly, right now? They are sitting on \$2 trillion. You can have interest—interest rates don't matter. I don't say they don't matter. They are not the key thing.

They are scared. People are scared. They are scared of a \$4 trillion increase in the Federal debt over the last 3 years. The housewife may not be sure why that is bad, but she knows that is basically not a good thing to do. She knows that printing money and dropping it out of airplanes, or the equivalent, which is what the Fed does, will not create jobs, will not create wealth. It might temporarily lead to some behavioral modifications that leave the appearance of some stimulus in the short run, but not in the long run.

I happen to like Abraham Lincoln, by the way, and I went to the Lincoln Memorial today to read the Gettysburg Address. And I noticed that they have torn up—that they have drained the reflecting pool. And there is a sign in front of it that says, this is part of the stimulus—whatever, the reinvestment—I don't remember the name of that thing—reinvestment act. And they also had a sign next to it that said, we are going to fill it back up again. We can drain the reflecting pool and fill it back up again and probably put a few people to work for a day or 2, but that doesn't create jobs.

People are scared. And banks have partly raised interest rates, to get more specific, on some types of credit because they feel they have to because of the Dodd-Frank bill. Another thing, when they see light

at the end of the tunnel, you add on more tunnel. Not you, personally, Congressman, but your colleagues add more tunnel. And we have added more tunnel.

So we have the Dodd-Frank bill that has all kinds of new restrictions on banks and financial institutions. They have to make up the money somewhere. They are not going to just simply say, oh, we are going to let our profits fall to zero, and we are going to become a charitable institution, a not-for-profit. That is not the way banks operate. So they have raised a lot of fees and so forth. So that has added to the frustration.

Mr. JONES. Would you like—

Mr. BIVENS. Yes, could I have a very quick response to that, as well?

I will say one thing. If you look at the survey of small businesses, the National Federation of Independent Business recently over the past year, you ask them, what is the number-one problem facing you, overwhelming highest response in history: sales; there are no customers.

And so then the question is, can monetary policy actually create some customers for those businesses? And it absolutely can. When you saw the ability to refinance mortgages at 4 percent, that freed up a lot of money for households. When you lower interests up and down the term and risk structure, you make it much cheaper for businesses who are on that razor's edge—"Should I borrow a little money to expand? It is uncertain out there"—but you make it much easier for them to do that.

And the idea that there are inflationary expectations driving up long-term rates, there just are not. The clearest indicator of inflationary expectations that economists use is the tip spread, the spread between inflation index treasuries and nominals. That was at historically low levels a couple of months ago. Now it is still below 2 percent lower than it was at any point during the 2000s. There is just no sign that inflationary expectations are out of line and that is what is driving anything like long-term rates rising.

And then just one last thing. I am no defender of the banks, but, actually, if you are worried the banks are having too easy of a time by borrowing cheap, short term from the Fed, and then raising long rates on what they are lending to their customers, quantitative easing actually squashes that spread. It actually makes it less hospitable for banks to do that. So if you don't like the banks, kind of, riding the easy term structure created by what the Fed is doing to short-term rates, you should like the quantitative easing program.

Mr. JONES. Thank you.

Mr. DiLORENZO. Is there time for one more comment on that?

Chairman PAUL. Go ahead.

Mr. DiLORENZO. I would add, since I have written three books that include a history of banking, so contrary to what Mr. Clay had to say about me, what we have been experiencing is what economists call “regime uncertainty.” With all the uncertainty of the Fed changing policy month by month—the threat of huge taxes for socialized medicine, the re-regulation of banking with the Dodd-Frank bill—businesses sit back and wait because there is so much great uncertainty about the future with all of these regulatory changes and tax changes.

And that is one of the things that is keeping them from lending to businesses. The businesses are putting a lot of their business plans on hold. And the economist Robert Higgs is best known for research on this whole area of regime uncertainty, and I think that is an important thing to factor in there.

Chairman PAUL. I now yield 5 minutes to the Congressman from Texas, Mr. Green.

Mr. GREEN. Thank you, Mr. Chairman.

I thank the witnesses, as well, again.

What we have, apparently, is this philosophical debate about how jobs are created. Do millionaires create jobs, or do millionaires simply respond to demand and, as a result, they facilitate the creation of jobs because there is demand?

Smart money doesn't create jobs just because it exists. Smart money creates jobs when there is a demand to be met. Is that, in essence, what you are trying to say or have been saying, Dr. Bivens?

Mr. BIVENS. Yes, I think that is a fair summary.

Mr. GREEN. And is it true, sir, that jobs and employment, that these factors are considered lagging economic indicators, employment?

Mr. BIVENS. That is right. I think that is fair to say, as well. The last couple of recessions, you have seen GDP go up.

Mr. GREEN. Right. And while other things will come back at a relatively different pace—let's say it this way: Jobs will be among the last things that will return, especially when you have a sharp downturn in the economy. And it is also fair to say that, because of some of the structural changes in the economy, there are some jobs that won't return. Is this a fair statement?

Mr. BIVENS. I think we will have a different-looking economy coming out of this than we did. We are going to have fewer con-

struction jobs when we eventually get out of this and get out of the jobs hole. Hopefully we have some more manufacturing jobs. So, yes, I think there is something to that.

Mr. GREEN. Also, changes in technology. A few years ago, we had technology that was greatly different. Something as simple as developing film, the technology has changed. So you won't have those jobs. Record companies won't have jobs. The structure of the economy is changing as well.

So I would like for you, if you would, to just do this for me. Take a moment and explain, if you would, how the lagging indicator of jobs returning, employment, how that will manifest itself as we go forward. Is that something that will happen immediately, or will we see signs of it?

And, also, does it rise and fall based upon people who are out of the employment market coming back into the market? Does that then cause the job numbers to go up again? And then as more people are employed, it comes down again? Please talk about it.

Mr. BIVENS. Yes, you raise a lot of interesting points.

First, I will say that the observation that jobs are a lagging indicator should absolutely not be taken as "everything is fine, and the jobs will come back," even at the current pace of economic growth. That is not the case. If you want jobs to come back really quickly, you need to boost economic growth that much quicker. And so I would say monetary ease.

But, yes, then the other issue is, you are right. If you look at the number of jobs lost between 2007 and today, it is roughly 7 million. But we should have created well over 3 million in that time period just to keep pace with population growth. Those people who didn't join the labor force over the past 3 years will start joining it if jobs start becoming available again. And so that means the unemployment rate is going to be very, very stubborn in coming down over the next couple of years, even if we get some good output growth, some good employment growth.

But that said, if you look at the agonizingly slow recovery, the 2001 recession, or the very slow recovery of today compared to the quick recovery of the early 1980s; the thing that distinguishes them is that output grew much faster in the 1980s. And part of what explains that output growth, as I say in my written testimony, is the Fed had a lot of room to provide a lot of monetary support to the economy, and they did. They cut interest rates by 10 percent. That sparked both output and jobs growth.

So I think you are right. I think, even as jobs come back, the unemployment rate is going to be very, very stubborn because of all those jobs that were not created. But we really should say we cannot be satisfied with this pace of economic growth.

Mr. GREEN. Thank you.

Let me quickly respond to something that was said about the CRA, and Fannie and Freddie to a certain extent. We do have to make a distinction between causes and contributing factors. The CRA did not create 3/27s, 2/28s, teaser rates that coincided with prepayment penalties, no-doc loans. All of these exotic products were not created by the CRA. It may have been a contributing factor, Fannie may have been a contributing factor, as well as Freddie. But we shouldn't label contributing factors as causes.

These products that were created were created in an environment where you had either a lack of regulation or regulators that were not properly adhering to regulations, following the law, making others follow the law.

Mr. Bevins, could you just comment on this briefly?

Mr. BIVENS. Yes, I think I agree with all of that. The idea that especially Fannie Mae and Freddie Mac were prime drivers of the housing bubble just doesn't work when you look at the evidence.

As the housing bubble gets under way in the early 2000s, as home prices go through the roof, and as these exotic mortgages come online, Fannie and Freddie hemorrhage market share. They lose it to all of the private servicers.

They, unfortunately, start to try to get into the game a little later in the decade, and they shouldn't have. That is clear. But they were not—they were followers. They were absolutely not leaders. And so, the idea that the housing bubble can be laid at their feet, I think, is just wrongheaded.

Mr. GREEN. Thank you, Mr. Chairman.

Chairman PAUL. I now yield 5 minutes to Congressman Luetkemeyer from Missouri.

Mr. LUETKEMEYER. Thank you, Mr. Chairman.

A while ago, Dr. DiLorenzo, you talked about another bubble coming. Can you elaborate on that just a little bit?

Mr. DiLORENZO. With all the so-called quantitative easing that the Fed is engaging in, it is more of the same policy that created the real estate bubble in the first place. And, at that time, it reallocated a lot of capital into housing and housing-related industries. And so, even if we are not seeing price inflation, we have all this credit out

there, the potential for lending. And, of course, the banks aren't lending as much as a lot of people would like to see them lend.

And so we can't really predict where the next bubble will be, but it was in the stock market—before the housing bubble, there was a stock market bubble. And the Fed responded to that bubble with the policy of low interest rates that created the housing bubble. And so I fear that we are going to have another one because of the amount of money that is being put in circulation is orders of magnitude greater than what the Greenspan Fed did.

But no one can forecast or predict what industry it is going to hit, and so I am afraid I can't help you there. But I am pretty confident that we should be worried about it.

Mr. LUETKEMEYER. What you are saying, though, is that, as a result of the money supply, there will be another bubble, because you are putting into the system some sort of an anomaly that will cause something else to happen somewhere else, such as—

Mr. DiLORENZO. Yes. What happened with real estate is the low interest rates made it much more profitable to invest in long-term investments when interest rates go down. And so, all that money and resources is poured into real estate especially, and it ended up not being sustainable.

Mr. LUETKEMEYER. Do you have a best guess as to where it may happen next?

Mr. DiLORENZO. We have some criteria. Like, one of the reasons why I think it happened in real estate and it was such a catastrophe was all these new products, new financial products, and there were a lot of people who really were confused by them.

And so, just as a general rule, in industries that are relatively new, where there is uncertainty on the side of the consumer, that is where the trouble can be. And so that might lead to a lot of possibilities. But I can't—I don't have any particular industry that I could—maybe Professor Vedder does. I don't.

Mr. VEDDER. I think economists who make predictions are foolish.

Mr. LUETKEMEYER. Are there a lot of Fed economists around?

Mr. VEDDER. A lot of failing economists?

Mr. LUETKEMEYER. No. Aren't there a lot of economists at the Fed?

Mr. VEDDER. There are a lot, and there are a lot of mistakes that are made. Dr. Bivens mentioned with great admiration Christina Romer, whose most famous quote in modern times was her quote early in 2009 when she said, "If the stimulus package passes, the unemployment rate will not go above 8 percent." It is at 9 percent now and has been to 10 percent.

And so, I agree with Tom that we have a ticking time bomb out there, and exactly what the shape of the disaster will be I don't know. We have these mammoth excess reserves at banks.

And Dr. Bivens is actually right, he is absolutely right, we haven't had a huge amount of inflation now. And it is true people aren't spending a lot of money now. Why aren't they spending money? Is it because interest rates are too high? No. It is because they are scared. They are just downright scared. They are scared because, "Oh, we don't know this Obamacare, what it is going to do to us." We have had a regime change. People are scared. We are not used to big changes all at once. And because of that—but we have the potential for a disaster.

Mr. LUETKEMEYER. Okay. Very good. Thank you.

Dr. Bivens, you made a comment a while ago—you were discussing Japan. And they have had many, many influxes of cash into their economic system, QE2, 3, 4, 5, 6, whatever. And you made the point that it was able, as a result of that, to sort of help keep inflation low and interest rates low.

My concern is that their economy still is struggling. And it has been that way for 15, 20 years. If QE2 is supposed to be the end-all, be-all to help us create jobs and get our economy going, how do you correlate those two?

Mr. BIVENS. If you look at Japan, it pretty much had a lost decade of the 1990s, and they were sort of riven with internal debate about just how aggressive to get with monetary policy. And they never actually did, sort of, the unconventional large-scale asset purchases that the Fed has been doing. And—

Mr. LUETKEMEYER. Yes, but didn't they put a lot of money into the system, though?

Mr. BIVENS. They kept interest rates very low, yes.

Mr. LUETKEMEYER. That is my point. My point is, if we go along with the Fed's mindset here and policy of throwing more money into the system and we look at Japan as an example, over many years and on many QE2s or QE1s or whatever, and it didn't really do what we are hoping that this QE2 over here is going to do, what is the thought process that would lead one to believe that ours is going to be different than theirs?

Mr. BIVENS. It won't be different. They only saw a real recovery between 2002 and 2008 when they started doing the QE2s. Before that, they sat at zero, but they did no more. They said, we can't do anything else unconventional, you just don't do that. Everyone— not everyone—many people said, no, the economy needs more.

When they finally started doing more on the monetary side, they actually saw a pretty decent recovery during 2002 to 2008. And then, of course, everybody, globally, went into the great recession.

Mr. LUETKEMEYER. Okay. I see my time is up. Thank you, Mr. Chairman.

Chairman PAUL. Thank you.

I want to yield 5 minutes now to Congresswoman Hayworth from New York.

Dr. HAYWORTH. I yield my time at this time, Mr. Chairman. Thank you.

Chairman PAUL. Okay. Thank you.

I yield 5 minutes to Congressman Huizenga from Michigan. Is he not here?

Okay. I yield 5 minutes to Congressman Schweikert from Arizona.

Mr. SCHWEIKERT. Thank you, Mr. Chairman, committee members, and witnesses.

I may be one of those who is a little less interested in what is going on now or the last couple of years. I can grab a financial paper and read that. What I am trying to get my head around is a central bank and the monetary policy as we run it as a country for the last, let's call it, 100 years. Does it exacerbate the swings and, therefore, in many ways, unemploy more people and make the troughs much deeper?

For any of you, if someone like myself wanted to sit and read and get better educated, where in the literature do I find the best scholarly, fairest, and most detailed papers? Let's start from the left.

Mr. DiLORENZO. There are several treatises on the history of money and banking. One of them is authored by Richard Timberlake, who has taught economics at the University of Georgia for many years. He is retired now. There is another one by Murray Rothbard, "A History of Money and Banking in the United States." And those are both very good books.

And since you are a very busy Member of Congress, that sounds like a tall order to begin with, but—

Mr. SCHWEIKERT. One of the joys of being from Arizona is that I have a 5-hour flight both ways.

Mr. DiLORENZO. Okay, those are two books I would pick up.

But, also, this weekend there is a conference at Wake Forest University under the title, "The Fed Was a Mistake." And there is a professor from the University of Georgia named George Selgin who is giving a presentation based on an academic paper. And he has looked

at the last hundred years of the Fed's performance, the very question you are asking. And I can put you in touch with Professor Selgin, if you really would like to, for your next flight back to Arizona.

But he was actually at my university last week and gave this presentation, a PowerPoint. And he looked at all the Fed's ostensible goals—price stability, unemployment—and makes the case that the Fed has, in general, failed, although it has not been a dramatic failure, but it was a failure nevertheless to stabilize prices and unemployment.

Mr. SCHWEIKERT. I appreciate it. I know I have only 5 minutes, so I want to, sort of, drive through this.

Mr. VEDDER. Congressman, there is a new history of the Federal Reserve written by a very distinguished scholar, Allan Meltzer of Carnegie Mellon University. It is up through the 1980s or the 1990s. And it is not a complete history, but it is a second volume of a history. He is a very well-renowned monetary scholar. I haven't read the book entirely, but I sat in on a conversation with him and Chairman Volcker a couple of weeks ago at AEI, and it strikes me that it would be a very instructive kind of work, as well.

Mr. SCHWEIKERT. All right.

Mr. BIVENS. Just quickly, spanning the spectrum of ideology, "A Monetary History of the United States," Milton Friedman and Anna Schwartz.

Mr. SCHWEIKERT. Okay, which I actually have.

Mr. BIVENS. "Secrets of the Temple" by William Greider. What is that?

Mr. SCHWEIKERT. No, go on.

Mr. BIVENS. And I would say an absolute classic and very readable, "Manias, Panics, and Crashes" by Charles Kindleberger, formerly of MIT.

Mr. SCHWEIKERT. All right.

Mr. Chairman, witnesses, when I see monetary expansion in the way—let's just take the most current case scenario. And, at the same time, I have been spending tremendous amounts of time reading about the GSEs and the overhang and the mortgages and all the nonperforming debt we have at so many different levels.

Does this monetary policy end up creating a situation where we are not taking nonperforming assets and either writing them down or getting them off the books? And does this end up creating a huge overhang here that this monetization makes it so I can keep them on the books, basically sort of creating sort of a flat line?

Mr. DiLORENZO. Yes, that is exactly what has to happen, the liquidation of all of those bad assets and those bad investments. Historically, that is how recessions end. The bust period, as I said earlier, of the boom-and-bust cycles that we have is really the recovery period where businesses become stronger on the way out, at the end of the recession.

And the Fed seems to have been doing everything it can to delay that process of the liquidation of these bad assets. And I think that is a very bad idea.

Mr. VEDDER. I am going to defer an answer on this because—I think Tom is probably right, but I haven't studied the specifics of the nonperforming assets closely enough to make an informed—

Mr. SCHWEIKERT. All right.
Doctor?

Mr. BIVENS. I don't think it is—I think it is true that some writing down of bad assets is going to be part of a good recovery. I have to say, though, I think the Fed's actions by avoiding deflation, outright falling prices, is actually going to make people climbing out of their debt burdens over the next 5 to 10 years easier.

If you have a mortgage that is fixed at \$150,000, and every other price in the economy starts plummeting around it, then all of a sudden your mortgage payment has just gotten a lot more onerous for you. And so I think, by avoiding deflation, it is actually going to make the debt overhang less of an impediment to recovery in the next 5 to 10 years.

Mr. SCHWEIKERT. Okay.

Mr. Chairman, how much time do I have?

Chairman PAUL. I think your time has expired.

Mr. SCHWEIKERT. Oh. And I was just getting to the really good questions.

Chairman PAUL. If you hang around, you will get another 5 minutes.

Mr. SCHWEIKERT. All right. Thank you.

Chairman PAUL. I would like to yield 5 minutes now to Congressman Renacci from Ohio.

Mr. RENACCI. Thank you, Mr. Chairman.

I have been a small-business owner for 28 years, and I actually created jobs at the age of 24 with very little money in the bank. But I did have the opportunity to have banks willing to lend me money and the opportunity to create over 1,500 jobs in my career.

I want to ask all three gentlemen on the panel whether they believe the new duties given to the Fed in the Dodd-Frank Wall Street

Reform and Consumer Protection Act will have an effect on employment growth. Because I am a believer that the free-market system will create jobs. I am a little concerned about that. I wanted to hear all three of your opinions.

Mr. DiLORENZO. The Fed has a publication that has a title something like, "The Structure and Functions of the Federal Reserve." And it lists, I think, at least 30 or 40 different areas where it regulates different types of financial markets.

And for those of you who are businesspeople, you know that there is a very big cost involved in that. As Professor Vedder mentioned about the Dodd-Frank bill, it is not a free lunch. It is very costly to banks to enforce the provisions of that bill, and they are going to pass on some of the costs to their customers.

And so, expanding the prerogatives of the Fed is going to add more layers of regulation and make the banking business that much more costly. There may be benefits along, but it is going to make it more costly and more costly to consumers, as well, and more burdensome for businesspeople like yourself, in my view.

Mr. VEDDER. The cause of unemployment is too high a price for labor. When labor cost go up too much, employers hire fewer workers. It is the law of demand. It is very simple, not very complicated. I wrote a book about this, which a lot of people have praised to the skies. I thought it was the simplest concept in the world.

Dodd-Frank, other things being equal, does not lower the cost of labor. If anything, it raises costs generally to employers, making it difficult to employ workers. So the net effect of a mechanism like Dodd-Frank is probably to reduce, rather than increase, employment and, thus, increase unemployment in the United States.

Mr. BIVENS. I would say quickly, it is going to have little effect on what happens to unemployment.

I will make two distinctions here. One, I have been mostly talking about, sort of, monetary ease and interest rates and I think that the Fed has mostly gotten it right, at least in direction. It is true, I do think that the Fed and every other institution in the 2000s had too light a regulatory touch. And so I think booms and busts are caused by light regulatory touches.

I think the way that Dodd-Frank empowers the Fed to actually provide some tighter regulation, I think that is going to be a good thing, reduce boom-and-bust cycles in the future. And so I think it is an improvement.

Mr. RENACCI. Thank you, Mr. Chairman. I yield back.

Chairman PAUL. I thank you.

We will now go into a second round of questioning.

I would like to address this question to Dr. Bivens. This has to do with the debt that we have and its relationship to monetary policy. Even the Chairman of the Fed, Chairman Bernanke, has indicated that he thinks debt and deficits are a problem and has admonished the Congress to get their budget under control.

Do you have similar concerns? Is there a limit to how much debt we can have and how high these deficits should run? Or is that of no concern at all when we are in the midst of a recession?

Mr. BIVENS. I absolutely have concerns over, sort of, the long-run debt limits that are on the United States. And I think we should definitely move to, sort of, long-run, closer budget balance than is currently forecast.

I will say, it is not a concern of mine over the next, say, 2 years. To me, what the economy needs now is spending power, support from both the fiscal and monetary side. Some moving in the next couple of years to radically reduce deficits and debt would be very counterproductive.

But, absolutely, in longer-run periods, as unemployment returns to a tolerable level, that should absolutely be a concern.

Chairman PAUL. Thank you.

I would like to suggest to Dr. DiLorenzo and Dr. Vedder that there is a connection between monetary policy and deficits. Because if we didn't have the facilitator there, the ability of the Fed to buy debt and manipulate interest rates, wouldn't there be a self-mechanism where Congress would literally be unable to spend the money because interest rates would go up? And interest rates—of course nobody wants them high and they are bad politics, but wouldn't that be a way of holding a check on government?

And, really, it isn't just the Congress; it is the fact that the monetary system there accommodates the Congress because there is a lot of bipartisanship in the Congress. Sometimes, there are big-government conservatives who like to spend money, and sometimes, there are big-government liberals who like to spend money, and there is too much bipartisanship. They get together and they spend this money. And they figure, if we can get away with it, we are just going to allow the Fed to monetize this.

And, for a long time, they can get away with it. And they have done this, especially since 1971, until they finally got this huge bubble that finally burst, and we are in the midst of this great recession. For those who are employed, it is a depression.

But do you agree with that connection, that the Fed has something to do with encouraging the Fed to act irresponsibly?

Mr. DiLORENZO. I would. I think you hit the nail on the head. I would agree completely with that.

And, of course, when the Fed gets involved, it reduces the perceived cost of government. If you raise taxes to pay for government services, it is much more explicit and hits you in the face; you get a bill. But when the Fed prints money and expands the money supply, it has what economists call a “fiscal illusion effect.” And it makes it that much easier for this bipartisanship to occur that you referred to.

Chairman PAUL. Dr. Vedder?

Mr. VEDDER. I agree with Dr. DiLorenzo and with your analysis, Dr. Paul. And, indeed, in my statement, I was worried I was talking a little bit too much about fiscal policy and debt, but I was doing it for exactly the reasons you indicated. I think there is a real connection.

And throughout the history of the Fed, even going back before 1951, when the Fed was tied into the Treasury to keep interest rates down during the war, the Fed just keeping buying bonds and so forth. It was a deliberate policy to help the government manage its fiscal affairs. The Fed accommodated it by monetizing a lot of the debt.

This has been going on and on and on. And it will go on as long as Congressmen have to be re-elected every 2 years and as long as the Fed has some connection to the Federal Government. It is inevitable that it will go on.

Chairman PAUL. Thank you.

This is a question for Dr. Bivens. This has to do with a reference to what Dr. Vedder said earlier. He said that part of the reason we go into recessions is because labor costs get too high. Of course, nobody likes to hear that.

But if this is true—and I believe Keynes spoke to this at one time, because labor costs get too high, but you can't go and, say, cut your labor. You can't cut nominal costs. But he argued that real costs could go down by inflation. And you raise it and you lower the value of the dollar, so real cost goes down. And that helps you get out of the recession.

Do you buy into that argument? Or how would you look at that, on the need to get labor costs down?

Mr. BIVENS. I actually don't buy into that argument.

The way I read Keynes is, sort of, as follows: that the first shot fired against his idea, that the way to fight recessions is to try to have the Fed and to have fiscal policymakers add more support to the economy, the first shot was, no, no, you just need to get the price of

labor down. And he said basically, one, it is hard to get the price of labor down, even if all workers in the economy said, “Yes, we all agree to a 10 percent wage cut today, cut our wages,” all that would do is lead to a 10 percent fall in prices, as well. So the real wage actually would not fall much. It is actually very hard—

Chairman PAUL. Wouldn’t that be good? Wouldn’t that be good, to see prices come down?

Mr. BIVENS. No, because—

Chairman PAUL. It would help the consumer.

Mr. BIVENS. I am sorry?

Chairman PAUL. It would help the consumer, with prices going— what is so bad about prices going down?

Mr. BIVENS. Because their wages went down the exact same amount, and so their purchasing power has not changed at all.

Chairman PAUL. Yes, but—

Mr. BIVENS. What you would do is you would make the value of their debt more onerous. Basically, by increasing the value of debt, again, you have a \$150,000 fixed mortgage and all of a sudden your wage is 10 percent lower, all of a sudden you are more constrained by your nominal debt payments. And that will make the economy worse.

And so, Keynes is pretty clear, wage-cutting is absolutely not the way to get out of a recession.

Chairman PAUL. Okay.

I now will yield 5 minutes to Congressman Clay.

Mr. CLAY. Thank you, Mr. Chairman.

And, Dr. Bivens, we were told by Dr. Vedder that private markets handled mortgages and other lending for generations successfully without Federal intervention. Again, the data shows otherwise.

According to the Congressional Research Service, during the years 1920 through 1945, the last period of time when the Federal Government had a very small role in homeownership, rates were only between 40 and 50 percent of homeownership nationally. Now that rate, at a time when the Federal Government is supposedly inappropriately involved, is 67 percent. The homeownership rate was even higher within the last few years, as high as 69 percent.

So I don’t see how the numbers back up these claims about supposed excessive, expansionary policies on home lending. Can you help explain this error?

Mr. BIVENS. I think my assessment, sort of, agrees with yours, that I think the government support of homeownership played a key role in having that increase a lot in the post-war era. I am willing to quibble a bit that maybe some of the homeownership rates we saw in

2006, 2007 were bubble-inflated. But the trend is clear as day: With the introduction of Fannie and Freddie, with government support for homeownership, those rates rose pretty quickly.

Mr. CLAY. Thank you for that response.

Do you think there is value in having the Fed maintain a dual mandate for monetary policy?

Mr. BIVENS. I do, and especially if the alternative is to drop the full employment mandate. I think that would be a disaster.

To my mind, if there is a criticism of the Fed over a longer run, the last 30 years, it is that they have actually allowed that part of their dual mandate, the full employment part of it, to sort of go by the wayside and focused excessively on the price stability part.

And so, a Fed that actually took that dual mandate seriously, I think, would be a very good thing.

Mr. CLAY. Do you think that if the Fed were operating with a single price stability mandate, that its execution of monetary policy since the onset of the financial crisis of September of 2008 would have been materially different or would have led to significantly different outcomes in the economy?

Mr. BIVENS. It is a good question. I think where that single mandate of price stability would really be a bad thing is during expansions.

The irony here is that most people think the Fed have something like a 1 to 2 percent inflation target, seems to be—they are pretty consistently missing that, on the low side, these days. Inflation rates are coming in well below 1 percent.

So even if they only had a commitment to 1½ percent inflation—forget the employment side—if that was their only commitment, they should still loosen. And so that is how bad the economy is today. Even if all they had was a pretty conservative price target, they should still be providing all the support they are and maybe even a little more.

Mr. CLAY. Thank you for that response.

And, Mr. Chairman, I yield back the balance of my time.

Chairman PAUL. Thank you.

I now yield 5 minutes to Mr. Huizenga from Michigan.

Mr. HUIZENGA. Thank you, Mr. Chairman. I appreciate that.

And my colleague from Missouri just, actually, started going down a road that I wanted to explore a little bit.

Dr. Vedder, from the historical perspective, I think it would be helpful to have a very brief explanation about the dual mandate. How long has it been in place? Why was it really implemented?

And then, moving on to all three of you, is the dual mandate a proper mandate? I think Dr. Bivens was starting to talk a little bit about that, but I would like to hear the remainder of the panel's views on that.

Mr. VEDDER. The dual mandate—when I think of the history of this, I think first of the Employment Act of 1946, where the government committed itself to a policy of encouraging full employment. And even in that bill, price stability was mentioned, and it was part of the so-called mandate. Again, it was more a statement of intent rather than a prescriptive statement.

The Humphrey-Hawkins bill, which I think was, what, 1977 or something like that, was a more explicit widening of that mandate and made much more explicit.

And all of this precedes, sort of—there was almost implicit in some of this, a lot of this, as relates to what we might call the “Phillips curve” idea, that if you have price stability—can you have price stability and full employment? That is the empirical issue.

We can have that discussion. I do not think that the manipulation of prices in the long run impacts on employment, period. I think it does in the short run. I have written a book which indicates it does. There is a Phillips curve in the short run sometimes, but in the long run—higher inflation, lower unemployment. But in the long run, I don't see that that relationship exists.

Mr. DiLORENZO. In terms of the price stability, we have price indexes that go all the way back to the 1790s or even a few years before that. And the price level in 1913, when the Fed was created, was roughly the same as it was in 1790, with some ups and downs. But ever since the Fed was created, the price level is 22 times higher now. So when I hear the idea that the Fed has a mandate to stabilize prices, it is almost farcical.

And I don't think, overall, it has done a very good job in stabilizing employment either. You can mandate that is the Fed's job, but I think, historically, it hasn't done a very good job in either one.

Mr. BIVENS. Yes, in regards to that, I will say that I would much rather have average economic growth and the frequency of duration of recessions we have had post-1914 than in the 150 years prior. Basically, some moderate rate of inflation is the price you pay for having economic growth and fighting recessions in a serious way.

Again, to the degree that there has been a problem with the dual mandate over the past 25, 30 years, it has been that one-half of it, the full employment commitment, has really been sort of the neglected part.

Mr. HUIZENGA. So if I am hearing you, Dr. Bivens, you want to see the dual mandate remain, correct?

Mr. BIVENS. Yes.

Mr. HUIZENGA. Okay.

And I guess, the other two panelists, do you believe it is appropriate for that language to remain in there as goals and objectives? Dr. Vedder and Dr. DiLorenzo?

Mr. VEDDER. I think we ought to repeal the Humphrey-Hawkins Act, period, just do away with it.

Mr. DILorenzo. I agree with that. We have mentioned Christina Romer several times. One of her academic articles revises some data and shows that the business cycle was actually not more unstable in the pre-Fed era in the 19th Century than it was after the pre-Fed era. So you can't even make the case anymore, according to Christina Romer's research, that the Fed has done anything to stabilize the business cycle compared to the bad system we had, the admittedly bad, flawed system we had before the Fed came into being.

Mr. HUIZENGA. Dr. Bivens, do you care to address Humphrey-Hawkins at all or any of the other points?

Mr. BIVENS. First, it was my understanding that Humphrey-Hawkins was actually no longer in effect. Am I wrong on that? Did it lapse in 2005 or 2006?

Mr. HUIZENGA. I wasn't here.

Mr. BIVENS. Okay. Sorry. So I am not, you know—I think the dual mandate should absolutely be part of what the Fed is tasked to do.

Mr. HUIZENGA. Okay.

Thank you, Mr. Chairman. I yield back my time.

Chairman PAUL. Thank you.

I now yield 5 minutes to Congresswoman Maloney from New York, who has joined us.

Mrs. MALONEY. Thank you so much, Mr. Chairman, for this hearing.

And I thank all the panelists for their thoughtful testimony that they delivered to our offices.

I would like to ask Dr. Vedder to comment on some of the facts that were raised in Dr. Bivens's testimony. In his testimony, he cited a study estimating that the \$600 billion in Treasury asset purchases is likely to boost GDP by up to a full percentage point, which translates into roughly 1 million full-time jobs.

That same study also stated that the full effect of all large-scale asset purchases undertaken by the Federal Reserve probably supported nearly 3 million jobs and will have lowered measured unem-

ployment by 1.5 percentage points through the end of 2012. Other economists and researchers have supported this with similar studies and results.

And so my question to Dr. Vedder is, isn't this solid research, solid evidence that sound monetary policy does help create jobs?

Mr. VEDDER. I haven't read the studies, to be honest, Congresswoman.

But I will say this: Since the recession began in late 2007, the Fed has followed the most expansionary monetary policy in, I think, its history in a situation like this. It has created a trillion dollars in excess reserves. It has done a whole variety of efforts and exertions to bail out companies and so forth in distress. And yet, we have fewer people working today than we did when this effort began. We have the worst employment record of any major downturn since the Great Depression.

And so I can't see any positive association between Federal Reserve monetary policy and job creation based on the reading of the evidence in a period when we have a 9 percent unemployment rate and we have, what, 15 million—"X" number of people out of work. It is kind of hard to get warm and fuzzy about the Fed's success rate with its monetary policy in recent times.

Mrs. MALONEY. May I ask unanimous consent to place this study in the record?

Chairman PAUL. Without objection, it is so ordered.

Mrs. MALONEY. And also to state that Christina Romer and others, other economists, including major economists, have testified that the economic shocks that our country has suffered are 3 times worse than the Great Depression. As the daughter of parents who suffered through the Great Depression, no matter how horrible this recession is or has been, it is nothing like what our country went through in the Great Depression.

So I would like to ask Dr. Bivens, Dr. Vedder mentioned that he believes that there should be constitutional constraints placed on the Federal Reserve's authority. Can you comment on that? And do you agree?

Mr. BIVENS. First, I would just like to reiterate your point. It is bad out there in the U.S. economy; the great recession is really bad. The shock to the private sector that happened with the burst in the housing bubble is absolutely enormous. Like you say, researchers in many places say it was bigger than what led to, actually, the Great Depression. And I think it was the aggressive response of policymakers across-the-board that kept it from being so.

In terms of constitutional limits on the Fed, I would like a lot more detail. If those limits would impede them from fighting future recessions as aggressively as they fought this one, I think that would be a very bad thing.

I think it is one thing to say this has been the most aggressive response ever and we still have 9 percent unemployment. It is kind of like, imagine a town that is building a levee wall in response to a flood. You can say, "It is the biggest levee we ever built, but the water keeps coming over it. We should stop. It is bigger than we have ever built." You have to build a wall as big as the shock.

Mrs. MALONEY. Okay. Thank you.

Last week, Chairman Bernanke gave a speech at the National Press Club. I ask unanimous consent to place that speech in the record.

Chairman PAUL. Without objection, it is so ordered.

Mrs. MALONEY. And he stated that, although economic growth will probably increase this year, unemployment is expected to remain above and inflation below the levels that policymakers have judged to foster maximum employment and price stability.

Since the Fed's rate has been near zero since December 2008, the Fed has been using alternative tools to provide additional monetary accommodation. Specifically, the Fed has been purchasing longer-term securities on the open market, or in common speech it has been called quantitative easing. And the goal of this has been to put downward pressure directly on longer-term interest rates.

Chairman Bernanke—and I want to ask the panelists if they could respond to whether or not they agree with his statement. He stated that, "A wide range of market indicators supports the view that the Federal Reserve's securities purchases have been effective at easing financial conditions."

I would like the panel to comment on whether they agree or disagree. I think it is an important question.

Mr. DILORENZO. They have to have had an effect in some industries, of course, because wherever the money goes to first. But, obviously, it has had very little effect on overall unemployment, since the unemployment rate remains stuck around 9 percent or more, depending on how it is measured.

So, yes, it has had some effect on some industries. That is why the stock market is up, some of the big corporations have done well. But unemployment is not being very successful.

Mrs. MALONEY. Could you also comment on what would have happened if we had not engaged in quantitative easing with the Fed's fund rate close to zero? What would have happened?

Mr. DiLORENZO. Since you are, sort of, looking at me, it is not a coincidence, I don't think, that we have had somewhat of an explosion in government at all levels—the Fed printing money, government spending, government debt, and we are stuck at 9 percent unemployment or more. Because all of this diverts resources in the direction of government-directed spending in resource allocation away from the entrepreneurs and the business owners and the consumers, who know a lot better what to do with that money than government bureaucrats and politicians do.

And so I think we would be much worse off—as we said earlier before you came, Congresswoman, that we may be sowing the seeds of another bubble with all this quantitative easing.

Mrs. MALONEY. Dr. Bivens, would you comment briefly?

Mr. BIVENS. Yes, very briefly. If we had not done the quantitative easing, long-term interest rates would be higher, and we would have less business investment and consumer spending.

And I would just note, business investment has performed very well for the past 5 or 6 quarters, growing at about 15 percent at an annualized rate. So we would have less of that if we had not done the quantitative easing.

Mrs. MALONEY. My time has expired.

Chairman PAUL. Thank you.

I now yield 5 minutes to Congressman Jones from North Carolina.

Mr. JONES. Mr. Chairman, thank you again.

And I again want to start with an e-mail from my district and then get to a question.

This is Mr. Gordon Hansen from New Bern, North Carolina: “Thank you for requesting my opinion with regard to the Federal Reserve. My initial reaction to the Fed's policy to printing more money is, how is the Fed going to stop inflation? Since the beginning of this century, standard of living has decreased because fuel increased so rapidly, the middle-class wages could not keep up, and no one seems to notice or care.”

This is America talking, quite frankly. And we have been elected by the people from all over this country to represent their feelings and their needs in Washington, D.C.

I have great respect for each and every one of you. You are very learned men, much more than I.

The frustration that I see back in my district and I feel is that, when I was born in 1943—and thank you for recognizing my birthday tomorrow—when I was born in 1943, this country was in war and coming out of war. This country impressed the world with its greatness after the war, of how we were in a position where we were creating things, we were manufacturing things.

And that gets me to the point that I am one of the few Republicans—I am opposed to any trade agreement at this time. I am not adamantly opposed to trade agreements, but when you are in a deep recession, which everybody has acknowledged, why are we passing the Korean trade agreement so we can create 70,000 jobs, I believe has been said. I am trying to verify that, by the way. I don't believe it.

But the point is, this country is a debtor nation. Now, we can pump it up, from the Feds to everybody else can put money out here. But, as everybody is saying, the people understand what is happening. They fully understand what is happening.

So my point is this. My State of North Carolina, from 1999 until 2009, lost 376,000 manufacturing jobs. What would have happened, in your opinion—I have a two-part question—what would have happened, in your opinion, if we had not passed NAFTA, CAFTA, and all of these trade agreements that supposedly were going to create more jobs for the American people?

I think greed is probably the most dangerous thing affecting America. Greed will destroy an individual, it will destroy a family, it will destroy a country. And my humble opinion is that greed has put America in this position, not only because of trade agreements.

But, in your learned minds, give me an example of nations that at one time were economically strong and yet, because of some decision such as free trade, that these nations—and maybe it is not exactly the same comparison—but these nations, in my opinion—at one time, Spain ruled the world. At one time, France ruled the world. At one time, Rome ruled the world. At one time, America was the dominant power. Now it is China. And we are slaves to China. We owe them over \$900 billion.

From an economic standpoint, where do you see America? Are we at a point that America needs to understand that we cannot come back to be a strong power in the world? Are we at a point where, yes, we will have somewhat of a quality of lifestyle, but it is never going to go back, it is not even going to come close to going back to what it was?

I don't think you can continue to sell yourself out to other nations and expect to be strong economically or militarily.

Any response?

Mr. DiLORENZO. Sir, the countries you mentioned, the Spanish empire and so forth, they essentially bankrupted themselves with empire. And, in my view, we are a long way down that road with our military empire all around the world, too. And so I think that is a contributing factor.

And the only other thing I will say is, I am a free-market economist, but I opposed NAFTA at the time because when I first saw it, it was, like, a thousand pages of government regulations. And I didn't think it really constituted free trade at all, but government-managed trade. And I guess you would you have to do a careful study of how it has been managed over the past 15 years or so to really know its effects. But I wouldn't blame the problems on free trade, because I don't think NAFTA was a free-trade agreement, despite the words "free trade."

Mr. JONES. Thank you.

Mr. VEDDER. I more or less agree with Professor DiLorenzo. I do believe in free trade as a concept. I think most economists do. This is one thing economists of all persuasions more or less agree with, but we do put a lot of provisions in these bills that get far afield from the issue of trade. And I think that is a source of concern.

As an economic historian, I would have to note that nations have rises and falls in the way people work and what they do. We had a rise in manufacturing in the 19th and early 20th centuries because of what us economists say, we had a comparative advantage in manufacturing. We have lost some of that comparative advantage today. Some of it has to do with government policies. Some of it has to do with other things that have nothing do with what the

U.S. Government does.

I don't personally worry too much about the loss of manufacturing jobs per se. What I worry about is the loss of jobs in totality, the productivity of labor in its totality, and so forth. And that is, I think, a broader concern.

Mr. BIVENS. You asked a very big question, so let me just try to be very brief.

I think it is absolutely true that if we want different results, if we want living standards to continue to grow at a reasonable rate in the United States for the broad workforce, we better start doing lots of things differently. And one of those things we should do differently is our international economic policy.

I am a little shocked to agree; I also did not like NAFTA. I think we need to think about exchange rates very differently. And so we better start doing things differently if we want to continue to grow.

Mr. JONES. Thank you, Mr. Chairman.

Chairman PAUL. Thank you.

I will yield 5 minutes now to Mr. Green from Texas.

Mr. GREEN. Thank you, Mr. Chairman.

Let's talk for just a moment about causal connections as opposed to coincidence. Last summer, when the American Recovery and Reinvestment Act was at its zenith, when it was providing maximum benefit, we also at that time saw the turnaround in terms of a recovery in the economy.

Mr. Bivens, was that just coincidence or is there a causal connection?

Mr. BIVENS. I definitely believe there is a causal connection. Like you say, the Recovery Act was providing a sort of maximal boost to the U.S. economy at that point. There are a lot of estimates that said, without the support provided by the Recovery Act, we would have seen zero growth for about 3 or 4 quarters even after the official recession ended.

Mr. GREEN. Let's move now to the FDIC.

Mr. DiLorenzo, do you, sir, believe that the FDIC serves a meaningful purpose with its ability to wind down banks that are failing?

Mr. DiLORENZO. With its ability to close down banks?

Mr. GREEN. That are failing. When they are failing, the FDIC moves in, usually on a Friday, they wind down the bank, and then on Monday there is a new bank that opens, perhaps under the same name, or a new name, but they do reopen, and they move the assets. And they have the ability to do this with a premium that is paid by banks so as not to interrupt the economy.

Do you agree with this?

Mr. DiLORENZO. I don't think we need a government institution to do that. That could be handled by the courts, I would think. But it is probably one of the least offensive things the FDIC—

Mr. GREEN. You would not have the FDIC, you would have the courts deal with the banks and the runs that would be created on banks? You would have multiple banks, as was the case when we were starting the great recession, that were challenged, and you would just simply let all of these banks go into bankruptcy? Do you not see that by doing this we would have runs, greater runs on banks that would create greater stress on the economy?

Mr. DiLORENZO. I am not sure—before we had an FDIC, I am not sure you could make the case that the bank runs were worse throughout history.

Mr. GREEN. They were. Before we had the FDIC, we had the Great Depression.

Mr. DiLORENZO. Yes, for a few short periods. But if you look at the long stretch of history, I don't think—you would have a much tougher time making that case.

Mr. GREEN. I would say to you that a few short periods that devastate the economy to the extent that the Great Depression did is something that would not go unnoticed.

Mr. Bivens, do you think the FDIC serves a meaningful purpose?

Mr. BIVENS. Absolutely, for the reasons you say. They make people secure in their deposits, and so you don't see the runs.

Mr. GREEN. Mr. Vedder, do you think the FDIC serves a meaningful purpose?

Mr. VEDDER. I wrote my doctoral dissertation on the FDIC. I think, generally, it has been one of the more successful government agencies. I do think it needs, however—

Mr. GREEN. Excuse me, since my time is limited. Thank you. Let me just follow up with this.

Mr. VEDDER. It needs—

Mr. GREEN. You will get an opportunity.

Let me follow up with this. Given that you think it serves a meaningful purpose—and I agree with you—let us then conclude something else. Do you think that we should be able to wind down these AIGs of the world when they can provide systemic risk to the economy? Or should they just be allowed to bring the economy down?

The AIGs of the world—you are familiar with AIG?

Mr. VEDDER. What do you mean by “wind them down?” Why don't we let them go into bankruptcy? What is wrong with bankruptcy?

Mr. GREEN. Why not let the banks go into bankruptcy? That is the point. You just said that the FDIC protects banks. If you are going to prevent banks from going into bankruptcy, why not try to salvage the economy and prevent the types of stress that can be caused by having these institutions that create systemic risk, by preventing them from just simply going into bankruptcy and creating all of these problems for us?

The point I am making is, Dodd-Frank deals with that. If you don't like Dodd-Frank, then you don't like a means by which we deal with “too-big-to-fail” institutions. Most people think that we need to do something about these institutions that were labeled “too-big-to-

fail.” Dodd-Frank addresses this. Dodd-Frank addresses other aspects.

You mentioned credit cards. Do you think there ought to be something called universal default? A lot of consumers are sitting in here. Are you familiar with that term, “universal default?”

Mr. VEDDER. I am familiar with the term, yes.

Mr. GREEN. Are you familiar with it? Do you think we ought to have universal default?

Mr. VEDDER. I haven't—I don't have a position on that.

Mr. GREEN. I do. I don't think consumers ought to be in a position such that, because they have problems in one place, credit card companies can simply decide, we are going to declare you in default with us because you had a problem someplace else, especially in this economy. Dodd-Frank deals with this.

Mr. VEDDER. Does it deal with Fannie Mae or Freddie Mac?

Mr. GREEN. Now, let me ask you one more. I have one more for you. I believe you are a gold standard person. Is that a fair statement, based upon your comments and your writings?

Mr. VEDDER. I think the gold standard—we did well when we were on the gold standard.

Mr. GREEN. And if we return to it, if we return to the gold standard, what would happen?

Mr. VEDDER. Pardon?

Mr. GREEN. What would happen if we returned to the gold standard?

Mr. VEDDER. It would be very—the return to the gold standard is not—if we did it and if the world did it, I think we would be a better place. I think we would be a better place. But I don't see it happening in the short term.

Mr. GREEN. Let's assume that you have made a prediction that we would be in a better place. Is that a fair statement?

Mr. VEDDER. Yes.

Mr. GREEN. Now, what did you say about people who make predictions earlier?

Mr. VEDDER. Economists are lousy predictors.

Mr. GREEN. What did you say about the people who make predictions?

Mr. VEDDER. So why are you sitting here listening to me, Congressman?

Mr. GREEN. I am listening to you because you are here as a person who merits some attention, given that you are before Congress.

Now, tell me, what did you say about people who make predictions?

Mr. VEDDER. What did I say?

Mr. GREEN. Yes, sir. You don't recall?

Mr. VEDDER. I said that some people, some economists make bad predictions, and some of them make good predictions.

Mr. GREEN. You had an "F" word that you used.

Mr. VEDDER. I did?

Mr. GREEN. Yes.

Mr. VEDDER. I don't remember.

Mr. GREEN. I do. You said they were foolish.

Mr. VEDDER. Foolish?

Mr. GREEN. Yes, sir.

Mr. VEDDER. Oh, okay.

Mr. GREEN. All right. Thank you for your prediction.

Mr. VEDDER. Okay.

Mr. GREEN. I yield back.

Chairman PAUL. I yield myself 5 minutes for closing remarks and anybody else who wants to have another question.

I do want to bring up the subject generally of QE2. There is a strong disagreement between those who object to it and Dr. Bivens, who thought that it really has helped a whole lot. And I don't think we will resolve that.

But, that was part of the program of injecting \$4 trillion into the economy, with the argument that it has done very, very little at all and, some of us believe, maybe harm in the long run. But the \$4 trillion, actually we can argue that it did help prevent a depression for some people, mainly Wall Street and the big bankers and some corporations. They were able to benefit. And who came out on the short end? The people who lost their jobs and lost their houses and lost their mortgages. So the whole thing didn't work if you were trying to help the poor people. I think you were destroying the poor people while it was nothing more than corporate welfare—\$4 trillion, and we have very little to show for it.

But the question I want to address is, there is a little bit of talk—I don't think it is serious—about unwinding this. We bought up all the trash, all the worthless assets. And the taxpayers own this now, and it is on the books. We can't fully audit the Fed. We can't find out what they are doing. And now they are talking about, maybe we ought to unwind this. That is, we are going to sell that trash. Who is going to buy it? How do we do it? And when do we do it?

Chairman Bernanke says it is not time yet, but he is really cocky about this. He knows when it is, and he is going to do it, and he is going to do it smoothly. And what did he say about problems coming? His anticipation, his whole idea that when a crisis comes and when there is a recession, I can take care of it, I know how to inject money in just unlimited amounts. And I tell you what, he did, unlimited amounts, the largest ever. And the jury may be still out on how bad a failure it is going to be, but the time will come.

But the question is, what are we going to do about unwinding? Are they really serious? And what would that do to employment? If they did it now—they are not going to dare do it now, with unemployment rates, real unemployment rates up to 22 percent, because it would do that horrible thing of raising interest rates. So that is not going to happen.

What they are going to do is continue to look at the CPI. That is where Bernanke is going to get his signal. When the CPI goes up and we have price inflation, that is when we have to unwind.

And he is so overconfident about this. You talk about predictions and braggadocio, “I can take care of it.” Like, he didn’t know it was coming, he would take care of it if it came, and now he says, “I know exactly when to turn it off.” I just think that is such dangerous talk.

By looking at the CPI, what does he do? He takes the CPI, he excludes food and energy, and says, gee, CPI isn’t going up, and he has price stability. There is no more price stability in this country when you look at what happens to the bond prices and the housing prices and commodity prices. There is nothing. What is this stuff about unwinding?

I would like a comment from each one of you on what is going to happen, or if it happens, and what are the abilities of truly unwinding this and really saving us from a calamity?

First, Dr. DiLorenzo.

Mr. DiLORENZO. Congressman, what you just said reminds me of what Friedrich Hayek won the Nobel Prize for in 1974. It is summarized in a book of his called, “The Fatal Conceit.” And it is essentially a critique of this whole idea that one man or one group or one committee could, sort of, essentially plan an economy, whether it is by manipulating interest rates or the price level or whatever else. And I see no reason why we Americans are better at central planning today than the Russians were in the 20th Century.

That is basically the mindset that you are talking about when you are talking about Chairman Bernanke claiming to be able to manipulate the economy in these ways. I don’t see any way out. If he

had a smooth exit strategy, I assume he would be taking it right now. And so I see nothing but bad things that could possibly happen from winding down, as you say.

Chairman PAUL. Dr. Vedder?

Mr. VEDDER. To me, the supreme irony of all of what you just said and what Professor DiLorenzo said is, why was the Fed created in the first place? I think if you read the history of the period, after the panic of 1907—the panic of 1907, there was no central bank. And so, what happened were a bunch of private bankers, led by J.P. Morgan, sort of organized an ad hoc committee to sort of save banks and prevent them from failing. And by the way, it achieved some success in doing that.

But afterwards, people said we can't have a single individual serve as sort of the guru to save our economy, like J.P. Morgan. We have to create a central bank and decentralize it into 12 banks and all, to keep the power diffuse.

And we moved away from that diffusion of power back to the centralization of power. Now it is Bernanke. At least J.P. Morgan had some skin in the game. He had some money in the game. When the banks failed, he failed. What does Bernanke have in the game? He gets his salary anyway and then goes off to work for Goldman Sachs.

So I think that is it. And I have no idea how it is going to be unwound. Because it is an historically unprecedented situation, I can't predict. But I am uneasy. And that is why markets are uneasy. And that is why prices—that is why we have the problems we have. That is why bond prices are starting to go up. That is why Moody's is starting to say, should we give AAA bond rating to the U.S. Government securities? Things like that. People are getting uneasy.

Chairman PAUL. Maybe Dr. Bivens will be more optimistic.

Mr. BIVENS. Slightly, yes. It is not a trivial challenge about how this is all going to be unwound. But I will say just two things quickly.

One, it is going to actually feel like a luxurious decision if we can start unwinding this and the unemployment rate is much lower. And so, to my mind, the proper focus now is on providing maximal support to job growth in the economy, not worrying so much about how this is unwound.

And two, I have to say, I am sure there will be mistakes made as we do it. I am sure there will be some targets missed. But he has actually—Ben Bernanke and the rest of the Fed has laid out a strategy for how this will be unwound. They have talked about the instruments they are going to use, the levers. Is it going to work perfectly? Are they going to hit forecasts to the decimal point?

Absolutely not. But, to my mind, the fact that they are focused much more on support and job growth in the near term says very good things about what they are doing.

Chairman PAUL. Thank you.

Mr. Clay, I yield to you for another 5 minutes. Or Mr. Green.

Mr. CLAY. Mr. Chairman, I will yield to Mr. Green.

Mr. GREEN. Thank you, Mr. Chairman. And I thank the ranking member, as well.

I would close by reminding us that we have seen, I am sure many of you, the movie, “Back to the Future.” Based upon what I have heard today, there are some who would take us “forward to the past”—back to the past, or forward to the past, when we didn’t have a Fed, when we didn’t have FDIC, when we did not have VA, when we did not have many of the institutions that have helped people move into the middle class. Home ownership, 30-year mortgages—these things have made a difference in the lives of the American people.

And I would caution us, before we make decisions to eliminate institutions that have served us well, perhaps we should consider the unintended consequences of such a massive decision. And I think we ought to proceed with a great degree of caution when we say things like, we can live without the Fed, without the FDIC. I am indicating VA; no one said it. But when you are on this track, it appears to me that you may be talking about the VA, as well.

Many of these institutions have served a good many middle-class people well, and we ought to move with caution. I thank you for the time, and I yield back. Chairman PAUL. The hearing is adjourned.

{Whereupon, at 12:15 p.m., the hearing was adjourned.}

STATEMENTS

STATEMENT FOR THE RECORD
HON. RON PAUL
REPRESENTATIVE, 14TH DISTRICT OF TX
CHAIRMAN, SUBCOMMITTEE ON
DOMESTIC MONETARY POLICY & TECHNOLOGY
U.S. HOUSE OF REPRESENTATIVES

For the past three decades, the Federal Reserve has been tasked with a dual mandate: keeping prices stable and maximizing employment. Influenced by Keynesian economics and the supposed tradeoff between inflation and unemployment, the dual mandate relies on the idea that a handful of experts can successfully steer the American economy and create economic growth. This has forced upon us an interventionist monetary policy that believes that creation of money out of thin air is the cure for all that ails us.

This policy relies not only on the fatal conceit of believing in the wisdom of supposed experts, but also on numerical chicanery. Rather than understanding inflation in the classical sense as a monetary phenomenon-- an increase in the money supply- it has been redefined as an increase in the Consumer Price Index (CPI). The CPI is calculated based upon a weighted basket of goods which is constantly fluctuating, allowing for manipulation of the index to keep inflation expectations low. Employment figures are much the same, relying on survey data, seasonal adjustments, and birth/death models, while the major focus remains on the unemployment rate. Of course, the unemployment rate can fall as discouraged workers drop out of the labor market altogether, leading to the phenomenon of a falling unemployment rate with no job growth.

In terms of keeping stable prices, the Fed has failed miserably. According to the government's own CPI calculators, it takes \$2.65 today to purchase what cost one dollar in 1980. And since its creation in 1913, the Federal Reserve has presided over a 98% decline in the dollar's purchasing power. Recent news stories have offered numerous anecdotes of prices rising far faster than would be expected if official inflation figures were accurate. With commodities, oil, or food prices, speculation is that the Federal Reserve's quantitative easing is leading to hot money flooding world markets. The average American family sees the price of milk, eggs, and meat increasing, while packaged household goods decrease in size rather than price. People around the world are reacting against the specter of sharp price increases. While the focus of this hearing does not deal with inflation or even specifically with the dual mandate, this subcommittee undoubtedly will hold further hearings on these topics in the future.

Today's hearing focuses on jobs, and the inability of the Federal Reserve's monetary policy to create jobs or to achieve maximum employment. The stagflation of the 1970s should have taught us this lesson already. The Federal Reserve's loose monetary policy, rather than leading to a tradeoff between jobs and inflation, instead led to both high inflation and high unemployment. Hopefully we will learn the lesson this time around.

Of course loose fiscal policy has failed to create jobs too. Consider that we had a \$700 billion TARP program, nearly \$1 trillion in stimulus spending, a government takeover of General Motors, and hundreds of billions of dollars of guarantees to Fannie Mae, Freddie Mac, HUD, FDIC, etc. On top of those programs the Federal Reserve has provided over \$4 trillion worth of assistance over the past few years through its credit facilities, purchases of mortgage-backed securities, and now its second round of quantitative easing. Yet even after all these trillions of dollars of spending and bailouts, total nonfarm payroll employment is still seven million jobs lower than it was before this crisis began. Since employment levels bottomed out last year, the government reports that roughly one million jobs have been created. This means that each job created has cost upwards of five million dollars. We probably would have been better off just printing out these trillions of dollars and throwing them out the window of a helicopter.

In this same period of time that we lost seven million jobs, the total U.S. population has increased by nine million people. We would expect that roughly four million of these people should have been

employed, so we are really dealing with eleven million fewer employed people than would otherwise be expected. Let us put this figure in perspective. Eleven million people represents almost the population of Ohio, a figure greater than the population of 43 of the 50 states. Eleven million people is twice as many people as are currently employed in construction, 45% more people than are currently employed in financial activities, and almost as many people as are currently employed in manufacturing.

Unfortunately, numbers like these are often ignored or overlooked. Everyone pays attention to the unemployment rate, which has just recently declined. Part of this is due to discouraged workers who have given up looking for work and have taken themselves out of the labor force, but the employment numbers are rigged in such a way as to make it look as though the employment situation is improving.

Another curious anomaly in employment data relates to seasonal adjustments. Seasonal variations are understandable-- for instance workers hired for the Christmas season and laid off immediately afterward. But such statistical adjustments are easy to manipulate. When unemployment figures were released in February of 2010, non-seasonally adjusted figures showed an additional 1.4 million unemployed workers from December 2009 to January 2010, while the seasonally adjusted numbers showed 69,000 fewer unemployed. The most recent figures released in February of 2011 showed an additional 3.1 million unemployed workers from December 2010 to January 2011, yet the seasonal adjustment shows 367,000 fewer unemployed. Spinning a 22% increase in the number of unemployed workers into a statistical decrease should be met with a healthy dose of skepticism.

It should not be surprising that monetary policy is ineffective at creating jobs. For one thing, there are numerous other factors that affect employment, including taxes, labor laws, and other regulations that contribute to labor market rigidity and institutional unemployment. But it is the effects of monetary policy itself that cause the boom and bust of the business cycle that leads to swings in the unemployment rate.

By lowering interest rates through its loose monetary policy, the Fed spurs investment in long-term projects that would not be profitable at market-determined interest rates. The signal to businesses is that consumers are increasing savings and deferring consumption in order to consume more capital-intensive more in the future. If the Fed-mandated interest rate is in fact lower than the

market interest rate, the reality is that consumer preferences between consumption and savings have not changed, but businesses act as though they have. The result of lower interest rates is an economic boom which manifests itself as a bubble.

Everything seems to go well for awhile until businesses realize that they cannot sell their newly-built houses, their inventories of iron ore, or their new cars. Low interest rates have spurred production, but because the low interest rates resulted from Fed intervention and not through changes in consumption patterns, the result is overcapacity. Resources have been "malinvested," directed into sectors of the economy which are not truly in demand from consumers. These resources must be liquidated, and this is the corresponding bursting of the bubble. Until these resources are redirected, often with great economic pain for all involved, true economic recovery cannot begin.

Labor is one of these resources that can be malinvested. As inflation rises due to the Fed's monetary intervention, real wage rates decrease, increasing the demand for labor and leading to lower unemployment. Sectors into which this new money flows see hiring increases, as we recently saw in financial services, mortgage lending, and construction during the housing boom. When the bust comes, however, these workers end up being laid off. They find it difficult to find employment in other industries due to an inability to sell their houses and move, or to retrain for a new skilled labor position, or for any number of other reasons. However the result of that initial meddling in monetary policy is an eventual increase in the unemployment rate.

We find ourselves now in the midst of the worst economic crisis in decades. Unemployment remains persistently high, and the United States cannot afford increased meddling by the Federal Reserve. Over \$4 trillion in bailout facilities and outright debt monetization, combined with interest rates near zero for over two years, have not and will not contribute to increased employment. I shudder to think of what the Fed might do if the unemployment rate were to continue to increase.

By falsely diagnosing the cause of the crisis, the Fed's solution is fatally flawed. What is needed is liquidation of debt and of malinvested resources. Pumping money into the same sectors that have just crashed merely prolongs the crisis and ensures that the day of financial reckoning that eventually will come will be far more severe than otherwise. Until we learn the lesson that jobs are produced through real savings and investment and not through the

creation of new money, we are doomed to repeat this boom and bust cycle.

STATEMENT FOR THE RECORD
HON. SPENCER BACHUS
REPRESENTATIVE, 6TH DISTRICT OF AL
CHAIRMAN, FINANCIAL SERVICES COMMITTEE
U.S. HOUSE OF REPRESENTATIVES

**ENTREPRENEURS AND WORKERS OF AMERICA WILL LEAD US TO
ECONOMIC RECOVERY, NOT GOVERNMENT**

Financial Services Committee Chairman Spencer Bachus prepared statement for the Domestic Monetary Policy Subcommittee hearing entitled “Can Monetary Policy Really Create Jobs?” follows:

“I commend Chairman Paul for choosing this topic for the first hearing of this subcommittee.

“The nation’s unemployment rate has been consistently at or above 9 percent for the longest period of time since World War II. Last week, the chairman of the Federal Reserve predicted we will have unacceptably high unemployment for several more years.

“There are reasons for this dearth of employment. Yes, we had a major economic catastrophe. But throughout our history, American businesses and American workers have proven themselves strong and resilient. In just our recent past, the economy was able to shrug off the S&L crisis and the bursting of the dot-com bubble relatively quickly. So what’s different this time? Unlike now, we didn’t have out-of-control spending and trillion dollar deficits as far as the eye can see. We did not have a Congress and a White House issuing an ever increasing and endless flurry of confusing statutory and regulatory mandates. We were not confronted by a Federal Reserve printing money at an alarming rate nor regulators and the White House arbitrarily deciding which private businesses would survive and which would perish. We didn’t have, with the exception of the Hoover and FDR administrations, the Executive Branch attempting to micromanage the private sector with a barrage of new regulations, commands or directives.

“All this has created higher costs and a level of uncertainty that is causing American businesses to hunker down rather than hire.

“Restoring confidence and certainty is essential for restoring our long-term growth, and I and many others are concerned that the Federal Reserve’s so-called QE2 action introduces more uncertainty which could lead to higher inflation and generate artificial asset bubbles that cause further economic harm.

“It will be the entrepreneurs and workers of America who will lead us to economic recovery, not government stimulus or

micromanagement. However, the private sector will do so only if we refrain from burying them in a blizzard of burdensome and overreaching regulatory constraints.

“The Financial Services Committee and House Republicans are committed to sweeping away unnecessary, repetitive or intrusive government-imposed obstacles to recovery and hiring. We will look to remove the confusing impediments the Dodd-Frank Act places in the way of a freely operating and safe financial services industry. And, through the focus of Dr. Paul’s subcommittee, we will look towards a more consistent Fed monetary policy -- as discussed at last week’s hearing by Dr. John Taylor -- without in any way compromising the central bank’s independence.”

STATEMENT FOR THE RECORD

HON. BILL HUIZENGA

REPRESENTATIVE, 2ND DISTRICT OF MI
U.S. HOUSE OF REPRESENTATIVES

Good morning and thank you Chairman Paul and Ranking Member Clay for holding this important hearing today.

By trade, I am a small business owner involved in both the real estate and construction. I now represent a district currently suffering an unemployment rate well above the national average and one in which this hearing's topic holds special significance. Earlier this month, the Bureau of Labor Statistics reported that the national unemployment rate fell from 9.4 percent to 9.0 percent. That equates to roughly 14 million Americans without a job. While this is a staggering number, in my home state of Michigan, the unemployment rate is an astonishing 11.7 percent and in some areas of the Second District, it is nearly double the national average.

This past fall, the American public made their voices heard loud and clear. The most vital issue facing this Congress is jobs, jobs, jobs, and I thank you Chairman Paul for demonstrating that it is this subcommittee's number one priority by making it the subject of your first hearing.

The Federal Reserve Board of Governors is congressionally mandated to enact monetary policy with the goal of maximizing employment. However, after witnessing the Obama administration's attempts over the previous two years to increase employment through failed policies, I am pleased that we are now spending some time exploring the role of monetary policy in the area of job growth.

As I previously mentioned, I am a small business owner at heart. Such businesses are the backbone of the U.S. economy and provide more than two-thirds of American jobs. I understand the universal principles of successful businesses, and it is important that we recognize the appropriate role for government in the process. Simply put, the private sector, not the public sector, creates prosperity. It is clear to all small business owners that responsible fiscal policy including reduced government spending and the implementation of friendly tax and regulatory environments go a long way in creating an atmosphere for success.

In recent years, the FED has taken unprecedented action to provide liquidity to the financial markets; yet month after month, unemployment remains at historic levels. Most recently, due to the fact that the federal funds rate sits near zero percent, the FED

decided to purchase an additional \$600 billion of Treasury securities commonly referred to as “quantitative easing” or “QE2.” This strategy was undertaken despite the fact that the first round of quantitative easing (QE1) – the FED purchase of \$1.2 trillion in Treasury and Agency securities in March 2009 – has not proven to be an effective method of creating jobs.

Today we will examine as a whole what effect the Federal Reserve’s open market operations have on long and short term unemployment rates. In addition, I look forward to carefully inspecting what potential role FED policies played in such artificial asset bubbles as that of the housing market between 2001 and 2008. As a Member of the 112th Congress and a member of this important subcommittee charged with overseeing operations at the Federal Reserve, I take my responsibility for strict oversight of taxpayer dollars with the utmost seriousness. I look forward to today’s robust discussion on the short-term effectiveness of monetary policy on job growth, the appropriateness of the FED’s dual mandate, and potentially negative long-term consequences from the FED’s most recent unparalleled intervention in the markets.

Mr. Chairman, thank you again for holding this important hearing, and I look forward to hearing from our witnesses.

WITNESS TESTIMONY

WRITTEN TESTIMONY OF THOMAS J. DILORENZO, Ph.D.

PROFESSOR OF ECONOMICS
SELLINGER SCHOOL OF BUSINESS
LOYOLA UNIVERSITY MARYLAND

Mr. Chairman and members of the committee, I thank you for the opportunity to address the issue of today's hearing: "Can Monetary Policy Really Create Jobs?" Since I am an academic economist, you will not be surprised to learn that I believe that the correct answer to this question is: "yes and no." Monetary policy under the direction of the Federal Reserve has a history of creating *and destroying* jobs. The reason for this is that the Fed, like all other central banks, has always been a generator of boom-and-bust cycles in the economy. Why this is so is explained in three classic treatises in economics: *Theory of Money and Credit* by Ludwig von Mises, and two treatises by Nobel laureate economist F.A. Hayek: *Monetary Theory and the Trade Cycle* and *Prices and Production*. Hayek was awarded the Nobel Prize in Economic Science in 1974 for this work. I will summarize the essence of this theory of the business cycle as plainly as I can.

When the Fed expands the money supply excessively it not only is prone to creating price inflation, but it also sows the seeds of recession or depression by artificially lowering interest rates, which can ignite a false or unsustainable "boom" period. Lower interest rates induce people to consume more and *save less*. But *increased* savings and the subsequent business investment that it finances is what fuels economic growth and job creation.

Lowered interest rates and wider availability of credit caused by the Fed's expansionary monetary policy causes businesses to invest more in (mostly long-term) capital projects (primarily real estate in

the latest boom-and-bust cycle), and there *is* an accompanying expansion of employment in those industries. But since the lower interest rates are caused by the Fed's expansion of the money supply and not an increase in savings by the public (i.e., by the free market), businesses that have invested in long-term capital projects eventually discover that there is not enough consumer demand to justify their investments. (The reduced savings in the past means consumer demand is weaker in the future). This is when the "bust" occurs.

The economic damage done by the boom-and-bust policies of the Fed occur in the boom period when resources are misallocated in the ways described here. The "bust" period is actually a necessary cure for the economic miscalculations that have occurred, as businesses liquidate their unsound investments and begin to make decisions on realistic, market-based interest rates. Prices and wages must return to reality as well.

Government policies that bail out businesses that have made these bad investment decisions will only delay or prohibit economic recovery while encouraging more of such behavior in the future (the "moral hazard problem"). This is how short recessions can be turned into seemingly endless ones. Worse yet is for the Fed to create even more monetary inflation, rather than allowing the necessary economic adjustments to take place, which will eventually set off another boom-and-bust cycle.

As applied to today's economic situation, it is obvious that the artificially low interest rates caused by the policies of the Greenspan Fed created an unsustainable boom in the housing market. Thousands of new jobs were in fact created – and then destroyed – giving an updated meaning to Joseph Schumpeter's phrase "creative destruction." Many Americans who obtained jobs and pursued careers in housing construction and related industries realized that those jobs and careers were not sustainable after all; they were fooled by the Fed's low interest rate policies. Thus, the Fed was not only responsible for causing the massive unemployment that we endure today, but also a great amount of what economists call "mismatch" unemployment. The skills that people in these industries developed were no longer in demand; they lost their jobs; and now they must retool and re-educate themselves.

The Fed has been generating boom-and-bust cycles from its inception in January of 1914. Total bank deposits more than doubled from 1914 to 1920 (partly because the Fed financed part of the American involvement in World War I) and created a false boom that turned to a bust with the Depression of 1920. GDP fell by 24% from

1920-1921, and the number of unemployed more than doubled, from 2.1 million to 4.9 million (See Richard Vedder and Lowell Galloway, *Out of Work: Unemployment and Government in Twentieth-Century America*). This was a more severe economic decline than was the first year of the Great Depression.

In *America's Great Depression* economist Murray N. Rothbard demonstrated that, once again, it was the excessively expansionary monetary policy of the Fed – and of other central banks – that caused yet another boom-and-bust cycle that spawned the Great Depression. It was not the Fed's subsequent restrictive monetary policy of 1929-1932 that was the problem, as Milton Friedman and others have argued, but its previous *expansion*. The Fed was therefore guilty of contributing greatly to the massive unemployment of the Great Depression.

In summary, the Fed's monetary policies tend to create temporary and unsustainable increases in employment while being the very engine of recession and depression that creates a much greater degree of job destruction and unemployment.

**WRITTEN TESTIMONY OF
RICHARD K. VEDDER, Ph.D.**
DISTINGUISHED PROFESSOR OF ECONOMICS
OHIO UNIVERSITY

Dr. Paul and committee members, thank you. The first decade of this century had the lowest rate of economic growth of any decade since the Great Depression. Employment growth was the lowest in six decades. Inflation-adjusted equity prices fell sharply. In large part, this reflects faulty government policies. On the fiscal side, federal spending soared, increasingly financed by borrowing. The ratio of national debt to output is at a historic high for a relatively peaceful period. On the monetary side, we had the worst financial crisis since the Depression, with many iconic financial institutions closing their doors or surviving only because of federal bailouts. And, despite huge federal exertions on both the fiscal and monetary side, we have the weakest recovery going on now in the lifetimes of most persons in this room. Moreover, the huge run-up in the ratio of federal debt to output will be a significant drag on the economy for many years, and may well lead the Fed to monetize debt, unleashing a wave of inflation that can only undermine our economy.

Let me add some more factual detail. Between December 2007 and December 2010 –three full years--employment fell by over seven million in the United States, despite a first \$160-180 billion stimulus package in early 2008, a supersized second one of nearly \$800 billion in early 2009 and the subsequent addition of four trillion dollars in debt through massive deficit spending. On the monetary side, the monetary base more than doubled as the Federal Reserve gave banks literally a trillion dollars in excess reserves. The Fed pushed real interest rates into the negative territory in an attempt to provide monetary stimulus. Yet job formation was persistently negative, and we had the worst downturn in post-war history. Far from providing stimulus, the combined easy money monetary policy and wildly expansionist fiscal policy scared the heck out of business persons and investors who were further scared by all the President's bashing of capitalists, the government takeover of iconic private corporations like General Motors, the passage of an unpopular, costly, and exceedingly inefficient health care bill, the restrictions imposed by Dodd-Frank, and so on. Businesses literally accumulated two trillion dollars in cash, and the price of gold rose by about 80 percent from Election Day 2008 as investors increasingly worried about inflation.

Turning to the 2008 financial crisis, while private irrational exuberance no doubt occurred, the crisis largely resulted from three types of government failure. First, the Federal Reserve for years prior to the crisis pursued an easy-money policy that reduced interest rates below levels justified by human behavior and market conditions. This led to an unsustainable and artificial inflation in housing prices. Second, the Feds encouraged imprudent lending practices through such things as the Community Reinvestment Act and HUD policies going back to the 1990s designed to promote home ownership. Third, Fannie Mae and Freddie Mac, government sponsored corporations, promoted totally inappropriate lending practices that contributed to the housing bubble and foreclosure mess. Congress blocked attempts to rein in these companies, no doubt because of the campaign contributions they generated.

You might say that the wildly expansionary policies of the Federal Reserve have not harmed the economy; we averted a meltdown of the financial system, the economy is beginning to recover, and the much talked about inflation threat has not occurred. But I think that is too optimistic. The recovery is by many measures the weakest since the Depression amidst the most aggressive fiscal and monetary policy stimulus of any in American economic history save that surrounding World War II. Inflation has been averted in large part because a frightened consuming and investing public has been hoarding cash rather than spending. The election results of 2010 have forced some moderation or led to anticipated moderation in the policies frightening consumers and investors, so economic activity is increasing a bit. At some point, banks will start to lend some of their huge excess reserves, increasing the money stock and unleashing inflationary forces. Fed Chairman Bernanke says “don’t worry; I will not let that happen,” but the markets are not overwhelmingly trusting of this former academic, with good reason. The king size federal deficit is increasingly raising interest costs on the debt, and the Fed will feel pressures to monetize that debt and try to keep interest rates low to minimize debt service costs. All of this will increase inflationary fears that can only be restrained by the Fed selling bonds and doing other things to reduce excess reserves and the monetary base, something that seems exceedingly unlikely as we approach a presidential election year. It is revealing that the dollar has generally fallen against an equally challenged currency, the Euro, itself under attack because of the fiscal and monetary excesses of European governments. The price of gold was \$740 an ounce on Election Day in 2008 and is now over 80 percent higher. Scared

people run to gold. How long will it be that before ratings on U.S. government bonds will be reduced?

I am an economic historian, and both economics and historical experience demonstrate that federal incursions into economic activity are counterproductive; some textbooks talk about the Policy Ineffectiveness Theorem. Aggressive deficit spending and Federal Reserve monetary expansion led to stagflation in the 1970s. Japan went on a huge binge of stimulus spending in the 1990s and economic growth virtually ground to a halt. The excesses of the European welfare state and its funding are causing crises all over the European Union, from Ireland to Greece. The Obama Administration engaged in stimulus plans accompanied by rising, not falling unemployment. Bail outs and “too big to fail” policies have created a huge moral hazard problem. The Federal Reserve has engaged in huge purchases of government long term bonds and mortgages to keep long term interest rates low, but long term interest rates are *not* falling as concerns about potential inflation justifiably have risen. By many indicators, this is the weakest postwar recovery. The Fed and the government have monetary and fiscal time bombs threatening both short term recovery and long term financial and economic vitality.

Lowell Gallaway and I have reviewed the 20th century from the standpoint of explaining variations in unemployment in our book *Out of Work: Unemployment and Government in Twentieth-Century America*. Variations in unemployment rates can be explained by changes in the productivity-adjusted real wages received by labor. Other things equal, rises in productivity or prices tend to have the impact of lowering unemployment, as does falling money wages. This implies inflationary monetary policies will increase employment and lower unemployment –the Phillips Curve phenomenon. But consistent inflation changes expectations, and reduces the willingness of workers to supply their services at any given price, typically leading to increases in unemployment. Unemployment during the highly inflationary 1970s, for example, was higher on average than in the less inflationary 1950 and 1960s. Government attempts to manipulate wages and prices have employment effects. Wage enhancing policies like minimum wage laws or pro-union legislation typically raise unemployment rates, for example. Monetary policy that increases an expectation of price stability is usually associated with relatively robust employment conditions, as we observed in the 1920s, 1950s, most of the 1960s, and, to a somewhat lesser extent, in the period from about 1985 to 2000. Monetary and fiscal activities that promote productivity advances likewise increase employment

opportunities and tend to reduce unemployment. Nearly every major spike in unemployment in the 20th century is associated with some government actions that led to temporary wage-price-productivity dis-coordination: the depression of 1920-22 was an outgrowth of explosive monetary expansion followed by deceleration and reversal of that growth in the World War I era. The 1929-41 Great Depression reflected a downturn prompted by a consumption bubble arising in large part from excessive monetary growth, and then various strategies designed to raise wages, ranging from moral suasion under President Hoover to laws such as the National Industrial Recovery Act and the Wagner Act under President Roosevelt. The downturns of the mid-1970s and 1981-82 are related first to the ineffectiveness of monetary and fiscal expansion in the midst of rising inflationary explanations, and then to the effects that the reversal of monetary expansion had temporarily on real wages and thus labor markets.

As an economic historian, I am alternatively amused and saddened by a richly ironic fact. The Federal Reserve Act was in large part a consequence of concerns growing out of the 1907 banking crisis. In that crisis, bank runs in New York City imperiled major institutions at a time when many country banks kept enormous reserves in New York. An ad hoc group of private bank officials, dominated by J.P. Morgan, put together a fund that was used to head off runs on some key institutions, moderating the banking crisis. The feeling grew that it is not appropriate to have a single man, even one like J.P. Morgan, have so much discretionary power over the banking system and the economy. Yet today, a single man, Ben Bernanke, backed by a small number of others, makes huge decisions about responding to the current crisis. Ben Bernanke is the new J.P. Morgan, but at least Morgan's behavior was constrained by the fact that he, personally, had a good deal of wealth at stake as a consequence of his actions, whereas Bernanke gets paid the same whether he succeeds or fails.

What to do? Our nation achieved economic supremacy from 1871 to 1914, a period of a gold standard, near price stability and no central bank. Consumer prices in 1914 were within 10 percent of what they were in 1871. We can learn from that experience. To restore monetary stability, ideally we would ultimately consider retreating from fractional reserve banking where even moderate declines in confidence potentially lead to devastating consequences. But more immediately, we need to limit monetary growth, and given human weaknesses, probably the best way to do that ultimately is by having a gold standard or some variant that removes or dramatically

reduces the discretion of central bankers. On the fiscal side, politicians unfettered by rules behave like unsupervised alcoholics in liquor stores. Thus we need some sort of constitutional constraints on governmental fiscal actions. Practically, changes of this magnitude take time. In the short run, however, you can start holding the Fed's feet to the fire; perhaps, for starters, you should establish price stability as the single monetary mandate for the Fed, repeal the Humphrey-Hawkins Act, and privatize or abolish Fannie Mae and Freddie Mac. Private markets handled mortgages and other lending for generations successfully without federal intervention, and they can do it again. Thank you.

WRITTEN TESTIMONY OF

MACROECONOMIST
ECONOMIC POLICY INSTITUTE

MONETARY POLICY AS MACROECONOMIC STABILIZER
DURING THE GREAT RECESSION

What we now call the Great Recession was a long time in coming. The economic expansion of 2001 to 2007 was dependent to a historically unprecedented degree on a huge increase in private sector debt. This debt was, largely, used to buy homes, which saw historically large price increases. These price increases were borrowed against by homeowners who then used this equity to support consumption – consumer spending as a share of the overall economy rose to its highest level on record during the housing boom of the 2000s.

The bursting of the home-price bubble had straight-forward effects on the economy – residential investment (the act of building homes) inflated to 6% of overall GDP at the peak of the boom then quickly shrank back down below its 3% of GDP average as home-builders realized that they had overbuilt and faced an enormous inventory of unsold homes. This contraction of residential investment reduced overall demand for goods and services in the economy by roughly \$420 billion. A similar (though less extreme) dynamic in commercial real estate reduced economy-wide demand by another \$140 billion. Further, as households saw their net worth decimated by falling home-prices and realized that they would now have to start saving out of current income to meet long-run wealth targets like providing a comfortable retirement or sending kids to college, consumer spending collapsed. The 30% fall in home prices erased roughly \$7 trillion of wealth from American households. The best research indicates that each \$1 fall in housing wealth leads (conservatively) to a \$0.06 fall in consumer spending through a “wealth effect” on consumption; translating into a \$420 billion annual decline in consumer spending.

This \$960 billion negative shock to annual demand for goods and services (\$420+\$140+\$420) is the Great Recession. **Figure 1** [Figure 7] below shows the path of home prices, residential investment as a share of the economy and mortgage equity withdrawals (just one way that households could increase spending through greater housing wealth) during and after the bubble.

Figure 7

How Monetary Policy Fights Recessions, in Theory

There are three policy levers that can be used to stabilize an economy that has suffered such a shock to aggregate demand: exchange-rate policy, fiscal policy, and monetary policy. This hearing is about the last, so I'll focus my attention here. As with fiscal and exchange-rate policies, the goal for monetary policymakers is to stabilize economic activity after a negative shock to aggregate demand by providing a countervailing *positive* spur to demand with the levers they have available to them. The primary lever the Federal Reserve (or Fed, henceforth) has available to them is control over short-term interest rates.

By lowering these “policy” interest rates (generally the Federal Funds Rate, the rate at which banks can lend each reserves at the Fed), the hope is that interest rates up and down the term- and risk-structure will fall through arbitrage. Then, as interest rates on longer-term and riskier debt fall, it becomes cheaper for firms to borrow to finance new expansions to their capital stock and for households to borrow to purchase new homes or durable consumption goods or to pay outstanding credit card balances - freeing up purchasing power for other kinds of consumer spending. Further, lower interest rates may provide a one-time boost to asset prices – directly to bonds as the Fed begins buying bonds to increase their price and hence lower the interest rates paid on them, and indirectly as lower interest rates on bonds, for example, may increase demand for other types of assets like equities. The boost to asset prices can ease firms’ borrowing constraints and allow them to finance new investments that they would otherwise be constrained from doing and can also provide a boost to household wealth that may spur new spending.

In recent decades, it has become the overwhelming consensus in the economics profession that the Federal Reserve is best-placed to fire the first shot in the fight against recessions. The “inside lag” of monetary policy – ie, the lag between when a developing problem is recognized and policymakers act – is much shorter for monetary policy than either of the other stabilization tools. The Fed is, by constitution, as cognizant of upcoming developments in the economy as any other institution and the relative smallness of the decision-making body makes rapid discussion, debate and action possible.

How the Fed Policy Acted as a Shock Absorber Against the Fallout From the Bursting Housing Bubble

This rapid decision-making and action began as the Great Recession approached – the Fed began lowering interest rates in August 2007 and began providing support to failing financial institutions early in 2008 – well before the blowup associated with the fall of Lehman Brothers.

Barely halfway through the Great Recession, however, the Fed had run out of the conventional ammunition it generally uses to stabilize the economy – policy rates were sitting at less than 1% by October 2008. It has been observed often enough to be a cliché, but having an economy mired in a deep recession with policy interest rates sitting just above zero is a very dangerous place to be – the U.S. economy during the Great Depression and Japan in its lost decade of the 1990s are two of the only historical episodes where this has happened. The danger is that zero constitutes a firm lower-bound on interest rates – as nobody would ever accept a negative return on their wealth-holdings (it would essentially be like *paying* the bank to store your money) – yet the economy might “need” short-term rates below zero for a time to generate the spending necessary to keep unemployment from rising.

Luckily, the Fed found ways to provide support through the economy through other means than just its short-term interest rates. First, it began providing extraordinary support for the liquidity of financial institutions through its “alphabet soup” of lending programs. These programs clearly worked to reduce credit-spreads on private-sector debt, largely calming the financial market chaos of late 2008 – see **Figure 2** [Figure 8] below for the reduction in credit spreads for automobile asset-backed securities following the beginning of the Term Asset –Backed Securities Loan Facility, or TALF.

Second, the Fed undertook two rounds of “quantitative easing”—attempting to lower long-term interest rates directly through the purchase of long-term assets. The first round of quantitative easing was focused on mortgage-backed securities (MBS)—largely through purchases of agency bonds (the debt of Fannie Mae and Freddie Mac). This first round of quantitative easing had the desired effect and established clearly that when it wanted to, the Fed could indeed lower long-term interest rates – as shown in **Figure 3** [Figure 9].

The second-round of quantitative easing was announced in November of 2010 and focused on the debt of the U.S. government instead of MBS. Again, strong anticipation of this move, based on

Figure 8

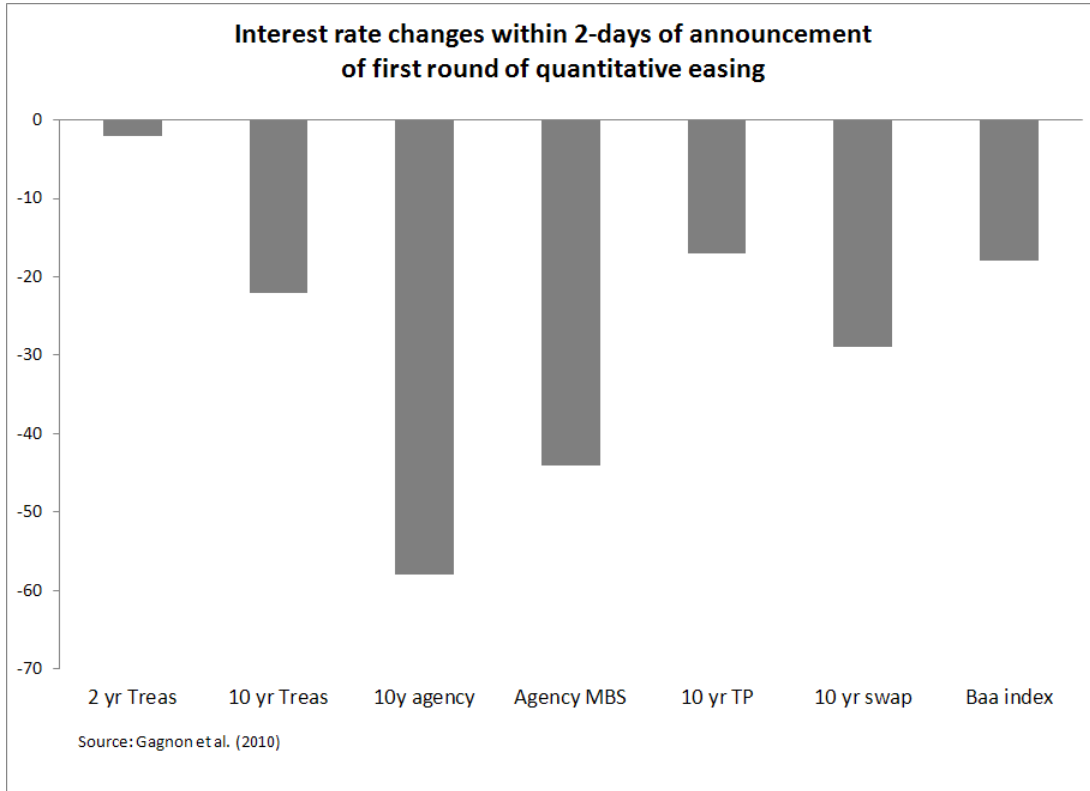

Figure 9

transparent communications from the Federal Open Market Committee (FOMC), led to clear downward movements in the interest rates of not only U.S. government debt, but other interest rates as well. Some on this committee may have noticed that 30-year rates on fixed home mortgages fell to almost 4% a couple of months ago – that was clearly a symptom of this second round of quantitative easing (or as it was popularly dubbed, QE2). **Figure 4** [Figure 10] shows that again returns on a range of securities fell with the announcement of QE2.

Just to give a sense of the potential of this quantitative easing for spurring purchasing power in the U.S. economy, analysts at JPMorgan Chase have estimated that if all mortgage holders guaranteed by the federal government (through Fannie Mae and Freddie Mac) had been able to refinance when 30-year rates dropped to nearly 4%, this could have added an economic stimulus of more than \$50 billion per year to the economy. Further, since this stimulus would be effectively permanent (the lower mortgage payments would be faced for the life of each holder's mortgage after refinance), the extra economic output it would have likely spurred would have been very large.

Have the Fed's Actions Propped Up Output and Employment?

There is no doubt at all that the Great Recession would have been worse, perhaps much worse, had the Fed kept interest rates at the 5.26 percent that characterized July 2007 – the last month before it was clear that a global financial crisis was in the making. There was, as far as I know, *not a single economist* arguing between July 2007 and June 2009 (the official end of the recession) that the Fed should *not* have lowered its conventional policy rate as the recession approached.

There is a school of thought (to which I'm sympathetic) that argues that while the Fed has great power to rein in an overheating economy through interest rate increases it actually has far less power to spur spending in an economy that is deflating – the vivid metaphor often used to explain this asymmetry is “pushing on a string”. And there are reasons to think the Fed's conventional tools were especially ill-suited to the fallout of the most current recession. For example, increased housing activity is a key tradition channel through which interest rate cuts spur economic activity. Given the massive overbuilding and plummeting home prices resulting from the burst housing bubble, it was always very unlikely that increased activity in the housing sector – regardless of what the Fed was doing – was

**Table 2: Responses of U.S. Interest Rates
to News about the Second Round of Asset Purchases**

Date	10-Year Treasury Yield	10-Year TIPS Yield	30-Year MBS Yield	10-Year BBB Corporate Bond Yield
Aug. 10, 2010	-7	-9	-2	-1
Aug. 11 to Nov. 2, 2010	-11	-47	-9	-23
Nov. 3, 2010	3	2	-2	2

Note: The table displays basis point changes from close of business on the day before the announcement to close of business on the day of the announcement, with the exception of Aug. 11 to Nov. 2, 2010, which shows the interperiod change. Changes in the 10-year nominal Treasury yield are computed using a smoothed yield curve estimated by staff from off-the-run Treasury coupon securities. Changes in the yield on 10-year Treasury inflation-protected securities (TIPS) are computed by staff using a smoothed inflation-indexed yield curve. Changes in the yield on 30-year mortgage-backed securities (MBS) are computed using Bloomberg data on securities issued by Fannie Mae. Changes in the yield on 10-year BBB corporate bonds are computed using a smoothed yield curve estimated by staff using Merrill Lynch data.

Figure 10

going to be a primary channel for pulling the U.S. economy out of recession.

However, noting this asymmetry in the Fed's power does not argue that interest rate loosening cannot work at all or is somehow the *wrong* thing to do. As households, for example, look to pay down debt in the wake of lost housing wealth, low interest rates can provide immediate space for them to do by lowering auto, credit card, and even some mortgage loans (and often can afford the possibility of re-finance).

And in the past, monetary loosening has clearly been a key ingredient in spurring rapid economic recovery, even from severe recessions. Romer (1992), for example, finds that expansionary monetary policy was a key ingredient in helping the U.S. economy escape from the Great Depression in the 1930s. Posen (2009) similarly argues that the strong performance of the Japanese economy between 2002 and 2008 was a result of loosening monetary policy as well. **Figure 5** [Figure 11] below shows the performance of economic growth in the year following a change in the federal funds rate. The precise statistical link between these variables is tough to pin down outside of careful econometrics because the Fed changes these rates precisely in reaction to changing economic conditions. Yet, the figure shows that large increases in the federal funds rate over a year tends to lead to slower growth in the subsequent year and vice-versa.

More recently in U.S. history, an examination of the very sharp (though thankfully very brief) recession of 1981-1982 also provides clear evidence of the efficacy of expansionary monetary policy. The unemployment rate in December 1982 actually peaked at 10.8% - higher than at any point in the Great Recession.⁴⁵ Yet 12 months later payroll employment was back to its pre-recession level. What contributed to this extraordinarily rapid recovery in jobs and unemployment? The simplest answer is very rapid output growth - GDP grew in the 2 years following the trough in 1982 at an annual average rate of 6.7% - in the 6 quarters since the trough of the most recent recession growth rates have averaged well under half this pace.

⁴⁵ Of course, the labor force in 1982 was younger and less-educated so should have, all else equal, had higher unemployment rates in general. Baker and Schmitt (2009) have pointed out that age-adjusting the U.S. workforce to match the 1982 age distribution results in higher unemployment rates being reached during the most recent recession.

Figure 11

Figure 12

This rapid output growth, in turn, was driven by an extraordinary degree of monetary easing – the policy rate controlled by the Fed fell nearly 10 percentage points between the business cycle peak of 1981 and the recession’s trough of November 1982. The Fed continued cutting rates for the next 6 months following this trough – and by November 1983 payroll employment had completely recovered its pre-recession level. **Figure 6** [Figure 12 above] below shows the path of the federal funds rate and economic growth between 1981 and 1984 – the reduction in the federal funds rate at the end of 1982 is clearly associated with a return to growth, while the slight uptick in these rates in 1984 sees these growth rates moderating.

It’s true that there was also a large fiscal stimulus injected into the economy in those years, but this stimulus was particularly ill-suited for spurring output growth, as most of it took the form of tax-cuts aimed at a[t] group[s] (high-income individuals and businesses) that were likely to have lower propensities to consume out of current income than others. In short, it is clear that the very rapid monetary easing was largely responsible for “morning in America”.

While there was less scope for this degree of *conventional* easing in the latest recession (because interest rates were lower going into it), the unconventional actions of the Fed have been able to provide a spur to spending even over and above what was provided by the move of federal funds rates to zero. Gagnon et al. (2010) argue that the unconventional actions of the Fed lowered interest rates across the term and risk-structure. Chung et al. (2011) then undertake a simulation exercise based on the historical relationships between these interest rates and components of GDP. They find that the \$600 billion in Treasury purchases recently undertaken by the Fed is likely to boost GDP by up to a full percentage point, which translates into roughly 1 million full-time equivalent jobs supported by these actions. It should again be noted that this is just the effect of the most recent Fed asset purchase – not the full range of effects spurred by their conventional easing in the early parts of the recession and the first round of quantitative easing – Chung et al. (2011) estimate that the full effect of all large-scale asset purchases undertaken by the Fed probably supported nearly 3 million jobs and will have lowered measured unemployment by 1.5 percentage points through the end of 2012.

Has the Fed Done Enough?

All this said, I don’t have to remind anybody on this panel that the U.S. economy is far from healed – unemployment was 9.0% as of

January 2011 (and will almost surely reach over 9.5% again before the labor-market recovery is complete) and if most private and public-sector forecasts are to be believed, will only fall slowly over the next couple of years – reaching a level comparable to its immediate pre-recession peak in 2015.

This begs the question – did the Fed do enough?

My short-answer to this is not yet, but it is on the right track. For one, the jobs-crisis is far from over and the economy far from stabilized. Until unemployment returns to tolerably low levels and the economy is much closer to producing at its potential level, the Fed should remain very aggressive in its policy stance: keeping policy-rates low, following through with the full round of QE2 and preferably engaging in more asset purchases after the initial \$600 billion is exhausted. However, absent support from the other levers of macroeconomic stabilization – fiscal and exchange-rate policies, the Fed is limited in how much it can contribute to recovery. If, for example, Congress acted to provide a new, significant round of effective fiscal support to the economy, the Fed could act to enhance the effectiveness of this support as well as keeping it from adding to the national debt held by the public by simply buying the new debt issues and holding them on its balance sheet.

This action should ameliorate the concerns of those worried that more fiscal support to the economy would lead to high debt burdens for the U.S. government in the future – if the Fed owns the newly-created debt that that provides fiscal support, interest on this debt would be paid to the Fed and recycled back to the U.S. Treasury. This is not a strategy that can be continued when the economy is near full-employment – it would surely lead to inflation. But there is no danger of that happening today, with vast numbers of unused resources available to match new production to new money creation.

Again, the Fed has clearly acted with more urgency than any of our other macroeconomic policymaking institutions to the Great Recession and continues to treat the jobs-crisis as the number one priority in setting its policy; this is to its great credit. It should continue with this aggressive pro-growth stance until a full economic recovery is reached. However, unless more support is forthcoming from *other* levers of macroeconomic stabilization, its ability to do much more than continue its current stance is limited.

In short, the Fed (a) saw the economic downturn coming before any other major macroeconomic policymaking body, (b) acted more aggressively than any other, and (c) continues to attack the problem of sluggish recovery in both output and employment with greater

urgency than any other team of economic policymakers. If our fiscal and exchange-rate policies were as aggressive as our monetary policy in historical terms, we could well have an unemployment rate 2-3 percentage points lower today and hundreds of billions of dollars of additional economic output.

Criticisms of the Expansionary Monetary Policy I: Did Low Interest Rates Cause the Bubble?

Given the absolutely central role played by the housing price bubble in generating the Great Recession and given as well that some critics of the current aggressively pro-growth stance taken by the Fed have tried to blame accommodative monetary policy on the *creation* of this bubble, it seems worthwhile to examine the case for and against the role of too-low interest rates in inflating home-prices in the 2000s.

The argument that low interest rates are a prime suspect in creating the bubble rests simply on the fact that as the bubble inflated in the early 2000s, these interest rates were kept unusually low by historical standards. As low interest rates should (all else equal) encourage borrowing, and mortgage debt is by far the single largest category of household borrowing, the case continues that easy credit engineered by the Fed pumped up the demand for homes and inflated the bubble. The corollary to this argument is often presented that it is obvious that the Fed should have considerably tightened monetary policy very quickly after the 2001 recession ended.

There are a number of reasons to reject this diagnosis and the proposed cure.

First, interest rates *should* have been low in the early 2000s – employment growth following the 2001 recession was, by far, the weakest of any recovery since the Great Depression. Between 1948 and 1990, it took an average of 13 months from the end of a recession to fully regain all employment losses. Yet it took 38 months following the 2001 recession (see **Figure 7** [Figure 13] below). In fact, employment growth did not even turn consistently *positive* until August 2003, 21 months after the official end of the recession. The notion that interest rates should have been sharply increased even while jobs were still being shed in the economy is hard to credit.

This can be seen more formally by invoking a standard “Taylor Rule” of prescriptive Fed behavior. The Taylor rule argues that policy rates should be changed based on a weighted average of expected inflation and productive slack in the economy. As expected inflation rises, the Taylor rule argues for rates to rise in response to cool the economy; when productive slack (or, the measured “output gap”)

Figure 13

Figure 14

rises, rates should be lowered to spur spending to tighten this slack. Applying a Taylor rule that weights inflationary expectations every bit as heavily as concerns over the economy underperforming potential actually would have led to a path of policy interest rates *very much like* what was actually pursued by the Fed in the early 2000s, as shown below in **Figure 8** [Figure 14 above].

Second, the timing of rising home-prices and low interest rates is much less clear than proponents of the “it was too-low interest rates” theory of bubble-inflation generally admit. Home prices began rising in the late 1990s – as *interest rates were being increased*. The pace of price-growth did rise in the early 2000s as interest rates were lowered, but, then the pace of growth remained torrid between 2004 and 2006 – as interest rates were being sharply *increased*. In short, the sharp rise in prices began in a period of rising rates and persisted nearly undiminished during a period of rising rates; this makes it hard to sustain the argument that low rates were the key driver of the housing price bubble. **Figure 9** [Figure 15] shows this by displaying the change in the federal funds rate and annual home-price appreciation for periods of rising and falling rates.

Third, the bubble in equity markets in the 1990s in the U.S. accelerated just after a sharp increase in policy interest rates beginning near the end of 1993. The bubble got larger and larger even as rates stayed generally steady throughout the late 1990s (see **Figure 10** [Figure 16] below).⁴⁶ Very few (I could find none) argued in real-time that the Fed had *caused* the equity-price bubble (some argued that they should have raised interest rates to smother it, but that’s a different question) – leading one to conclude at least that excessively low interest rates are not a necessary condition for asset-price bubbles.

Fifth, we can use the fact that the housing bubble of the 2000s was not unique to the U.S. economy to see if there is a durable connection between rising home prices and interest rates. France, Denmark, and the UK (among others) all saw home-price appreciation faster than the U.S. from 2001 to 2006. Yet these nations also saw monetary policy that was tighter than in the U.S. relative to what should have been expected from a Taylor rule based on their national inflation and output-gap indicators. In short, these countries more closely followed the diagnosis of interest rate tightening (relative to current economic conditions) yet still saw

⁴⁶ There was a dip in policy rates in 1998, largely in reaction to crises in East Asia and the Russian bond defaults. This dip was quickly reversed, however.

Figure 15

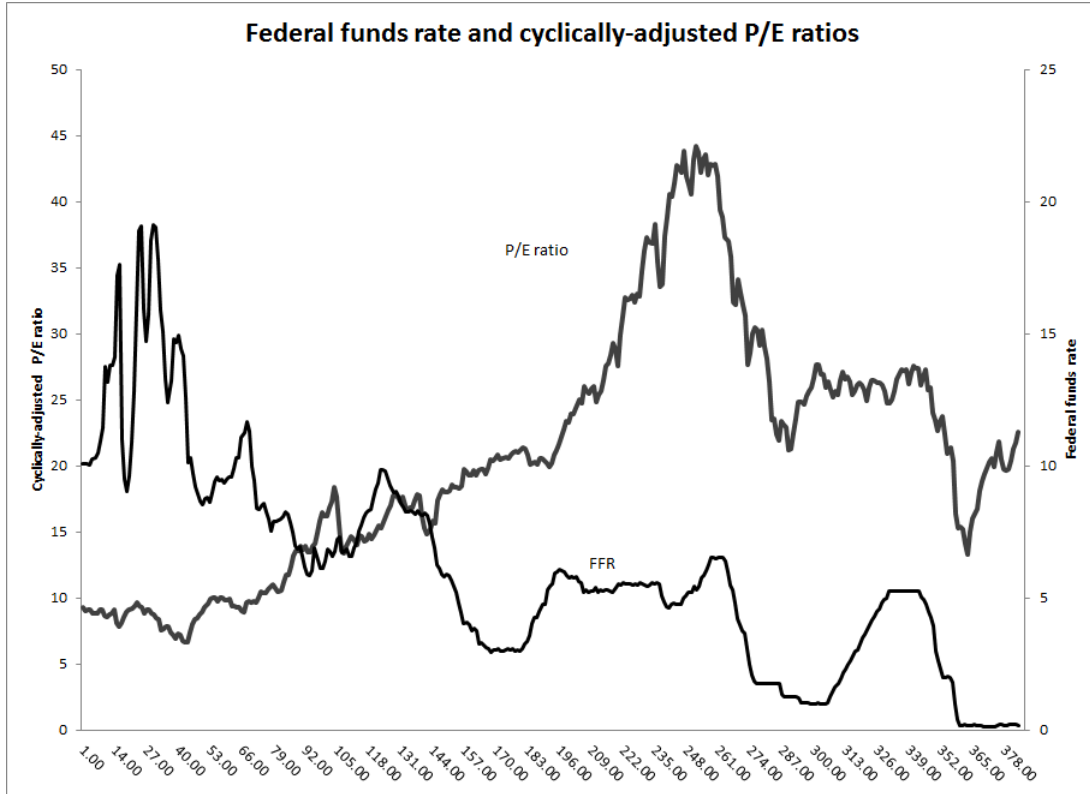

Figure 16

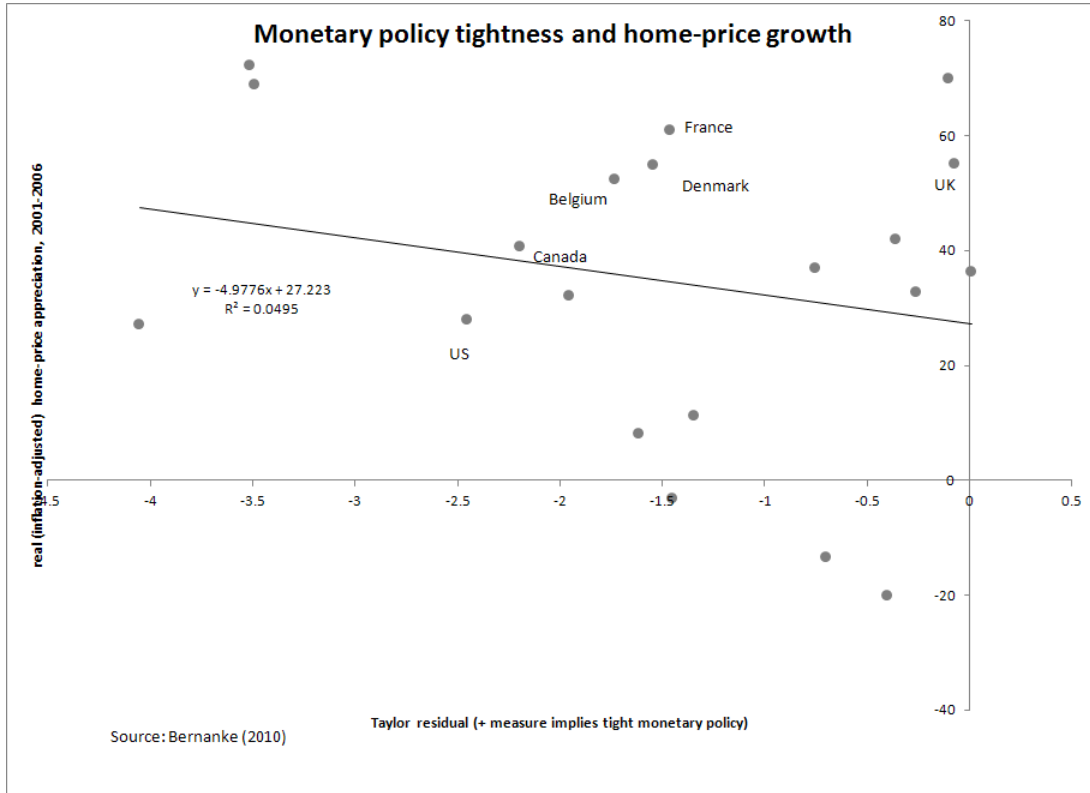

Figure 17

larger increases in home-price growth during the 2000s (see **Figure 11** [Figure 17]).

Criticisms of Expansionary Monetary Policy II: It Will Cause Inflation and That's Bad

Lastly, there is commonly-voiced concern that the Fed's current aggressive actions to spur growth and jobs in the economy will instead give rise to rapid inflation. It is true that large-scale money creation would indeed translate mostly into higher prices and not higher output in an economy characterized by no productive slack (with no productive slack, output could not, by definition, be increased in the short-term). This is why the short-hand definition for inflation is often stated as "too much money chasing too few goods".

However, the key phrases in the formulations above are "no productive slack" and "too few goods". There is significant productive slack in the U.S. economy right now, as evidenced by very high rates of unemployment of labor and non-utilization of productive capacity. Given this, it seems hard to frame the problem of "too few goods" being chased by "too much" money – if there is excess demand for ("too much money chasing") new goods and services, *we should make more of these goods and services* to solve concerns over inflation.

The simplest way to assuage fears of incipient inflation is just to look at the price-data. We should be clear here what data we're looking at and why. Inflation is, by definition, a *generalized* rise in prices. The prices of individual goods or services rise and fall all of the time. Cherry-picking a single good (or select basket of goods) to "prove" that prices overall are falling or rising makes no sense – it is, by definition, not a measure of inflation.

Additionally, it is the overwhelming consensus in empirical macroeconomics that measures of "core" inflation are the proper ones to examine when gauging the impact of monetary policy on price growth. The simplest forms of these "core" measures exclude the costs of food and energy. As food and energy prices are volatile and change often and are often dramatically affected by idiosyncratic supply-side influences (bad weather, closing of shipping lanes, refinery fires), they are a very bad measure of the inflation *momentum* building up in an economy.

When firms set those prices that are less volatile than food or energy (wages in the case of workers), they take the overall state of inflationary expectations into account. For example, if a worker desires real (i.e., inflation-adjusted) wage stability, if she expects overall inflation to run at 2 percent for the forthcoming year, she'll

need to ask for a 2% raise to insure this real (inflation-adjusted) wage stability. And when a grocer wants his sales to finance the same living standard he purchased for himself last year, he needs to raise his prices by 2% if he expects overall prices in the economy to rise this much. If rapid money creation does occur during times of little productive slack, this could well lead to increases in prices across-the-board and hence to rising expectations of inflation, which become self-fulfilling.

Scare-stories (sometimes true) about central banks unleashing inflation upon their economies are about this inflationary momentum, not about discrete jumps in single-prices.

Further, because it is not just food and energy prices that are volatile and non-informative about the embedded state of inflationary expectations, there are a number of measures of “core” inflation. Import prices can rise or fall sharply based on movements in the value of the dollar. In some countries, changes in national sales taxes (or value-added taxes) can lead to large one-time jumps in the price-level without causing permanently higher inflationary expectations. In short, good measures of “core” inflation seek to exclude those prices that do not convey much useful information about the real inflationary momentum in the economy.

Luckily, *all* measures of core inflation are telling the same story – the last couple of years have seen rapid disinflationary pressures in the U.S. economy (see **Figure 12**⁴⁷ [Figure 18] for a range of commonly-used core measures of inflation). In short, the data from the recent past argues that worrying about rampant price-growth is profoundly misguided.

Further, forward-looking measures of inflationary expectations used by forecasters and market participants are telling largely the same story. The spread between real and nominal 10-year Treasury securities is one commonly-used proxy for inflationary expectations – this spread has shown no upward trend in the past couple of years (see **Figure 13**⁴⁸ [Figure 19] below).

Importantly, the data showing disinflation and very low rates of expected inflation in coming years are not a surprise – they are in fact exactly what conventional macroeconomic theory would lead one to expect. High unemployment rates and large output gaps (again, measures of productive slack) are historically correlated with low

⁴⁷ [In the original testimony the information described in the text as Figure 12 was depicted in the chart labeled Figure 14.]

⁴⁸ [In the original testimony the information described in the text as Figure 13 was depicted in the chart labeled Figure 15.]

Figure 18

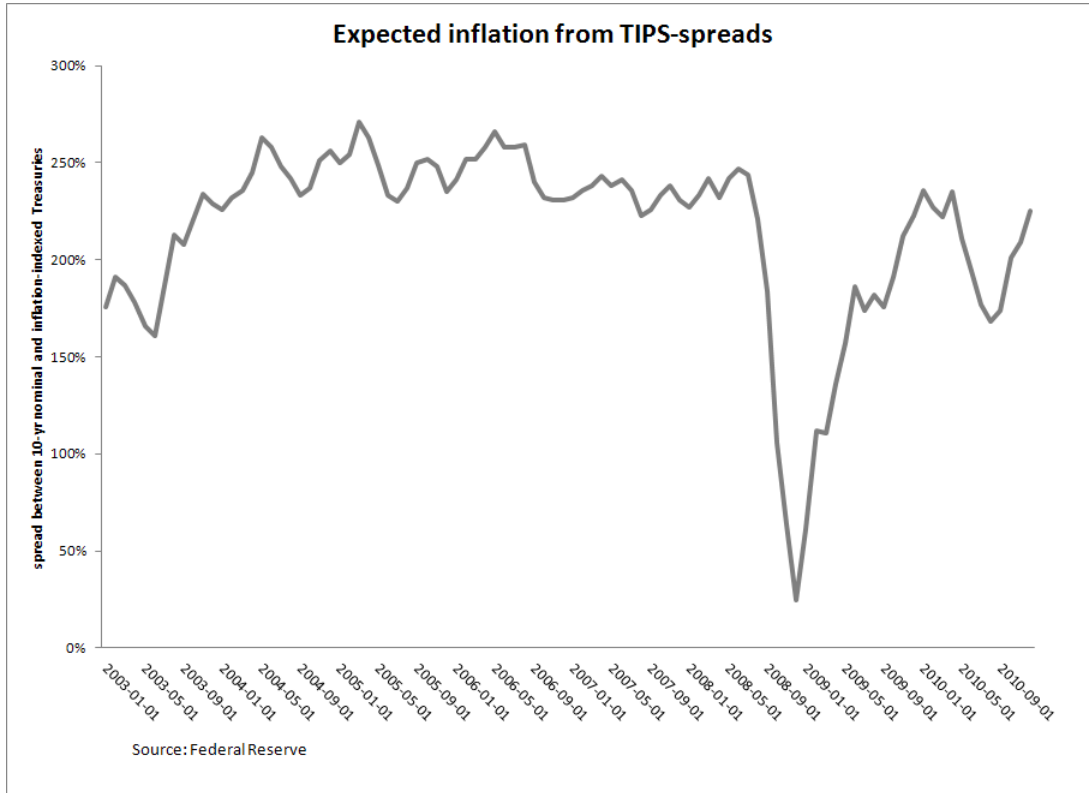

Figure 19

Figure 20

rates of inflation. The reason is simple; as the economy cools and consumers and businesses stop spending, firms see output piling up unsold and hence lose the ability to raise prices and workers lose the ability to demand large wage-increases when they see many of their peers out of work.

Figure 14⁴⁹ [Figure 20 above] below shows the relationship between unemployment and inflation in the U.S. over the 2000s – with the last 4 quarters highlighted. This short-run relationship between prices and unemployment replicates a common pattern within business cycles – periods of high unemployment rarely see growing price pressure. The one recent historical counter to this trend, the “stagflation” of the 1970s (high unemployment accompanied by high inflation) can be largely explained developments on the supply-side of the economy – an oil price-shock combined with very rapidly decelerating trend productivity growth in the economy.

We can reassure ourselves that there is little evidence of a similar fall in productivity that could lead to upward price-pressures on the horizon. Another key predictor of inflation is a rise in unit labor costs – the labor cost of each additional unit of output. This cost rises as labor compensation rises, but falls as productivity increases (as each worker can now produce more output). **Figure 15**⁵⁰ [Figure 21] below shows a plot of inflation versus unit labor costs for the U.S. economy since 1959, with the most recent quarters highlighted. As can be seen, a price-push from the supply-side looks very unlikely.

Lastly, it should be noted that the current rates of inflation are undesirably low for the U.S. economy. For example, the price deflator for core personal consumption expenditures rose by less than 1% over the past year – the first time in the history of this indicator that it has fallen under 1%. Disinflation is bad because as inflation falls, real interest rates tend to rise – and given that the economy needs more spending from households and businesses right now, rising interest rates will not help this.

Further, the debt-driven nature of the Great Recession would make higher inflation rates desirable right now. Both households and businesses are operating underneath a very large overhang of debt accumulated during the last 15 years. Over time, debt fixed in nominal terms (like mortgage debts) actually becomes less and less burdensome relative to other prices and wages in the economy so long

Figure 22

as there is positive inflation. For example, if your mortgage payment is \$1,000 per month and inflation runs at 4% per year, by the 30th year your mortgage payment has actually shrunk by just under 70% relative to all other prices and wages in the economy. If, instead, inflation only rises by 1%, then the mortgage payment will only have only shrunk by 25% by the 30th year (and deflation, falling prices, would actually cause one's mortgage burden *to rise*). Given the very high debt burden currently afflicting American households and business (see **Figure 16**⁵¹ [Figure 22] below for household debt measures), inflation rates of under 1% will allow them to dig out of this debt overhang very slowly indeed.

Conclusion

What we now call the Great Recession can be described simply in the terms of macroeconomics – it was a huge negative shock to economy-wide demand for goods and services caused by the bursting of the housing bubble. Since this shock, the Federal Reserve has, as would be recommended by the vast majority of professional macroeconomists, attempted to lean against this negative shock to demand and spur spending with its policy levers. It has done this through conventional (lowering the short-term policy interest rates it controls) and unconventional (direct purchases of longer-term securities) means.

Its actions have clearly helped. They have also clearly *not* been accompanied with the same degree of urgency on the part of policymakers in charge of the other levers of macroeconomic stabilization policy (fiscal and exchange-rate policy). Because of this, we remain today at intolerably high levels of unemployment. However, blaming the Fed for this is quite odd – they have been by far the policymaking institution that has responded most forcefully and in the timeliest manner to the crisis.

Arguments that the Fed actions have been in the *wrong direction* are even odder. Here a (strained) analogy might help. Say that the economy in the midst of the housing bubble burst is akin to a man who has fallen out of a third-story window. The actions by Fed in response can be thought of as throwing a mattress underneath him to break the fall; the mattress will surely help but may not be thick enough to prevent all damage from the fall. Criticizing the Fed for flirting with inflation with its actions during the current crisis would be like arguing that the mattress thrown under our falling man is *too*

[⁵¹ In the original testimony the information described in the text as Figure 16 was depicted as the second of two charts labeled Figure 16..]

thick and *too* plush: if slept on for a long time our falling man may eventually develop an achy back.

Going into the recession, the overwhelming consensus among professional macroeconomists was that the Fed could be an effective part of stabilization policy and through forceful actions could make recessions shallower and shorter. Absolutely nothing that has happened in the past three years has shaken that belief.

MONETARY POLICY AND THE DEBT CEILING: EXAMINING THE RELATIONSHIP BETWEEN THE FEDERAL RESERVE AND GOVERNMENT DEBT

Wednesday, May 11, 2011

WITNESSES

Ebeling, Richard M., Ph.D., Professor of Economics, Northwood
University

Ely, Bert, Ely & Company, Inc

Slaughter, Matthew J., Ph.D., Dean, Tuck School of Business,
Dartmouth College

*B*ACKGROUND

The Subcommittee on Domestic Monetary Policy and Technology held a hearing entitled “Monetary Policy and the Debt Ceiling: Examining the Relationship between the Federal Reserve and Government Debt” at 10:00 a.m. on Wednesday, May 11, 2011 in Room 2128 of the Rayburn House Office Building.

The hearing examined the fundamental role that federal government debt plays in the monetary system of the United States. It discussed the relationship between the U.S. Treasury, the Federal Reserve System, and the primary dealers in issuing and purchasing Treasury securities. The hearing also examined the integral role of U.S. Treasury securities in the conduct of monetary policy and how federal budget deficits are exacerbated by the special treatment of government debt throughout the monetary system.

This was a one-panel hearing with the following witnesses:

- Richard M. Ebeling, Ph.D., Professor of Economics, Northwood University
- Bert Ely, Principal, Ely & Company, Inc.
- Matthew J. Slaughter, Ph.D., Dean, Tuck School of Business, Dartmouth College (Witness for the Minority)

The Fed’s Monetary Policy Authority

The Federal Reserve System was established in 1913 as the central banking system of the United States. The Federal Reserve formulates the monetary policy of the nation, supervises and regulates banks, and provides financial services to depository financial institutions and the federal government. The Federal Reserve was given the authority by Congress to issue Federal Reserve notes, which have been designated as legal tender and as obligations

of the United States. Congress has empowered the Fed to engage in monetary policy, abdicating any authority or responsibility it had over monetary policy.

Although the Federal Reserve is supposed to remain nominally independent and to refrain from directly purchasing new issuance of government debt, the current monetary system is largely built on government debt, and monetary policy itself is conducted through the purchase and sale of government debt.

Structure of Monetary Policy Operations

The Federal Reserve System conducts monetary policy through open market operations, in which it buys and sells Treasury debt (Treasuries) on the open market to reach a targeted federal funds rate, the rate at which banks lend funds to each other overnight. Open market operations expand and contract the money supply. When the Federal Reserve purchases Treasuries on the open market it does so by electronically increasing the amount of money that a primary dealer has in its reserve account at the central bank, which expands the money supply. When the Fed sells Treasuries, it electronically decreases the amount of money that the primary dealer has in its reserve account, effectively retiring the dollars that the Fed receives in exchange for Treasuries, thus contracting the money supply.

Treasuries are perceived as an ideal instrument for conducting monetary policy because they are widely traded, with plenty of investors both buying and selling them, making the market place for Treasuries highly liquid. Treasuries are also heavily traded, accounting for more than half of U.S. bond market trade volume over the last decade. The popularity of Treasury securities in the bond market can be attributed to their status as a debt instrument backed by the full faith and credit (i.e. power of taxation) of the U.S. government.

The Federal Open Market Committee (FOMC) sets monetary policy by establishing the target federal funds rate, also known as the overnight rate. The FOMC consists of up to twelve voting members at a time: the seven members of the Board of Governors of the Federal Reserve System and five of the twelve regional Federal Reserve Bank presidents. Of these five regional bank president members, four rotate off the FOMC every year. The president of the Federal Reserve Bank of New York, however, is a permanent voting member of the FOMC.

Open market operations are conducted by the Federal Reserve Bank of New York (the New York Fed) by means of its counterparty relationships with twenty or so primary dealers.⁵² These primary dealers are required to participate “consistently” in auctions of U.S. government debt and to provide the New York Fed with market information and analysis helpful in the formulation and implementation of monetary policy. Although other dealers may participate in Treasury debt auctions, primary dealers often purchase the bulk of offered Treasury debt. Among the primary dealers are Barclays Capital; Citigroup Global Markets; Deutsche Bank Securities; Goldman, Sachs & Co.; J.P. Morgan Securities; and UBS Securities.⁵³

When the U.S. Treasury issues new debt, the primary dealers and other banks purchase the new Treasuries at auction. Because primary dealers are required to participate “consistently,” there is always a purchaser of government debt. However, banks, including the primary dealers, generally do not maintain excess liquidity for the purchase of additional assets, but rather loan out funds up to the limit of their reserve requirements. In order to facilitate the purchase of new Treasury debt and conduct effective monetary policy, the Federal Reserve in some instances may purchase old Treasury debt from the dealers in the market, providing them additional liquidity with which to purchase newly issued Treasury debt at auction.

Monetary Policy Since 2007

Since the first indications of the financial crisis in July of 2007, the Federal Reserve began to examine new ways of conducting monetary policy. The Federal Reserve’s first attempt at stabilizing markets was its Term Auction Facility, which began operations in late 2007. By the time Bear Stearns collapsed in March of 2008, the Federal Reserve had opened an additional credit facility, the Primary Dealer Credit Facility (PDCF). As the crisis worsened in September of 2008, traditional monetary policy operations played a minor role compared to the Fed’s newly created credit facilities. The Federal Reserve’s balance sheet mushroomed in size as a result of their unconventional programs.

⁵² As of December 2012 there were twenty-one primary dealers while there were only twenty in May 2011, at the time this hearing took place.

⁵³ A full list of primary dealers can be found on the New York Fed’s website at http://www.newyorkfed.org/markets/pridealers_current.html. Last accessed December 11, 2012.

While total Reserve Bank credit averaged just over \$880 billion in August of 2008, by November of 2008 it had risen to over \$2 trillion. During that same period the monetary base had risen to nearly \$1.5 trillion as total excess bank reserves increased from \$2 billion to over \$600 billion.

“Permanent” Open Market Operations

As the Federal Reserve began to phase out the credit facilities created to respond to the financial crisis, it began large-scale asset purchase programs such as the Mortgage-Backed Securities Purchase Program. The Fed's typical short-term monetary policy operations gave way to these new “permanent” open market operations, as the Fed described them, in which assets were bought and held by the Federal Reserve for longer periods of time.

The New York Fed began these “permanent” operations in early 2009, encompassing the Mortgage-Backed Securities Purchase Program and the Federal Reserve's large-scale purchases of Treasury debt, which became popularly known as QE1 and QE2, respectively, referring to the popularly-named quantitative easing (QE) policy. The rationale behind these large-scale asset purchases was to drive down long-term interest rates in order to try to facilitate economic growth. Fed Chairman Ben Bernanke maintained that the programs achieved that goal, pointing to a decline in interest rates on Treasury and Agency (Fannie Mae and Freddie Mac) securities, lower longer-term interest rates for other securities that were not part of the purchase program and a rise in equity prices. Critics of these programs say that they have resulted in higher consumer and commodity prices.

U.S. Government Debt, the Monetary System, and the Deficit

Given the pivotal role that the U.S. government's debt plays in the monetary system, the debate over the federal government's budget deficits is more complicated than just balancing revenues and expenditures. The political cost of issuing U.S. government debt is typically far lower than the costs of raising taxes or cutting spending. This reality resulted in the nation's overall debt level reaching \$14.3 trillion at the time of this hearing. By December 2012, the debt of the United States government had increased to \$16.4 trillion.

Unlike businesses or households that face market constraints on the amount they can borrow, such as prohibitively high interest rates, the U.S. government has been able to sustain high debt levels for an extended period of time. The highly liquid market and high demand

for government debt, brought about by both the guaranteed purchase of government debt and its subsequent use by the Federal Reserve in conducting monetary policy, and the backing of the full faith and credit of the U.S. government, has insulated the U.S. government from typical market discipline.

Developments prior to this hearing indicated, however, that investors other than the Federal Reserve were beginning to reconsider their willingness to buy Treasuries. China had said that it may begin to reduce its holdings of Treasury debt, and indicated that its \$3 trillion total foreign exchange reserves were excessive. The global investment manager PIMCO completely divested itself of Treasuries in early 2011, and its co-founder, Bill Gross, publicly warned of a U.S. debt default. If foreign governments and large institutional investors begin to shy away from Treasuries, the Federal Reserve could face increasing pressure to monetize new debt.

Even as the total level of government debt continues to exceed an ever-increasing statutory debt ceiling, political discussions have maintained a focus almost solely on the spending or taxing elements of the federal budget. The integral role of the nation's monetary policy has to date not been a central topic of discussion.

*T*RANSCRIPT

The subcommittee met, pursuant to notice, at 10:05 a.m., in room 2128, Rayburn House Office Building, Hon. Ron Paul {chairman of the subcommittee} presiding.

Members present: Representatives Paul, McHenry, Luetkemeyer, Huizenga, Schweikert; Clay, Maloney, and Peters.

Ex officio present: Representative Frank.

Chairman PAUL. This hearing will come to order. Without objection, all members' opening statements will be made a part of the record.

I would like to go ahead and start with our opening statements and then get to our introductions.

Today's hearing deals with monetary policy and the debt ceiling and examining the relationship between the Federal Reserve and government debt. The government debt, the national debt now is a big issue mainly because the debt limit has once again been met, and the Congress has to go through the process of raising the debt limit.

The question is whether or not monetary policy is in any way related to the debt increase. Some say it is related; some say it is not. And the statistics are available to us to study that issue.

But to me, it looks like there is a relationship. It seems like the Federal Reserve System provides a moral hazard, and that as long as Congress knows that Treasury bills will be bought and interest rates will not be allowed to rise, therefore the Congress is more careless.

If we had no monetization of debt, which would annoy a lot of people, I am sure, who think the world would come to an end if that happened, the Congress would be self-regulated in many ways, because if we in the Congress spent excessively and we taxed excessively and borrowed excessively and we still didn't have enough

money to keep interest rates reasonably low, interest rates would rise.

And it would be Congress that would have to respond and not be bidding for so much capital out of the market, and therefore wouldn't be tempted to say, "Well, it really doesn't matter. We have an emergency. We have a war going on. We must finance the war. We have an entitlement system that depends on this, so therefore if we print the money, this will take care of things."

It may well take care of things for a while, but ultimately, this process will run up against a stone wall. And I think that is where we are today.

We have raised the debt limit many times over the years, and it has been generally a non-event. It used to be that when you passed a budget resolution, the only part that was actual law was raising the debt limit. It wasn't even debated. It was just generally done.

But things have been moving along rather rapidly, and I cannot believe that what we are doing is sustainable. Right now, we are accumulating obligations. When you look at the deficit plus what we borrow from our trust funds plus our increase in our entitlement obligations, there are good estimates made that this amounts to about \$5 trillion a year. And that, obviously, is unsustainable when we have a weak economy, jobs are going overseas, we are not producing, and we are in the midst of a slump.

The solution hardly seems to be just more debt and depending on the Federal Reserve to come to our rescue while devaluing the currency, which means that many people that some of this deficit financing is supposed to help will actually be hurt by it, because they are the ones who lose their jobs, and then they end up with the prices going up because of the debasement of the currency. So this deficit financing seems like it can't last forever.

When the Fed was started, we didn't have the same type of monetary statistics that we have today. But the base at that time, the monetary base at that time, was probably around \$4 billion. By 1971, at the time when we lost the last leak of our dollar to gold, it was about \$67 billion. But with the removal of any restraint on the Fed to buy debt, the monetary base went up to \$616 billion.

Now, in this last decade, which has been a decade of economic weakness, real income has not gone up. Good jobs have not been added; they have been leaving our country because of our economic problems. But in these last 10 years, the monetary base has jumped

from 616 billion to \$2.5 trillion, so there is a lot of activity going on there.

I also find that if you look at the debt during this period of time, of course, in 1913 the debt was practically irrelevant, a couple of billion dollars, but by 1971, incrementally, on a weak economy, the debt went up to \$398 billion. Ten years ago, it was \$5.8 trillion, but in this weakened economy, it has jumped up to \$14 trillion.

And I think what is interesting is that if you still pay a little bit of attention to M3, which we are not allowed to see any more from the Fed, because it costs too much money to produce those statistics, M3 is \$14 trillion, and the national debt is \$14 trillion. I don't know how coincidental that is, but I just think there is a relationship to that.

We have the statistics from the Fed that tell us about how many Treasury bills they are buying, and they are buying routinely. But what we don't know is whether or not—because we don't have a full audit of the Fed—we extend loans to other foreign banks with the quid pro quo for them to buy Treasury bills, because foreigners are still buying a lot of our debt.

But, it is interesting to see how passionate this whole argument about raising the debt limit is. It was a former Secretary of the Treasury who just recently said that if we don't bow down, immediately raise this level, it will be so destructive that it would actually be equivalent to a terrorist act. That is how serious it is.

The whole thing is they said, "Well, we can't default." But we started our country by defaulting. I don't endorse this idea, but we started it. We defaulted on the continental dollar. We defaulted in the Civil War period. We refused to pay what we promised to pay in gold. They just unleashed unlimited spending.

We defaulted in the 1930s, took the gold from the people, and didn't pay off the gold to the people. We took it from them. And then in 1971, we defaulted again. We said to foreigners, "No." We said we would honor our dollar at \$35 an ounce, and we just quit.

So we have defaulted many times. Sure, there are going to be problems if we don't raise our national debt, but I think if we don't cut the spending, that kind of a default is going to be much, much worse.

And now I yield to Mr. Clay, the ranking member.

Mr. CLAY. Thank you, Chairman Paul. And thank you for holding this hearing regarding the Federal Reserve's role in United States monetary policy and the responsibility to address the U.S. budget deficits.

To address this issue of the Federal Reserve's role in the economy, we have to address the Federal Reserve's dual mandate it has to maintain stable prices and full employment. And we also have to have an adult conversation here in Washington about this credit card mentality we have of putting big-ticket items on a national credit card.

I think that has to stop, when you think about the last decade, how we conducted two wars without having a way to finance those wars. We had a prescription drug benefit instituted without a way to pay for that.

Those are just two examples of what is wrong with the Washington mentality, so I agree with you. We have to have an adult conversation. Hopefully, this hearing can be the start of it.

Mr. Chairman, I yield back.

Chairman PAUL. I thank the gentleman.

I now yield 5 minutes to Congressman Huizenga.

Mr. HUIZENGA. Thank you, Mr. Chairman. I appreciate the opportunity and I appreciate our panel of witnesses coming and speaking to us today. And I, too, Mr. Chairman, appreciate your willingness to hold this hearing and leading this conversation in so many ways.

My constituents—I am from Michigan, the west side of Michigan, so I am very familiar with our friends over on the other side of the State at Northwood, but my constituents in the 2nd District have made it very, very clear that the debt and our spending is one of the most vital issues that is facing not just this current Congress, the 112th Congress, but us as a nation and to us as a people and our way of life.

And they are asking us to rein our spending in, reduce our massive debt. And that is why I think it is so important that we are holding this hearing.

The Federal Reserve Board of Governors is congressionally mandated, as we all know, to maximize employment as well as to hold down inflation. But after witnessing this massive debt load that has been accumulated by other Administrations, but has ramped up in this current Administration, it seems to me that those are really failed fiscal policies.

And I am pleased that we are now spending some time exploring the role of monetary policy and the national debt. I am very concerned about the liquidity that has been put into markets by the Fed. And through the purchase of those debts and most recently through the fact that Federal funds rates sit at basically zero, we have had to

go through, or haven't had to go through—the Fed made the decision to go through by purchasing an additional \$600 billion in Treasury securities with utilizing the philosophy of quantitative easing.

And we have gone through QE1 and now QE2, and despite purchasing \$1.2 trillion previously in March of 2009, it seems to me it has not proved to be an effective method of creating jobs. And I would love to have your input on that.

Today, we will examine what effect the Fed's government debt plays on the Federal Reserve's open market operations. In addition, I look forward to inspecting how that role affects our yearly deficits when compared to the more costly tax-and-spend fiscal policies that we have had.

And I take my charge here as a Member, as a freshman Member of this 112th Congress and as a member of this important subcommittee, I take my responsibility for strict oversight of taxpayer dollars with the utmost seriousness. And I know that has to be done.

We have been irresponsible in the past, I believe, with the trust that we have been given by the American people. And it is time that we step up and take care of that.

I look forward to a robust conversation today. I am sure that there are a number of differing opinions here. And as we are exploring sort of the Fed's unparalleled intervention in the markets, I am looking forward to hearing from you.

So again, Dr. Paul, Chairman Paul, I appreciate the opportunity to be a part of this committee and a part of this hearing and I look forward to that. Thank you.

Chairman PAUL. I thank the gentleman.

Does anybody else care to make an opening statement?

Thank you.

Without objection, the written statements of our witnesses will be made a part of the record, and each of you will be granted 5 minutes to summarize what you have to say, and then we will go into the questions. I will go ahead and introduce the panel now.

The first panelist is Dr. Richard Ebeling, a professor of economics at Northwood University in Midland, Michigan. He is recognized as one of the leading members of the Austrian School of Economics.

He is a former president of the Foundation of Economic Education and author of, "Political Economy, Public Policy and Monetary Economics." Dr. Ebeling earned his Ph.D. in economics from Middlesex University in London.

Also with us today is Mr. Bert Ely. He is the principal of Ely & Company. He has consulted on banking issues since 1981 and has

focused in recent years on banking problems, housing finance, and the crisis in the entire U.S. financial system.

Mr. Ely frequently testifies before Congress on banking issues and continuously monitors conditions in the banking industry, as well as monetary policy. Mr. Ely received his MBA from Harvard business school.

Also with us today is Dr. Matthew Slaughter. He is associate dean of the MBA program at the Tuck School of Business at Dartmouth. He is also a research associate at the National Bureau of Economic Research and a member of the State Department's Advisory Committee on International Economic Policy.

During the George W. Bush Administration, he served as a member of the President's Council of Economic Advisors. Dr. Slaughter is co-author of, "The Squam Lake Report: Fixing the Financial System." Dr. Slaughter received his doctorate from MIT.

And we will go ahead and recognize Dr. Ebeling at this time.

**STATEMENT OF RICHARD M. EBELING, Ph.D.⁵⁴
PROFESSOR OF ECONOMICS
NORTHWOOD UNIVERSITY**

Mr. EBELING. Mr. Chairman, I would like to thank you and the other committee members for this opportunity to testify on our current fiscal crisis and the issue of raising the government's debt ceiling.

The current economic crisis through which the United States is passing has given heightened awareness of the country's national debt problem. Between 2001 and 2008, the national debt doubled from \$5.7 trillion to \$10.7 trillion and has grown by another \$3.6 trillion in the last 3 years to a total of \$14.3 trillion.

As I point out in my written testimony, this addition to the national debt since 2008 represents a huge sum. It is 2 times as large as all private sector manufacturing expenditures and nearly 5 times the amount spent on non-durable goods in 2009. The interest payments alone during the first 6 months of the current fiscal year are equal to 40 percent of all private-sector construction spending in 2009.

This highlights the social cost of government spending above what it already collects in taxes from the American public. Every dollar borrowed by the United States Government and the real resources that dollar represents in the marketplace is one dollar less that could have been available for private sector investment, capital

⁵⁴ [The prepared statement of Dr. Ebeling can be found on page 484.]

formation, consumer spending, and other uses that could have been put to work to improve the quality and the standard of living of the American people.

The bottom line is that over the decades, the government, under both Republicans and Democrats, has promised the American people, through a wide range of redistributive and transfer programs and other ongoing budgetary commitments, more than the U.S. economy can successfully deliver without seriously damaging the country's capacity to produce and grow for the rest of the century.

To try to continue to borrow our way out of this dilemma will be just more of the same on the road to ruin. The real resources to pay for all the governmental largesse that has been promised would have to come out of either significantly higher taxes or crowding out more private sector access to investment funds to cover continuing budget deficits.

Whether from domestic or foreign lenders, the cost of borrowing will eventually and inescapably rise. There is only so much savings in the world to finance both private investment and government borrowing, particularly in a world in which developing countries are intensely trying to catch up with the industrialized nations.

Interest rates on government borrowing will rise, both because of the scarcity of savings to go around and lenders' concerns about America's ability to tax enough in the future to pay back what has been borrowed. Default risk premiums need not only apply to countries like Greece.

Reliance on the Federal Reserve to print our way out of this dilemma through more monetary expansion is not and cannot be the answer. Printing paper money or creating it on computer screens at the Federal Reserve does not produce real resources.

It does not increase the supply of labor or capital, the machines, tools and equipment out of which desired goods and services can be manufactured or provided. That only comes from work, savings, and investment, not from more green pieces of paper with Presidents' faces on them.

As I point out in my written testimony, monetizing the debt refers to the creation of new money to finance all or a portion of the government's borrowing. Since 2007–2008, the Federal Reserve, through either buying U.S. Treasuries or mortgage-backed securities, has in fact increased through the money multiplier of fractional reserve an amount already equal to about two-thirds of all of the government's new deficit spending over the last 3 years or so.

The fact is the Federal Reserve has more or less monetized—that is, created paper money—to cover a good portion of what the government has borrowed. The bottom line is that government is too big. It spends too much, taxes too heavily, and borrows too much.

For a long time, the country has been treading more and more in the direction of increasing political paternalism. The size and scope of the Federal Government has to and must be reduced dramatically to a scale that is more consistent with the limited government vision of our founding fathers, as is outlined in the Declaration of Independence and formalized in the Constitution of the United States.

The reform agenda for deficit and debt reduction, therefore, must start with the promise of cutting government spending and having a target downsizing of the government. As I suggested in my remarks, the Federal budget should be cut 10 to 15 percent each year across-the-board to get government down to a more manageable, traditional constitutional size.

As a first step in this fiscal reform, it is necessary to not increase the national debt limit. The government should begin now living within its means—that is, the taxes currently collected by the Treasury.

In spite of much of the rhetoric in the media, the United States need not run the risk of defaulting or losing its international financial credit rating. Any and all interest payments and maturing debt can be paid out of tax receipts. What will have to be reduced are other expenditures of the government.

The required reductions and cuts in various programs should be viewed as a necessary wake-up call for everyone in America that we have been living beyond our means. And as we begin living within our means, priorities will have to be made and trade-offs will have to be accepted as part of the transition to a smaller and more constitutionally limited government.

In addition, we have to rein in the power of the Federal Reserve. As I point out in my comments again, the power of discretionary monetary policy must be removed from the hands of the Fed.

They have too much authority to manipulate the supply of money in the economy, to influence the purchasing power of the monetary unit, and to distort interest rates, which influences the savings and investments in the economy that easily set in motion the boom and bust of the business cycle.

It is necessary first to think of seriously returning to a monetary system as a transition first that is a commodity-backed system, such as a

gold standard. And we should in the long run seriously consider the possibility of even a monetary system completely privatized and competitive without government control and management.

In conclusion, the budgetary and fiscal crisis right now has made many political issues far clearer in people's minds. The debt dilemma is a challenge and an opportunity to set America on a freer and potentially more prosperous track.

And in conclusion, Mr. Chairman, I would just like to give the following quote from a former President of the United States, with your permission:

"I place the economy among the first and most important virtues and public debt as the greatest of dangers to be feared. To preserve our independence, we must not let our leaders load us with public debt. We must make our choice between economy and liberty or confusion and servitude. If we run such debts, we must be taxed in our meat and drink and our necessities and comforts and our labor and in our amusements. If we can prevent the government from wasting the labor of the people under the pretense of caring for them, they will be happy."

Whose words are those, Mr. Chairman? Thomas Jefferson, the third President of the United States. Thank you very much.

Chairman PAUL. I thank the gentleman.

And I will now recognize Mr. Ely.

STATEMENT OF BERT ELY⁵⁵
[PRINCIPAL]
ELY & COMPANY, INC.

Mr. ELY. Chairman Paul, Ranking Member Clay, and members of the subcommittee, I appreciate this opportunity to testify today.

The first two charts attached to my written testimony show the tremendous growth of the Fed balance sheet September 2008, which reached an all-time high of \$2.7 trillion in assets last Wednesday. How much more will grow is anyone's guess.

As my testimony shows, almost all the growth in the Fed's liabilities has occurred in deposits in the Treasury Department and banks. Initially, the Treasury borrowed funds to lend to the Fed that the Fed then lent and invested in the financial markets. The later jump in bank deposits enabled the Treasury to reduce its deposits and borrowing. Bank deposits at the Fed rose to \$1.54 trillion last month.

⁵⁵ [The prepared statement of Mr. Ely can be found on page 495.]

Exhibit 2 also has faced the steady growth of the Fed's other major liability, currency. The Fed has no control over the amount of currency outstanding, though. It is totally demand-driven.

Turning to the Fed's income statement, the Fed has been extremely profitable since 2008. Exhibit 6 shows how the Fed earned a \$52.9 billion profit for taxpayers last year. Over the 2008–2010 period, the Fed earned almost \$90 billion, more than all FDIC-insured institutions, and 2011 will be another extremely profitable year for the Fed.

A key public policy question is whether the Federal Government, through the Fed, should play such a substantial role in the credit intermediation business.

Turning to the Fed's independence, that independence in fact is a myth. The Fed is a creature of Congress, and it operates with the full faith and credit backing of the Federal Government. Key to understanding the linkage of the Fed to the rest of the Federal Government is to consolidate the Fed and Treasury Department's balance sheet. There are several merits in viewing this balance sheet on a consolidated basis.

First, the asset side of the balance sheet shows the extent to which the Federal Government, through the Treasury and the Fed, is supplying credit to the private sector, notably to finance housing and higher education.

Second, the liability side of this consolidated balance sheet shows that private sector funds, principally deposits by banks in the Fed, currently provide substantial funding to the Federal Government.

Third, the liability side of the consolidated balance sheet shows at the end of March currency outstanding accounted for 10.4 percent of the total Federal debt held by the public. This non-interest-bearing portion of the Federal debt has declined as budget deficits have forced the issuance of substantial amounts of interest-bearing debt.

Given the magnitude of Federal budget deficits for the foreseeable future, the currency portion of the Federal debt will continue to decline. The printing press will not be a cure for funding unseen future deficits.

In sum, the Fed could be folded into the Treasury Department tomorrow. Doing so would permit a unified management of the Federal Government's balance sheet. The Treasury could also assume the role of lender of last resort. Since the Fed, when acting as an emergency lender, is lending taxpayer dollars, it is not doing anything that Treasury itself could not do. Treasury's assumption as

lender of last resort would bring much greater political accountability to such lending.

Since folding the Fed into the Treasury will not occur any time soon, Congress should mandate that the Treasury Department periodically produce a consolidated balance sheet of the Fed and the Treasury. This would present a more complete picture of Federal finances and the impact of the Federal Government on the U.S. economy.

Finally, the fundamental premise of central bank independence is that monetary policy should be free of political interference. Leaving aside the merits of that premise, the key question is what constitutes monetary policy.

Today, it consists solely of the Fed trying to influence interest rates through its open market operations, specifically to hold the overnight Fed funds rate as close as practical to the Federal Funds Rate Target, or FFRT, that is set by the FOMC.

The Fed does not control the money supply. The amount of currency in circulation is totally demand-driven. Money, however defined, is merely that portion of the credit supply which serves as media of exchange.

Inflation in the modern industrialized economy is to a great extent a function of the price of credit. If credit is underpriced, inflation may emerge as increased demand stimulated by underpriced credit causes the economy to overheat and asset prices to soar, as we saw in the recent years' housing bubble. Overpriced credit has the opposite effect.

Given that monetary policy is all about interest rates, the question is, who can better set interest rates: a committee of government bureaucrats; the FOMC; or the financial market? The experience of recent years certainly does not support the notion that bureaucrats can do a better job than the financial markets in pricing credit.

This question could be posed another way. What is it about credit that makes it desirable for government to determine its price? Somehow, either the central bank must provide a so-called nominal anchor for the credit market, a pricing benchmark, if you will. In the United States, that would be for the Federal funds rate target.

In my opinion, a good case has never been made that the financial markets cannot set interest rates across the entire yield curve that will promote stable, non-inflationary economic growth while minimizing the emergence of asset bubbles. More specifically, there certainly is no reason why the interbank lending market cannot es-

establish and vary the overnight interest rate, which the FOMC now establishes through its open market operations.

I encourage the subcommittee to address the question of why interest rates need a nominal anchor, why it is in the public interest to have a government committee signaling what its members consider to be the appropriate level of interest rate, and why the Fed should try to enforce that signal through open market operations.

If that case cannot be made, then the primary *raison d'être* for the Fed disappears, which would lead to folding the Fed into the Treasury Department.

Mr. Chairman, thank you for this opportunity to testify. I welcome the opportunity to answer questions.

Chairman PAUL. Thank you very much.

And finally, we will go on to Dr. Slaughter.

**STATEMENT OF MATTHEW J. SLAUGHTER, Ph.D.⁵⁶
ASSOCIATE DEAN OF THE TUCK SCHOOL OF BUSINESS
DARTMOUTH COLLEGE**

Mr. SLAUGHTER. Chairman Paul, Ranking Member Clay, and members of the subcommittee, thank you very much for inviting me to testify on these important and timely issues regarding America's monetary and fiscal policies.

In my remarks, I will make two points regarding the relationship between the Federal Reserve and Federal Government debt. I will then make two broader points regarding the debt ceiling.

First, it is important to emphasize that the Federal Reserve purchases of Federal Government debt has for decades been standard operating procedure for how the Fed conducts monetary policy. In pursuit of its dual mandate of both price stability and full employment, in the normal course of operations the Fed has long bought or sold Treasury securities to increase or decrease supply of what is commonly called high-powered money, or the monetary base.

In turn, through rounds of lending in the private financial system, these changes of the monetary base affect the broader U.S. economy. Indeed, for many years before the world financial crisis, the Fed executed monetary policy almost exclusively by transacting Treasury Securities. There is nothing inherently nefarious or worrisome about the Fed owning a large amount of Federal Government debt.

⁵⁶ [The prepared statement of Dr. Slaughter can be found on page 525.]

Second, it is important to emphasize that the current fiscal challenges facing America have not been caused or abetted by the historic interventions the Federal Reserve undertook amidst the world financial crisis. The Fed's efforts to restore liquidity and stability to America's capital markets required it to expand both the size and asset composition of its balance sheet in unprecedented ways.

This historic expansion of Federal Reserve monetary policy did not somehow cause the commensurate historic fiscal expansion. Rather, massive Federal fiscal deficits were triggered by a combination of sharp downfalls in Federal tax receipts and especially sharp increases in Federal spending.

Thus, historically, monetary and fiscal expansion coincided, but neither directly caused the other. Rather, both have been directed at containing the damage to the real economy of the world financial crisis.

Let me now turn to the broader issue of America's looming debt ceiling. Here I would like to make two points, the importance of which it is difficult for me to overstress.

First, the decision to lift the debt ceiling is a necessary consequence of previous decisions on taxes and spending. If America does not want to default, then raising the debt ceiling is mandatory, not optional. Pick whatever deficit reduction plan you like— that of the bipartisan deficit reduction panel, that of Congressman Paul Ryan, that of President Obama. No matter which plan you like, that plan will expand total Federal debt outstanding by several trillion dollars over the next decade.

This means that no matter which plan you like, to see it become a reality without the United States defaulting, you must support increasing the debt ceiling.

My second and final point is to implore you to understand that America is tempting a crisis of unknowable proportions if we default on our Federal Government debt. In many ways, global capital markets today remain deeply impaired. Housing prices in the United States continue to decline. Several sovereign debtors in Europe are struggling to remain liquid and solvent. Central banks continue to provide extensive support to the global financial system.

At the same time, economic recovery remains tentative in the United States and in many other countries, as Chairman Paul indicated in his opening remarks. About 25 million Americans remain unemployed or underemployed. Today's 108.9 million private sector jobs is the same number that America had nearly 12 years ago.

Amidst all this fragility and uncertainty, the prospect of a U.S. Government default is truly frightening. As the recent past so painfully demonstrated, financial crises often arise from unexpected sources and metastasize in unknowable ways. And a default in U.S. Treasuries, rather than on some other debt security in the world, would be especially worrisome for two important reasons.

One is that U.S. Treasuries are the one asset that world investors generally regarded to be free of default risk. But there is no law of physics that states the world's risk-free asset will always be

U.S. Treasuries. Indeed, it was not always so.

The other reason is that America's creditors are increasingly foreign, not domestic. Thanks to ongoing low saving rates by U.S. households, the foreign holdings of U.S. Government debt are likely only to rise beyond the recently crossed the 50 percent threshold.

History shows that deeply-in-debt sovereign powers are more likely to encounter sudden loss of confidence, the larger is the share of their outstanding debt held by foreign creditors. These fiscal crises have often come sharply and with little warning. All is okay, all is okay, all is okay. And then one day, all is catastrophically not okay.

America's fiscal challenges are grave. We need the understanding of our creditors to overcome these challenges. As such, America should be doing everything in its power not to cast doubt on the pledge to honor our debt. Time is running short, and what America needs most of all is leaders, such as those of you on this committee, to raise America's debt ceiling as part of meeting our fiscal challenges.

Thank you again for your time and interest in my testimony. And I look forward to answering any questions that you may have.

Chairman PAUL. Thank you.

[QUESTIONS & ANSWERS]

I will start the session for questioning. I want to follow up on Dr. Slaughter's position, on what would happen if we don't raise the national debt.

I concede it will be a problem and there would be some consequences, but the reason I come down on the side of saying that we shouldn't continue to do this is that we have embarked on a course that will lead us to such a consequence that will be much worse than not facing up to the fact that we just can't continue to do this constantly. There has to be some pressure put on the system that we can't depend on the creation of new money to accommodate the deficits that we come up to.

And I would like to ask Dr. Ebeling and Mr. Ely and let Dr. Slaughter respond, if he would like to, how bad is that if this debt

limit is raised? And is there an argument made that it might not be nearly as bad as they suggest? They were panicking us now and saying that anybody who would suggest this is the equivalent to a terrorist suggesting that. And that came from a Republican.

So can you comment on that, Dr. Ebeling?

Mr. EBELING. Yes. I don't think that it has the danger that has been suggested. As I said in my comments, both in my opening remarks and in my written remarks, the U.S. Government certainly takes in enough tax revenue far and above the tax revenue necessary to meet interest and rollover costs of existing debt.

What would be required, if one is going to maintain one's international creditworthiness in that manner, is to start cutting back on other domestic spending other than one's debt obligation.

Will that necessarily require trimming, cutting, reducing a variety of current expenditures that the U.S. Government is committed to? Yes. But the fact is that the same thing applies to households.

If a household finds itself in the situation where it cannot afford, because it has reached its credit card limit, to add to this debt without serious problems, and is threatened with default if you can't meet its minimum payment, it then tightens its belt, and to decide maybe not to buy the flat screen TV for the extra bedroom for a while, maybe not to go out to the restaurant 2 or 3 times a month, and maybe to watch more on Netflix for the \$14 a month as opposed to going to the movie theater for \$15 a ticket.

And that is how it will have to be managed. Now, as I say, this is an important—

Chairman PAUL. Excuse me. I want to follow up, because you have emphasized the need to cut back, and you suggested where it would have to be.

Mr. EBELING. Right.

Chairman PAUL. And it would not be all that much comfort for the people who have to cut back. But can't you include in there how rapidly could we cut some of the spending that we do overseas and some of this foreign policy adventurism? Wouldn't that be a place that we could save some money as well?

Mr. EBELING. I totally agree with you. The fact is that even in the post-Cold War era, the United States has dozens upon dozens of military bases and facilities around the world. Tens of thousands of American servicemen—Army, Navy, Air Force, Marine Corps—are stationed in various numbers in many, many countries around the world.

I see no reason why we could not significantly cut back on this overreach in our foreign policy and bring those soldiers home, reduce our expenditures for those bases, and make the countries that have for decades had this umbrella of military security from the United States shoulder these expenses themselves.

The fact is the United States still provides a huge military umbrella for the European Union, which they have had a free ride on practically since the beginning of NATO. I see no reason why we couldn't cut back and expect them to defend themselves more effectively. And the same thing applies to Korea or Japan.

Chairman PAUL. Let me get Mr. Ely's comments, too.

Mr. ELY. Mr. Chairman, I am clearly concerned by what the present trajectory of spending is and, more importantly, what this means in terms of the ratio of Federal debt to GDP. It is reaching astronomical heights.

And the challenge that Congress faces is basically not only trimming the spending, but getting the economic growth we need to help bring down the relationship of Federal debt to the current GDP. And, of course, as everybody knows, entitlements are a key aspect of that problem.

I am one who draws Social Security and is a beneficiary of the Medicare program, which, of course, are two of the really serious long-term problems facing the Federal Government. And they have to be addressed.

As much as I am—as I say, I am a beneficiary of those two programs. I fully appreciate, and I think even many of my fellow seniors do, that this cannot continue indefinitely. I do not envy the 30-year-olds and the 25-year-olds and so forth just now coming into the workforce because of the accumulation of these debts.

So it is going to have to be addressed, but it has to be more than cutting at the margin. It has to be some really fundamental changes and trimming back of the basic entitlement program.

Chairman PAUL. My 5 minutes is up, but I hope to be able to give you a chance to respond as well in time, so I am going to move on and recognize Congressman Frank.

Mr. FRANK. I agree on the need to cut back America's overcommitment internationally. I would say to Mr. Ebeling that, one, you said NATO has been getting a free ride practically since the beginning. No, not practically, no—since the very beginning.

Look, in 1949 we had countries in Western and Central Europe that were poor and devastated—enabled by his method to mobilize it all into military. And so the United States stepped in.

Two of those elements have changed. Western and Central Europe is no longer poor and weak and defenseless. There is no more Soviet Union menacing them. The only thing that hasn't changed is the American military protection. So, yes, there is a lot that could be done to shave that.

But—and I think this is true elsewhere in the world—Afghanistan. We are being told by some we should stay in Iraq another year to be the political and religious referee for Iraqi—but that is one of the points I want to make first of all.

The way this debt limit issue has been framed, I have had people acting—frankly, some of my Republican colleagues—as if they would be doing me a favor by raising the debt limit. The Federal Government doesn't owe me any money. I am not involved here.

I didn't vote for the war in Iraq. I didn't vote for the tax cuts of 2001 and for their renewal. I didn't vote for an unfunded prescription drug program. If everybody voted the way I did, we would have another couple of years before we would have to raise the debt limit.

Now, I lost. We incurred those debts. So that doesn't mean they don't pay them. But this notion that somehow I am responsible, that people on our side are responsible, no, there was a joint responsibility.

Let me just ask, though, Mr. Ely, in your response, the chairman had asked, and Mr. Ebeling responded, about what the consequences would be of not raising the debt limit. You didn't get to that. Would you tell me what is your view? Should we raise the debt limit? What if we are unable to come to a formula and don't raise the debt limit and run into the problem of not being able to— what do you think the consequences of that are?

Mr. ELY. I think it depends on how long things would go on before there was either resumption of the payment of the debt or at least the interest on the debt. If it is something that lasted a couple of days, I think—

Mr. FRANK. Okay. But if it is a couple of weeks or longer?

Mr. ELY. A couple of weeks or longer, I think could create some very serious longer-term negative consequences for the Federal Government in terms of leading to higher interest rates on Treasury debt. Again, I think it comes back to how does the financial—

Mr. FRANK. Yes, I am sorry, but I only have 5 minutes. I appreciate, but you—so you do think an indefinite problem. I agree that 1 or 2 days is never much of a problem. But if there is real uncertainty about how we are going to do that and it goes on for a while, there are negative consequences.

Mr. ELY. Oh, there is no question that there will be. And those negative consequences will mean higher interest rates on the Federal debt, and that will add to the budget deficit, if it goes on for a long time. A couple of days—

Mr. FRANK. Yes, if you don't have a resolution, yes, again, nobody thinks 1 or 2 days is a problem. We can do anything around here for 1 day except maybe hold our breath. But if you start getting into a deadlock, it is a different story.

Mr. Slaughter, you served in a very important position during the previous Administration, the Bush Administration. Again, on the debt limit, I appreciate your coming here and sharing your view.

What was the general view in the Bush Administration of the President and other high financial officials at Treasury and elsewhere, about the consequences if we were unable to come to an agreement on raising the debt limit?

Mr. SLAUGHTER. I think there was a variety of views, but I think almost everyone recognized that the unique position the United States has in global capital markets where Treasuries are regarded as the risk-free asset, everyone reasonably knew to have the humility to not know what would happen if we jeopardized that.

If we were to breach the debt ceiling and not have a resolution for some period of time, it is really difficult to know what is going to happen to demand for Treasuries around the world. We have never lived in that world. And again, today, now of the roughly \$10 trillion in U.S. Federal debt that is in public hands, slightly over half of it is foreign-held.

Mr. FRANK. Let me just a quick question, because you have been to business school. What about American businesses that operate internationally? Is there some negative impact for them, the multi-nationals that have to operate across national—

Mr. SLAUGHTER. There absolutely is. The global corporations, they have long time horizons, and when they discuss seeking certainty for the key investment and job creation decisions they make, the kind of uncertainty that we create in not resolving the debt issue makes them look outside of the United States to create those jobs.

Mr. FRANK. Mr. Paul and I can persuade our colleagues that we are spending hundreds of billions over time unnecessarily. By the way, we are defending wealthy nations against nonexistent threats. If we just started to bring some of that home, we can do some good work.

I thank you, Mr. Chairman.

Chairman PAUL. I thank the gentleman.

And I now recognize Mr. Huizenga for 5 minutes.

Mr. HUIZENGA. Thank you, Mr. Chairman. And I wanted to continue your line of questioning.

Dr. Slaughter, if you care to comment briefly on what Chairman Paul was asking before he ran out of time.

Mr. SLAUGHTER. Sure, I would add just a little bit of data. Again, there is about \$5 trillion of the \$10 trillion in U.S. debt outstanding in public hands that is now held by foreign entities. We don't have great data on who is holding U.S. Treasuries and what the source of their demand is. That is the reality of how data is collected globally.

Most people think that the People's Bank of China, which is the Chinese central bank, is the single largest entity holding U.S. Treasuries outside of the United States at about \$1.5 trillion. A lot of both the private and public institutions are holding Treasuries, we think, because of the perceived safety of that asset.

And safety is not something you can measure like you can measure things in the physics laboratory. What is saved in the eyes of these international investors is up to them, in large part. And so whether it is a 2-day breach, whether it is a 2-week breach of the debt ceiling, what is sort of mandated or chosen liquidations of holding U.S. Treasuries, it is hard to predict.

And it is hard to predict, then, as Bert said, what is going to be the impact on interest rates in the United States and that stress more generally on world capital markets that in many ways remain quite strained. And frankly, I think it is important to keep in mind financial crises are almost by definition hard to predict what would be the exact causes of them and hard to predict how they will evolve through time.

Mr. HUIZENGA. I appreciate that. And I wish our former chairman hadn't left. I was scarily going to say that we might be coming from a similar spot here. I am a freshman. I haven't been involved here on the run-up on our debt either, as his claim was, but we certainly have a position here—I have a position here of my desire to stop spending.

And that, I think, is how, if we hear from some of our friends on the other side of the aisle, who argue, "I wasn't part of that problem, because I didn't vote for this or that," I am here now, and I believe that part of that solution, exactly as Dr. Ebeling is talking about, is stopping our spending.

So it seems to me that is a fiscally responsible thing to do, as we are moving ahead, because I have a fear that, too, also, Dr. Slaughter, if we are going to put our currency as the reserve currency of the world at risk and we are going to be looking at much of what has

happened to many of our constituents, where they have had issues with their own personal credit and then had to go back and try to borrow more money, what has happened?

They are a greater credit risk, and they have had greater interest rates. We have seen this in Portugal recently. But I think our first and foremost focus needs to be on the stop-spending part. And I am curious to hear a comment there.

And then also, if anybody cares to comment on the value of the U.S. dollar, as opposed to the other currencies of the world and what we have seen in the rise of those other currencies or maybe more accurately a fall of our value.

Mr. ELY. If I could jump in here, again, I think a key aspect of the attack on spending has to be on the entitlements, has to be on money that people my age and older and even younger now are getting under Social Security and Medicare. And particularly, as the boomers come onto Social Security and Medicare, the problem is going to grow. And I think that is a very tough political issue that you have to deal with.

There is also the question that I know came up before, and that is about the savings rate. America is the world's largest debtor nation, somewhere in the range of \$3 trillion. And I think a key aspect of our poor financial situation isn't just the Federal debt, but it is the overall position of the United States with the rest of the world.

I know there are folks in the Pentagon who are concerned about our net debtor position, because the key reason why foreign interests hold so much in Treasury is because as a country, as a whole, we are so deeply in hock to the rest of the world.

So domestic savings and trying to encourage a greater level of domestic savings is, I think, a very important element of dealing with our global situation.

Mr. HUIZENGA. Dr. Ebeling?

Mr. EBELING. Yes, if I can just make a couple of comments, the concern has been expressed, and I don't disagree that if the United States were to default on its debt, its interest payment, this would have significant ramifications for our creditworthiness, interest rates at which the Treasury could borrow and so on.

But let us think of the alternative. If, as the Secretary of the Treasury has recommended, the debt limit is increased by \$2 trillion, then that will mean that between now and the beginning of 2013, the United States is likely, given the current trajectory, to need to borrow additional \$2 trillion.

Now, it is very hard to believe that if the Federal Reserve does not increase the money supply, that will not eventually have an effect

of rising interest rates anyway because of the amount of money that is going to be sucked into the government's deficit spending either domestically or from the international financial market.

There is also the fact that if the Fed monetizes it, as could happen as well, and as I was suggesting it has already done to a great extent, that will start having even more inflationary effects as the money starts percolating through the economy. And eventually, as people develop inflationary expectations, interest rates will rise anyway as they put an inflation premium on the rate of interest. So the fact is that it is between a rock and a hard place.

Mr. HUIZENGA. It is inevitable, is what you are saying?

Mr. EBELING. But in the long run, the important thing is that the government's budget has to be put under control. And the starting point, in my view, is that we do not raise the debt limit. We get our financial house in order now and start cutting and trimming spending so as to meet our financial obligations, but start taking our medicine to get on a sound financial course.

Mr. HUIZENGA. Dr. Slaughter, would you like to comment on that?

Mr. SLAUGHTER. I agree with many of the previous comments on the need for the United States to address both its medium- and long-term fiscal challenges. Our fiscal trajectory is completely unsustainable. I don't anticipate getting any Social Security, quite frankly.

Mr. HUIZENGA. I am 42, and I will be shocked if I get any.

Mr. SLAUGHTER. I am also 42, and my wife is the house accountant. I am the household trash recycling guy, but that is how we do it.

But that said, with no disrespect to anyone here or the broader

U.S. Congress, I just don't see how these deep challenges of spending and savings choices both for America overall and for the Federal Government can be addressed, frankly, in the next few days or few weeks without having major damage done to the credit-worthiness of the United States if it breaches—

Mr. HUIZENGA. Are you implying that maybe we don't have the political will to go out and do some of the things that we need to do?

Mr. SLAUGHTER. I am saying it is a really complicated set of issues and trade-offs that our country faces about what—

Mr. HUIZENGA. Because I would say I don't believe we have the political will to go out and do what probably most people believe we need to do.

Mr. SLAUGHTER. In which case, I am just very concerned about how the policy conversation proceeds and what happens in global

capital markets. That timetable of global capital markets is not one that anyone in the United States controls.

Mr. HUIZENGA. Would anybody care to comment?

My time has expired. So thank you, Mr. Chairman.

Chairman PAUL. The gentleman's time has expired. And if you hang around, we might be able to get some more questions later.

Now, I recognize the ranking member, Mr. Clay.

Mr. CLAY. Thank you, Chairman Paul.

Dr. Ebeling, the President's deficit reduction commission recommended numerous items of reining in spending. Also, they addressed a fair tax proposal. You have mentioned several times that we need to reduce spending. Should some type of tax reform be a part of that equation also?

Mr. EBELING. With all due respect, Congressman Clay, I think there needs to be tax reform, but the reform has to be taking the longer view—cutting taxes, not raising them. I believe that all across the income spectrum, Americans are paying more than enough taxes for what government does.

The fact is, it is not a taxing problem. True, the taxes have fallen because of the recession, but it is not a taxing problem. It is a spending problem.

The Congress, the President, too many special interest groups, and the general environment of the country have become addicted to the idea that the U.S. Government can afford and has the ability to hand out more and more largesse to society in general, to various special interest groups, for which the money and the resources are not there.

It is a spending problem, not a taxing problem. You don't want to raise taxes—

Mr. CLAY. Right. We have—

Mr. EBELING. —and create disincentives for work, savings, and investment, which in the long run doesn't make the economic pie get bigger. If you raise taxes, you slow down the pie's growth potential.

Mr. CLAY. You have mentioned the accumulation of U.S. debt over the past 3 years. What was the accumulation of the U.S. debt over the past decade?

Mr. EBELING. I am here at one level as someone who is not wearing a political hat. I am an academic economist. That means I try to look at the truth. And the Republicans were unbelievably irresponsible.

As I mentioned in my written testimony, between 2001 and 2008, our national debt doubled from approximately \$5 trillion to \$10

trillion. And therefore, they were as responsible, as I think the present situation is, with an unwillingness to cut government spending to bring this danger to a close.

Mr. CLAY. Okay.

Mr. EBELING. So, no. Both hands have a little bit of dirt on them.

Mr. CLAY. There are no clean hands. You are correct.

Dr. Slaughter, has the Fed policy of quantitative easing helped to improve the economy over the past 18 months?

Mr. SLAUGHTER. Yes, I think it has. I think both phase one and phase two were an attempt to continue to stabilize U.S. and global capital markets. I think they largely succeeded in that.

In particular, quantitative easing two was put into place at a time in mid- to late 2010 when there were a number of signs that the U.S. economy's rate of growth was slowing and that the general level of prices was coming close to being flat to falling, and so the need to try to avoid deflation, which can be very corrosive and as the Japanese experience over the past many years has demonstrated can be very difficult to overcome, it was important to avoid that outcome.

That said, as Chairman Bernanke himself said in his press conference recently, the Fed can't solve all the systematic challenges that face the United States, and in particular trying to get economic growth going again and get the job creation and income growth that America needs.

The Fed, simply over the medium- and long-term, can't create those jobs and can't create those rising incomes. That largely comes from the private sector. And so the policy conversations we need to have, I think, need to focus on what it is to incite job creation in the private sector.

Mr. CLAY. Earlier this week, Speaker John Boehner offered up a \$2 trillion cut in exchange for raising the debt ceiling. And with the conditions being as they are on Capitol Hill, with a split Senate and a House, what is the likelihood of actually resolving this, if we have a protracted battle over this, over raising the debt ceiling? Or what would be the consequences of it?

Mr. SLAUGHTER. Again, part of the challenge I would stress is I don't exactly know how and where the consequences will arise. But if we miss an interest payment or we miss a principal repayment because the United States is not able to re-channel some of the incoming tax revenue away from current spending obligations to making good on interest and/or principal payment, it is difficult to say how credit rating agencies will respond.

It is difficult to know what both domestic and foreign creditors to the United States, how that might cut back on their demand for U.S. Treasuries.

I would stress again that financial crises by definition are hard to know how they arise and hard to know how they develop, so I think it is incumbent on people to realize as fragile as the world's financial system and the U.S. economy remain today, going in that direction carries great risk.

Mr. CLAY. Thank you for your responses.

Mr. Chairman, I am out of time.

Chairman PAUL. I thank the gentleman.

I recognize Mr. Luetkemeyer for his 5 minutes.

Mr. LUETKEMEYER. Thank you, Mr. Chairman.

I would like to ask a question of Mr. Ebeling, probably, with regards to interest rates and the end of QE2 this summer. What do you think is going to happen when we quit absorbing all of our debt? Do you think that the rest of the world has enough liquidity in it to purchase our debt? And if so, at what interest rate do you think would be able to have that done?

Mr. EBELING. I am not sure if there is enough liquidity in the global economy to make up the difference of what the Fed has been doing in increasing the money supply to help finance the government borrowing. I think that inevitably when the Fed ends its QE2, as it is saying in June formally, that means we are going to be relying upon what the financial markets—what the fixed amount of funds in the financial markets can do at home and any money that might be lent to us from abroad.

I will be surprised if looking over the next year, the Federal Reserve does not go on a monetary expansionary policy again if we don't start seeing interest rates rise.

Of course, there could be political crises in other parts of the world where everyone runs to the United States as a traditional shelter to park their money. But presuming that does not occur, I would be very surprised if the Fed does not become accommodative again, if interest rates don't start nudging up.

It was pointed out earlier by Mr. Slaughter, and I agree with him—or I believe it was Mr. Ely—that savings rates have been very low in the United States. The fact is, according to the St. Louis Federal Reserve in their monthly monetary trend publication, since the last quarter of 2009, when adjusted for inflation, the Federal Reserve has pushed interest rates so low, such as the 1-year

Treasuries and the Federal funds rate, that real interest rates are in the negative range, -2 percent.

It is not surprising, then, that when interest rates in whole are so low that you don't create much of an incentive for people to save. The fact is we have to allow the financial markets to tell us how much real savings is in the domestic economy and how much of the world economy has savings to share with us. And then on that basis, we can know what real interest rates should be.

And the United States, as I say, should cut back, eliminate its deficit spending so that the savings that is available, either domestically or from foreign sources, can help the recovery in the United States.

MR. LUETKEMEYER. Okay. So it is your contention that the Fed, in order for us to continue to spend at a deficit level, will have to have a QE3?

MR. EBELING. Whether they call it that or not, I don't see how \$2 trillion more of borrowing over what amounts to the next year-and-a-half is going to be successfully provided by the global or the domestic economy alone.

MR. LUETKEMEYER. And if it is provided, it would definitely be at a higher interest rate, I would assume. Would you agree with that?

MR. EBELING. If it is accommodated by the Fed, interest rates may temporarily stay low. But as I was suggesting in response to an earlier question, the fact is that inflation will start nudging up even further, and inflation premium will go on the rate of interest, and we will not get away from it. And in addition, the value of the dollar will continue to fall on foreign exchange markets.

MR. LUETKEMEYER. And there is another problem here as well. As interest rates go up, the cost of our monies go up, the deficit that we have is going to go up, which means all of the cuts that we make, all those stays we make in our budget are going to be eaten up by increased interest rates.

MR. EBELING. Correct. This is the dilemma that is facing those peripheral European countries, as they are called, such as Greece and Portugal. On the one hand, they are trying to carry out what they call austerity programs, but the international creditors don't have confidence in them, so it is time for them to rollover or pay off debt, and the new interest rates are even higher, which immediately reverses or cuts into the attempt to get their budget under control.

MR. LUETKEMEYER. Okay. Let us leave it at—

MR. EBELING. It has to be believable.

MR. LUETKEMEYER. I agree with you.

Mr. ELY. If I could just interject in here—

Mr. LUETKEMEYER. Yes, sir.

Mr. ELY. —there are many, myself included, who are concerned that interest rates, that nominal interest rates are too low and that what may happen is that before we know it, we will start to see asset bubbles emerge again and that the Fed will not respond quickly enough. And so what we will do is we will get an overshoot in terms of rising asset prices.

Now, that doesn't seem like much of a concern today, particularly when we look at where housing prices are, but in fact the Fed can't turn on a dime, in part because we don't know in a real-time basis what is happening out there in the market. So I—

Mr. LUETKEMEYER. I have one more quick question, if I can interrupt.

Mr. ELY. Okay.

Mr. LUETKEMEYER. Just with regards—I see my time is up. Okay. Thank you, Mr. Chairman.

Chairman PAUL. I thank the gentleman.

And I recognize the gentlelady from New York, Mrs. Maloney.

Mrs. MALONEY. Thank you.

And welcome. I would like to ask each of your perspectives on this question: Isn't it true that the real drivers of U.S. debt are not the Federal Reserve's monetary policy, but fiscal policy decisions that we have to face about congressional policy on entitlements, taxes, and spending?

I recognize that there has been controversy surrounding monetary policy decisions like the QE2 program, keeping the Federal funds rate at nearly zero percent to access to the Federal Reserve's lending window. But all of these programs are really temporary. And once the economy turns around, the Fed will exit from them.

And so I would like your comment on it. The title of the hearing, of course, is about the Federal Reserve policies and the debt ceiling, but I am asking whether you see it as Federal Reserve policies or really congressional decisions on spending and fiscal policy.

Mr. ELY. If I could jump in here, I think it is basically focused on fiscal policies. I am not going to blame the Fed for the situation that we are in. But this is going to be that tough issue of what do we do about fiscal policy.

I am not in favor of raising taxes. I think the entitlements have to be addressed, although I think in the context of tax reform, there should be greater incentives in place to not only save, but also not to borrow.

One of the problems we have in the economy is that the Federal Government, through the Tax Code, effectively subsidizes borrowing, and borrowing in the private sector did a lot to get us in the mess we are in now. But I think the key longer-term focus has to be on the spending side, and particularly on entitlements.

Mrs. MALONEY. Any other comments?

Mr. SLAUGHTER. I would agree with Mr. Ely. Yes, the debt problem we face today with the debt ceiling has been driven by fiscal policy choices, not by monetary policy choices. And again, as they go to the medium- and long-term, it is the projected increases in Social Security, Medicare, and Medicaid spending that are going to present the largest charges to the United States.

On the tax side, the one thing I would say is I agree raising tax rates is not great. When you are raising tax rates on income, that creates disincentives for work and effort. But there are a lot of inefficiencies in our Tax Code today. We could raise tax revenues without raising tax rates with simplifying the Tax Code in a lot of ways.

One example is the mortgage interest deduction. Another example is the tax advantage that is given currently to health care spending. The cost of both of those tax advantages in our current Tax Code are currently estimated to be north of \$200 billion per year.

So as we think about innovative solutions to address these challenges, I think that is one thing to keep in mind is tax reform can be a great way to try to incent job creation and a lot of great things in the private sector, while also helping address the tax revenue challenge.

Mr. EBELING. It is a fiscal problem fundamentally. In this process, the Federal Reserve has been an accomplice during the fact in the sense that it has supplied the money to fund a lot of what the government has been borrowing.

But the bottom line is the burden is here in the House of Representatives, in the Senate, and in the White House. You are the ones who have the authority to tax. You are the ones who also have, more importantly, the authority to spend. And it is the spending side more than anything else that has to be handled.

This gap between revenues and expenditures, this deficit each year, has to do with the fact that you are promising the American people, in entitlements or other current annual expenditures, more than the economy is generating in the tax revenues, given the code that you have, and the economy's ability to generate wealth in the long run.

So the fact is it is a fiscal problem. And as I have suggested, the bottom line is—there is nothing wrong with, obviously, introducing

efficiencies in the Tax Code in principle, depending upon the content and the specific character of it—but the bottom line is it is the spending that is out of control, not the taxing.

Chairman PAUL. I thank the gentlelady.

I recognize Mr. Schweikert, from Arizona.

Mr. SCHWEIKERT. Thank you, Mr. Chairman.

A slightly different question and what I have been trying to watch, as we go through this summer, and let us assume that we will call it quantitative easing goes into an unwind. Japan, being what, they hold about 20 percent of our foreign-held U.S. sovereign debt, has to do some unwind there to pay for infrastructure. Some of the tells coming out of China are true that they intend to do more moving of foreign reserves into commodity or commodity-based currency.

What happens at the end of the summer if we were to go just raise the debt ceiling, not having a series of triggers and mechanics and tells to the market that we are serious about this explosion of

U.S. sovereign debt, and at the same time the very people who have been buying and financing our debt are not as big a participant in the market?

First, am I being realistic? Am I just being a “Chicken Little?” And if there is any truth in that scenario, what happens to interest rates on our debt? Anyone who wants to answer?

Mr. SLAUGHTER. That kind of scenario is eminently plausible. Again, there are a lot of investors around the world that hold U.S. Treasuries today for a lot of complicated reasons, but they have a lot of other assets that they can choose from. That is true for the government-related entities, the central banks, and some fiscal authorities, but also the private savers in other countries as well, sovereign wealth funds, individual pension funds, things like that.

So their demand for Treasuries would depend, as you rightly say, a lot on whether they perceive the United States leadership as credibly addressing the fiscal challenges we face. So the sooner that we can credibly signal to our creditors that we are on that, the less likely it is that bond rates in the United States will go up with damages to the United States.

And the one thing I would add is I am struck at the heterogeneity in opinions that you see out there from a lot of the key investors in asset markets. To single out one particular gentleman, Bill Gross, head of PIMCO, publicly announced in the past couple of months that a lot of their key bond funds have totally divested of U.S. Treasuries.

Mr. SCHWEIKERT. And just a little bit of trivia on that, if you noticed their latest disclosure, they have actually increased their hedge again. They are basically hedging on the downturn.

Mr. SLAUGHTER. Yes, so that uncertainty, I think, is symptomatic of why I would urge caution and prudence on all these fiscal things, but especially get on not breaking the debt ceiling.

Mr. ELY. The key thing is that what you are suggesting and what is implied in your question is that there will be reduced demand for Treasuries from outside the United States. That has to have an upward effect on Treasury rates. And given the fact that we have so much in the way of short-term and medium-term Treasury debt outstanding, that starts to bite pretty quickly in terms of higher interest costs. So we are in a very dicey situation.

Mr. SCHWEIKERT. Mr., is it pronounced "Ely?"

Mr. ELY. "Ely."

Mr. SCHWEIKERT. "Ely," like the coffee?

Mr. ELY. Yes.

Mr. SCHWEIKERT. Okay. Are we also under a common understanding that our WAM is what, about 4.25 years?

Mr. ELY. I am not sure what it is right now. It has shortened up, I know, and, of course, the shorter the weighted average maturity of the debt, the sooner an increase in rates is going to whack the Federal budget.

Mr. SCHWEIKERT. It makes us very interest rate sensitive, which is—

Mr. ELY. Yes, it is. It is increasingly interest rate sensitive because of the shortening up. In fact, it is a very significant question as whether or not Treasury has properly managed debt, our Federal debt, so it is actually extend the maturity during this time of historically low interest rates.

Mr. SCHWEIKERT. You are actually hitting one of the things I was going to pitch at the end is maybe we should also in this environment, even though the outer end of the curve is a little bit steeper, but maybe we really need to start pushing out our maturities to insulate ourselves from shock.

Mr. ELY. I would agree, and actually we have gone the wrong way.

Mr. SCHWEIKERT. I want to pounce on just my scenario. Am I pitching a doomsday scenario? Am I pitching just a realist's on what essentially will drive up our interest rate?

Mr. ELY. In my opinion, your scenario is very realistic.

Mr. EBELING. I don't think it is unrealistic. I think the very points that you raise—the Japanese are going to have a huge financial cost to rebuild the destruction from the earthquake and the tsunami. The Chinese might very well lose their taste or their desire for U.S. Government securities. There is the question of the amount of savings to come into the United States to fund U.S. Treasuries, given the financial crisis in the European Union.

All of these things are creating serious problems looking over this year. But I think that this concern about what is the signal or the message that foreign creditors, either the private sector or others, sovereign wealth funds, for example, will read from this.

What will they read from it if you raise the debt limit by, for example, Secretary Geithner's request of \$2 trillion, and this basically puts aside virtually any debate, discussion or decision about what to do for the budget between now and the next election cycle—that is, to 2013—and the uncertainty, to be honest, who is going to be the next President of the United States? Will it be the continuing current President or someone else?

Mr. SCHWEIKERT. Doctor—

Mr. EBELING. That will create a huge amount of further uncertainty on the financial markets and hesitancy about maintaining the value of the dollar in those markets.

Mr. SCHWEIKERT. Thank you.

And, Mr. Chairman, I know I am out of time, but one interesting conversation, I spent a couple of days in New York—actually, Monday and Tuesday—and I had a couple of folks who are huge buyers, are marketers in U.S. sovereign debt issues. And they said, "Look, we are going to punish you if you go and raise the debt ceiling and don't communicate to the markets that you are taking this seriously."

And every single point is what, \$100+ billion bleeding. So even just moving back to normalized interest rates is devastatingly ugly to this budget. Thank you, Mr. Chairman.

Chairman PAUL. I thank the gentleman. And we will have a chance for a follow-up, if you care to stay.

I have a follow-up. I want to talk a little bit more about the consequences of not raising the debt limit. And I think even Dr. Slaughter admitted that he is not exactly sure—it wouldn't be good, but not precisely sure exactly what will happen, because it is unknown territory.

The question I have, Dr. Slaughter, is how do you answer the argument that others say why don't we, Treasury, just use priorities, pay the most important bills, pay the debt? Does that raise a lot of

questions about our credit rating, if we always honored the commitment to pay the interest?

And, of course, we would still have a problem. We would have to pay our other bills slower. But wouldn't that protect the integrity of the credit?

Mr. SLAUGHTER. So that has a couple of costs, I think. One important cost is you are implicitly turning into creditors, involuntarily, Social Security recipients or government contractors. They are being made unwanted creditors to the U.S. Government to make good on outstanding—

Chairman PAUL. Maybe farm subsidies.

Mr. SLAUGHTER. Whatever it is, but the principle that I think a lot of holders of Treasuries look at is a sudden, on-the-fly change in priority of payments by the U.S. Government. That is going to introduce uncertainty and risk.

And I am not a legislative expert, but I just don't know. My understanding from what I have read up to learn about this is we simply don't have a set of rules and laws or executive orders in place to prioritize payments coming out of the U.S. Treasury when there isn't any existing law or regulatory structure in place to make those priorities—

Chairman PAUL. But okay, let us assume they can do it and they always honored the commitment to pay it. Would that mean that it would be less drastic than you anticipate? Wouldn't that soften the concern, if you knew that they put it into a form of a law and they said that you could do it? Would that soften your concern?

Mr. SLAUGHTER. No, not necessarily. The other issue I want to raise is the economic concern—again, the fragility of the recovery right now.

If we are talking about truly not raising the debt ceiling at all, the implied fiscal contraction that would come in the coming months from that, without offsetting policy support for economic growth of the private sector, so things like trade liberalization and other things, would have a very bad impact on jobs and the labor market in the broader U.S. economy.

Chairman PAUL. A concern I have sometimes is the crisis is very often overblown. In 2008, it was a major crisis. We didn't do it. We are going to have a grand depression.

But what we did was we had TARP funds and we had the Federal Reserve pumping trillions, and everybody said, "See? We saved ourselves from a depression." Maybe Wall Street didn't get their

depression, but the people got the depression. They lost their jobs and they lost their houses.

So I can't see how ringing the alarm bells and doing it just because something terrible might happen—maybe doing it will make things worse. And I think what we are doing will eventually make it worse. You had another comment on it?

Mr. SLAUGHTER. I guess my concern is I would express again the unknowability of how capital markets are going to react to a breach of our debt ceiling.

And I would stress again part of the challenge in the fall of 2008 was how quickly the crisis with Lehman Brothers and AIG and capital markets metastasized to the General Electrics and other firms that were not able to rollover their commercial paper. And we were looking at layoffs several million more potentially than what we actually saw.

Chairman PAUL. But we don't know. It might even boost confidence to say, "Hey, they are going to get their house in order." It might even give more integrity to the dollar, and then we wouldn't have the crashing dollar.

Bert?

Mr. ELY. If I could just add something to that, there has been this discussion of we will pay the interest, but not repay the principal. In effect, what that is is a forced rollover of the debt.

Now, if you take Treasury bills, bills get paid off because the government sells new bills. If you say, "Okay, we are not going to pay off the bills as they are maturing," effectively, that has the same cash flow effect for the Federal Government as paying them off and rolling them over. So nothing is gained, in my opinion, by delaying the payment of maturing debt.

But the effect of paying on the markets, of not paying off maturing debt I think would be catastrophic, because people, particularly institutional investors, have cash flow programs that are based on known maturity dates for their debt.

If they don't get it, it may actually cause severe financial problems in some circumstances, but certainly really rattle the market. So I think one option that is, as a practical matter, not on the table is not paying debt as it matures.

Chairman PAUL. Of course, the other side of the argument is what we are looking at is something even more catastrophic with an inflationary blow-off, and that can be very, very tragic.

Dr. Ebeling, did you want to make a comment on that?

Mr. EBELING. I do. I think that the soundest policy, the one that would send the right signals to our international creditors, to set a tone in the United States, is precisely to say we will meet our financial obligations as interest and securities become due and that we are going to adjust our domestic spending to assure that.

The fact is, obviously, nobody wants their ox to be gored while others don't. But it seems to me that if we had the political will, which means the Members of the Congress make these decisions, to say that we are going to meet our financial obligations on the debt as they come due, but we are going to be reducing spending across the board by 5, 10 percent to see that it is covered without getting an increase in the debt limit, certainly, that sends the right signals internationally.

And it makes every American realize that nobody is getting a cut that they are not—well, that another person is, and that everyone has to bear the burden of this precisely because the promises have been greater than the tax structure and the economy can sustain.

I think that if it is across-the-board, it is very difficult to say that someone is getting something of a deeper cut or burden compared to someone else.

That requires political commitment and willingness to do it as well, but what else are you going to do? Do you want to be in this situation, maybe not today? You could raise the debt limit. You could put it off 2, 3, 4 years. But do you want to be put in the position in our own circumstances of a Greece or a Portugal? Eventually, you cannot keep this going.

Chairman PAUL. Right. My time has expired.

Now I am going to recognize the gentleman, Mr. Luetkemeyer, from Missouri.

Mr. LUETKEMEYER. Thank you, Mr. Chairman.

The reason for my question a while ago was we had a discussion with Chairman Bernanke in this committee at one point, and, obviously, you gentleman answered the question the opposite of the way he did, which is not surprising.

Another question for you with regards to the discussion we had with him with regards to the Fed and their policy, he made the point during the discussion that with QE2, look at how great the stock market is. It has all gone up.

And my concern is, I am not sure you can use the stock market as an indication of the strength of the economy, when you are looking at 9 percent unemployment.

Can you tell me the relationship between the stock market and our economy, the jobs, Fed policy? Can you kind of put it into—that is a broad thing to talk about in just a 30-second sound bite, but it would seem to me that I think the stock market is an institute unto itself. It is a daily reaction to what is going on in the world versus a long-term thought process or process on long-term thinking about really where our economy is going.

Would you care to comment or give me some thoughts on it? And we will go right down the line. I would like to have everybody's comment.

Mr. EBELING. I think that what we have seen for the last 2½ years with this huge run-up in the stock market has basically been due to Fed policy. It is not due to anything of a natural and normal recovery in the economy, which has been delayed by, as I also mentioned in my written remarks, regime uncertainty.

The fact is the economy was thrown out of the severe imbalance due to the monetary expansion and interest rate manipulations of the bubble years from 2002 to 2007. And it is necessary for these misallocations of resources, investment mistakes, to sort themselves out.

But the fact is that instead of allowing the market to properly correct, the Fed bought up these mortgage-backed securities and distorted the housing market. What are houses worth? Nobody knows. We think they are at the bottom. But what do we know about the real supply and demand?

So there is uncertainty in the housing market. This has affected the construction industry. The fact is the ones who have benefited are some people in the stock market and in the financial market.

If you break down the government statistics that have been coming out every month about GDP and employment figures to sectors of the economy, as 2008 and 2009 rolled on, you saw falling employment in virtually every sector of the economy except the one. If you look at the little sectoral breakdowns, that was the financial market.

It seems that no one from the top to the teller in the retail bank office lost their job. And that is because the Fed basically bolstered the financial market for their bad decisions, which they felt confident would be bolstered because of expected bailouts. And it has fallen upon the rest of the economy while the economy has not been left alone to properly adjust.

Mr. LUETKEMEYER. Thank you.

Mr. Ely?

Mr. ELY. The stock market is based on—and values in the stock market are based, as much as anything else, on expectations. What are future earnings going to be and future dividend levels? And so the market tends to be a leading indicator in a crude way of where the economy is going.

But the market doesn't always get it right. It tends to undershoot and overshoot. And the real question is, how has the market gotten ahead of itself, given some of the factors that you pointed out, such as the very high unemployment rate?

Ultimately, the stock market has to reflect the real economy, and the fact is we have a weak economy. The unemployment rate is still at very high levels. We are running these huge deficits, as we have been talking about here. So it may be a situation where the market is ahead of itself, and that is why I don't think we ought to place too much emphasis on where the market is and focus more on what is happening in the real economy.

Mr. SLAUGHTER. That is a great question. There is a positive effect from stock market valuations to the broader economic performance, but it is not lockstep, and it is not what drives economic performance overall.

You can look at the balance sheets of households. Only about half of households own any equities directly or indirectly. And for the median household, the single biggest asset on its balance sheet is the equity it may have in its home. The home prices matter a lot more for the typical family. And for income statements for most households, it is to have a job and what is their earnings for that job.

If you look at the recovery, a lot of the publicly traded companies, a lot of them, the revenue growth such as they are realizing, if any, is coming from outside the United States. It is the Caterpillars and the Deeres and companies like that reporting huge revenue growth around the world, especially in emerging markets.

So I think the challenge that you rightly point to is how can we get job creation in America? We need it from all kinds of companies now, U.S.-based and foreign-based. We need it from big and little companies, but creating jobs linked especially to exports and investment opportunities around the world, not as much as we have been discussing, the things like consumption spending in the United States.

But if you look at—that comes back to, in part, the fiscal conversations we are having in this hearing. If you look at recent surveys of small business owners in the NFIB, the single biggest problem that a lot of these firms cite is there is some combination of poor sales, but

also government uncertainty, uncertainty over tax rates and government regulation.

Mr. LUETKEMEYER. Okay. I see my time is up, but I want to thank you gentlemen for being here.

It seems as though there is an underlying theme through all of this, and it is confidence in the ability to get our economy going. It is confidence in the ability of the Fed to manage. It is confidence in the ability of financial institutions to work back and forth and believe that they are going to be able to get their money back when invested.

As somebody in the financial industry, the whole thing is held together by confidence, believing that we can do business with each other and be able to get our money back. I think we have a huge confidence problem right now.

Thank you, gentlemen.

Thank you, Mr. Chairman.

Chairman PAUL. Thank you.

I now recognize the gentleman from Arizona, Mr. Schweikert.

Mr. SCHWEIKERT. I love this, where I can get another question this quickly, Mr. Chairman.

Back in sort of the circle I was trying to—and I appreciate you indulging me, because I have been trying to get my head wrapped around some of this—how much of a benefit do you believe we have had? Because I am looking at the short end of our interest rate curve right now and we basically have free money. And if you look at also throw a little inflation on top of that, it is almost people are giving us money and almost taking a hit on it.

How much of that, though, is because of the world situation around us? With turmoil in the Middle East, is there a flight of capital? I read stories about how much capital is actually leaving countries like Russia, even the things we have seen in the EU. Are we just really lucky right now? Let us start from Doctor—yes, no?

Mr. EBELING. I think there has been a degree of luck. You might have read in the press like I did that the Russian government is thinking of imposing more export controls on capital leaving the country, precisely because people earn money in the Russian economy from resources and raw materials, etc., and then they also want to park their money outside of Russia. That is very much the case, yes.

Mr. ELY. But I, whether or not it is lucky is a matter of where you sit. If you are a saver, if you are a senior citizen, you are getting killed from an income standpoint by these very low interest rates. And for people in their working years, what is the incentive to save when you

go to a bank and maybe it was 75 basis points or a percent on your CDs?

So for the debtor, these low rates are a great idea and a great benefit, but for the creditors, who are as much owed as is owned, they are really taking a beating on this. And it looks like it is going to continue for a while. So again, a matter of whether we are lucky depends so much on where you sit.

Mr. SCHWEIKERT. Understood. When I ask that question, I am actually asking for a series of my concerns of what happens when we start to get real pricing of risk.

Mr. Slaughter?

Mr. SLAUGHTER. You are definitely right that if you look at the fall of 2008, despite the crisis that we are having here in America, demand for Treasuries surged in part because of the fear and uncertainty about some of the other countries at the financial crisis there and what was happening to their sovereign debtors.

And so I think you hit upon an important point, which is our fiscal conversations we need to increasingly see in a global context. It is not just what we do here. There is a limited pool of savings in the global economy, and where those savers choose to allocate what assets they want to buy of U.S. Treasuries relative to other assets in the world, it is not just what we do, it is what other countries are doing.

And to the extent that if they can continue to make progress—the U.K. is having some serious fiscal conversations today and how that plays out, I think, will be very instructive for our country—the more other countries are able to address their fiscal challenges and we aren't, that compounds the problems that we have been talking about today.

Mr. SCHWEIKERT. Okay. And, Mr. Chairman, Dr. Slaughter, my understanding, and you shared with me over the last 12 months, or 11 months as it may be, the Fed has consumed what percentage and how much of U.S. sovereign debt issue?

Mr. SLAUGHTER. Meaning of the United States?

Mr. SCHWEIKERT. Yes.

Mr. SLAUGHTER. One of my fellow panelists may know the numbers better than me, but it is a pretty high fraction of the net new debt that Treasury has issued—has a net been bought by the Fed.

Mr. SCHWEIKERT. Is it close to 80? What percentage of new issuances have been financed through the Fed?

Mr. EBELING. The figure that I found was that just U.S. Treasuries, they have bought about \$1.2 trillion.

Mr. SCHWEIKERT. Okay. What percentage of all issuance is that?

Mr. EBELING. The total issuance of debt, let us say, since 2007–2008, has been an additional 3.6—

Mr. SCHWEIKERT. I am just trying to do the QE2 math in my head.

Mr. ELY. Can I interject something here? When you talk about how much the Fed's Treasury holdings have increased, that is only looking at one side of the equation. The other side is, where did the Fed get the funds to buy those Treasuries?

And where they have come from is basically a tremendous increase in the funds, up to now roughly \$1.5 trillion, that banks have on deposit in the Fed. So then, arguably, it is the banking industry through the Fed that has financed much of the increase that we have seen in outstanding Federal debt. The Fed is just kind of a middleman.

Mr. SCHWEIKERT. Mr. Chairman, Mr. Slaughter, isn't this sort of right, because in many ways you just closed the circle, because I was going to make the argument that the Fed is a huge, huge buyer of new issuances. They are not as interest rate sensitive, where your banks may say, "Look, I am not going to buy this. I am going to buy an agency product." And is that one of the things that has helped push down these interest rates in the short term of the curve?

Mr. SLAUGHTER. So, again, I had stressed for many, many years, the Fed on its balance sheet, a sizable fraction of its total assets have been Treasury securities at different maturities. That has been in part because of the liquidity and transparency of Treasury markets. They value being able to conduct monetary policy in their open market operation.

So I think the larger challenge for the United States you have hit upon, which is it is the demand from other savers in the United States and, importantly, demand from the rest of the world for U.S. Treasuries that increasingly will shape what happens with interest rates that we have to pay as a country.

Mr. ELY. And if I could add to that, and the reason that will be the case that other foreign countries, foreign investors become more important is because the United States continues to get deeper into debt to the rest of the world. And so as an economy as a whole, we are sucking in more and more of the world's savings.

Just imagine that the United States was not in that debtor position. In effect, we would owe the money to ourselves in terms of the economy as a whole. But we are in hock to the rest of the world, ultimately, because of our low savings rate in this country that has led to this \$3 trillion-plus net debtor position that we have.

Mr. EBELING. If I can add just one more point here, there is a bit of a musical chairs situation here. The Fed goes in and buys up all of these Treasury securities and mortgage-backed securities out of bank portfolios. Then they pay these banks an interest rate higher than market rates to park the money that they have created with the Federal Reserve.

It still ends up being money that the Federal Reserve created out of thin air. It may have this appearance on the ledger book, assets and liabilities—

Mr. SCHWEIKERT. It is a three-legged—

Mr. EBELING. It is still funny money.

Mr. SCHWEIKERT. It is a three-legged stool, where there is a premium paid within it, Mr. Slaughter.

And thank you for tolerating my rambling, Mr. Chairman.

Mr. SLAUGHTER. I was just going to echo Mr. Ely's insight. Japan is a good example. Japan's debt outstanding as a share of GDP is now approaching 200 percent. A major reason we have not had an international financial crisis related to the yen is because the large majority of that debt outstanding is held by Japanese households due to their high savings rate.

Mr. SCHWEIKERT. The internal, yes.

My last statement, and I will share this with you, Mr. Chairman, because you and I have had this conversation on the side, is one of my great, great fears is with the Fed intervention in U.S. sovereign debt and some of the other mechanics out there, we have no real pricing for risk.

We are approaching a debt ceiling. We are approaching a lot of these untenable numbers, but yet the old days when we used to look at bond futures and say, "The market is starting to price risk," in many ways the Fed's actions now, it is hard to know what is reality in the market anymore. Thank you, Mr. Chairman.

Chairman PAUL. And I thank the gentleman.

This hearing is now finished. The Chair notes that some members may have additional questions for this panel, which they may wish to submit in writing. Without objection, the hearing record will remain open for 30 days for members to submit written questions to these witnesses and to place their responses in the record.

{Whereupon, at 11:40 a.m., the hearing was adjourned.}

STATEMENTS

STATEMENT FOR THE RECORD
HON. RON PAUL
REPRESENTATIVE, 14TH DISTRICT OF TX
CHAIRMAN, SUBCOMMITTEE ON
DOMESTIC MONETARY POLICY & TECHNOLOGY
U.S. HOUSE OF REPRESENTATIVES

I am very pleased to hold this hearing today. For far too long, monetary policy and fiscal policy have been viewed as completely separate issues. Congress controls fiscal policy, the Federal Reserve controls monetary policy, and never the twain shall meet.

The truth, however, is that fiscal and monetary policy have always been tightly intertwined. In fact, the Federal Reserve has served as the enabler of bad economic policy for many decades. Without the Fed's relentless expansion of the money supply during both the Greenspan and Bernanke eras, the U.S. Treasury never would have been able to issue the staggering sums of debt that now threaten our economic well being. This Treasury debt is the very lifeblood of deficit spending, permitting one Congress after another to spend far more than the Treasury collects in taxes. It is precisely this unholy alliance between the enabling Fed and a spendthrift Congress that I hope our witnesses will address today.

Until 1971 the United States operated on a gold exchange standard, meaning dollars could be redeemed in gold by foreign governments. The dollar was thought to be "as good as gold" because the U.S. would never renege on its gold exchange commitment. The U.S. had to keep that commitment or risk gold outflows that presumably would keep the government from engaging in loose fiscal and monetary policy.

Unfortunately, the system did not in fact keep government spending in check. The federal government ran large budget deficits throughout the 1960s, with the Federal Reserve duly covering the gap and inflating the money supply. Foreign creditors understood that the dollar was being devalued, and increasingly began to exchange their dollars for gold. Rather than bring monetary and fiscal policies back into balance, however, the federal government under President Nixon defaulted on its obligations by closing the gold window in August of 1971.

Despite this, the United States' position as the world's largest economy and the de facto leader of the Western world enabled the dollar to maintain its position as the world's major reserve currency. We've also enjoyed having OPEC price oil in dollars, creating enduring worldwide demand for our currency. But without any effective structural restraints on Congressional spending or Fed monetary expansion, our unchecked fiat paper money system has led to an explosion of debt over the last 40 years.

Yet foreign governments (especially those that have large trade surpluses with the United States) continue to purchase Treasury debt in order to keep their excess U.S. dollar reserves from losing value to relentless inflation. Because of the dollar's continued status as the world's reserve currency, there is still a highly liquid market for Treasury securities. These Treasury securities are backed by the full faith and credit of the U.S. government, meaning they are backed by the government's power to levy taxes.

Not surprisingly, the increase in U.S. national debt over the past several years and the likelihood of continued trillion-dollar deficits has caused many of our creditors to rethink their position on Treasury debt. China slowly has begun to reduce its holdings, and indicated that its \$3 trillion total foreign exchange reserve is excessive. The investment firm PIMCO completely divested itself of Treasuries, and its co-founder Bill Gross publicly warned of a U.S. debt default. If foreign governments and large institutional investors begin to shy away from U.S. Treasuries, the Federal Reserve will face increasing pressure to monetize new Treasury debt issues.

The recent increases in fiscal deficits have been unprecedented. The \$1.4 trillion dollar deficit in FY 2009 was almost as large as the previous five years combined, and FY2010's deficit was not much smaller. Half a decade's worth of new debt could not possibly have been absorbed by the financial markets, at least not without a significant increase in interest rates. The Fed, however, absorbed this deficit by inflating the money supply. Since summer of 2008 the

Fed's balance sheet has tripled to \$2.7 trillion, while the monetary base has tripled to \$2.5 trillion.

The fundamental problem is that Congress cannot and will not cut federal spending and balance the budget. When Congress cannot balance the budget, it must cover the shortfall by raising taxes or borrowing money. Because the burden of taxes falls on current voters, while the burden of interest payments on debt falls largely on future voters, borrowing money has always been the politically favored method of funding.

Both the public and most members of Congress do not understand the mechanics of how the Fed and the Treasury Department work together to create new money and new debt. It's a circular process, but one that affects all Americans perhaps even more than the actions of their elected Congress.

In order to borrow money the Treasury department creates new debt securities, which it sells at auction to banks. However, banks generally do not maintain excess liquidity for the purchase of additional assets, but rather loan out funds up to the limit of their reserve requirements.

In order to facilitate the purchase of new Treasury debt, the Federal Reserve creates money out of thin air to purchase old Treasury debt from the dealers in the market. Banks then find themselves holding excess reserves, which they wish to get rid of by purchasing new assets—in this case newly issued Treasury debt.

These new excess reserves have an expansionary effect on the banking system. Given a reserve requirement of 5% and thus a money multiplier of 20, \$1 billion of asset purchases by the Fed can result in \$20 billion of new credit creation, as the initial \$1 billion is loaned out through the banking system. This entire system is purely inflationary and causes prices to rise and the purchasing power of the dollar to fall.

As price levels increase and the value of the dollar falls, holders of existing dollar-denominated assets see depreciation in the value of their holdings. This makes them both less willing to continue to hold dollar-denominated assets, as well as less willing to purchase more dollar-denominated assets in the future. But the continued operation of the profligate federal government is contingent upon finding purchasers for new Treasury debt.

Given the anxiety of institutional and government investors, the Fed increasingly must act—in effect—as the buyer of last resort for U.S. Treasury debt. Of course the Fed is prohibited from purchasing Treasury debt directly from the Treasury, as this outright

monetization would indicate that the nation's fiscal situation is so bad that the Treasury could not find sufficient debt purchasers to fund its fiscal deficit. So while the Fed does not directly purchase Treasury debt, the number of instances in which it has purchased freshly issued debt directly from primary dealers has begun to gain public attention. This is merely a step away from direct monetization.

Direct debt sales to a central bank are always seen as the last resort of a failed regime, as the central bank at that point acts merely as a rubber stamp for the government's fiscal profligacy. History teaches that the next step is severe inflation, if not hyperinflation, with investors and savers completely wiped out. The only reason we have not experienced hyperinflation so far is that the Fed has managed to keep the monetary base increases in check by paying interest on excess reserves held by banks. If these excess reserves begin to be loaned out, however, all bets are off.

We are told that Congress must raise the debt ceiling limit or else the financial markets and the U.S. economy will suffer great harm. In reality, raising the debt ceiling will allow the government to continue its fiscal profligacy. Fed financed deficits will continue; foreign investors will continue to divest their holdings of Treasury securities; the Fed will be forced to monetize new debt issuances, and prices will continue to rise as the standard of living of the average American continues to plummet. If we have learned anything from history, we should know that printing money out of thin air cannot lead to prosperity. It can only lead to penury.

I believe Congress should refuse to raise the debt ceiling. It would be one of the best things that could happen to this country. Congress finally would be forced to address the spending issue once and for all. Outlays would have to be covered by receipts, and Congress would have to get serious about eliminating unconstitutional government departments and programs. It is my hope that this hearing will help to examine the symbiotic relationship between the Federal Reserve's monetary policy and the Treasury's debt issuance, and I look forward to the testimony of our witnesses.

STATEMENT FOR THE RECORD

HON. BILL HUIZENGA

REPRESENTATIVE, 2ND DISTRICT OF MI
U.S. HOUSE OF REPRESENTATIVES

Good morning and thank you Chairman Paul and Ranking Member Clay for holding this important hearing today.

My constituents in West Michigan continue to make it clear. One of the most vital issues facing this Congress is reigning in spending and reducing our massive debt, and I thank you Chairman Paul for demonstrating that it is a priority by holding this hearing.

The Federal Reserve Board of Governors is congressionally mandated to enact monetary policy with the goal of maximizing employment as well as minimizing inflation. However, after witnessing the load of debt accumulated by the Obama administration's recent attempts to reach such goals through failed *fiscal* policies, I am pleased that we are now spending some time exploring the role of *monetary* policy and the national debt.

In recent years, the FED has taken unprecedented action to provide liquidity to the financial markets through the purchase of government debt. Most recently, due to the fact that the federal funds rate sits near zero percent, the FED decided to purchase an additional \$600 billion of Treasury securities commonly referred to as "quantitative easing" or "QE2." This strategy was undertaken despite the fact that the first round of quantitative easing (QE1) – the FED purchase of \$1.2 trillion in Treasury and Agency securities in March 2009 – has not proven to be an effective method of creating jobs.

Today we will examine what affect the federal government's debt plays in the Federal Reserve's open market operations. In addition, I look forward to inspecting how that role affects our yearly deficits when compared to the more costly tax and spend fiscal policies.

As a Member of the 112th Congress and a member of this important subcommittee charged with overseeing operations at the Federal Reserve, I take my responsibility for strict oversight of taxpayer dollars with the utmost seriousness. I look forward to today's robust discussion on the relationship between monetary policy and the debt, as well as the potentially negative long-term consequences from the FED's most recent unparalleled intervention in the markets.

Mr. Chairman, thank you again for holding this important hearing, and I look forward to hearing from our witnesses.

WITNESS TESTIMONY

WRITTEN TESTIMONY OF RICHARD EBELING, Ph.D. PROFESSOR OF ECONOMICS NORTHWOOD UNIVERSITY

Government Debt and Deficits

The current economic crisis through which the United States is passing has given a heightened awareness to the country's national debt. After a declining trend in the 1990s, the national debt has dramatically increased from \$5.7 trillion in January 2001 to \$10.7 trillion at the end of 2008, to over \$14.3 trillion through April of 2011. The debt has reached 98 percent of 2010 U.S. Gross Domestic Product.

The approximately \$3.6 trillion that has been added to the national debt since the end of 2008 is more than double the market value of all private sector manufacturing in 2009 (\$1.56 trillion), more than three times the market value of spending on professional, scientific, and technical services in 2009 (\$1.07 trillion), and nearly five times the amount spent on nondurable goods in 2009 (\$722 billion). Just the interest paid on the government's debt over the first six months of the current fiscal (October 2010-April 2011), nearly \$245 billion, is equal to more than 40 percent of the total market value of all private sector construction spending in 2009 (\$578 billion).⁵⁷

⁵⁷The 2011 Statistical Abstract: The National Data Book (Washington, D.C., U.S. Census Bureau, 2011), Table 669. <http://www.census.gov/compendia/statab/2011/tables/11s0669.pdf>.

This highlights the social cost of deficit spending, and the resulting addition to the national debt. Every dollar borrowed by the United States government, and the real resources that dollar represents in the market place, is a dollar of real resources not available for use in private sector investment, capital formation, consumer spending, and therefore increases and improvements in the quality and standard of living of the American people.

In this sense, the government's deficit spending that cumulatively has been increasing the national debt has made the United States that much poorer than it otherwise could have and would have been, if the dollar value of these real resources had not been siphoned off and out of use in the productive private sectors of the American economy.

What has made this less visible and less obvious to the American citizenry is precisely because it has been financed through government borrowing rather than government taxation. Deficit spending easily creates the illusion that something can be had for nothing. The government borrows "today" and can provide "benefits" to various groups in the society in the present with the appearance of no immediate "cost" or "burden" upon the citizenry.

Yet, whether acquired by taxing or borrowing, the resulting total government expenditures represent the real resources and the private sector consumption or investment spending those resources could have financed that must be foregone. There are no "free lunches," as it has often been pointed out, and that applies to both what government borrows as much as what it more directly taxes to cover its outlays.

What makes deficit spending an attractive "path of least resistance" in the political process is precisely the fact that it enables deferring the decision of telling voter constituents by how much taxes would otherwise have to be increased, and upon whom they would fall, in the "here and now" to generate the additional revenue topay for the spending that is financed through borrowing.⁵⁸

But as the recent fiscal problems in a number of member nations of the European Union have highlighted, eventually there are limits to how far a government can try to hide or defer the real costs of all

⁵⁸ Richard M. Ebeling, "Why Government Grow: The Modern Democratic Dilemma," *AIER Research Reports*, Vol. LXXV, No. 14 (Great Barrington, MA: American Institute for Economic Research, August 4-18, 2008); James M. Buchanan and Richard E. Wagner, *Democracy in Deficit: The Political Legacy of Lord Keynes* (New York: Academic Press, 1977); and earlier, Henry Fawcett and Millicent Garrett Fawcett, *Essays and Lectures on Social and Political Subjects* (Honolulu, Hawaii: University Press of the Pacific, [1872] 2004), Ch. 6: "National Debts and National Prosperity," pp. 125-153.

that it is providing or promising through its total expenditures to various voter constituent groups. Standard & Poor's recent decision to downgrade the U.S. government's prospective credit rating to "negative" shows clearly that what is happening in parts of Europe *can happen here*.

And given current projections by the Congressional Budget Office, the deficits are projected to continue indefinitely into future years and decade, with the cumulative national debt nearly doubling from its present level.⁵⁹ In addition, whether covered by taxes or deficit financing, these debt estimates do not include the federal government's unfunded liabilities for Social Security and Medicare through most of the 21st century. In 2009, the Social Security and Medicare trust funds were estimated to have legal commitments under existing law for expenditures equal to at least \$43 trillion over the next seventy-five years.⁶⁰ Others have projected this unfunded liability of the United States government to be much higher – possibly over \$100 trillion.⁶¹

The Federal Reserve and the Economic Crisis

The responsibility for a good part of the current economic crisis must be put at the doorstep of America's central bank, the Federal Reserve. By some measures of the money supply, the monetary aggregates (M2M or M-2) grew by fifty percent or more between 2003 and 2007. This massive flooding of the financial markets with huge amounts of liquidity provided the funds that fed the mortgage, investment, and consumer debt bubbles in the first decade of this century. Interest rates were pushed far below any historical levels.

For a good part of those five years, according to the St. Louis Federal Reserve Bank, the federal funds rate (the rate of interest at which banks lend to each other), when adjusted for inflation – the "real rate" – was either negative or well below two percent. In other words, the Federal Reserve supplied so much money to the banking sector that banks were lending money to each other for free for a good part of this time. It is no wonder that related market interest rates were also pushed way down during this period.⁶²

⁶² For more details, see, Richard M. Ebeling, "The Financial Bubble was Created by Central Bank

Market interest rates are supposed to tell the truth. Like any other price on the market, interest rates are supposed to balance the decision of income earners to save a portion of their income with the desire of others to borrow that savings for various investment and other purposes. In addition, the rates of interest, through the present value factor, are meant to limit investment time horizons undertaken within the available savings to successfully bring the investments to completion and sustainability in the longer-term.

Due to the Fed's policy, interest rates were not allowed to do their "job" in the market place. Indeed, Fed policy made interest rates tell "lies." The Federal Reserve's "easy money" policy made it appear, in terms of the cost of borrowing, that there was more than enough real resources in the economy for spending and borrowing to meet everyone's consumer, investment and government deficit needs far in excess of the economy's actual productive capacity.⁶³

The housing bubble was indicative of this. To attract people to take out loans, banks not only lowered interest rates (and therefore the cost of borrowing), they also lowered their standards for credit worthiness. To get the money, somehow, out the door, financial institutions found "creative" ways to bundle together mortgage loans into tradable packages that they could then pass on to other investors. It seemed to minimize the risk from issuing all those sub-prime home loans, which we now see were really the housing market's version of high-risk junk bonds. The fears were soothed by the fact that housing prices kept climbing as home buyers pushed them higher and higher with all of that newly created Federal Reserve money.

At the same time, government-created home-insurance agencies like Fannie Mae and Freddie Mac were guaranteeing a growing number of these wobbly mortgages, with the assurance that the "full faith and credit" of Uncle Same stood behind them. By the time the Federal government formally had to take over complete control of Fannie and Freddie in 2008, they were holding the guarantees for half of the \$10trillion American housing market.⁶⁴

Policy," American Institute for Economic Research, November 5, 2008, <http://www.aier.org/research/briefs/667-the-financial-bubble-was-created-by-central-bank-policy> (accessed on May 5, 2011).

⁶³ See, Richard M. Ebeling, "Market Interest Rates Need to Tell the Truth, or Why Federal Reserve Policy Tells Lies," in Richard M. Ebeling, Timothy G. Nash, and Keith A. Pretty, eds., *In Defense of Capitalism* (Midland, MI: Northwood University Press, 2010) pp. 57-60; <http://defenseofcapitalism.blogspot.com/2009/12/marketinterest-rates-need-to-tell.html>

⁶⁴ Thomas Sowell, *The Housing Boom and Bust* (New York: Basic Books, 2010); Johan Norberg,

Low interest rates and reduced credit standards were also feeding a huge consumer-spending boom that resulted in a 25 percent increase in consumer debt between 2003 and 2008, from \$2 trillion to over \$2.5 trillion. With interest rates so low, there was little incentive to save for tomorrow and big incentives to borrow and consume today. But, according to the U.S. Census Bureau, during this five-year period average real income only increased by at the most 2 percent. Peoples' debt burdens, therefore, rose dramatically.⁶⁵

The easy money and government-guaranteed house of cards all started to come tumbling down in the second half of 2008. The Federal Reserve's response was to open wide the monetary spigots even more than before the bubbles burst.

The Federal Reserve has dramatically increased its balance sheet by expanding its holding of U.S. government securities and private-sector mortgage-back securities to the tune of around \$2.3 trillion. Traditional Open Market Operations plus its aggressive "quantitative easing" policy have increased bank reserves from \$94.1 billion in 2007 to \$1.3 trillion by April 2011, for a near fourteen-fold increase, and the monetary basis in general has expanded from \$850.5 billion in 2007 to \$2,242.9 trillion in April of 2011, for a 260 percent increase. The monetary aggregates, MZM and M-2, respectively, have grown by 28 percent and 21.6 percent over this same period.⁶⁶

In the name of supposedly preventing a possible price deflation in the aftermath of the economic boom, Fed policy has delayed and retarded the economy from effectively readjusting and re-coordinating the sectoral imbalances and distortions that had been generated during the bubble years.⁶⁷ Once again interest rates have been kept artificially low. In real terms, the federal funds rate and the 1-year Treasury yield have been in the negative range since the last quarter of 2009, and at the current time is estimated to be below *minus* two percent.

This has prevented interest rates from informing market transactors what the real savings conditions are in the economy. So,

Financial Fiasco (Washington, D.C.: Cato Institute, 2009).

⁶⁵ Richard M. Ebeling, "Is Consumer Credit the Next Bomb in the Economic Crisis?" American Institute for Economic Research, October 22, 2008, <http://www.aier.org/research/briefs/599-consumer-credit-the-next-qbombq-in-the-economic-crisis> (accessed May 5, 2011).

⁶⁶ *Monetary Trends* (St. Louis, MO: St. Louis Federal Reserve, May 2011)

⁶⁷ See, Richard M. Ebeling, "The Hubris of Central Bankers and the Ghosts of Deflation Past" July 5, 2010, <http://defenseofcapitalism.blogspot.com/2010/07/hubris-of-central-bankers-andghosts-of.html> (accessed May 5, 2011)

once again, the availability of savings and the real cost of borrowing is difficult to discern so as to make reasonable and rational investment decisions, and not to foster a new wave of misdirected and unsustainable private sector investment and financial decisions.

The housing market has not been allowed to fully adjust, either. With so much of the mortgage-backed securities being held off the market in the portfolio of the Federal Reserve, there is little way to determine any real market-based pricing to determine their worth or their total availability so the housing market can finally bottom out with clearer information of supply and demand conditions for a sustainable recovery.

This misguided Fed policy has been, in my view, a primary factor behind the slow and sluggish recovery of the United States economy out of the current recession.

Federal Reserve Policy and Monetizing the Debt

Many times in history, governments have used their power over the monetary printing press to create the funds needed to cover their expenses in excess of taxes collected. Sometimes this has led to social and economic catastrophes.⁶⁸

Monetizing the debt refers to the creation of new money to finance all or a portion of the government's borrowing. Since the early 2008 to the present, Federal Reserve holdings of U.S. Treasuries have increased by about 240 percent, from \$591 billion in March 2008 to \$1.4 trillion in early May 2011, or a nearly \$1 trillion increase. In the face of an additional \$3.6 trillion in accumulated debt during the last three fiscal years, it might seem that Fed policy has "monetized" less than one-third of government borrowing during this period.

However, the Fed's purchase of mortgage-backed securities, no less than its purchase of U.S. Treasuries, potentially increases the amount of reserves in the banking system available for lending. And since 2008, the Federal Reserve had bought an amount of mortgaged-backed securities that it prices on its balance sheet as being equal about \$928 billion.

The \$1.4 trillion increase in the monetary base since the end of 2007, from \$850.5 billion to \$2.2 trillion, has increased MZM measurement of the money supply by \$2,161.1, or an additional \$769

⁶⁸See, Richard M. Ebeling, "The Lasting Legacies of World War I: Big Government, Paper Money, and Inflation," *Economic Education Bulletin*, Vol. XLVIII, No. 11 (Great Barrington, MA: American Institute for Economic Research, November 2008), for a detailed example of the German and Austrian instances of monetary-financed inflationary destruction following the First World War.

billion dollars in the economy above the increase in the monetary base. This is an amount that is 83 percent of the dollar value of the \$927 billions in mortgage-backed securities.

Due to the “money multiplier” effect – that under fractional reserves, total new bank loans are potentially a multiple of the additional reserves injected into the banking system – it is not necessary for the Fed to purchase, dollar-for-dollar, every additional dollar of government borrowing to generate a total increase in the money supply that may be equal to the government’s deficit.

Thus, it can be argued that Fed monetary policy has succeeded, in fact, in generating an increase in the amount of money in the banking system that is equal to two-thirds of the government’s \$3.6 trillion of new accumulated debt.

That the money multiplier effect has not been as great as it might have been, so far, is because the Federal Reserve has been paying interest to member banks to *not lend* their excess reserves. This sluggishness in potential lending has also been affected by the general “regime uncertainty” that continues to pervade the economy. This uncertainty concerns the future direction of government monetary and fiscal policy. In an economic climate in which it is difficult to anticipate the future tax structure, the likely magnitude of future government borrowing, and the impact of new government programs, hesitancy exists on the part of both borrowers and lenders to take on new commitments.

But the monetary expansion has most certainly has been the factor behind the worsening problem of rising prices in the U.S. economy and the significant fall in the value of the dollar on the foreign exchange markets.

The National Debt and Monetary Policy

It is hard for Americans to think of their own country experiencing the same type of fiscal crisis that has periodically occurred in “third world” countries. That type of government financial mismanagement is supposed to only happen in what used to be called “banana republics.”

But the fact is, the U.S. is following a course of fiscal irresponsibility that may lead to highly undesirable consequences. The bottom line truth is that over the decades the government – under both Republican and Democratic leadership – has promised the American people, through a wide range of redistributive and transfer programs and other on-going budgetary commitments, more than the U.S. economy can successfully deliver without seriously damaging the

country's capacity to produce and grow through the rest of this century.

To try to continue to borrow our way out of this dilemma would be just more of the same on the road to ruin. The real resources to pay for all the governmental largess that has been promised would have to come out of either significantly higher taxes or crowding out more and more private sector access to investment funds to cover continuing budget deficits. Whether from domestic or foreign lenders, the cost of borrowing will eventually and inescapably rise. There is only so much savings in the world to fund private investment and government borrowing, particularly in a world in which developing countries are intensely trying to catch up with the industrialized nations.

Interest rates on government borrowing will rise, both because of the scarcity of the savings to go around and lenders' concerns about America's ability to tax enough in the future to pay back what has been borrowed. Default risk premiums need not only apply to countries like Greece.

Reliance on the Federal Reserve to "print our way" out of the dilemma through more monetary expansion is not and cannot be an answer, either. Printing paper money or creating it on computer screens at the Federal Reserve does not produce real resources. It does not increase the supply of labor or capital – the machines, tools, and equipment – out of which desired goods and services can be manufactured and provided. That only comes from work, savings and investment. Not from more green pieces of paper with presidents' faces on them.

However, what inflation can do is:

- Accelerate the *devaluation of the dollar* on the foreign exchange markets, and thereby disrupting trading patterns and investment flows between the U.S. and the rest of the world;
- *Reduce the value, or purchasing power, of every dollar* in people's pockets throughout the economy as prices start to rise higher and higher;
- *Undermine the effectiveness of the price system* to assist people as consumers and producers in making rational market decisions, due to the uneven manner in which inflation impacts of some prices first and effects others only later;
- *Potentially slow down capital formation or even generate capital consumption*, as inflation's uneven effects on prices

makes it difficult to calculate profit from loss;

- *Distort interest rates in financial markets, creating an imbalance between savings and investment that sets in motion the boom and bust of the business cycle;*
- *Create incentives for people to waste their time and resources trying to find ways to hedge against inflation, rather than devote their efforts in more productive ways that improve standards of living over time;*
- *Bring about social tensions as people look for scapegoats to blame for the disruptive and damaging effects of inflation, rather than see its source in Federal Reserve monetary policy;*
- *Run the risk of political pressures to introduce distorting price and wage controls or foreign exchange regulations to fight the symptom of rising prices, rather than the source of the problem – monetary expansion.*

What is To Be Done?

The bottom line is, government is too big. It spends too much, taxes too heavily, and borrows too much. For a long time, the country has been trending more and more in the direction of increasing political paternalism. Some people argue, when it is proposed to reduce the size and scope of government in our society, that this is breaking some supposed “social contract” between government and “the people.”

The only workable “social contract” for a free society is the one outlined by the American Founding Fathers in the Declaration of Independence and formalized in the Constitution of the United States. This is a social contract that recognizes that all men are created equal, with governmental privileges and favors for none, and which expects government to respect and secure each individual’s right to his life, liberty, and honestly acquired property.

The reform agenda for deficit and debt reduction, therefore, must start from that premise and have as its target a radical “downsizing” of government. That policy should plan to reduce government spending across the board in every line item of the federal budget by 10 to 15 percent each year until government has been reduced in size and scope to a level and a degree that resembles, once again, the Founding Father’s conception of a free and limited government.⁶⁹

⁶⁹See, Richard M. Ebeling, “The Cost of the Federal Government in a Freer America,” *The Freeman: Ideas on Liberty* (March 2007), pp. 2-3;

A first step in this fiscal reform is to *not* increase the national debt limit. The government should begin, *now*, living within its means – that is, the taxes currently collected by the Treasury. In spite of some of the rhetoric in the media, the U.S. need not run the risk of defaulting or losing its international financial credit rating. Any and all interest payments or maturing debt can be paid for out of tax receipts. What will have to be reduced are other expenditures of the government.

But the required reductions and cuts in various existing programs should be considered as the necessary “wake-up call” for everyone in America that we have been living far beyond our means. And as we begin living within those means, priorities will have to be made and trade-offs will have to be accepted as part of the transition to a smaller and more constitutionally limited government.

In addition, the power of monetary discretion must be taken out of the hands of the Federal Reserve. The fact is, central banking is a form of monetary central planning under which it is left in the hands of the members of the Board of Governors of the Federal Reserve to “plan” the quantity of money in the economy, influence the value or purchasing power of the monetary unit, and manipulate interest rates in the loan markets.

The monetary central planners who run the Federal Reserve have no more or greater knowledge, wisdom or ability that those central planners in the old Soviet Union. The periodic recurrence of the boom and bust of the business cycle demonstrates that there is no way for them to get it right – in spite of them saying, again and again, that “next time” they will get it right.

It is what the Nobel Prize-winning, Austrian economist, Friedrich A. Hayek, once called a highly misplaced “pretense of knowledge.” That is why in a wide agenda for reform, the goal should be to move towards a market-based monetary system, the first step in such an institutional change being a commodity-backed monetary order such as a gold standard.⁷⁰

And in the longer-run serious consideration must be given the possibilities of a monetary system completely privatized and

competitive, without government control, management, or supervision.⁷¹

The budgetary and fiscal crisis right now has made many political issues far clearer in people's minds. The debt dilemma is a challenge and an opportunity to set America on a freer and potentially more prosperous track, if the reality of the situation is looked at foursquare in the eye.

Otherwise, dangerous, destabilizing, and damaging monetary and fiscal times maybe ahead.

WRITTEN TESTIMONY OF
BERT ELY
PRINCIPAL
ELY & COMPANY, INC.

Mr. Chairman Paul, Ranking Member Clay, and members of the Subcommittee, I very much appreciate the opportunity to testify to you today about the relationship between the Federal Reserve and government debt, specifically as that relationship relates to monetary policy and the federal debt ceiling. After first discussing the Fed's balance sheet and financial results in recent years, I will address policy questions related to the relationship of the Fed to the Treasury Department and the wisdom of monetary policy.

The Federal Reserve's Balance Sheet

I begin by presenting two charts (attached) which illustrate the components of the Fed's balance sheet over the last four years – Exhibit 1 [Figure 23] shows the components of the asset side of the Fed's balance sheet and Exhibit 2 [Figure 24] shows the components of the liability side of its balance sheet.⁷² These two charts show the extremely rapid growth of the Fed balance sheet – it more than doubled in size, with total assets rising from \$907 billion on September 3, 2008, to \$2.26 trillion on December 17, 2008. After shrinking in early 2009, the Fed balance sheet resumed growing, reaching an all-time high of \$2.72 trillion just last Wednesday, May 4, 2011. How much more it will grow is anyone's guess.

As the Fed balance sheet has grown, the composition of its assets has changed significantly. In 2008 and through 2009, most the growth in the Fed's assets was related to the Fed's support of the financial system through programs such as its Term Auction Credit, loans to banks and others, such as AIG, and portfolio investments, principally three Maiden Lane LLCs. The Fed also engaged in liquidity swaps with other central banks to help ease international monetary pressures. To finance these new activities, the Fed first shrank its holdings of Treasury securities – they declined from a peak of \$791 billion on August 8, 2007, to a low of \$475 to \$480 billion between June of 2008 and March of 2009.

⁷² The data presented in these two charts are taken from Table 9 in the Federal Reserve's weekly H.4.1 statistical release. That table presents the statement of condition (balance sheet), as of the Wednesday of that week, for each of the twelve Federal Reserve banks and a consolidated balance sheet for all twelve banks.

About two years ago, Fed assets began a second transformation which continues to this day. While its balance sheet has continued to grow, Fed lending to and investments in the credit markets and private-sector institutions has declined significantly while all of its central bank liquidity swaps have expired, reflecting the increased stability of the international financial markets. At the same time, the Fed's investment in federal agency debt, i.e., debt issued by government-sponsored enterprises (GSEs), and mortgage-backed securities (MBS)⁷³ has grown dramatically – from an initial \$10 billion on September 24, 2008, to \$1.05 trillion last Wednesday; that amount is down from a peak of \$1.294 trillion on June 23, 2010. The Fed now owns about 14% of the total debt and MBS issued or guaranteed by the three housing-finance GSEs and Ginnie Mae.

The other element of the second transformation in the Fed's asset composition has been the growth of its holdings of Treasury securities. From March 2009 to October 2009, they rose to a new plateau, in the range of \$775 billion, which held until August 2010. Since then, the Fed's holdings of Treasury securities have nearly doubled, to \$1.442 trillion as of last Wednesday. This tremendous growth in the Fed's Treasury securities reflects in large part the consequence of the Fed's Quantitative Easing program to bring down longer term interest rates.

As Exhibit 2 shows, almost all of the growth in the Fed's liabilities has occurred in its deposits – from the Treasury Department and from banks. Treasury deposits started rising in late September 2008 and peaked at \$615 billion on October 22, 2008, as the Treasury borrowed funds to effectively lend to the Fed so that the Fed could lend and invest those funds in the financial markets.

As the proceeds from the Fed's lending and investing began flowing into banks, banks deposited those funds in the Fed. On October 9, 2008, the Fed began paying interest on reserve balances, which gave banks an incentive to hold cash balances at the Fed. Consequently, as Exhibit 2 shows, bank deposits at the Fed grew dramatically in late 2008 and early 2009, rising from \$11 billion on September 3, 2008, to \$860 billion on December 31, 2008.

The jump in bank deposits permitted the Treasury to begin to reduce its deposits at the Fed, a trend that, with ups and downs, has continued to this day. That reduction in its deposits at the Fed has permitted a corresponding reduction in Treasury borrowings. After

⁷³ Fannie Mae and Freddie Mac debt and MBS, Federal Home Loan Bank System debt, and Ginnie Mae MBS.

remaining relatively flat through 2010, bank deposits at the Fed began rising during the first quarter of this year, reaching \$1.54 trillion on April 13, 2011. Bank deposits at the Fed now account for more than 10% of total banking-industry assets.

Exhibit 2 also illustrates the relatively steady growth of the Fed's other major liability – currency outstanding. Over the last four years, from May 2, 2007, to May 4, 2011, currency outstanding (much of which circulates outside the United States) has grown at a compound annual rate of 6.02%.⁷⁴ Currency (along with coins issued by the Treasury) represents the non-interest-bearing portion of the federal debt. Although pieces of currency are labeled as Federal Reserve Notes, they are in fact just as much a liability of the federal government as are the interest-bearing bills, notes, and bonds issued by the Treasury Department. That is, each piece of currency represents a zero-interest Treasury bill with no fixed maturity date.

Currency outstanding, i.e., currency actually in circulation versus currency sitting in Fed vaults, is the one element of the Fed balance sheet over which the Fed has no control as to the amount outstanding. That is, the amount of currency outstanding is totally demand-driven. The Fed cannot force currency into circulation – Americans and others will hold only as much currency as they desire, and no more. That is why the Fed could not look to currency as a funding source for its tremendous balance-sheet growth in recent years. Instead, the Fed has had to borrow from the Treasury, in the form of Treasury deposits, and from the banking industry, in the form of deposits banks have placed at the Fed. If inflation emerges again in the United States, it will not be because the government literally cranked up the printing press to force more paper currency into circulation.

Exhibit 3 [Figure 25] illustrates the symbiotic relationship between the Fed and the Treasury by showing the extent to which the Net Treasury Position (NTP) at the Fed has varied over the last four years. The NTP is merely the total amount of Treasury securities owned by the Fed at any point in time minus the amount the Treasury has on deposit at the Fed on that day. In effect, the NTP measures the extent to which the Fed is using liabilities largely held in the private sector – currency and bank deposits at the Fed – to finance the federal government's accumulated deficit.

Normally, the NTP is positive because the Fed invests the proceeds of its currency issuance in Treasury securities. However, in

⁷⁴ The annual growth rates within that four-year period (measured from the Wednesday closest to May 2) were as follows: .64%, 11.42%, 3.65%, and 8.71%.

late 2007, as the Fed began to support the private credit markets and global financial stability, the NTP started to decline before falling off the cliff in the fall of 2008. From December 5, 2007, to October 22, 2008, the NTP dropped \$913 billion, reaching a negative position of \$138 billion on the latter date. The Treasury had to access the capital markets to fund that drop in the NTP. Fortunately, rates on Treasury debt remained relatively stable during that time. It then took over two years, until January 12 of this year, for the NTP to reach its former level. Since then, the NTP has grown another \$524 billion as bank deposits at the Fed have grown and as the Fed has steadily liquidated its non-traditional loans and investments.

Exhibit 4 [Figure 26] further illustrates changes in the Fed balance sheet over the last four years. The left column (June 6, 2007) illustrates a typical pre-crisis Fed balance sheet, with Fed-issued currency intermediated into Treasury securities and both of those items comprising approximately 90% of their side of the Fed balance sheet.

The middle column (June 3, 2009) shows the Fed just past the peak of the credit-market crisis but as it is ramping up its support of the housing-finance GSEs. The bracketed numbers, totaling \$1.213 trillion, show the amount of non-traditional support the Fed was providing to the credit markets and the GSEs at that time.

The right column summarizes the most recently available Fed balance sheet – May 3, 2011. Although almost \$650 billion larger than the June 3, 2009, balance sheet, it shows a substantial increase – \$836 billion – in Treasury securities as the NTP was rebuilt but only a modest \$80 billion decline in non-traditional credit support. However, all but \$81 billion of that non-traditional activity represented Fed support of the housing GSEs – over \$1 trillion.

The Fed has become an Extremely Profitable Bank

There has been insufficient recognition that the Fed has become an extremely profitable bank since 2008. Exhibit 5 [Figure 27] illustrates the Fed income statement for 2007 – the last “normal” Fed year in which it sent back to the Treasury \$5.7 billion less than it received as interest on Treasury securities. That is, Fed activities cost taxpayers \$5.7 billion for calendar year 2007.

Exhibit 6 [Figure 28], which illustrates the Fed income statement for 2010, shows how the Fed earned a \$52.9 billion *profit* for taxpayers last year as it assumed substantial credit and market risks. That is, the Fed returned \$52.9 billion more to the Treasury than the Treasury paid the Fed as interest on its Treasury securities

– \$79.27 billion paid to the Treasury by the Fed minus \$26.37 billion paid to the Fed by the Treasury.

Exhibit 7 [Figure 29] shows changes in the Fed’s income statement from 2007 to 2010. Three items are of particular note in this exhibit. First, the decline in the amount of interest the Fed earned on its Treasury securities reflects the decline of the average yield on the Fed’s Treasury securities offset to a small degree by a 3.3% increase in the average amount of the Fed’s Treasury securities in 2010 relative to 2007. Second, the tremendous increase – from \$575 million in 2007 to \$53.02 billion in 2010 – in interest the Fed earned other than on loans and its Treasury securities. Third, largely as a result of that jump in “other interest income,” the huge increase in the monies the Fed returned to the Treasury.

The Fed’s 2010 profitability follows Fed profits of \$24.5 billion in 2009 and \$4.2 billion in 2008.⁷⁵ Over 2008 to 2010 period, the Fed increased its Surplus account (in effect, Fed earnings not turned over to the Treasury) by \$8.07 billion. Therefore, over 2008-2010 period, the Fed earned almost \$90 billion – \$89.681 billion to be exact. By contrast, the total after-tax profit for the 2008-2010 period for all FDIC-insured institutions was less, \$81.39 billion.

The Fed’s profitability in recent years has been due to, one, the tremendous growth in its income-producing assets, specifically GSE debt and MBS; two, its extremely low cost of funds – zero on the currency it issues and .25% on deposits banks have placed with it; and three, the relatively modest increase in its operating expenses since 2007. Given that all three trends have continued into 2011, there is every reason to believe that 2011 will be another extremely profitable year for the Fed. A key public-policy question, though, is whether the federal government, through the Fed, should play such a substantial role in the credit-intermediation business.

The Fed should be Viewed as an Extension of the U.S. Treasury

Although Congress chartered the Fed as an independent entity, specifically to operate independently of the Executive Branch, that independence should be questioned from two perspectives – the management of the federal government’s finances and the efficacy and desirability of monetary policy. This section of my testimony will

⁷⁵ For 2009, the Fed earned \$22.89 billion on its Treasury securities and returned \$47.43 billion to the Treasury. For 2008, the Fed earned \$27.52 billion on its Treasury securities and returned \$31.69 billion to the Treasury.

examine Fed independence from a financial perspective while the next section will address monetary policy.

Federal Reserve independence is a myth in one crucial regard – the Fed is a creature of Congress and it operates with the full-faith-and-credit backing of the federal government and therefore of the federal taxpayer. The Fed has no creditworthiness of its own – its creditworthiness stems strictly from being an instrumentality of the federal government and therefore from the financial backing of American taxpayers. In this regard, the Fed is no different than all other central banks. The Fed has independent decision-making power only to the extent that Congress has granted that power. Likewise, the Fed's ability to issue currency, and to earn interest on investments funded by that currency, was authorized by Congress, and could be retracted by Congress.

Key to understanding the linkage of the Fed to the rest of the federal government is to consolidate the Fed and Treasury Department balance sheets. Exhibit 8 [Figure 30] places these two balance sheets side-by-side. Exhibit 9 [Figure 31] presents an accounting consolidation of the two balance sheets so as to present a more complete picture of the federal government's finances.⁷⁶

There are important merits in viewing the Treasury and Fed balance sheets on a consolidated basis. First, the asset side of this balance sheet shows the extent to which the federal government – through the Treasury and the Fed – is supplying credit to the private sector, notably to finance housing and higher education. That amount of credit as well as other assets financed by the Fed and the Treasury totaled to \$2.12 trillion at the end of March 2011, as shown in Exhibit 10 [Figure 32]. This government-supplied credit has been funded entirely by Treasury debt, pushing the outstanding federal debt \$2.12 trillion closer to the federal debt ceiling.⁷⁷

Second, the liability side of this consolidated balance shows in Exhibit 10 that private-sector funds – principally deposits by banks in the Fed – provided \$1.676 billion of financing to the federal

⁷⁶ The Treasury balance sheet is derived from Table 6 of the Monthly Treasury Statement; the most recent statement is as of March 31, 2011. The nearest Federal Reserve balance sheet is as of March 30, 2011. The difference in Treasury deposits at the Fed is due to the effect of March 31, 2011, transactions on the Treasury cash balance at the Fed. Other transactions on March 31, 2011, would affect the amounts shown in Exhibit 9, but the effect of those transactions is not considered to be material for the purposes of this discussion.

⁷⁷ For the purpose of calculating the amount of federal debt subject to the federal debt ceiling, outstanding federal debt includes debt held by the public and the Federal Reserve as well as intragovernmental holdings of Treasury debt securities (such as Treasuries held by the Social Security Trust Fund), but excludes currency outstanding.

government as of the end of March 2011. These non-Treasury-debt liabilities effectively funded 79% of the federal government's financial assets at March 31 (\$1.676 trillion/\$2.12 trillion). One of the big financial challenges the federal government (i.e. the Fed and the Treasury) faces going forward is winding down both of these components of the government's balance sheet as the economy continues to recover.

Third, the liability side of the consolidated balance sheet shows that at the end of March currency outstanding accounted for 10.4% of the total federal debt held by the public – \$964 billion in currency plus \$8.313 trillion of interest-bearing Treasury debt. This non-interest-bearing portion of the total debt held by the public has declined in recent years as budget deficits have forced the issuance of substantial amounts of interest-bearing debt. At the end of 2007, currency accounted 15.3% of the federal debt held by the public.⁷⁸

Given the magnitude of federal budget deficits for the foreseeable future, the currency portion of the federal debt will continue to decline unless the federal government adopts the practice of third-world countries and, one, begins to pay its bills in currency and, two, refuses to permit banks to exchange currency deposited with them for interest-bearing Treasury debt. Given the evolution of the federal government's payment mechanisms from currency⁷⁹ to checks to direct deposit, it is highly unlikely that the federal government can finance future deficits with currency, except to the extent that Americans and non-Americans are willing to hold U.S. currency. *The printing press will not be a cure for financing future deficits.*

In sum, the Fed could be folded into the Treasury Department tomorrow with no adverse effects (except for the jobs that would be eliminated and the Fed buildings which could be sold). Doing so would permit a unified management of the federal government's balance sheet and the Treasury Department could directly issue currency, as it did in pre-Fed days. Because of current payment technology, there would be no danger, as a practical matter, of Treasury over-issuance of U.S. currency. To further protect against over-issuance, Congress could provide a statutory guarantee of the convertibility of U.S. currency into interest-bearing Treasury debt.

⁷⁸ At December 31, 2007, Treasury debt held by the public and the Fed was \$5.122 trillion, including \$741 billion held by the Fed. Currency outstanding on that date was \$792 billion. Therefore, the total federal debt held by the public was \$5.173 trillion (\$5.122 trillion - \$741 billion + \$792 billion); \$792 billion/\$5.173 trillion = 15.3%.

⁷⁹ In 1966, this witness was paid in currency while he was on active duty for training in the U.S. Army. Presumably no federal employee is paid in currency today.

The Treasury also could assume the role of lender-of-last-resort. Since the Fed, when acting as an emergency lender, is lending taxpayer dollars and using its federal backing to support any guarantees it issues, it is not doing anything that the Treasury itself could not do. Put another way, the Fed has no resources or powers at its disposal that the Treasury Department does not also have or could have, if Congress so provided. Treasury's assumption of the lender-of-last-resort role also would bring much great political accountability to such lending. The need for greater accountability was quite evident during the recent crisis.

Since folding the Fed into the Treasury is unlikely to occur in the near future, Congress should take the next best step and mandate that the Treasury Department periodically produce, say monthly, a consolidated balance sheet of the Fed and the Treasury, as I present in Exhibits 9 and 10. Such a consolidation would present a much more complete picture of federal finances and the impact of the federal government on the U.S. economy.

Does America benefit from Monetary Policy?

The fundamental premise of central-bank independence is that monetary policy must be free of political interference. Leaving aside the merits of that premise, the key question is: What constitutes monetary policy?

As a practical matter, monetary policy today consists solely of the Fed trying to influence interest rates through its open-market operations. That activity consists of the New York Fed, as agent for the Federal Reserve System, buying and selling Treasury securities or engaging in repurchase transactions involving Treasuries. The purpose of these transactions is hold the overnight Fed Funds rate as close as practical to the Federal Funds Rate Target (FFRT)⁸⁰ set by the Fed's Federal Open Market Committee, or FOMC.⁸¹ The Fed also has used open market operations to carry out its Quantitative Easing initiatives and to accumulate its inventory of GSE debt and MBS.

Fed management of the money supply has no relevance today, from a monetary-policy perspective, because, one, the amount of currency in circulation is totally demand-driven and two, money

⁸⁰ The FFRT is the interest rate the Fed would like to see in the overnight Fed Funds market; i.e., the interest rate at which banks lend to each other on an overnight basis. The FFRT is viewed as the "anchor" for longer-term interest rates.

⁸¹ The FOMC has twelve members – the seven Fed governors, the president of the New York Fed, and four of the presidents of the other eleven Fed banks, who serve on a rotating basis as voting members of the FOMC.

(however defined) is merely that portion of the credit supply which also can efficiently serve as media of exchange. Inflation in a modern industrial economy – whether of assets or consumption goods – is to a great extent a function of the price of credit. If credit is underpriced – interest rates are too low – inflation may begin to emerge as increased demand stimulated by underpriced credit causes the economy to overheat and asset prices to soar, as we saw in the recent U.S. housing bubble. Overpriced credit – interest rates are too high – has the opposite effect. Demand for goods, services, and assets declines, increasing the potential for an economic downturn and price deflation.

Given that monetary policy is all about interest rates, the question is who can better set interest rates – a committee of government bureaucrats (which the FOMC is) or the financial markets? The experience of recent years certainly does not support the notion that bureaucrats can do a better job than the financial markets in determining the price of credit. This question can be posed another way – what is it about credit that makes it desirable for government to determine its price, or at least to try to do that, when it is well known that government price-fixing of other services is highly undesirable?

Some argue that a central bank must provide a “nominal anchor” for the credit markets – a pricing benchmark, if you will. In the United States, that would be the FFRT. Quite possibly, the interest rate the Fed now pays on the reserves (i.e., deposits banks have placed at the Fed) will emerge as another component of the Fed’s interest-rate price-fixing activity.

In the opinion of this witness, a strong case has never been made that the financial markets cannot set interest rates across the entire yield curve that will promote stable, non-inflationary economic growth while minimizing the emergence of asset bubbles.⁸² More specifically, there certainly is no reason why the interbank lending market cannot establish and vary the overnight interest rate which the FOMC now establishes through its open-market operations.

I encourage this subcommittee to address the question of why interest rates need a “nominal anchor,” why it is in the public interest to have a government committee signaling what its members consider to be the appropriate level of interest rates, and why the Fed should try to enforce that signal through open-market operations? If the

⁸² This witness discussed the role that monetary policy played in helping to cause the recent U.S. financial crisis in “Bad Rules Produce Bad Outcomes; Underlying Public-Policy Causes of the U.S. Financial Crisis,” *Cato Journal*, Vol. 29, No. 1 (Winter 2009), pages 93 to 114.

case cannot be made that the Fed's interest-rate signaling is beneficial to the U.S. economy, then the primary *raison d'être* for the Fed disappears, which would open the door to folding the Fed into the Treasury Department.⁸³

Mr. Chairman, I thank you for this opportunity to testify to the Subcommittee today. I welcome the opportunity to answer questions posed by its members.

The Federal Reserve's Balance Sheet

I begin by presenting two charts (attached) which illustrate the components of the Fed's balance sheet over the last four years – Exhibit 1 [Figure 23] shows the components of the asset side of the Fed's balance sheet and Exhibit 2 [Figure 24] shows the components of the liability side of its balance sheet.⁸⁴ These two charts show the extremely rapid growth of the Fed balance sheet – it more than doubled in size, with total assets rising from \$907 billion on September 3, 2008, to \$2.26 trillion on December 17, 2008. After shrinking in early 2009, the Fed balance sheet resumed growing, reaching an all-time high of \$2.72 trillion just last Wednesday, May 4, 2011. How much more it will grow is anyone's guess.

As the Fed balance sheet has grown, the composition of its assets has changed significantly. In 2008 and through 2009, most the growth in the Fed's assets was related to the Fed's support of the financial system through programs such as its Term Auction Credit, loans to banks and others, such as AIG, and portfolio investments, principally three Maiden Lane LLCs. The Fed also engaged in liquidity swaps with other central banks to help ease international monetary pressures. To finance these new activities, the Fed first shrank its holdings of Treasury securities – they declined from a peak of \$791 billion on August 8, 2007, to a low of \$475 to \$480 billion between June of 2008 and March of 2009.

About two years ago, Fed assets began a second transformation which continues to this day. While its balance sheet has continued to grow, Fed lending to and investments in the credit markets and private-sector institutions has declined significantly while all of its central bank liquidity swaps have expired, reflecting the increased

⁸³ The Fed's non-monetary-policy functions, such as banking supervision, could be placed elsewhere in the government or, in the case of some of its payment-system activities, privatized.

⁸⁴ The data presented in these two charts are taken from Table 9 in the Federal Reserve's weekly H.4.1 statistical release. That table presents the statement of condition (balance sheet), as of the Wednesday of that week, for each of the twelve Federal Reserve banks and a consolidated balance sheet for all twelve banks.

stability of the international financial markets. At the same time, the Fed's investment in federal agency debt, i.e., debt issued by government-sponsored enterprises (GSEs), and mortgage-backed securities (MBS)⁸⁵ has grown dramatically – from an initial \$10 billion on September 24, 2008, to \$1.05 trillion last Wednesday; that amount is down from a peak of \$1.294 trillion on June 23, 2010. The Fed now owns about 14% of the total debt and MBS issued or guaranteed by the three housing-finance GSEs and Ginnie Mae.

The other element of the second transformation in the Fed's asset composition has been the growth of its holdings of Treasury securities. From March 2009 to October 2009, they rose to a new plateau, in the range of \$775 billion, which held until August 2010. Since then, the Fed's holdings of Treasury securities have nearly doubled, to \$1.442 trillion as of last Wednesday. This tremendous growth in the Fed's Treasury securities reflects in large part the consequence of the Fed's Quantitative Easing program to bring down longer term interest rates.

As Exhibit 2 shows, almost all of the growth in the Fed's liabilities has occurred in its deposits – from the Treasury Department and from banks. Treasury deposits started rising in late September 2008 and peaked at \$615 billion on October 22, 2008, as the Treasury borrowed funds to effectively lend to the Fed so that the Fed could lend and invest those funds in the financial markets.

As the proceeds from the Fed's lending and investing began flowing into banks, banks deposited those funds in the Fed. On October 9, 2008, the Fed began paying interest on reserve balances, which gave banks an incentive to hold cash balances at the Fed. Consequently, as Exhibit 2 shows, bank deposits at the Fed grew dramatically in late 2008 and early 2009, rising from \$11 billion on September 3, 2008, to \$860 billion on December 31, 2008.

The jump in bank deposits permitted the Treasury to begin to reduce its deposits at the Fed, a trend that, with ups and downs, has continued to this day. That reduction in its deposits at the Fed has permitted a corresponding reduction in Treasury borrowings. After remaining relatively flat through 2010, bank deposits at the Fed began rising during the first quarter of this year, reaching \$1.54 trillion on April 13, 2011. Bank deposits at the Fed now account for more than 10% of total banking-industry assets.

Exhibit 2 also illustrates the relatively steady growth of the Fed's other major liability – currency outstanding. Over the last four years,

⁸⁵ Fannie Mae and Freddie Mac debt and MBS, Federal Home Loan Bank System debt, and Ginnie Mae MBS.

from May 2, 2007, to May 4, 2011, currency outstanding (much of which circulates outside the United States) has grown at a compound annual rate of 6.02%.⁸⁶ Currency (along with coins issued by the Treasury) represents the non-interest-bearing portion of the federal debt. Although pieces of currency are labeled as Federal Reserve Notes, they are in fact just as much a liability of the federal government as are the interest-bearing bills, notes, and bonds issued by the Treasury Department. That is, each piece of currency represents a zero-interest Treasury bill with no fixed maturity date.

Currency outstanding, i.e., currency actually in circulation versus currency sitting in Fed vaults, is the one element of the Fed balance sheet over which the Fed has no control as to the amount outstanding. That is, the amount of currency outstanding is totally demand-driven. The Fed cannot force currency into circulation – Americans and others will hold only as much currency as they desire, and no more. That is why the Fed could not look to currency as a funding source for its tremendous balance-sheet growth in recent years. Instead, the Fed has had to borrow from the Treasury, in the form of Treasury deposits, and from the banking industry, in the form of deposits banks have placed at the Fed. If inflation emerges again in the United States, it will not be because the government literally cranked up the printing press to force more paper currency into circulation.

Exhibit 3 [Figure 25] illustrates the symbiotic relationship between the Fed and the Treasury by showing the extent to which the Net Treasury Position (NTP) at the Fed has varied over the last four years. The NTP is merely the total amount of Treasury securities owned by the Fed at any point in time minus the amount the Treasury has on deposit at the Fed on that day. In effect, the NTP measures the extent to which the Fed is using liabilities largely held in the private sector – currency and bank deposits at the Fed – to finance the federal government's accumulated deficit.

Normally, the NTP is positive because the Fed invests the proceeds of its currency issuance in Treasury securities. However, in late 2007, as the Fed began to support the private credit markets and global financial stability, the NTP started to decline before falling off the cliff in the fall of 2008. From December 5, 2007, to October 22, 2008, the NTP dropped \$913 billion, reaching a negative position of \$138 billion on the latter date. The Treasury had to access the

⁸⁶ The annual growth rates within that four-year period (measured from the Wednesday closest to May 2) were as follows: .64%, 11.42%, 3.65%, and 8.71%.

capital markets to fund that drop in the NTP. Fortunately, rates on Treasury debt remained relatively stable during that time. It then took over two years, until January 12 of this year, for the NTP to reach its former level. Since then, the NTP has grown another \$524 billion as bank deposits at the Fed have grown and as the Fed has steadily liquidated its non-traditional loans and investments.

Exhibit 4 [Figure 26] further illustrates changes in the Fed balance sheet over the last four years. The left column (June 6, 2007) illustrates a typical pre-crisis Fed balance sheet, with Fed-issued currency intermediated into Treasury securities and both of those items comprising approximately 90% of their side of the Fed balance sheet.

The middle column (June 3, 2009) shows the Fed just past the peak of the credit-market crisis but as it is ramping up its support of the housing-finance GSEs. The bracketed numbers, totaling \$1.213 trillion, show the amount of non-traditional support the Fed was providing to the credit markets and the GSEs at that time.

The right column summarizes the most recently available Fed balance sheet – May 3, 2011. Although almost \$650 billion larger than the June 3, 2009, balance sheet, it shows a substantial increase – \$836 billion – in Treasury securities as the NTP was rebuilt but only a modest \$80 billion decline in non-traditional credit support. However, all but \$81 billion of that non-traditional activity represented Fed support of the housing GSEs – over \$1 trillion.

The Fed has Become an Extremely Profitable Bank

There has been insufficient recognition that the Fed has become an extremely profitable bank since 2008. Exhibit 5 [Figure 27] illustrates the Fed income statement for 2007 – the last “normal” Fed year in which it sent back to the Treasury \$5.7 billion less than it received as interest on Treasury securities. That is, Fed activities cost taxpayers \$5.7 billion for calendar year 2007.

Exhibit 6 [Figure 28], which illustrates the Fed income statement for 2010, shows how the Fed earned a \$52.9 billion profit for taxpayers last year as it assumed substantial credit and market risks. That is, the Fed returned \$52.9 billion more to the Treasury than the Treasury paid the Fed as interest on its Treasury securities – \$79.27 billion paid to the Treasury by the Fed minus \$26.37 billion paid to the Fed by the Treasury.

Exhibit 7 [Figure 29] shows changes in the Fed’s income statement from 2007 to 2010. Three items are of particular note in this exhibit. First, the decline in the amount of interest the Fed

earned on its Treasury securities reflects the decline of the average yield on the Fed's Treasury securities offset to a small degree by a 3.3% increase in the average amount of the Fed's Treasury securities in 2010 relative to 2007. Second, the tremendous increase – from \$575 million in 2007 to \$53.02 billion in 2010 – in interest the Fed earned other than on loans and its Treasury securities. Third, largely as a result of that jump in “other interest income,” the huge increase in the monies the Fed returned to the Treasury.

The Fed's 2010 profitability follows Fed profits of \$24.5 billion in 2009 and \$4.2 billion in 2008.⁸⁷ Over 2008 to 2010 period, the Fed increased its Surplus account (in effect, Fed earnings not turned over to the Treasury) by \$8.07 billion. Therefore, over 2008-2010 period, the Fed earned almost \$90 billion – \$89.681 billion to be exact. By contrast, the total after-tax profit for the 2008-2010 period for all FDIC-insured institutions was less, \$81.39 billion.

The Fed's profitability in recent years has been due to, one, the tremendous growth in its income-producing assets, specifically GSE debt and MBS; two, its extremely low cost of funds – zero on the currency it issues and .25% on deposits banks have placed with it; and three, the relatively modest increase in its operating expenses since 2007. Given that all three trends have continued into 2011, there is every reason to believe that 2011 will be another extremely profitable year for the Fed. A key public-policy question, though, is whether the federal government, through the Fed, should play such a substantial role in the credit-intermediation business.

The Fed Should be Viewed as an Extension of the U.S. Treasury

Although Congress chartered the Fed as an independent entity, specifically to operate independently of the Executive Branch, that independence should be questioned from two perspectives – the management of the federal government's finances and the efficacy and desirability of monetary policy. This section of my testimony will examine Fed independence from a financial perspective while the next section will address monetary policy.

Federal Reserve independence is a myth in one crucial regard – the Fed is a creature of Congress and it operates with the full-faith-and-credit backing of the federal government and therefore of the federal taxpayer. The Fed has no creditworthiness of its own – its

⁸⁷ For 2009, the Fed earned \$22.89 billion on its Treasury securities and returned \$47.43 billion to the Treasury. For 2008, the Fed earned \$27.52 billion on its Treasury securities and returned \$31.69 billion to the Treasury.

creditworthiness stems strictly from being an instrumentality of the federal government and therefore from the financial backing of American taxpayers. In this regard, the Fed is no different than all other central banks. The Fed has independent decision-making power only to the extent that Congress has granted that power. Likewise, the Fed's ability to issue currency, and to earn interest on investments funded by that currency, was authorized by Congress, and could be retracted by Congress.

Key to understanding the linkage of the Fed to the rest of the federal government is to consolidate the Fed and Treasury Department balance sheets. Exhibit 8 [Figure 30] places these two balance sheets side-by-side. Exhibit 9 [Figure 31] presents an accounting consolidation of the two balance sheets so as to present a more complete picture of the federal government's finances.⁸⁸

There are important merits in viewing the Treasury and Fed balance sheets on a consolidated basis. First, the asset side of this balance sheet shows the extent to which the federal government – through the Treasury and the Fed – is supplying credit to the private sector, notably to finance housing and higher education. That amount of credit as well as other assets financed by the Fed and the Treasury totaled to \$2.12 trillion at the end of March 2011, as shown in Exhibit 10 [Figure 32]. This government-supplied credit has been funded entirely by Treasury debt, pushing the outstanding federal debt \$2.12 trillion closer to the federal debt ceiling.⁸⁹

Second, the liability side of this consolidated balance shows in Exhibit 10 that private-sector funds – principally deposits by banks in the Fed – provided \$1.676 billion of financing to the federal government as of the end of March 2011. These non-Treasury-debt liabilities effectively funded 79% of the federal government's financial assets at March 31 (\$1.676 trillion/\$2.12 trillion). One of the big financial challenges the federal government (i.e. the Fed and the Treasury) faces going forward is winding down both of these

⁸⁸ The Treasury balance sheet is derived from Table 6 of the Monthly Treasury Statement; the most recent statement is as of March 31, 2011. The nearest Federal Reserve balance sheet is as of March 30, 2011. The difference in Treasury deposits at the Fed is due to the effect of March 31, 2011, transactions on the Treasury cash balance at the Fed. Other transactions on March 31, 2011, would affect the amounts shown in Exhibit 9, but the effect of those transactions is not considered to be material for the purposes of this discussion.

⁸⁹ For the purpose of calculating the amount of federal debt subject to the federal debt ceiling, outstanding federal debt includes debt held by the public and the Federal Reserve as well as intragovernmental holdings of Treasury debt securities (such as Treasuries held by the Social Security Trust Fund), but excludes currency outstanding.

components of the government's balance sheet as the economy continues to recover.

Third, the liability side of the consolidated balance sheet shows that at the end of March currency outstanding accounted for 10.4% of the total federal debt held by the public – \$964 billion in currency plus \$8.313 trillion of interest-bearing Treasury debt. This non-interest-bearing portion of the total debt held by the public has declined in recent years as budget deficits have forced the issuance of substantial amounts of interest-bearing debt. At the end of 2007, currency accounted 15.3% of the federal debt held by the public.⁹⁰

Given the magnitude of federal budget deficits for the foreseeable future, the currency portion of the federal debt will continue to decline unless the federal government adopts the practice of third-world countries and, one, begins to pay its bills in currency and, two, refuses to permit banks to exchange currency deposited with them for interest-bearing Treasury debt. Given the evolution of the federal government's payment mechanisms from currency⁹¹ to checks to direct deposit, it is highly unlikely that the federal government can finance future deficits with currency, except to the extent that Americans and non-Americans are willing to hold U.S. currency. *The printing press will not be a cure for financing future deficits.*

In sum, the Fed could be folded into the Treasury Department tomorrow with no adverse effects (except for the jobs that would be eliminated and the Fed buildings which could be sold). Doing so would permit a unified management of the federal government's balance sheet and the Treasury Department could directly issue currency, as it did in pre-Fed days. Because of current payment technology, there would be no danger, as a practical matter, of Treasury over-issuance of U.S. currency. To further protect against over-issuance, Congress could provide a statutory guarantee of the convertibility of U.S. currency into interest-bearing Treasury debt.

The Treasury also could assume the role of lender-of-last-resort. Since the Fed, when acting as an emergency lender, is lending taxpayer dollars and using its federal backing to support any guarantees it issues, it is not doing anything that the Treasury itself could not do. Put another way, the Fed has no resources or powers at

⁹⁰ At December 31, 2007, Treasury debt held by the public and the Fed was \$5.122 trillion, including \$741 billion held by the Fed. Currency outstanding on that date was \$792 billion. Therefore, the total federal debt held by the public was \$5.173 trillion (\$5.122 trillion - \$741 billion + \$792 billion); \$792 billion/\$5.173 trillion = 15.3%.

⁹¹ In 1966, this witness was paid in currency while he was on active duty for training in the U.S. Army. Presumably no federal employee is paid in currency today.

its disposal that the Treasury Department does not also have or could have, if Congress so provided. Treasury's assumption of the lender-of-last-resort role also would bring much great political accountability to such lending. The need for greater accountability was quite evident during the recent crisis.

Since folding the Fed into the Treasury is unlikely to occur in the near future, Congress should take the next best step and mandate that the Treasury Department periodically produce, say monthly, a consolidated balance sheet of the Fed and the Treasury, as I present in Exhibits 9 and 10. Such a consolidation would present a much more complete picture of federal finances and the impact of the federal government on the U.S. economy.

Does America Benefit from Monetary Policy?

The fundamental premise of central-bank independence is that monetary policy must be free of political interference. Leaving aside the merits of that premise, the key question is: What constitutes monetary policy?

As a practical matter, monetary policy today consists solely of the Fed trying to influence interest rates through its open-market operations. That activity consists of the New York Fed, as agent for the Federal Reserve System, buying and selling Treasury securities or engaging in repurchase transactions involving Treasuries. The purpose of these transactions is hold the overnight Fed Funds rate as close as practical to the Federal Funds Rate Target (FFRT)⁹² set by the Fed's Federal Open Market Committee, or FOMC.⁹³ The Fed also has used open market operations to carry out its Quantitative Easing initiatives and to accumulate its inventory of GSE debt and MBS.

Fed management of the money supply has no relevance today, from a monetary-policy perspective, because, one, the amount of currency in circulation is totally demand-driven and two, money (however defined) is merely that portion of the credit supply which also can efficiently serve as media of exchange. Inflation in a modern industrial economy – whether of assets or consumption goods – is to a great extent a function of the price of credit. If credit is underpriced – interest rates are too low – inflation may begin to emerge as increased demand stimulated by underpriced credit causes the

⁹² The FFRT is the interest rate the Fed would like to see in the overnight Fed Funds market; i.e., the interest rate at which banks lend to each other on an overnight basis. The FFRT is viewed as the "anchor" for longer-term interest rates.

⁹³ The FOMC has twelve members – the seven Fed governors, the president of the New York Fed, and four of the presidents of the other eleven Fed banks, who serve on a rotating basis as voting members of the FOMC.

economy to overheat and asset prices to soar, as we saw in the recent U.S. housing bubble. Overpriced credit – interest rates are too high – has the opposite effect. Demand for goods, services, and assets declines, increasing the potential for an economic downturn and price deflation.

Given that monetary policy is all about interest rates, the question is who can better set interest rates – a committee of government bureaucrats (which the FOMC is) or the financial markets? The experience of recent years certainly does not support the notion that bureaucrats can do a better job than the financial markets in determining the price of credit. This question can be posed another way – what is it about credit that makes it desirable for government to determine its price, or at least to try to do that, when it is well known that government price-fixing of other services is highly undesirable?

Some argue that a central bank must provide a “nominal anchor” for the credit markets – a pricing benchmark, if you will. In the United States, that would be the FFRT. Quite possibly, the interest rate the Fed now pays on the reserves (i.e., deposits banks have placed at the Fed) will emerge as another component of the Fed’s interest-rate price-fixing activity.

In the opinion of this witness, a strong case has never been made that the financial markets cannot set interest rates across the entire yield curve that will promote stable, non-inflationary economic growth while minimizing the emergence of asset bubbles.⁹⁴ More specifically, there certainly is no reason why the interbank lending market cannot establish and vary the overnight interest rate which the FOMC now establishes through its open-market operations.

I encourage this subcommittee to address the question of why interest rates need a “nominal anchor,” why it is in the public interest to have a government committee signaling what its members consider to be the appropriate level of interest rates, and why the Fed should try to enforce that signal through open-market operations? If the case cannot be made that the Fed’s interest-rate signaling is beneficial to the U.S. economy, then the primary *raison d’être* for the

⁹⁴ This witness discussed the role that monetary policy played in helping to cause the recent U.S. financial crisis in “Bad Rules Produce Bad Outcomes; Underlying Public-Policy Causes of the U.S. Financial Crisis,” *Cato Journal*, Vol. 29, No. 1 (Winter 2009), pages 93 to 114.

Fed disappears, which would open the door to folding the Fed into the Treasury Department.⁹⁵

Mr. Chairman, I thank you for this opportunity to testify to the Subcommittee today. I welcome the opportunity to answer questions posed by its members.

⁹⁵ The Fed's non-monetary-policy functions, such as banking supervision, could be placed elsewhere in the government or, in the case of some of its payment-system activities, privatized.

**WRITTEN TESTIMONY OF
MATTHEW J. SLAUGHTER, Ph.D.**

DEAN, TUCK SCHOOL OF BUSINESS
DARTMOUTH COLLEGE

Committee Chairman Bachus, Committee Ranking Member Frank, Subcommittee Chairman Paul, Subcommittee Ranking Member Clay, and fellow members, thank you very much for inviting me to testify on these important and timely issues regarding America's monetary and fiscal policies.

My name is Matt Slaughter, and I am currently Associate Dean and Signal Companies' Professor of Management at the Tuck School of Business at Dartmouth, Research Associate at the National Bureau of Economic Research, and Senior Fellow at the Council on Foreign Relations. From 2005 to 2007 I also served as a Member on the Council of Economic Advisers, where my international portfolio spanned topics on the competitiveness of the American economy.⁹⁶

For today's hearing, you requested that I comment on "the relationship between the Federal Reserve and Federal government debt, including how the Federal Reserve finances portions of government debt and how Federal Reserve purchases of Treasury debt are used as a basis for conducting monetary policy."

In my remarks, I will make two points regarding the relationship between the Federal Reserve and Federal government debt. I will then make two broader points regarding the debt ceiling.

First, it is important to emphasize that Federal Reserve purchases of Federal government debt has for generations been standard operating procedure for how the Fed conducts monetary policy. In pursuit of its dual mandate of both price stability and full employment, in the normal course of operations the Fed has long bought or sold Treasury securities to increase or decrease the supply of what is commonly called "high powered money" or the "monetary base." In turn, through rounds of lending in the private financial system, these changes in the monetary base expand into changes in

⁹⁶ Currently and in the past two years, I have not received any Federal research grants. Currently, in addition to the affiliations listed above I serve as a member of the academic advisory board of the International Tax Policy Forum; an academic advisor to the Deloitte Center on Cross-Border Investment; an academic advisor to the Organization for International Investment, and a member of the U.S. State Department's Advisory Committee on International Economic Policy. For many years I have consulted both to individual firms and also to industry organizations that support dialogue on issues of international trade, investment, and taxation. For a listing of such activities, please consult my curriculum vitae posted on my web page maintained by the Tuck School of Business at Dartmouth.

the broader U.S money supply and thus in economic activity.

Indeed, for many years before the World Financial Crisis the Fed executed monetary policy almost exclusively by transacting Treasury securities—and so Treasurys accounted for a very large share of the Fed's balance sheet. Thus did the Fed report that as of January 23, 2008, 82.1% of all the Fed's assets—\$723.3 billion of \$881.0 billion—were Treasury securities. There is nothing inherently nefarious or worrisome about the Fed owning such a large amount of Federal government debt. Rather, the deep liquidity of Treasurys has long supported the Fed's ongoing policy efforts.

Second, it is important to emphasize that the current fiscal challenges facing America have not been caused or abetted by the historic interventions the Federal Reserve undertook amidst the World Financial Crisis. The Fed's efforts to restore liquidity and stability to America's capital markets required it to expand both the size and asset composition of its balance sheet in several unprecedented ways. As of last week, the Fed's holdings of U.S. Treasury securities stood at approximately \$1.442 trillion: about double the amount of Treasurys it held on the eve of the Crisis. But the overall Fed balance sheet has more than tripled during this time, standing today at about \$2.763 trillion.

This historic expansion of Federal Reserve monetary policy did not somehow cause the commensurate historic fiscal expansion. Rather, massive fiscal federal deficits were triggered by a combination of sharp downfalls in federal tax receipts and especially sharp increases in federal spending. Tax receipts fell precipitously because of declines in labor income, in corporate profitability, and in asset returns of many kinds. Spending increased sharply both because of automatic stabilizers built into existing law (e.g., unemployment insurance) and because of new spending authorized by, for example, the 2009 American Recovery and Reinvestment Act. Thus, historic monetary expansion has coincided with historic fiscal expansion. But neither has directly caused the other. Rather, both have been directed at containing the damage to the real

U.S. economy of the World Financial Crisis. History does offer grim examples where central banks have excessively monetized runaway fiscal deficits when too few buyers of government debt materialized—and thus spawned hyperinflation: Germany in the early 1920s or Zimbabwe in recent years. Thanks in large part to the ongoing sound leadership of Federal Reserve Chairman Ben S. Bernanke and his colleagues, such a catastrophe remains a near-impossibility in America today.

Let me turn now to the broader issue of America's looming debt ceiling. Here I want to make two points, the importance of which it is difficult for me to over-stress.

First, the decision to lift the debt ceiling is a necessary consequence of previous decisions on taxes and spending. If America does not want to default on its existing debt obligations, then raising the debt ceiling is mandatory, not optional. Pick whichever deficit-reduction plan you like: that of the bi-partisan Deficit Reduction Panel, that of Congressman Paul Ryan, that of President Obama. No matter which deficit-reduction plan currently being floated you like, that plan will expand the total federal debt outstanding by several trillion dollars over the next decade. This means that no matter which plan you like, to see it become reality without the United States defaulting on its outstanding debt you must support increasing the debt ceiling.

Some might ask, couldn't a deficit-reduction plan be crafted and implemented that would create fiscal balance and thus prevent America from breaching its looming debt ceiling? Speaking practically, the answer is no. As of May 3 the total amount of federal debt outstanding was about \$14.28 trillion. The debt limit is \$14.294 trillion. Even if America wanted to do so, there simply is not enough calendar time for America to rewrite its spending and taxing laws to prevent reaching this limit. Speaking economically, the answer should also be no. There is no doubt that America must soon control its massive fiscal deficits. But doing so immediately would require such a massive combination of spending cuts and/or tax increases that it would almost surely throw America back into a deep recession. This real economic hardship on American workers and families would not be worth enduring for the sake of immediate fiscal balance.

My second and final point is to implore you to understand that America is tempting a crisis of unknowable proportions if we default on our Federal government debt. In many ways, global capital markets today remain deeply impaired by the World Financial Crisis. Housing prices in the United States and other countries continue to decline towards an unclear bottom—while in other countries such as Canada and China escalating housing prices are raising worries of new bubbles. Several sovereign debtors in Europe are struggling to remain liquid and solvent amidst widening concern among creditors. Central banks such as the Federal Reserve continue to provide historic support to the global financial system.

At the same time, economic recovery remains tentative in the United States and in many other advanced countries. About 25 million Americans—nearly one in six in the entire labor force—

remain unemployed or under-employed. Today's 108.9 million private-sector jobs is the same number America had nearly 12 years ago, in August 1999. And the last time America had just 11.7 million manufacturing jobs, like we do today, was in April of 1941. Median household income in 2009, at \$49,777, was barely above where it was in 1997. All forecasts are that it will take several years of economic growth for the American labor market to fully recover.

Amidst all this fragility and uncertainty, the prospect of a U.S. government default is truly frightening. As the past few years have so painfully demonstrated, financial crises often arise from unexpected forces and metastasize in unknowable ways. And a default on U.S. Treasuries, rather than on some other debt security in the world, would be especially worrisome for two important reasons.

One is that, at least to date, U.S. Treasuries remain the one asset that world investors generally regard to be free of default risk. But there is no law of physics that states the world's risk-free asset will always be U.S. Treasuries. Indeed, it was not always so. Over much of the 19th century the world's risk-free asset was widely regarded to be the debt securities of the British government. Over time, in part because of how the U.K. economy lost ground to the U.S. economy, world perceptions shifted and U.S. Treasuries came to hold that special position. This position is not a right of nature, however. A default on Treasuries would almost surely upset this position, with unknowable consequences for the function of global capital markets.

The other is that creditors holding U.S. government debt are increasingly foreigners, not domestic savers. Today the amount of Federal debt held by the public is approaching \$10 trillion. It is now widely estimated that the United States has recently crossed the threshold at which foreign savers hold at least 50% of this public debt. Thanks to ongoing low saving rates by U.S. households, this foreign share of U.S. government debt is likely only to rise. The single largest foreign creditor appears to be China's central bank, the People's Bank of China, with a current holding of Treasuries of about \$1.5 trillion. Other major foreign creditors include other central banks, such as the Bank of Japan, and sovereign wealth funds. All of this matters because history shows that deeply indebted sovereign borrowers are more likely to encounter sudden losses of confidence the larger is the share of outstanding debt held by foreign creditors.

In response to all these warning signs, some scoff and point to today's low Treasury interest rates: "The full faith and credit of the U.S. government remains on display in today's low interest rates. Markets are not worried about a possible default. Why should we?"

My reply to this argument is history. Fiscal crises have often come sharply and with little warning. All is okay; all is okay; all is okay. And then, one day, all is catastrophically not okay. Markets are not omniscient. Low interest rates today do not guarantee against interest rates spiking tomorrow if our creditors lose confidence in America's leaders. Do we really want to risk all the damage this might cause—to asset prices, to capital markets, to the jobs and well-being of American workers and their families?

America's fiscal challenges are grave. We will need the understanding of our creditors— domestic and, increasingly, foreign—to overcome these challenges. As such, America should be doing everything in its power to not cast doubt on the pledge to honor our debts. Time is running short. What America needs most of all is leaders—such as those of you on this committee—to raise America's debt ceiling as part of meeting its fiscal challenges: by acknowledging the problems, by imagining solutions to these problems, and by manufacturing the tangible steps needed to realize these solutions.

Let me close by thanking you again for your time and interest in my testimony. I look forward to answering any questions you may have.

*H*EARING IV.

**THE PRICE OF MONEY: CONSEQUENCES OF THE
FEDERAL RESERVE'S ZERO INTEREST RATE
POLICY?**

Friday, September 21, 2012

WITNESSES

Grant, James, Editor, Grant's Interest Rate Observer
Lehrman, Lewis E., Senior Partner, L.E. Lehrman and Company

*B*ACKGROUND

The Subcommittee on Domestic Monetary Policy and Technology held a hearing entitled “The Price of Money: Consequences of the Federal Reserve’s Zero Interest Rate Policy” at 9:30 a.m. on Friday, September 21, 2012 in Room 2128 of the Rayburn House Office Building.

This hearing examined the role that interest rates play in resource allocation, economic growth, and economic crises; the effects of interest rates on inflation and the purchasing power of the dollar; and the impact of the Federal Reserve’s zero interest rate policy on investors, savers, and the economy. This was a one-panel hearing with the following witnesses:

- Mr. James Grant, Editor, Grant’s Interest Rate Observer
- Mr. Lewis E. Lehrman, Senior Partner, L.E. Lehrman & Co

The Time Element of Money

Interest rates are the price of money over time. Like all prices, in a free market economy they would be subject to the laws of supply and demand. When the forces of supply and demand are allowed to function, the preferences of consumers and producers are coordinated through prices. As supply and demand change, the price adjusts, which signals to consumers and producers the optimal amounts to produce and consume. In the market for money and credit, supply is produced by savers while demand comes from borrowers.

Unlike the market for many other goods and services, the element of time is critical in influencing the behavior of both lenders and borrowers. The market for borrowing and lending money is different from that of other goods and services because money is not exchanged for goods or services; instead, money now is exchanged for money in

the future. The market for money and credit thus coordinates not only the transfer of money from lenders to borrowers, but also the time preferences of individuals. This element of the market for money plays an important role in the allocation of resources in the economy.

Money is not necessarily useful in and of itself; instead, individuals demand money as a medium of exchange to buy goods and services. All other things being equal, individuals prefer to consume goods and services in the present rather than in the future; therefore they prefer money in the present rather than money in the future. When individuals choose not to expend all their money satisfying their present needs and wants, they have shifted their preferences from present consumption to future consumption. They save in the present in order to increase their ability to consume in the future.

When an individual borrows money, he or she does so in order to consume more in the present. Individuals borrow not only to consume present goods such as food, but also to invest in the production of more time-intensive capital goods, such as houses and machinery. Capital goods bring about productivity gains and overall increases in the amount of future consumer goods; in other words, capital goods generate economic growth.

Because resources are finite, the production of time-intensive capital goods requires the use of present consumer goods. Therefore savings are necessary not only to provide money to be borrowed, but also to forego personal consumption so that present goods can be used in capital formation. Interest rates coordinate such saving and borrowing.

Pricing Mechanism of Interest Rates

The interest rate is the amount charged to a borrower for the use of money for a period of time and is compensation to a saver for not spending that money in the present. Like any other price, interest rates make economic calculation possible. They allocate, coordinate, and signal the best uses of scarce resources.

Higher interest rates imply a low supply of savings relative to the amount of borrowing demanded; as rates rise, more people are motivated to save and more would-be borrowers forego borrowing. *Lower* interest rates imply a high supply of savings relative to the amount of borrowing demanded; as rates fall, saving is deterred while borrowing is spurred. Additionally, prevailing high interest rates indicate a preference for present consumption while lower interest rates indicate a preference for future consumption.

Lower interest rates tend to favor longer-term, more capital-intensive projects that increase the amount of consumer goods that will be available in the future. For example, a project that takes five years to complete might not be profitable if the borrowing to finance the project is priced at eight percent interest. But a drop in the interest rate to three percent makes financing the project cheaper, while also signaling that consumers have become more future-oriented and will want the product once the project is completed five years later, thus making the venture profitable.

The economic calculations needed to coordinate the preferences of savers and borrowers are made possible by the information transmitted in the price signal of the interest rate. The prevailing market interest rate is the equilibrium point that coordinates saving and borrowing.

Interest Rates and Central Banks

Interest rates today are heavily influenced by central banks. Rather than relying on the market interest rate to coordinate savings and borrowing, central banks influence the interest rate by adjusting the supply of credit in the market. Credit is added to the economy by creating an entry on the central bank's balance sheet and using the newly created funds to purchase assets, thus increasing the supply of credit available in the market and lowering the interest rate. Credit is drawn out of the economy by selling the assets on the central bank's balance sheet, thereby retiring the credit the central bank created and raising the interest rate. The supply of central bank credit, and the resulting high or low interest rates, is determined by the policy objectives of the issuing central bank.

The Federal Reserve System, the central bank of the United States, attempts to manage interest rates in order to influence economic activity and stabilize the economy. When the economy is judged to be expanding too quickly, the Federal Reserve contracts the supply of credit to raise interest rates and decrease economic activity. When the economy is judged not to be expanding quickly enough or is judged to be contracting, the Federal Reserve increases the supply of credit to decrease the interest rate and spur economic activity.

Consequences of Non-Market Interest Rates

Because the interest rate is a price, the efforts of central banks to manage interest rates have adverse effects. When interest rates are set by central banks rather than the market, the interest rate is a price control rather than a pricing mechanism and no longer efficiently allocates resources.

For example, when the Federal Reserve decides on a policy of low interest rates, it sends a signal to the market to borrow more and save less. The lower interest rate tells investors that individuals are saving in order to consume more in the future. This makes investors' time- and capital-intensive projects seem profitable and indicates that consumers are deferring present consumption in order to consume more in the future. On the other hand, low interest rates can deter savings, causing present consumption to increase and diminishing the amount of savings available for future consumption.

Because these lower rates result from the Federal Reserve's policy decision rather than changed economic behavior, the policy cannot continue indefinitely. At some point, capital projects funded by this new credit are completed: houses are put up for sale, mines begin producing ore, and factories start manufacturing goods. But because consumers' consumption patterns have either remained unchanged or have become more present-oriented, by the time these new capital projects are completed producers find no market for their goods. The coordination between savings and consumption was severed through the Federal Reserve's decision to lower interest rates, which induced savers and borrowers into unsustainable patterns of economic activity. Resources that could have been used in productive endeavors under market-determined interest rates are instead used in endeavors that turn out to be unprofitable. An economic correction becomes necessary in order to free up malinvested resources and put them to more productive use elsewhere in the economy.

Another effect of injecting new credit into the system is that prices rise. Increasing the amount of credit increases the buying power of borrowers, which increases the demand for goods produced in the market. The additional demand brought about by newly created credit puts upward pressure on prices as more money chases the same amount of goods. Newly created credit benefits those who receive it first, since they are able to use the new credit before prices rise. Savers, those on fixed incomes, and the poor tend to suffer because they experience a reduction in the purchasing power of the dollar; they see prices increase before they receive any of the newly-created credit.

Federal Reserve's Zero Interest Rate Policy (ZIRP)

In December 2008, the Federal Reserve set the target federal funds rate at 0-0.25%. The Federal Reserve announced in mid-September 2012 that it plans to maintain this zero lower bound

target until mid-2015. The zero federal funds rate policy is intended to maintain low short-term interest rates. The Federal Reserve also announced a third round of quantitative easing by purchasing an additional \$40 billion of mortgage-backed securities (MBS) per month, with no definitive end date. It also announced a continuance of its policy of extending the average maturity of its security holdings, through the end of 2012. In December 2012, the Fed announced it would purchase Treasuries at a rate of \$45 billion per month, again without an end date. The Federal Reserve's quantitative easing and maturity extension programs have been aimed at reducing longer-term interest rates through the purchase of MBS and long-term Treasury securities. By forcing market interest rates as low as possible, the Federal Reserve hopes to ease credit conditions and spur economic growth and job creation to bolster economic recovery.

The Federal Reserve's accommodative monetary policy, by holding interest rates at zero for a prolonged period of time, negatively impacts the economy. Because interest rates can no longer function as a pricing mechanism, zero interest rates will lead to unsustainable patterns of economic behavior that will require eventual correction and impede recovery. Zero interest rates also encourage investors to move into riskier assets in a search for yield, potentially increasing economic instability. While ZIRP favors borrowers, savers are deprived of returns on their investments. Low returns are especially harmful to retirees and those on fixed incomes who rely on interest income as a primary means of financial support. In addition, the unprecedented amounts of liquidity that result from the Federal Reserve's accommodative monetary policy may result in inflationary or even hyperinflationary price increases if economic activity picks up as the Federal Reserve hopes.

*T*RANSCRIPT

The subcommittee met, pursuant to notice, at 9:33 a.m., in room 2128, Rayburn House Office Building, Hon. Ron Paul {chairman of the subcommittee} presiding.

Members present: Representatives Paul, Jones, Lucas, Luetkemeyer, Huizenga, and Schweikert.

Chairman PAUL. This hearing will come to order. And without objection, all Members' opening statements will be made a part of the record.

I want to welcome our two witnesses here today, and I will now recognize myself for 5 minutes to make an opening statement.

Today, we are emphasizing the importance of interest rates. In a free market, interest rates are crucial. It is a crucial bit of information that tells a lot of people what to do, whether it is the investors, the savers, the spenders, consumers, whatever.

But once it is interfered with and interest rates are artificial, it tends to mess things up.

We talk a lot about monetary policy and the soundness of the dollar and the spending and monetizing of debt. Today, we are more or less concentrating on that aspect of monetary policy that deals with interest rates—how important is it—and has that whole emphasis on interest rates and this concession through the Federal Reserve (the Fed) that they have a duty and sometimes an unregulated duty to pretend they know what the interest rates should be.

This opens up a lot of questions. Who benefits and who suffers from this? Has it done any good? Is it a worthy effort even to try to pretend that we know what interest rates should be? And figure out exactly how much difficulty it has caused.

From my viewpoint, I think that, from the viewpoint of the marketplace—just as all prices, I want the market to set these prices.

And we have been living now with a Federal Reserve for 100 years, and early on, they were manipulating interest rates.

It is hard to manipulate the supply of money or be the lender of last resort without getting involved in interest rates. And it is usually done with either trying to prevent a problem or to solve a problem.

But if we look at history, especially in our last 100 years, we have had a lot of ups and downs. It hasn't been smooth sailing. The Federal Reserve is supposed to be providing for a sound dollar and making sure that prices are stable and that there is high employment.

And yet the results that we see today, because they have pursued this almost obsession on believing that they can leap over into a central economic planning through the manipulation of money and credit, and in particular interest rates, we have ended up with some pretty poor results.

So I am working under the assumption that we are in a period of time probably unparalleled in our history, possibly unparalleled in the history of the world, because we have never had quite the global economy involved like we have today and we have never had a single fiat currency for 30, 40 years being used as the reserve currency of the world. So I think the distortions now are so great.

And if it is indeed true that the concentration on interest rates might be the culprit, it would be good to get it exposed, so that when the time comes when it becomes an absolute necessity to try to correct this problem, we might be able to put a better system together.

So I am delighted today that we have been able to bring two individuals who are very well-versed on this subject to talk about this, and other members of the committee, to emphasize the importance of price fixing of money.

Some people don't like to call it price fixing and they refer to it as something in interest. But in a way, it is easy to understand it is a price fixing.

Price fixing is bad when we have wage and price controls. Not many people are advocating wage and price controls at the moment, even though there is a lot of that going on in a subtle way, if money is one-half, the currency is one-half of every transaction and you have some price fixing involved in the price of money, it can be a fairly significant event that should be exposed, and we certainly ought to recognize that as we move into that period of time when there is a necessity for monetary reform.

So I am delighted that we have had this opportunity to further this discussion.

I would now like to yield 5 minutes to the gentleman from North Carolina, Walter Jones.

Mr. JONES. Mr. Chairman, thank you. And I won't take but 1 or 2 minutes. I want to thank you again for your national leadership on this area of monetary policy and concerns of where this country is going.

And to our witnesses today, thank you very much. I look forward to listening to your comments.

I don't think there is a better time, when we are going home for the next 5 weeks, all of us in the United States Congress, to be with the people. And knowing that I am from eastern North Carolina and the concern about the actions of the Federal Reserve, I think the topic today is absolutely fascinating and critical.

So I just want to say to you, Mr. Chairman, thank you very much for holding this hearing, and I look forward to listening to the witnesses and thank them for being here. And just thank you for your service to our Nation.

I yield back.

Chairman PAUL. I thank the gentleman.

I now yield time to Mr. Lucas from Oklahoma.

Mr. LUCAS. Thank you, Mr. Chairman. And as all of the hearings that you have called in your tenure as a subcommittee chairman reflect, this is an important subject matter and something on which we all need to focus. Perhaps not quite as exciting to the membership, as one can tell, as it should be, but nonetheless it cuts to the very basis of how our free market system works in this country.

That said, let me reminisce for just a moment, since this session of Congress is beginning to wind down, and there is always a possibility this might be the last hearing of this subcommittee. I suspect we might be around after Election Day, but a lame duck session is to be avoided if it is humanly possible.

I would just simply note that—having sat next to you on this dais on the full committee and served on your subcommittee for almost a decade now—we have had many a good policy discussion, and not just monetary policy, but we have discussed the intricacies of farm policy, agricultural economics.

It might surprise some of you to know that Dr. Paul and I, while we agree on many, many, many things, we are not exactly in sync on agricultural economics. But we have had some lovely, very thoughtful, to-the-point discussions, and you have opened my mind in an area or two, and I appreciate that. And I hope perhaps even on an

occasion or two, I have offered a thought for you to think about. But you have just been a pleasure.

And if Congress is about free elections, and an open and thoughtful debate process where policies can be formulated in the best interest of the country, then I think you have done more than your part, and we will all be ever so appreciative of that for many, many years to come.

And with that, thank you, Mr. Chairman.

Chairman PAUL. I thank the gentleman.

And now, I yield time to Mr. Luetkemeyer from Missouri.

Mr. LUETKEMEYER. Thank you, Mr. Chairman. I add my congratulations and empathies from Chairman Lucas as well. It has been an honor to serve with you these past 2 years.

The subject we have today I think is extremely important from the standpoint that the Fed continues to tinker around with our economy through the money supply, and, from all things that I see, it is having minimal success. I am concerned about the direction that they are going, the situation that they are putting us in.

If you look at the global situation, other entities, central banks around the world, they are struggling. And is this the proper path to take? I don't know, I am not an economist, and I think there is a general disagreement even with good economists on whether it is a good policy or a bad policy.

But I think that the discussion is pertinent, extremely important to today's economic welfare from the standpoint that we are in an economic stagnation period here, and how we get out of this is everybody's concern.

And I think monetary policy by the Fed and their money-supply policy is an extremely important subject to discuss.

So with that, I thank you for the subject today, Mr. Chairman, and I yield back.

Chairman PAUL. I thank the gentleman.

Now, I yield time to Mr. Schweikert from Arizona.

Mr. SCHWEIKERT. Thank you, Mr. Chairman. I will be very quick.

You do realize that you letting me on this subcommittee has really screwed up my subjects of reading over the last 2 years. All of a sudden, I find myself reading more about monetary policy than I ever thought I would want to touch. And I have learned a lot. I have also worked through a series of things that I realize are just sort of complete folklore out there.

And, Mr. Chairman, I am hoping also in our testimony and in some of the discussion, I am one of those who is absolutely fixated on

the concept that interest rates ultimately are the pricing of risk and where interest rates and capital flows, and then that interest rate charged to where that capital flowed is sort of an allocation and a management of risk.

Do you end up moving large amounts of capital, or even sometimes, us as individuals, capital to places that it shouldn't be because it is misallocated and mispriced? And what are the ultimate consequences for what we have done here when we have basically destroyed what should have been the historical pricing mechanism or risk mitigation, risk analysis system, which is interest rates and our economy.

And with that, Mr. Chairman, I look forward to the testimony.

Chairman PAUL. I thank the gentleman.

We will now proceed to our witnesses.

First, Mr. James Grant is a noted investor and founder and editor of Grant's Interest Rate Observer, a widely circulated bimonthly newsletter on finance that accurately foresaw the financial crisis.

A former columnist from Barron's, he is the author of five books on finance and financial history. Mr. Grant has appeared on television programs such as "60 Minutes" and "The Charlie Rose Show" to share his expert knowledge of finance, and his journalism has been featured in numerous publications, including The Wall Street Journal, the Financial Times, and Foreign Affairs.

Second, Mr. Lewis Lehrman is a senior partner of the investment firm L.E. Lehrman & Co., and is chairman of the Lehrman Institute, a public policy organization he founded in 1972, where he heads up the Gold Standard Now Project.

As a member of President Ronald Reagan's Gold Commission, Mr. Lehrman helped write the Commission's minority report entitled, "The Case for Gold."

Over the years, he has written widely about economic and monetary policies and has been featured in Harper's, The Washington Post, and The New York Times, among others.

Without objection, your written statements will be made a part of the record. You will each now be recognized for a 5-minute summary of your testimony.

Mr. Grant?

**STATEMENT OF JAMES GRANT⁹⁷
FOUNDER & EDITOR
GRANT'S INTEREST RATE OBSERVER**

⁹⁷ [The prepared statement of Mr. Grant can be found on page 291.]

Mr. GRANT. Mr. Chairman, and members of the subcommittee, good morning. It is an honor and a pleasure, and may I underscore honor to be here.

The price mechanism is our indispensable contrivance, and without it, the store shelves would be stocked with things we don't want, if they would be stocked at all. Our economy is wondrously complex, and what coordinates the moving parts is Adam Smith's invisible hand.

For a superb critique of the perils of price control, look no further than Ben Bernanke's own lectures last March to the students of George Washington University. "As you know," the chairman reminded his charges, "prices are the thermostat of an economy; they are the mechanism by which an economy functions. So putting controls on wages and prices," here Mr. Bernanke was referring to the disastrous Nixon experiment of the early 1970s, "meant that there were all kinds of shortages and other problems throughout the economy."

Yet this same observant critic is today leading the Fed in a policy of financial price control, to call the thing by its name. Interest rates are, after all, prices. They convey information, or are intended to. Market-determined interest rates are the prices that balance the supply of savings with the demand for savings.

These, however, are not our interest rates. Actually, we hardly have any. They are so small you can hardly see them. They are tiny. Today, the Federal Reserve imposes interest rates, and those rates it does not impose, it heavily influences.

Mr. Bernanke's bank fixes at zero percent the basic money market interest rates called the Federal funds rate that manipulates the alignment of rates over time, the yield curve, and it has its fingerprints all over the relationship between government yields on the one hand, and the yields attached to private claims on the other.

The Federal Reserve has decreed that ultra-low interest rates are a necessary if not sufficient condition for economic recovery. It says that miniature interest rates will boost hiring and another aspiration of the central bank, keep consumer prices rising by just enough; "a decent minimum, say, of 2 percent a year," so says the Fed.

Now, every market intervention has consequences, but not necessarily the consequences that the intervening authority intended. In the nature of things, there can be no predicting exactly what will come of today's radical and indeed unprecedented monetary policies.

Mr. Bernanke himself makes no bones about it in his widely scrutinized speech at Jackson Hole, Wyoming, on August 31st. He

used the phrase, “learning by doing.” Indubitably the Fed is doing, nobody can doubt its manic energies, but it seems not to be learning.

Artificially low interest rates must inevitably subsidize speculation at the expense of saving. It must raise up the prices of stocks and commodities, but only temporarily. It must enrich the asset holders and inadvertently punish the wage earner. It must advantage one class of financial institutions—say, banks—over another—say, life insurance companies. It must disturb the currency markets, and therefore interfere with international trade, and it must conflate our understanding of the strength of the Treasury’s own finances.

This year, in the just-ending fiscal year—or the soon to end—the interest cost in the debt will run to an estimated \$125 billion. That happens to be slightly lower than the outlay the Treasury bore in 2006 when the debt was 58 percent smaller than it is today, but when the average interest rate was a towering 4.8 percent as opposed to the current average of 2.1 percent.

Ultra-low rates flatter the Nation’s credit profile, yet that credit profile remains the same.

Mr. Chairman, millions of Americans are earning nothing on their savings. Having nowhere else to turn, they are investing in richly priced corporate debt, some of that speculative grade. The Fed author of this interest-rate famine of ours has inadvertently created a paradox that would be funny if it weren’t dangerous.

Mr. Bernanke’s bank has created a high-yield bond market, junk bonds to the cognoscenti, but a market lacking one customary attribute of high-yield security. That is, the Fed has created a high-yield bond market without the yield.

I thank you.

Chairman PAUL. Mr. Lehrman, go ahead.

**STATEMENT OF LEWIS E. LEHRMAN⁹⁸
SENIOR PARTNER
L. E. LEHRMAN AND CO.**

Mr. LEHRMAN. So, Mr. Grant and I like to switch one sentence to express how much we honor the extraordinary record of the chairman in his 30 years plus, perhaps, service in the Congress. It has been a heroic effort on behalf of the authentic Constitution, and on behalf of the liberties which we have inherited from our forefathers, and of course, for sound money.

⁹⁸ [The prepared statement of Mr. Lehrman can be found on page 272.]

Now, Mr. Grant is about six feet, five inches tall. I am only five feet, 10 inches tall, and he determined the protocol of our presentation. So, he established that he would focus on the problem, and I should spend a moment or two on the solution.

Indeed, Jim has described the consequences of Federal Reserve quantitative easing and interest rate manipulation and suppression.

From Mr. Grant's analysis, one concludes that the Fed's unlimited power to purchase Treasury debt and financial market securities not only funds the Treasury deficit with newly printed money, but the Fed's market intervention process also makes of the financial class a special interest group of privileged investors and speculators, because of their special access to subsidized funds at near zero interest rates, while middle-income families depend upon their credit card balances and pay upwards of 20 percent or more.

A well-connected financial class subsidized by the Federal Reserve is a crucial cause of increasing inequality of wealth in America. In this regard, I would cite only one fact for the Monetary Policy Subcommittee to contemplate. Since the termination of dollar convertibility to gold in 1971, a mere generation, the financial sector has doubled in size as a share of the American economy, but the manufacturing sector has been cut in half.

Only comprehensive reform of the Fed and termination of the Reserve currency role of the dollar will arrest this trend. For example in 2002, Mr. Bernanke described the Fed's extraordinary power to create new money and credit in our present financial regime of inconvertible paper money and inconvertible bank deposit money.

I quote Mr. Bernanke, "Under a fiat paper-money system, a government, the central bank in cooperation with other agencies, should always be able to generate increased nominal spending and inflation. Even when the short-term nominal interest rate is at zero, the U.S. Government has a technology," Bernanke continues, "called a printing press, or today its electronic equivalent that allows it to produce as many U.S. dollars as it wishes at essentially no cost."

Reading this, I don't know whether to laugh or to cry. In effect, as James Grant wrote elsewhere, "The Fed is not only the American central bank, but with this exalted power to print money, the Fed is now the government's central planner."

During the Volcker years, from 1979 to 1987, Fed interest rate manipulation was justified as the means to end inflation. By 1994, employment as a Fed target had all but disappeared from the minutes of Fed meetings.

Now, in 2012, despite inflation being again on the rise, employment is as a practical matter the sole target of quantitative easing. The Fed and its apologists in the media and the academy justify quantitative easing and its unlimited scope and duration as the way to restore economic growth—surely, an extra-Constitutional form of fiscal spending through Federal Reserve capital allocation reserved for the Congress of the United States.

But as soon as one examines that Federal Reserve balance sheet, which if I may say so, few politicians do, one sees that the Fed primarily buys Treasury securities and mortgage-backed securities. In effect, a subsidy by which to finance the government deficit, and to refinance bank balance sheets that is to say the promotion of more financial and consumption sector growth. In a word, quantitative easing is the most pernicious form of trickle-down economics.

Now, the problem of the American economy is neither under-consumption nor is it under-banking. The problem is the lack of rapidly growing investment in domestic production and manufacturing.

The investment is the necessary means by which to enable our producers to lead in both domestic and global markets. It is rapidly increasing investment and production growth which begets employment growth and with it healthy unsubsidized consumption growth, not by means of transfer payments.

It is a truth of economic theory and practice that rising personal and family real income grows from increasing per capita investment in innovative businesses; new plant, new equipment. So the question is, in reforming the Fed, how can our runaway central bank be harnessed by the financial markets to target the goal of economic growth through increased productive investment, not the promotion of consumption and Treasury deficit financing by means of interest rate manipulation and quantitative easing?

The answer, I believe, is transparent. The Congress of the United States has the exclusive constitutional power under Article I, Sections 8 and 10, not only to establish the definition of the dollar, but Congress also has the power to define by statute the eligible collateral that the Federal Reserve may buy and hold against the issue of new money and credit.

Thus, a simple congressional statute defining sound commercial loans as the primary eligible collateral for discounts and new credit from the Fed would have two primary defects. First, it should rule out Fed purchases of Treasuries, thus requiring the government to finance its deficits not with newly printed Fed money, but instead in the open market away from the banks.

Second, the Fed would then become a growth-oriented central bank by which to finance productive business loans, encouraging thereby commercial banks themselves to make banks to solvent businesses in order to sustain economic and employment growth.

Now, why is this the case? Commercial banks would focus on production and commercial loans because solvent loans, instead of Treasury debt, could then be used by commercial banks as the primary eligible collateral by which to secure credit from the Fed as the lender of last resort. In a word, Treasury subsidies by the Fed should be displaced by productive business loans oriented toward economic and employment growth.

Mr. Chairman, this simple proposed reform of Fed operations was the very monetary policy insisted upon by Carter Glass, a leading Democrat who was the chief sponsor of the Federal Reserve Act of 1913. The congressional legislative leaders who created, indeed founded, the Federal Reserve System of 1913 designed the Fed by law to enable steady commercial investment and employment growth.

The Federal Reserve Act was also designed explicitly to uphold and maintain dollar convertible to gold in order to maintain a reasonably stable general price level. Now, such a congressional Federal Reserve reform today, consistent with the original Federal Reserve Act, would require no further legislative mandate to sustain employment growth and to rule out systemic inflation and deflation.

Just a word more—so today, the Fed reiterates at every meeting that it, the central bank, must manage and manipulate interest rates to fulfill a congressional mandate to maintain reasonable price stability and reasonably full employment. But the best way to do this is to remobilize the express intent and the techniques of the original Federal Reserve Act, namely the statutory requirement that the Fed uphold the classical gold standard and, as was intended by the original Federal Reserve Act, to substitute commercial market credit for Treasury debt as the primary eligible collateral for bank loans from the lender of last resort, the Federal Reserve System.

Mr. Chairman, may I say with respect, Congress has defaulted to the Federal Reserve System its sole and solemn constitutional authority to define and to regulate the value of the dollar and to define the vital economic use of eligible collateral by which to obtain productive business loans from the Federal Reserve System. It does not have to be this way.

Thank you very much.

Chairman PAUL. Thank you.

[QUESTIONS & ANSWERS]

We will go into the questioning session right now. I yield myself 5 minutes.

I want to ask both of you the same question. In 1979, and the 1980s, we had a bit of a crisis, quite different than we have today because interest rates were very, very high and even made higher. At that time, as I recall, not too many people were happy and claiming they were getting benefits from the higher interest rates. I don't think the markets—the higher the rates went, I don't think the markets were saying “wonderful, wonderful.”

But today, even with this most recent announcement of the accelerated quantitative easing, there is almost an immediate response—as a matter of fact, instantaneous response. We are going to print a lot more money and those individuals who are holding stocks seem to be delighted with that and bonds rally.

My question is: Under today's circumstances, with this constant effort to keep lowering interest rates, now that they are down to essentially zero, below zero when you talk about real interest rates, who benefits from this? Who is really benefiting? And who are the people who are suffering? Can you divide it up and find out if there are some groups who have no benefit whatsoever and some people actually get punished? And other people are rewarded, whether it is temporary or not, at least they think they are being rewarded.

And if there is a case where somebody benefits, and somebody else is hurt, is this done on purpose? Or would you want to make a stab at it to say is this sort of a consequence of just bad policy? Or what might be the motivation here if there are winners and losers?

Mr. Grant?

Mr. GRANT. Mr. Chairman, the great French economist Frederic Bastiat talked about that which is seen and that which is not seen. There are many obvious beneficiaries. There are many obvious victims. Let me suggest a subtler distortion that these policies are responsible for, and then I will touch on some of the ones that are perhaps as important or more so.

Capitalism is a little like the forest floor. There is life. There is death. There is regeneration. There is movement. The famous phrase “creative destruction” defines the inevitable ebbing of economic power that was once constructive and now has passed its prime.

One of the consequences of these subsidized interest rates is that organizations that perhaps ought not to be around are given new life. The financial markets on Wall Street are increasingly welcoming to

the most marginal credits because there is a stampede for interest income. People are starving for it and Wall Street is providing for it.

When nearly anyone can get a new loan—when nearly anyone can get a pass in the public market that means there are not enough bankruptcies. It is a problem, albeit a paradoxical one. We need new enterprise and we need the exit of unprofitable or over-the-sell-by date enterprise; so ultra-low interest rates perpetuate the status quo.

Interest rates, as someone mentioned, are among other things, great sources of information. When interest rates are pressed to the floor, the credit markets provide less and less information. The information is there, but it is not to be intuited by prices.

So, as to the other beneficiaries and losers, some of them are painfully obvious. The Fed talks more or less nonstop about inflation, but then I think is troubled by the lack of it. It wants to see more of it. Well, one department of American finance in which there is rampant inflation is the cost of obtaining a dollar of income. One might say the cost of retirement is in a terrific inflationary crisis.

A friend of mine and of Lew's, a Wall Street figure of wonderful renown and of some mordant future, said a while ago, before he passed away, "You know," he said, in all seriousness, "you really can't get by today without \$100 million."

The point survives the exaggeration. You need more and more capital to maintain a decent income as a saver. That, to me, is not the least of the cost of these policies.

Chairman Bernanke, in Jackson Hole, spoke to try to put our collective minds at ease about the unintended consequences of quantitative easing. And he said, "I can enumerate four possible pitfalls"—four. There are 400,000 possible pitfalls.

The Chairman, I think, is in error when he implicitly tells us that for every monetary cause A, there is a predictable monetary effect B. There are effect B, C, D, N, Z, and myriad effects that are so weird that no proper letter in the English language can describe them.

What we are now embarked on is one of the great monetary experiments of all times and, Mr. Chairman, we are the lab rats.

Chairman PAUL. Mr. Lehrman?

Mr. LEHRMAN. Mr. Chairman, you mentioned the period of 1979, 1980—that period of high interest rates over which Mr. Volcker presided. I was there and I remember it, just as you do. One of the remarkable things about a review of the history of the Federal Reserve System from 1914 until the present is that the techniques that have been used either to suppress interest rates or the use of vaulting

interest rates to bring about changes in economic activity has seen no reform.

That is to say, Paul Volcker, you will remember in 1979, said his goal was to target the bank reserves; that is to say, to control the stock of money in circulation. This was another new experiment on interest rate manipulation, of course, with a noble intent.

But this was just another form of interest rate manipulation which ultimately wound up putting the prime rate at 21 percent and market rates for a long-term Treasury at the highest level that they would be in American history, approximately 15 percent.

It is forgotten in the dreamlike remembrance of that period that from 1979 to 1982 the American economy was in recession, the unemployment rate in New York State in 1982 in November—I remember that date very well for personal reason—was 11.2 percent, higher even than the unemployment rate at the peak of the “Great Recession,” which we have undergone since 2008.

It was not a halcyon period. President Reagan’s first years of the Administration were almost impeached economically because of that.

So as the French say, the more it changes, the more it is the same way; that is to say, Federal Reserve interest rate manipulation and management for one purpose or another.

Who benefits and who suffers? In each period, under each of the Federal Reserve Chairmen who exercised this extraordinary power, it was different.

Today, I want to point out only in response to the question the technique and its effect by which the Federal Reserve actually does operate in open market operations at the New York Federal Reserve System and has done so since the First World War.

The Federal Reserve enters the market and purchases outright or on a match sale or on a repurchase agreement Treasury securities from the market against which they issue new money.

That new money is made available only to the banks because— or the today 16 authorized dealers. So their portfolios are reduced and substituted with new money, which they then are in a position either to lend out to dealers and brokers or speculators or Wall Street investors who can post collateral, liquid collateral, by which they then can satisfy the lend that they can repay the loan.

So the very first effect and the dominant effect, the generalized effect is commodity dealers and equity dealers who have first access to the money which is created anew by the purchase of Treasuries, which themselves cannot be repaid as they are refinanced with renewal bills.

This is a prescription and has been in effect for a very long time, but especially since the end of the Second World War and even more dynamically since the end of Bretton Woods in 1971, to enrich the investor class.

I cannot incriminate them because to a certain extent I am a member of that class, but one does not have to be a rocket scientist to see that the Federal Reserve's process of monetizing the U.S. Treasury debt, providing new credit to the banking system to lend to their preferred clients divorces supply from demand, creating a monetary demand unassociated with the production of new goods and services.

When total monetary demand exceeds supply, which is the prescription and the technique of the Federal Reserve, inflation must get under way.

Now, that inflationary process today is hidden by the vast unemployed resources which we now have. And as a result, the new credit money immediately goes into the commodity and equity markets as well as into speculative vehicles like farmland, for example, which is the most exotic investment today of a sort of inside Wall Street investors.

No change can occur in such a process without a full reform of the Federal Reserve System and a reform of the monetary system.

Chairman PAUL. Thank you very much.

I now recognize Mr. Luetkemeyer for 5 minutes.

Mr. LUETKEMEYER. Thank you, Mr. Chairman.

I appreciate your comments, Mr. Lehrman. They are interesting. You called farmland an "exotic" investment.

I am looking to try and buy the farm next to mine, and I wouldn't think it would be an exotic investment. But I understand where you are coming from.

I am just kind of curious, if the Fed would not purchase all of the government's debt, would there actually be a market out there, in your judgment, for our debt because of the size of the debt that we have, the amount of money that it would take to service that debt? Is there enough capital out there to service that debt? Is there enough capital out there to purchase that if we don't run the printing presses here at the debt and pick it up, in your judgment?

Mr. LEHRMAN. May I first say, Congressman, that I am the owner of a 1,600-acre farm—corn, soybeans. And it is exotic from the standpoint of speculators who have never set foot in a cornfield, but certainly not from those—

Mr. LUETKEMEYER. That is who I am bidding against on the farm right now, are those guys.

Mr. LEHRMAN. So then you understand what—

Mr. LUETKEMEYER. Yes, I do.

Mr. LEHRMAN. —I was getting at.

Mr. LUETKEMEYER. But to me, it is not exotic. I would like to buy my neighboring farm, but to those folks, it brings the price up. I understand, but go ahead.

Mr. LEHRMAN. So the question is: What would happen if, as the founders of the Federal Reserve System intended, the Congress of the United States and the budget of the Treasury were not able to finance its deficit by selling securities ultimately to the Federal Reserve System? Is the open market substantial enough to accommodate the vast sums presently required by the Treasury in order to finance its current spending?

The answer to that is we would find that out, and it would be the ultimate discipline, which would require Congress on notice to the public that the financing of the Treasury was forcing interest rates higher and higher and excluding businesses and commercial firms from access to the credit markets because at the present level of deficits—let us call it all in about \$1.5 trillion, including the credit financing bank—it would absorb almost all the net national savings available in the market, which gets right to the point of this hearing. What is the effect of the suppression of interest rates and their manipulation and the financing of 77 percent of the Federal Reserve's budget deficit in Fiscal Year 2011; what is the effect of that?

It disguises from the public, the sovereign people, the effects of the fact that only 60 percent of the revenues which Congress decides to spend are financed through taxes, and 40 percent of them through printed money either through the banks, the commercial banks, for foreign central banks.

Mr. LUETKEMEYER. I think there is another point to be made here too, which is the fact that because they are driving rates so low they are also disguising or hiding the fact—the exposure that we have when you go to \$16 trillion worth of debt in just—an additional \$4 trillion, \$5 trillion, \$6 trillion in the last 3 or 4 years—the amount of exposure we have to interest rate fluctuation. Right now, the cost of interest to our government is rather low compared to what it has been in the past because of driving interest rates down.

If that would not happen the rates would go back—it would be very easy to double or triple the rates, because they are so low right

now. Imagine what it would do to our budget if you doubled or tripled our cost of funds.

Mr. LEHRMAN. We dealt with that issue at the last hearing, Congressman. We dealt with that issue. And were you to normalize the long-term interest rates—let us say for 30-year Treasury bonds—were you to normalize them consistent with the past history of the generation and given the scale of the direct debt of Treasury right now at \$16 trillion, the total amount of the Federal budget devoted to interest payments could rise to as high as \$800 billion, even towards a \$1 trillion if the deficit were to continue.

That puts, I think, a number on the effect.

Mr. LUETKEMEYER. Very good.

Very quickly, how do we unwind this? What happens when we unwind this thing?

Mr. Grant?

Mr. GRANT. We don't know. The Fed is—

Mr. LUETKEMEYER. We are still going to be a laboratory even for that.

Mr. GRANT. Yes. That, too, will be a learning-by-doing experience.

Mr. LUETKEMEYER. How painful will it be, do you think?

Mr. GRANT. Sorry?

Mr. LUETKEMEYER. How painful do you think it will be? Because—until interest rates rise, will inflation take place or will we go into a depression? Will it be runaway glory, everything going to be hunky-dory here? Or where are we going? If the Fed has to unwind this thing and get rid of the 2-point whatever—\$8 trillion now—

Mr. GRANT. Congressman, we can rule out hunky-dory.

As for the rest, we will see.

Imagine a day in which the Treasury, to finance another \$1.5 trillion deficit is raising, say, \$15 billion in 2-year notes in the morning; and in the afternoon the Fed is holding a special auction to liquidate the remaining excess portion of those balance sheets. So they will be one auction on top of another.

We simply don't know the outcome, but we do know, I think, that the Fed's assurances must be discounted. The Fed is remarkably complacent with regard to its capacity to form financial judgments. This is the outfit that panicked in front of the prices of computer clocks in 1999—neglected to see or to take due measure of the speculative mania in technology stocks that ended in the early aughts. And that positively saw not one aspect of the greatest credit crisis in three generations looming before it in the mid-2000s.

And we are meant to believe that the perspicacity of the judgment of the Fed will now help them anticipate the end of the necessity for this Q.E. and to unburden themselves of the excess security.

So I don't doubt that they mean to have the techniques to affect the exit. What I do doubt—and I think there is evidence in support of doubt—is that they have the judgment to mark the time and the need.

Mr. LEHRMAN. May I say a word on that question, Mr. Chairman?

Every Thursday, at about 4 p.m., the Federal Reserve System publishes its balance sheet. That balance sheet as of Thursday night, last night—I looked at it—shows that to do it in round numbers, the Fed owns approximately \$3 trillion of securities, primarily Treasury securities and mortgage securities, mortgage-backed securities and agency bonds.

If you look further into the detail and the footnotes you will observe that the largest fraction of the balance sheet of the Federal Reserve System is in long-term securities.

The historic practices of central banks during long periods of stable prices was only to own short-term securities so that were inflation to arise, they could, to use your phrase, unwind their portfolios selling securities, or letting them run off into the market in order to reduce the quantity of money and credit in circulation and stabilize the price level.

The Federal Reserve is now faced not only with the daunting task of unwinding the enormous monetization of Treasury and mortgage-backed securities, but they have encumbered the balance sheet with long-term securities which will not run off on a regular basis the way short-term commercial bills do with 90-day maturities.

They have the largest fraction of—far and away the dominant fraction in 10-to-30-year securities. So the only way they can get rid of them is to sell them into the open market.

If the economy is running full-tilt at full employment, and let us say the employment rate might be at 5 percent, it could have nothing less than, as you implied, a very dynamic effect on interest rates in general, not just in the United States, but worldwide in as much as the United States dollar is the world reserve currency.

Mr. LUETKEMEYER. Thank you.

I yield back. Thank you, Mr. Chairman.

Chairman PAUL. Thank you.

We are going to a second round now of questioning.

The first question I have I would like to get sort of a short answer for, because I have another question that follows and we will be

voting on the Floor pretty soon. But what is your concept of the current situation now and whether or not we have a bubble? Most of us recognize a NASDAQ bubble. Others recognize the housing bubble. Do you see a bubble right now that could suddenly change and change the markets and all perceptions?

Mr. Grant?

MR. GRANT. Yes, Mr. Chairman, I do. I see a bubble in Treasury securities. I see a bubble in sovereign debts worldwide. The world has come to believe that the promises to pay of sovereign governments are intrinsically safe—not everyone—but Northern European governments are meant to be intrinsically safe. Australia, I think there are seven or eight AAA-rated governments left on the face of the Earth. People are crowding into the claims of these governments, not least into our own.

These are interest rates that have not been seen in modern times in Northern Europe. There are plenty of governments borrowing at negative interest rates. And as was the case in every single market bubble in history, there are wonderfully persuasive stories circulated to rationalize what on the face of it is an abuse of common sense.

So I nominate bonds themselves as our looming bubble.

Chairman PAUL. Mr. Lehrman, any additional comments?

MR. LEHRMAN. The number of bubbles—even with vast unemployed resources in nations around the world, not just in the United States—is legion. And Jim has just mentioned some, but the Congressman and I were talking about farmland.

The value of farmland, as one vehicle for speculation, not only among well-positioned farmers, but I mean to say the investor class, the price of farmland, high-quality, let us say 160-bushel-per-acre, non-irrigated farmland from Central Pennsylvania all the way to the foothills of the Rockies, that is to say the great corn belt, has doubled just in the past 4 years.

This has never been experienced at quite this rate of change; or I should say this bubble has never occurred on this scale in the past. It is one more example.

Chairman PAUL. My follow-up question is to you, Mr. Lehrman. I would like Mr. Grant to comment as well. You talked about a long-term solution, more about the monetary reform and the use of gold. I want to concentrate more on that shorter-range solution or something you suggest that could help. And that is to look to the original Federal Reserve Act and not to allow the Fed to buy Treasury bills, but to allow the Fed to be the lender of last resort to sound commercial loans.

Did I state that correctly?

Mr. LEHRMAN. Exactly.

Chairman PAUL. Okay. If the Fed buys a commercial loan, they could buy this with money creation. Would this be expanding the money supply? Would this be monetizing a debt? And could it lead to a problem as well? Or would you argue that this is not monetary inflation?

Mr. LEHRMAN. I would argue it would not be monetary inflation. The difference is profound. The purchase of commercial bills for the purpose of production by the Federal Reserve or by commercial banks against the issue of new money goes to solvent firms who, in the process of production, then sell their output and they repay the loans.

And as a result, the new credit which has been advanced against the commercial bill or against the productive loan expands the money supply during that particular market interval. But 90 days later or 120 days later, the goods that were produced as a result of that financing realize their value and then those loans are liquidated, restoring equilibrium to the money market.

Chairman PAUL. So do you separate this from being the lender of last resort? Or would you put it in that category?

Mr. LEHRMAN. I use the phrase "lender of last resort" because that is, of course, the rationalization that everybody uses to give the Fed the privileges to create money without limit. As the lender of last resort, the Fed would have the possibilities of buying solvent commercial loans in the open market, which themselves would be liquidated in a windup naturally in the course of economic activity.

Whereas, in the case of the Treasury, the Treasury is never able, under present circumstances, and has not been since pretty much the end of the Second World War, to liquidate the bills or the bonds which they are selling. And it leads to a permanent expansion of the money supply never to be unwound by the natural course of production.

Chairman PAUL. Would doing this interfere with interest rates?

Mr. LEHRMAN. In the case of commercial bills or productive loans, which the Fed would then discount when they were offered by the commercial banks against the desire for new credit, this would, in the same sense, lead to a rise in interest rates when credit demands were higher, and a fall in interest rates when the commercial loans were being repaid to the commercial banks, and the commercial banks repaying the central bank for the loans that they obtained against commercial lending collateral.

Chairman PAUL. Okay. And our voting has started, but I would like to get Mr. Grant to make a comment on that, if he could.

Mr. GRANT. I would vote. I am with Lew.

Chairman PAUL. Pardon me?

Mr. GRANT. I said I would go vote; I am with Lew on this. I can't add to this or shouldn't take your time in adding to it.

Chairman PAUL. Okay. Mr. Huizenga from Michigan, would you like to ask some questions?

Mr. HUIZENGA. I would. Also, Mr. Chairman, I want to say thank you for your service to our country and your time here in Congress, as well as your service to the philosophy, the battle that we have going on.

And the question I have is, I am curious if we can touch on the dual mandate of the Fed and what you believe that may have done to get us in the current situation. And would you suggest us changing that dual mandate of having them pursue low inflation and high employment? And any time I have, I would like to give back to the Chair if he so desires to do a follow up.

Mr. GRANT. Congressman, I think that one might, again, go back to the founding concepts of the Fed. The Fed got into business, if you read the opening paragraphs of the Federal Reserve Act, the Fed was to create a market in commercial bills and to exchange paper for gold in such a way as to support the working of the gold standard.

And the phrase added was, "and for other purposes"—pregnantly, it was added. But I would keep the mandate even simpler than one. I would say that the Fed ought to be in business to support an objective definition of the value of the dollar.

In this day and age, we could not have anything resembling industrial commerce as we know it without the most precise specifications of material weights and measures. And somehow, we have neglected this in money.

Money is what someone thinks it should be in some particular public institution like a central bank or a Treasury Department. The lead article of the Financial Times this morning was a plaint by the finance minister of Brazil against quantitative easing on the grounds that the willful depreciation of the dollar—or I might say the willful redefinition of the dollar—would certainly lead to the interruption of trade and to frictions that did not exist previously.

The gentleman to my left has written a fabulous book on this, and I think it is his view as well that what is wanted is the restoration of objective value in the dollar. And if the Fed could do that and maintain it, it seems to me that good things would follow.

As it is, we have arrived at the most peculiar point in which people have come to think that if the Fed can raise up the value of stocks,

bonds, farmland and commodities, somehow prosperity will follow. It seems to me that is a very peculiar horse in front of a very odd cart.

Mr. HUIZENGA. I appreciate that.

And Mr. Chairman, I am happy to yield my time to you.

Chairman PAUL. I thank you.

I will recognize Mr. Luetkemeyer.

Mr. LUETKEMEYER. Thank you, Mr. Chairman.

Just very quickly, I only have a couple of questions.

Mr. Grant, what do you believe would be the ideal interest rate or the ideal range that the Fed should shoot for, that our rates should be for, say, our T-bills or Fed funds rates or home loans or somewhere in there? Use some of those figures.

Mr. GRANT. Sir, I think the Fed should not be shooting at those rates. I think that they should be determined in the marketplace. If you look back on history, kind of a normal mortgage rate was

4.5 to 5 percent; T-bill rate, maybe 3 to 4 percent; long-dated securities, yielding perhaps 6, 7 percent depending on the credit; and higher with regard to junk or speculative grade credits.

But I would let the wonderfully invisible forces of the marketplace into this line of work and let them do their thing—

Mr. LUETKEMEYER. Okay, if that is the case then, do you get rid of the Fed, or do you think there is a place for it?

Mr. GRANT. Sir?

Mr. LUETKEMEYER. Would you get rid of the Fed then or do you believe there is a place for it?

Mr. GRANT. I believe that the Fed ought to be doing much less than what it is doing, and it could do with many fewer economists. They could be doing with a much narrower mission statement and as long as we are talking about reforming this outfit, we should not fail to institute the Fed's first office of unintended consequences.

Mr. LUETKEMEYER. Mr. Lehrman, would you like to comment on that?

Do you believe we need to have a Fed or do you believe—

Mr. LEHRMAN. I have made the case in my book and in previous books that if we are going to have a Federal Reserve system—for it should be said it is not an indispensable necessity—but if we are going to have a mere agency of the Congress maybe with the stature, so to speak, of the Interstate Commerce Commission or the Federal Communication Commission, then it must be circumscribed by very careful rules, whereby it conducts its policy such that it is consistent with the activities of a free market and a free people.

So, that yes, I can embrace the Federal Reserve Act of 1913, and the very few moments in which it conducted itself according to Article I of the Constitution, Sections 8 and 10, namely, to define the value of the dollar, regulate the—

Mr. LUETKEMEYER. So you could live with it as long as it went back to its original intentions and functions?

Mr. LEHRMAN. I think we can go forward. We can't go backward, but I think we can go forward to a restoration of a Federal Reserve System which operates with some restraints imposed by Congress, the definition of the collateral, which is eligible at the Federal Reserve for discount against new money to encourage economic growth as opposed to encourage Treasury budget deficit.

Mr. LUETKEMEYER. Thank you.

Mr. Chairman, I yield back.

Chairman PAUL. Thank you.

I wanted to thank our Members who are here today, and our witnesses. And I appreciate very much you being here.

The Chair notes that some Members may have additional questions for this panel, which they may wish to submit in writing. Without objection, the hearing record will remain open for 30 days for Members to submit written questions to these witnesses and to place their responses in the record.

This hearing is now adjourned.

{Whereupon, at 10:36 a.m., the hearing was adjourned.}

STATEMENTS

STATEMENT FOR THE RECORD
HON. RON PAUL
REPRESENTATIVE, 14TH DISTRICT OF TX
CHAIRMAN, SUBCOMMITTEE ON
DOMESTIC MONETARY POLICY & TECHNOLOGY
U.S. HOUSE OF REPRESENTATIVES

One of the most enduring myths in the United States is that this country has a free market, when in fact nothing could be further from the truth. In reality, government has pervaded so many aspects of the market that what we see as a free market is merely the structural shell of formerly free institutions, while government pulls the strings behind the scenes. No better illustration of this can be found than in the Federal Reserve's manipulation of interest rates.

The Fed has interfered with the proper functioning of interest rates for decades, but perhaps never as boldly as it has in the past few years through its policies of quantitative easing. In Chairman Bernanke's most recent press conference he stated that the Fed wishes not only to drive down rates on Treasury debt, but also rates on mortgages, corporate bonds, and other important interest rates. Markets greeted this statement enthusiastically, as they realize that this means trillions more newly-created dollars flowing directly to Wall Street.

What almost no one realizes, however, is that interest rates are a price, the price of money. Like any other price, interest rates perform both a signaling and a coordination function. Interest rates coordinate the actions of savers and borrowers: higher interest rates attract savers, lower interest rates attract borrowers, and the market interest rate provides an equilibrium between saving and borrowing.

The interest rate also signals the availability of funds: lower interest rates signal an abundance of loanable funds, while high interest rates signal a paucity of funds. As interest rates rise, more people save and fewer people borrow; as interest rates fall, fewer people save and more people borrow. Lower interest rates also tend to favor longer-term, more capital-intensive projects. Projects which might not be profitable at eight percent interest rate may suddenly become profitable if the interest rate drops to three percent.

In order to lower the interest rate, more loanable funds must be available. But if individual saving habits remain unchanged, the only way to lower interest rates is to inject additional money or credit into the financial system. This new injection of credit, which has its origins not in savings but merely through a new bank balance sheet entry, results in a lowering of the rate of interest. The lower rate of interest signals the availability of additional loanable funds, which spurs additional borrowing. These borrowed funds are then put to use to fund capital projects. Additionally, as the interest rate lowers some savers may judge that their funds are now better off being used to fund present consumption, rather than continuing to be saved for future consumption.

Because the interest rate is the price of money, manipulation of interest rates has the same effect in the market for loanable funds as price controls have in markets for goods and services. Since demand for funds has increased, but the supply is not being increased by the market, the only way to match the shortfall is to continue to create new credit. But this process cannot continue indefinitely. At some point the capital projects funded by the new credit are completed. Houses must be sold, mines must begin to produce ore, factories must begin to operate and produce consumer goods.

But because consumption patterns have either remained unchanged or have become more present-oriented, by the time these new capital projects are finished and begin to produce, the producers find no market for their goods. Because the coordination between savings and consumption was severed through the artificial lowering of the interest rate, both savers and borrowers have been signaled into unsustainable patterns of economic activity. Resources that would have been used in productive endeavors under a regime of market-determined interest rates are instead shuttled into endeavors that only after the fact are determined to be unprofitable. In order to return to a functioning economy, those resources which have been malinvested need to be liquidated and shifted into sectors in which they can be put to productive use.

Another effect of the injections of credit into the system is that prices rise. Because credit functions as money, the effect of creating new credit is the same as printing new money. More money chasing the same amount of goods results in a rise in prices. And that rise in prices affects different groups of people in different ways. Wall Street always is the first to benefit from the new credit, because it is injected by the Fed directly into the financial system. From there it trickles down through the economy, but Wall Street and the banking system gain the use of the new credit before prices rise. Main Street, however, sees the prices rise before they are able to take advantage of the newly-created credit. The purchasing power of the dollar is eroded and the standard of living of the American people drops.

We live today not in a free market economic system but in a “mixed economy”, marked by an uneasy mixture of corporatism; vestiges of free market capitalism; and outright central planning in some sectors. The folly of central planning that should have been learned after the fall of the Soviet Union never took hold in Washington. Each infusion of credit by the Fed distorts the structure of the economy, damages the important role that interest rates play in the market, and erodes the purchasing power of the dollar. Markets see the interest rate and assume that the price is functioning as it should, when in fact it is being manipulated by a select few bureaucrats in Washington. Fed policymakers view themselves as wise gurus managing the economy, yet every action they take results in economic distortion and devastation.

The concept of the free market suffers as a result, since markets see a façade of market-determined prices as well as the reality of economic crisis. Wall Street makes out like bandits, while Main Street continues to suffer. The negative effects of manipulated interest rates are readily apparent in the economic malaise we are suffering now, but the real cause of this crisis, the Fed's centrally planned mismanagement, remains artfully concealed. Unless Congress gets serious about reining in the Federal Reserve and putting an end to its manipulation, the economic distortions the Fed has caused will not be liquidated; they will become more entrenched, keeping true economic recovery out of our grasp and sowing the seeds for future crisis.

WITNESS TESTIMONY

WRITTEN TESTIMONY OF JAMES GRANT FOUNDER & EDITOR GRANT'S INTEREST RATE OBSERVER

WHAT THE CHAIRMAN DIDN'T MENTION

An undramatic reading of 19 pages of double-spaced text lifted stocks, bonds, commodities and non-dollar monetary assets on the Friday before Labor Day. In a few short hours, the price of gold rallied by more than the \$35 per ounce at which it was officially valued between the mid-1930s and the early 1970s. The text, "Monetary Policy since the Onset of the Crisis," and the mind of the man who recited it, the chairman of the Federal Reserve Board, are the subjects at hand.

"Self-parody and self-plagiarism, neither intentional, are the bugbears of the aging author," wrote Whitney Balliett, the late, great jazz critic at *The New Yorker*. The readers of *Grant's* don't need to be told. The aging Ben Bernanke has been saying one thing, your aging editor another for a decade. We persist because he persists, and because monetary ideas have consequences. If we're right about the chairman's message, danger and opportunity are staring the holders of dollar-denominated assets right in the face. We write to try to sort out risk and reward.

It's old news, though worth repeating for emphasis, that the Jackson Hole, Wyo., address broadly hinted at a further radical monetary stroke. "The stagnation of the labor market in particular is a grave concern," warned Bernanke, "not only because of the enormous suffering and waste of human talent it entails, but also because persistently high levels of unemployment will wreak structural damage on our economy that could last for many years.

Over the past five years, the Federal Reserve has acted to support economic growth and foster job creation, and it is important to achieve further progress, particularly in the labor market. Taking due account of the uncertainties and limits of its policy tools, the Federal Reserve will provide additional policy accommodation as needed to promote a stronger economic recovery and sustained improvement in labor market conditions in a context of price stability.”

For a trade, the market seized on the phrase, “will provide additional policy accommodation as needed.” For an investment, it may profitably consider the more important and revealing words, “[t]aking due account of the uncertainties and limits of its policy tools.” It makes all the difference that the chairman does not, in fact, take due account of the “uncertainties and limits” of his “policy tools.” He may pay them lip service, as he did in his speech. But he does not really weigh the costs and benefits of doing what no other American central banker has done before. With Bernanke, as with Adm. David Farragut, it’s “[d]amn the torpedoes, full speed ahead,” though Farragut’s aggression, unlike Bernanke’s, got quick and quantifiable results.

Shining through the chairman’s text is the conviction that economic problems are susceptible to a monetary solution. For every monetary-policy action, Bernanke all but said out loud, there is a

predictable reaction. That is, for policy A, you may bet your boots on outcome B. For ourselves, we have come to believe—the past five years have decided us on the question—that while policy A may deliver outcome B, it may alternatively serve up outcomes J or Q or Z—or, not inconceivably, some other result too strange to be classified under a known English letter. Especially are surprises in store for the makers of “nontraditional” policy—and for the millions on the receiving end of those inventions.

Bernanke makes no bones that he is improvising. “Large scale asset purchases,” a.k.a. QE, and the “maturity extension program,” a.k.a. Operation Twist, are, if not absolutely novel in concept, then unprecedented in scale. “[W]e were guided by some general principles and some insightful academic work but—with the important exception of the Japanese case—limited historical experience,” the chairman admitted. “As a result, central bankers in the United States, and those in other advanced economies facing similar problems, have been in the process of learning by doing.”

All of us learn by doing. To learn how to ride a bicycle, we pedal. But money has been circulating for millennia, and there is a voluminous monetary record. It is there to be read. Did the chairman or his staff consult the wisdom of the ages before deciding to muscle around the yield curve, manipulate asset values, materialize dollars by the hundreds of billions and, in general, to short-circuit the price mechanism? Not on the evidence of the four-and-a-half-page

bibliography appended to the Bernanke text. To judge by this reading list, the chairman consulted no authority published before 1965. He cites relatively few sources published before the onset of the 2007 financial cave-in. His favorite authors are his employees at the Federal Reserve Board.

Perhaps not surprisingly, Bernanke and his authorities are in broad agreement on the post-2007 policy record of U.S. monetary policy. It is swell, they conclude. “After nearly four years of experience with large-scale asset purchases,” said Bernanke, “a substantial body of empirical work on their effects has emerged. Generally, this research finds that the Federal Reserve’s large-scale purchases have significantly lowered long-term Treasury yields.”

And not only Treasury yields, he goes on. QE has tamped down mortgage rates and corporate bond yields and firmed up stock prices: “it is probably not a coincidence that the sustained recovery of U.S. equity prices began in March 2009, shortly after the [Federal Open Market Committee’s] decision to greatly expand securities purchases. This effect is potentially important because stock values affect both consumption and investment decisions.”

So you didn’t build that, Mr. Market. The Federal Reserve got the rally rolling—and much to the advantage of the macroeconomic situation, too, Bernanke judged. Granted, the chairman told his audience, there’s no telling how the economy might have fared in the absence of these improvised measures. But, “if we are willing to take as a working assumption that the effects of easier financial conditions on the economy are similar to those observed historically, then econometric models can be used to estimate the effects of [QE] on the economy.” The Fed’s own models rate the Fed’s monetary policy a winner, the chairman again noted: “as of 2012, the first two rounds of LSAPs may have raised the level of output by almost 3% and increased private payroll employment by more than two million jobs, relative to what otherwise would have occurred.”

Striking the pose of a disinterested scholar, the chairman next sought to persuade his listeners that he had considered the risks, not just the rewards, of monetary experimentation. He mentioned four potential pitfalls, of which the first was the risk that the Fed’s interventions might impair the “functioning” of the securities markets. Second was the chance that QE might frighten the uninitiated into doubting the Fed’s ability to normalize policy without seeding a new inflation. Third was the risk to “financial stability” presented by the temptation to reach for yield in these times of pygmy interest rates. Fourth was the possibility that the Fed might

suffer a mark-to-market loss “should interest rates rise to an unexpected extent” (a slightly disingenuous point given the 2011 accounting change that shifts the burden of absorbing financial losses away from the Fed and onto the Treasury; on this little-reported innovation, so handy for an activist and leveraged central bank, the chairman was silent). All these risks the chairman discounted.

Omissions from the Bernanke checklist of unintended consequences and undesirable side effects, though they received no press, deserve the attention of every investor. He said nothing about the distortions wrought by the so-called zero-percent interest rate policy on the allocation of capital or on the analysis of investment value. Neither did he acknowledge how the whisking away of interest income has punished savers and nudged them into unsuitable risk taking. Though quick to claim credit for the decline in mortgage rates or the rise in stock prices, Bernanke was characteristically mute on the Fed's contribution to resurgent prices of commodities and farmland. We commend to the chairman the cover story in the August 18 issue of *The Spectator*, published in London. “Hunger strikes,” says the headline: “Rising food prices will mean more revolutions.”

With a lot more time and a little more candor, Bernanke could have held forth for hours in this vein. The crisis-era money market alone could have afforded him all the material he needed. Zero-percent interest rates and blanket FDIC guarantees of bank deposits have reconfigured what used to be a market in short-dated IOUs of the private sector. Today's money market is increasingly a market of short-dated IOUs of the public sector.

Before the rains came in 2007, money market mutual funds earmarked just 6.2% of their assets for Treasury securities, agency obligations and repurchase obligations collateralized by the same. As of last report in July, according to an Aug. 29 bulletin from Fitch Ratings, such holdings weighed in at 34.2% of money-fund assets. Midway in 2007, \$2.2 trillion of commercial paper—unsecured corporate promissory notes—was outstanding. Less than half of that amount is outstanding today. As Bernanke did not get around to saying in Jackson Hole, zero-percent money market interest rates obviate the value of credit analysis. When a given claim yields nothing, the prudent investor will roll Treasury bills or—functionally the same thing—lay up deposits at a too-big-to-fail bank.

Zero-percent interest rates may impart no credit information, but that doesn't mean they're inexpressive. “Be afraid, Mr. or Ms. Investor, because the government is afraid,” is the subliminal message. It's a suggestion that the post-crisis regulatory regime

powerfully reinforces. The 2010 amendments to Rule 2a-7 of the Investment Company Act of 1940, for instance, slap tough new liquidity tests on money market mutual funds. They require that 10% of the assets of a taxable fund be held in cash, U.S. Treasuries or securities that convert to cash the next business day. And they require that 30% of the assets of a taxable fund be placed in securities that mature within 60 days or that convert to cash within five days. Pre-crisis, the money-fund managements decided such matters for themselves.

Post-crisis, the government has its knives out, and the new rules push the funds into the least remunerative spots on the nearly barren money market credit and liquidity curves. Thus, the smaller funds face starvation, the biggest funds malnutrition. Nancy Prior, president of Fidelity's Money Market Group, the nation's largest, told readers of the June issue of *Money Fund Intelligence* that "we monitor every single dollar, every hour," and that there are no fewer than 80 Fidelity money market credit analysts on the case, some of whom "can hop on a plane or a train and be in Germany, Brussels or France in an hour." It is, however, travel, overhead expense and man-hours expended in the service of delivering a .01% return, pretax, to the investors in Fidelity Cash Reserves.

That ultra-low interest rates tend to beget even lower—and more dysfunctional—rates is another side effect of zero-percent rate policy that the chairman didn't get around to mentioning. He could have cited the example of the European Central Bank, which in July shaved the rate it pays on bank deposits to zero percent from 25 basis points. By this adjustment, Mario Draghi, president of the ECB, presumably expected to drive money out of his vaults and into the receding European economy. But the funds have stayed put while other yields have actually turned negative. It stands to reason that repurchase rates on the highest quality collateral would be quoted at less than zero if that collateral itself—short-dated notes issued by the governments of Germany, Denmark and Switzerland, for instance—yields zero percent or less. As optimism has a life of its own, so does pessimism, and the central bankers are having a hard time cheering up the glum and broken-spirited. Maybe they're pushing the wrong nostrums.

In June 2011, Jamie Dimon asked a question of Bernanke at a banking conference in Atlanta. The CEO of JPMorgan Chase & Co. asked the chairman of the Federal Reserve if it weren't possible that the sum total of the monetary and regulatory reforms undertaken since 2007 was thwarting financial and economic recovery rather

than advancing it. "Has anyone bothered to study the cumulative effect of all these things?" Dimon posed.

Bernanke replied that he, for one, was gratified by how thoroughly the government had scoured the system. As to Dimon's question, he answered that no one had attempted to study the cumulative effect of so much rule and policy making and that, in truth, "it's just too complicated, we don't really have the quantitative tools to do that." And the chairman had a most revealing afterthought. He had a "pet peeve," he said, about people insisting that "the single cause of the crisis was 'x.' There was not a single cause of the crisis," Bernanke went on. "There were many, many different causes, and they interacted in a way that was in many ways unpredictable, and led to the disaster that we experienced."

So, after all, the chairman was prepared to concede that outcomes are unpredictable, that financial systems are complex and that policies implemented for one purpose can wind up serving another. Yet the very same Bernanke, speaking at Jackson Hole, talked up the new federal crisis-prevention bureau, the Financial Stability Oversight Council, as if it had powers of divination never before available to the federal bureaucracy. "We have seen little evidence thus far of unsafe buildups of risk or leverage," he said, "but we will continue both our careful oversight and the implementation of financial regulatory reforms aimed at reducing systemic risk."

Market economies excel at identifying and repricing error. Regimented economies, in contrast, are ill suited to making mid-course corrections, as the only thing the Dear Leader despises more than error is the messenger who tells him about it.

America's Dear Leaders are the functionaries who, with the best of intentions, are busily substituting bureaucracy for the price mechanism. Nowadays, when things go pear-shaped, Chairman Bernanke is front and center with broad hints to print enough money or suppress enough prices or inflate enough assets to make us forget our troubles. Don't worry that QE or Twist or ZIRP will end in inflationary tears, Bernanke said at Jackson Hole: "The FOMC has spent considerable effort planning and testing our exit strategy and will act decisively to execute it at the appropriate time."

But, of course, Mr. Market doesn't hand out wristwatches. It isn't the Fed's efforts or good intentions one doubts, but its judgment. As for our judgment, as fallible as anyone's, we expect that our drugged bond markets will give no helpful signal that the central banks of the world have over-cranked the printing presses. The radical monetary experiments of 2012 will strike posterity as the most obvious setup to

a virulent inflation there ever was, except that our monetary mandarins had no clue it was happening.

In 1921, O.M.W. Sprague, author of “History of Crises under the National Banking System,” contributed an essay on the Federal Reserve, then just seven years young, to *The American Economic Review*. In it, Sprague, a Harvard professor, warned against the temptation to print one’s way out of cyclical trouble. The Fed had hugely expanded the nation’s money and credit to help the Treasury finance America’s participation in World War I. There had been a rip-roaring inflation. And now came the time to undo the inflationary damage. What, if anything, could the new central bank do to smooth the process of adjustment?

“If we insist upon using such power as a means of temporary relief and stimulation,” wrote Sprague, “ultimate disaster is the certain consequence. Past experience shows that it is dangerous for governments to issue paper money. There is a constant temptation to overissue when confronted by real or imaginary emergencies. The same danger arises in the case of the [R]eserve system—that public opinion and perhaps legislative action will compel the employment of its resources in a vain endeavor to cure evils which are mainly due to credit already granted in excess.”

Now comes Chairman Bernanke, a Harvard man himself, doing exactly what Sprague warned against, and with the support of the 21st-century economics establishment. We are betting on a new inflation with a flight of investable funds from the assets that are today deemed safe (notably, sovereign debt) to assets deemed infra dig or permanently impaired (for instance, precious metals and equities—at least until interest rates push significantly higher). Anyway, central banking is a short sale.

WRITTEN TESTIMONY OF
LEWIS E. LEHRMAN
SENIOR PARTNER
L.E. LEHRMAN AND COMPANY

I. Preface: The Problem of Federal Reserve Manipulation of Interest Rates: What is the Solution?

The Federal Reserve System has in fact manipulated interest rates since the first year of Federal Reserve operations in 1914. Professor Allan Meltzer's magisterial, three-volume history of the Fed is the definitive witness to unrestrained Federal Reserve credit operations and their consequences. The problems created by Fed interest rate manipulation are very similar to the problems of government wage and price controls.

During the 1920s the Federal Reserve collaborated with the Bank of England in suppressing interest rates, leading to the worldwide stock market boom and 1929 crash. Excessive Fed credit expansion and interest rate manipulation between 1996 and 1999 led to the wild tech-stock market boom during those years, and the subsequent collapse of the stock market between 2000 and 2002. The Fed suppression of interest rates between 2002 and 2005 led to the stock market, commodity, and real estate boom during those years; then the rise of interest rates, engineered by the Fed, causing an inverted yield curve; followed by the financial and economic collapse of 2008.

The extravagant and unprecedented Fed credit policy of Quantitative Easing, now intensified by QEIII announced Thursday, September 13, is one more extraordinary experiment in central bank interest rate and credit manipulation (money printing). These episodes of interest rate suppression and excessive Fed credit expansion -- with effects similar to wage and price controls -- have well-studied precedents in earlier economic and financial history. For example, the effects of the President Nixon-Arthur Burns (chairman of the Fed) credit expansion (1970-1973); and their wage and price controls of 1972 led to the collapse of financial markets in 1973 and 1974, and the worst economic decade in American history since the Great Depression. Indeed, during the late 1970s, the highest interest rates and inflation in American history were the ultimate result of previous Federal Reserve credit expansion, and government wage and price controls. The effects of substantial Fed interest rate suppression and credit expansion have, in the end, led to inflation of food prices -- or oil, or natural resources, or real estate, or equities; or in the 1970s consumer price inflation -- followed by a fall.

The most important economic and monetary issue before the Congress is how, through institutional reform of the Fed and the monetary system, to solve this Fed-created monetary problem of cyclical booms and busts -- largely the results of unrestrained Fed interest rate manipulation and quantitative easing (money printing).

In my oral testimony and statement, I shall briefly focus on the problems caused by Federal Reserve interest rate manipulation and quantitative easing -- moreso on the solution to the problem.

Herewith, in my longer, written testimony, I shall concentrate on a detailed solution to the problem.

II. Oral Statement for the Record

Mr. Chairman:

James Grant has described the consequences of Federal Reserve quantitative easing and interest rate suppression and manipulation. From Mr. Grant's analysis, one concludes that the Fed's unlimited power to purchase Treasury debt and financial market securities not only funds the Treasury deficit with newly printed money; but the Fed's market intervention process also makes of the financial class, with special access to the Fed, privileged investors and speculators. A well-connected financial class, subsidized by the Federal Reserve, is a crucial cause of increasing inequality of wealth in America. In this regard, I cite only one fact for the Monetary Subcommittee to contemplate: -- Since the termination of dollar convertibility to gold in 1971, the financial sector has doubled in size as a share of the American economy; but the manufacturing sector has been cut in half.

In 2002 Mr. Bernanke described the Fed's extraordinary power to create new money and credit in our present financial regime of inconvertible paper money and inconvertible bank deposit money. I quote Bernanke:-

"Under a fiat (that is, paper) money system, a government (in practice, the central bank in cooperation with other agencies) should always be able to generate increased nominal spending and inflation, even when the short-term nominal interest rate is at zero. The

U.S. government has a technology, called a printing press (or, today, its electronic equivalent), that allows it to produce as many U.S. dollars as it wishes at essentially no cost."

In effect, as James Grant wrote, the Fed is not only the American

central bank but, with this exalted power to print money, the Fed is now the government's central planner.

During the Volcker years from 1979 to 1987, Fed interest manipulation was justified as the means to end inflation. By 1994, employment as a Fed target had all but disappeared from the minutes of Fed meetings. Now in 2012, despite inflation being again on the rise, employment is, as a practical matter, the sole target of quantitative easing. The Fed and its apologists in the media and the academy, justify Quantitative Easing and its unlimited scope and duration, as the way to restore economic growth -- surely an extraconstitutional form of fiscal spending through Federal Reserve capital allocation. But so soon as one examines the Fed balance sheet, which few politicians do, one sees that the Fed primarily buys Treasury securities and mortgage-backed securities, in effect a subsidy by which to finance the government deficit and to refinance bank balance sheets, that is to say, the promotion of more financial and consumption-sector growth.

The problem of the American economy is neither underconsumption, nor underbanking. The problem is the lack of rapidly growing investment in domestic production and manufacturing. Investment is the necessary means by which to enable our producers to lead in both domestic and global markets. Rapidly increasing investment and production growth begets employment growth, and with it, healthy, unsubsidized consumption growth.

It is a truth of economic theory and practice that rising personal and family real income grow from increasing per capita investment in innovative businesses, new plant, and equipment. So, the question is: in reforming the Fed, how can our runaway central bank be harnessed by the financial markets to target the goal of economic growth through increased productive investment, not the promotion of consumption and Treasury deficit funding by means of quantitative easing? The answer is transparent: - the Congress of the United States has the exclusive constitutional power (under Article I, Sections 8 and 10) not only to establish the definition of the dollar; but Congress also has the power to define by statute the eligible collateral that the Federal Reserve may buy and hold against the issue of new money and credit. Thus, a simple congressional statute - - defining sound commercial loans as the primary eligible collateral for discounts and new credit from the Fed -- would have two primary effects.

First, it should rule out Fed purchases of Treasuries, thus

requiring the government to finance its deficits not with newly printed Fed money, but instead in the open market away from the banks. Second, the Fed would then become a growth-oriented central bank by which to finance productive business loans, encouraging thereby the commercial banks, themselves, to make loans to businesses in order to sustain economic and employment growth. Commercial banks would focus on production and commercial loans because solvent business loans could then be used by commercial banks as the primary eligible collateral by which to secure credit from the Fed as the lender of last resort. In a word, Treasury subsidies at the Fed should be replaced by productive business loans oriented toward economic and employment growth.

Mr. Chairman, this simple, proposed reform of the Fed was the very monetary policy insisted upon by Carter Glass, a leading Democrat, who was the chief sponsor of the Federal Reserve Act of 1913. The congressional legislative leaders who created the Federal Reserve Act of 1913 designed the Fed to enable steady commercial investment and employment growth. The Federal Reserve Act was also designed explicitly to uphold and maintain a dollar convertible to gold in order to maintain a reasonably stable, general price level. Such a Fed reform today, consistent with the original Federal Reserve Act, would require no further legislative mandate to sustain employment growth and to rule out systemic inflation and deflation.

Today, the Fed reiterates at every meeting that the central bank must manage interest rates to fulfill a congressional mandate to maintain reasonable price stability and reasonably full employment. The best way to do this is remobilize the express intent and techniques of the original Federal Reserve Act, namely the statutory requirement that the Fed uphold the classical gold standard; and, as was intended by the original Federal Reserve Act, to substitute commercial market credit for Treasury debt as the primary eligible collateral for bank loans from the lender of last resort, the Federal Reserve System.

May I say, with respect Mr. Chairman, Congress has defaulted to the Federal Reserve System, its sole constitutional authority to regulate the value of the dollar and to define the vital economic use of eligible collateral to obtain productive business credit from the Federal Reserve System.

It does not have to be this way.

III. A Road to Prosperity: The Case for a Modernized Gold Standard

Gold, a fundamental, metallic element of the earth's constitution, exhibits unique properties that enabled it, during two millennia of market testing, to emerge as a universally accepted store of value and medium of exchange, not least because it could sustain purchasing power over the long run against a standard assortment of goods and services. Rarely considered in monetary debates, these natural properties of gold caused it to prevail as a stable monetary standard, the most marketable means by which trading peoples worldwide could make trustworthy direct and indirect exchanges for all other articles of wealth.

The preference of tribal cultures, as well as ancient and modern civilizations, to use gold as money was no mere accident of history. Nor has this natural, historical, and global preference for gold as a store of value and standard of measure been easily purged by academic theory and government fiat.

Gold, by its intrinsic nature, is durable, homogenous, fungible, imperishable, indestructible, and malleable. It has a relatively low melting point, facilitating coined money. It is portable and can be readily transported from place to place. Gold money can be safely stored at very low cost, and then exchanged for monetary certificates, bank deposits, and notes -- convertible bills of exchange that efficiently extended the gold standard worldwide.

Like paper money, gold is almost infinitely divisible into smaller denominations. But paper money has a marginal production cost near zero. Producing gold money, like other articles of wealth, requires real labor and capital.

This investment of real labor and capital gives gold an objectively grounded value on which to base proportional exchanges -- a value that can be compared to that invested in producing a unit of any product or service. Prices for goods and services always vary with subjective preferences. But the real costs of production persist as an underlying market-price regulator. Despite subjective preferences, a mutual exchange of real money -- a gold monetary unit -- for a good or service is a transparent, proportional, equitable exchange, grounded by real costs of production, namely labor, capital, and natural resources.

In contrast, almost no marginal labor or capital is required to produce an additional unit of paper money. Thus, legal tender paper money is subject only to quantitative control and the discretion of political authorities. Historical evidence shows that inconvertible

paper money is overproduced, tending always toward depreciation and inflation, interrupted by bouts of austerity and deflation. Over the long run, government-forced and spurious paper money has not maintained equitable exchanges between labor and capital. Market exchanges based on depreciating paper money and floating paper currencies issued through the banking system always lead to speculative privilege of insiders, generally the financial class.

Because of its imperishability and density of value per weight unit, gold can be held and stored (saved) permanently at incidental carrying costs. Precious metal monetary tokens (gold and silver) survived millennia of experiments with inferior alternatives such as shells, grains, cattle, tobacco, base metals, and many others. These alternatives are consumable, perishable, bulky, or of insufficient value for large-scale commercial exchange over long distances. For example, perishables like wheat or cattle are not storable for long periods at very low cost; nor are they portable cheaply over long distances to exchange for other goods; nor are they useful and efficient to settle short- and long-term debts promptly.

Through a process of long-term economic evolution in tribal, interregional, and national trading markets, gold's natural properties were discovered and utilized in almost all cultures. Gold thus became universally marketable and acceptable as the optimum long-term store of value, uniform standard of commercial measure, and durable medium of exchange. Universal marketability and acceptability is a hallmark of global money. Silver, with its much lower value per unit of weight, was the suboptimal monetary metal of modern civilization, exhibiting many but not all of the properties required for large-scale international exchange.

Merchants, bankers, farmers, and laborers may not have consciously considered these facts, but over the long run, they behaved as if they did. Thus gold became an unimpeachable, universally accepted currency, to be held as reserves and passed on as a reliable store of future purchasing power. People, even hostile nations, freely accepted gold, a non-national currency, from one another in exchange for other goods, even as they rejected the sovereign risk of holding national currencies as their exclusive reserves. All who cherished the value of their saved labor -- pensioners, working people, those on fixed incomes -- came to rely on the gold monetary standard as a stable, long-term proxy for goods and services to be purchased later, perhaps much later.

Today's global stock of aboveground gold in all its forms is approximately 5 to 6 billion ounces, perhaps more -- close to one

ounce per capita of the world population. Because of gold's lasting value from time immemorial, and the human incentive to conserve all scarce resources, these 5 to 6 billion ounces represent most of the gold ever produced. Yet the aboveground gold stock today may be enclosed in a cube of approximately 70 feet on each side. Gold may be easily converted to substantial amounts of monetary coin to underwrite convertible paper money and bank deposits or convenient exchange in the market.

Moreover, the empirical data demonstrate that the stock of aboveground gold has grown for centuries in direct proportion to the growth of population and output per capita. The average, annual, long-run growth of the stock of gold in the modern world is approximately 1.5 percent. This remarkable fact accounts for the unique, long-run stability of its purchasing power. New output of gold money, joined to its rate of turnover, is sufficient for both economic growth and long-run stability of the general price level, as modest but regular output of gold does not affect the relative value of the large existing stock.

This hidden but crucial commercial equation of the social order was a fundamental reason why the true gold standard, i.e., gold-based money, became the foundation of the monetary institutions of modern civilization. Gold-based money not only stabilized the long-term price level, but its network effects also integrated and compounded the rapid growth of the advanced, competitive trading nations of the Western world during the Industrial Revolution. For the purpose of global trade, exchange and investment currencies convertible to the universally acceptable gold monetary standard had engirdled the earth by the beginning of the 20th century.

As the technology and productivity of the payments mechanism evolved, banknotes and checking account deposits (among other credit and transfer systems), came into modern circulation as substitutes for physical, monetary tokens. But these banknotes and checks derived and sustained their value from the fact that everyone knew they were credit instruments convertible to gold. Still, actual gold transfers were used to settle residual balance-of-payments deficits among nations, a necessary and efficient international adjustment mechanism by which to rebalance domestic and international trade and exchange.

Despite legal tender inconvertible paper money and the disabilities presently imposed on gold by the political authorities, gold retains the same inherent properties that make it the least imperfect monetary standard. Indeed, all inconvertible paper money systems,

based on contemporary fractional reserve banking, use the vestigial forms but not the substance of their original convertible currency systems.

In sum, gold is natural currency, not least because it provides in a single, indestructible substance the primary functions of money -- i.e. a standard unit of account, a stable medium of exchange, a stable store of value, and a stable deferred means of payment. By reason of these facts, the market guided the authorities over time to bestow on gold coin the status of an official monetary standard. Gold money was, moreover, endowed by nature with profound but simple national and international networking effects, the digital standard by which free prices could be communicated worldwide. Thus, the gold standard exhibited natural economies of global information scale, a necessary virtue in the present electronic age. The adoption of the gold standard by the major trading nations in the 19th century led to a radical reduction in the settlement costs of international trade and transactions, a crucial confidence and reliability factor stimulating an unparalleled boom in trade that was constantly and promptly rebalanced by residual deficit settlements in gold.

A Just Social Order and Economic Growth

To choose or to reject the true gold standard is to decide between two fundamental options: on the one hand, a free, just, stable, and objective monetary order; and on the other, manipulated, inconvertible paper money, the fundamental cause of a casino culture of speculation and crony capitalism, and the incipient financial anarchy and inequality it engenders.

Restoration of a dollar convertible to gold would rebuild a necessary financial incentive for real, long-term, economic growth by encouraging saving, investment, entrepreneurial innovation, and capital allocation in productive facilities. Thus would convertibility lead to rising employment and wages. Economic growth would be underwritten by a stable, long-term price level, reinforced domestically by a rule-based, commercial and central banking system subject to convertibility, and internationally by exchange rates mutually convertible to gold. Consider the past decade of hyper-managed paper currencies and manipulated floating exchange rates wherein American annual economic growth fell to an anemic 1.7 percent. Under the classical gold standard (1879–1914), U.S. economic growth averaged 3 to 4 percent annually, the equal of any period in American history.

Different growth rates are not mere accidents of history. The gold

dollar, or true gold standard, underwrites, among other things, just and lasting compensation and purchasing power for workers, savers, investors, and entrepreneurs. It prevents massive, recurring distortions in relative prices created by manipulated paper currencies and floating exchange rates, which misallocate scarce resources. It suppresses the incentives for pure financial speculation, everywhere encouraged under manipulated paper currencies and floating exchange rates. It rules out the “exorbitant privilege” and insupportable burden of official reserve currencies, such as the dollar and the euro. It limits and regulates, along with bankruptcy rules, the abuse of fractional reserve banking that is commonplace under inconvertible paper-money systems. It minimizes the enormous premium exacted by the banker and broker establishment in the purchase and sale of volatile foreign exchange.

Moreover, the lawfully defined gold content of a stable currency encourages long-term lending and investment, stimulating more reliance on equity, less on leverage and debt. With currencies convertible to gold, long-term lenders receive in turn, say after 30 years, similar purchasing power compared to the capital or credit they surrendered to the borrowers. (Convertibility thus encourages stable long-run domestic and international growth, not the austerity engendered by deficits.)

A dollar legally convertible to gold, reinforced by effective bankruptcy law, sustains economic justice, regulating and disciplining speculative capital, and restraining political and banking authorities such that they cannot lawfully depreciate the present value or the long-term purchasing power of lagging dollar wages, savings, pensions, and fixed incomes. Nor under the sustained, legal restraint of convertibility can governments ignite major, long-run, credit and paper money inflations with their subsequent debt deflations. Under the gold standard, the penalty for excessive corporate and banking leverage is insolvency and bankruptcy. As the profits belong to the owners, so should the losses. Bankruptcy of insolvent firms shields the taxpayer from the burden of government bailouts. Under the rule-based gold standard in a free-market order, managers, stockholders, and bondholders must bear the responsibility for insolvency.

A stable dollar, convertible to gold, leads to increased saving not only from income, but also from dishoarding, a fact often neglected by economists. Disharding means releasing a vast reservoir of savings previously held in hedges such as commodities, antiques, art, jewelry, farmland, or other items purchased to protect against the ravages of

inflation. These trillions of savings, imprisoned in hedging vehicles by uncertainty and inflation, are induced out of hedges, and the capital is then supplied in the market to entrepreneurs, business managers, and households who would create new income-generating investment in production facilities, thereby leading to increased employment and productivity. On the other hand, central bank subsidies to government and subsidized consumption, both enabled by inconvertible paper and credit money, lead -- through deficit financing, transfer payments, paper money fiscal and monetary stimulation -- to disinvestment, debt financing, speculative privilege, and growing inequality of wealth.

It is rarely considered by conventional academic opinion that the long-term stability of a rule-based currency convertible to gold brings about a major mutation in human behavior. In a free market every able-bodied person and firm must first make a supply before making a demand. This principle effectively alters human conduct. It encourages production before consumption, balances supply and demand, rules out inflation, maintains balanced international trade, and upholds the framework for economic growth and stable money. In a free market and its banking system, grounded by the rule of convertibility to gold, new money and credit may be prudently issued only against new production or additional supply for the market, thus maintaining equilibrium between total demand and total supply. Inflation is thereby ruled out. Moreover, worldwide hoarding of real assets, caused by government overissue of paper money, would come to an end.

The irony of the gold standard and currency convertibility is that it ends speculation in gold. It restores the incentive to use and hold convenient, convertible paper currency and other gold-convertible cash balances. Thus can the road to economic growth, rising real wages, and growing employment be rebuilt on the durable foundation of a free monetary order -- that is, money free from government manipulation.

Rebalancing the Global Economy

The overall balance-of-payments of a country, or a currency area, is in deficit when more money is paid abroad than received; a surplus occurs when more money is received than paid abroad. The United States, because of the dollar's role as the reserve currency of the world, has experienced an overall balance-of-payments deficit most of the past half-century and, over that full period, systemic inflation.

Under both the Bretton Woods agreement (1944–71) and the

subsequent floating, dollar-based, global reserve currency system, the U.S. budget and balance-of-payments deficits have been financed substantially by U.S. government trust funds, the Federal Reserve, and foreign purchases of dollars abroad. Since 2008, these deficits have been accompanied by unprecedented quantitative easing, a euphemism for large-scale central bank money and credit creation (or “money printing”). By this means the Fed finances not only the government budget and balance-of-payments deficits, but also overleveraged banks, insolvent debtors, and other wards of the state. The issue of new money by the central bank unaccompanied by the production of new goods and services leads ultimately to inflation because total demand in the market will exceed total supply.

With the dollar as the reserve currency, the U.S. balance-of-payments deficit causes Fed-created dollars to rush abroad, directed there by relative price differences. In foreign countries, many of these excess dollars are monetized by foreign authorities and held as official foreign exchange reserves. But these reserves are not inert. They do not lie around in bank vaults. They are in fact reinvested in the U.S. dollar market -- especially in U.S. government securities sold to finance the federal budget deficit. In effect, the United States exports its debt securities, thus receiving back the dollars it created and used to settle its balance-of-payments deficits abroad. Everything goes on as if the deficits didn't exist. No adjustment is required of the United States to settle its debts, or to rebalance the deficits with surpluses. Thus again, total demand is enabled to exceed total supply. In a word, the world dollar standard enables America to buy without really paying, a fundamental cause of inflation. But when the Federal Reserve slows or ends quantitative easing, or money printing, total monetary demand declines and deflation threatens.

Rebalancing world trade is impossible under an official reserve currency system. (The International Monetary Fund and the central banks are pathetic shadows of “all the king's men” trying to put Humpty Dumpty -- that is, global rebalancing -- back together again.) This perverse international monetary system, whereby the reserve currency country issues its own money to finance and refinance its increasing deficits and debts, augments global purchasing power and potential worldwide inflation, because the newly issued central bank money is not associated with newly produced goods and services. Total demand has been divorced from supply. When total demand exceeds total supply, inflation usually occurs first in marketable, scarce commodities, equities, and inflation hedges (2009–2012); other

more general price level effects may be deferred because of unemployed labor and other unutilized resources in excess supply. But ultimately, the general price level will rise as the economy approaches full employment. (The worldwide panic demand for the dollar over the past two years, during the European crisis, has mitigated the general price level effect of quantitative easing. The desire to hold the dollar in cash equivalents rather than to spend or invest it defers inflation.)

Under the rule-based gold standard, the regular settlement of balance-of-payments deficits eliminates a root cause of global imbalances, re-establishing equilibrium among trading nations. Under the true gold standard, residual payments deficits could no longer be settled in newly issued national paper and credit monies, such as the reserve currencies of the dollar or euro. Instead, these deficits would be settled with an impartial, non-national monetary standard: gold. The requirement to settle in gold rules out the exponential debt increases of flawed reserve currency systems. A famous example of this is the flawed gold-exchange-reserve currency system of the 1920s, the collapse of which turned a recession into the Great Depression. Another case is the financial bubble and its collapse during the past decade (2002–2012).

Moreover, it is very much in the American national interest to terminate the reserve currency role of the dollar. This role is an insupportable burden borne by the United States since the end of World War II (even since the great powers' Genoa agreement of 1922). The U.S. taxpayer should no longer go further into debt in order to supply the world with dollar reserves denominated in U.S. debt. Terminating this burdensome "privilege," combined with the restoration of dollar convertibility to gold, will gradually end the long era of extreme global trade imbalances, secular debt accumulation and inflation, and currency depreciation. Furthermore, because the reserves of monetary authorities will be held only in gold and domestic currency claims, the exchange-rate risk will be eliminated in all national banking systems.

The rule-based, true gold standard not only would end the official reserve currency role of the dollar, but also limit arbitrary Federal Reserve money issuance secured by spurious, defective, and illiquid collateral. Unstable mutations in the gold standard of the past -- including the failed reserve currency-based "gold-exchange" system of Bretton Woods and the collapse of its predecessor, the reserve currency-based "gold-exchange system" of the 1920s and 1930s -- must be ruled out. So, too, must floating exchange rates. For almost a

century, policymakers, politicians, historians, and economists have confused the flawed, interwar gold-exchange standard, based on official reserve currencies, with the true or classical gold standard. They have mistakenly blamed the Great Depression on the gold standard, instead of on the liquidation of the official reserve currencies underpinning the gold-exchange system established at Genoa in 1922, which, like Banquo's ghost, reappeared in 1944 in the form of the Bretton Woods system.

The Bretton Woods pegged exchange rate system, based on the official reserve currency role of the dollar, collapsed in 1971 because the United States had accumulated more short-term debt to foreigners than it was willing to redeem in gold. Its collapse ushered in the worst American economic decade since the 1930s. The unemployment rate in 1982 was higher even than the unemployment rate occasioned by the collapse of the Fed-induced real estate bubble of 2007–09. Similarly, the recession of 1929–30 became the Great Depression of the 1930s because of the collapse and liquidation of the interwar official reserve currency system, based as it was on the pound and the dollar. The liquidation of official sterling and dollar currency reserves deflated the world banking system: Without these foreign currency reserves the banks were forced to deleverage, call in loans, or go bankrupt. They did all three.

Since 1971, the floating exchange rate system, or the world dollar standard, has been even more perverse and crisis-prone than Bretton Woods and the Genoa interwar system. The dollar's role as the reserve currency has caused not only extreme inflation and the subsequent threat of deflation, but also industrial and manufacturing displacement in the United States. It has resulted in declining American competitiveness, one witness of which is the collapse of the international net investment position of the United States (essentially, U.S. assets held abroad, less foreign assets held in the United States). In 1980, the U.S. net international investment position was 10 percent of GDP. In 2010 it was negative 20 percent of GDP. The difference was equal to the increase of foreign-held official dollar reserves, arising from continuous U.S. balance-of payments deficits under the dollar-based official reserve currency system.

Under the present system, the perennial U.S. balance-of-payments deficit will, more often than not, continue to flood foreign financial systems and central banks with undesired dollars, followed by brief periods of dollar scarcity, the threat of deflation, and a cyclical rise of the dollar on foreign exchanges. Foreign authorities may continue to purchase excess dollars against the issue of new

domestic money. This duplicates potential purchasing power unassociated with the production of new goods, causing total demand to exceed total supply -- thus tending to sustain worldwide inflation, generally followed by recession and the threat of deflation. So-called sterilization techniques designed to neutralize central-bank money printing are not fully effective. Without monetary reform, the excess dollars purchased by foreign central banks, reinvested in U.S. government securities and other dollar debt, will continue to finance excess consumption and rising government spending in the United States.

Today inflation of the general price level (or CPI) proceeds gradually in the United States because of unemployed resources, combined with the panic demand worldwide to hold the dollar rather than spend it, or to repay debt with the money rather than to consume. At full employment, inflation will pick up. Because the reserve currency system generally leads to a rapid increase in global purchasing power, without a commensurate increase in the supply of goods and services, the systemic tendency of the reserve currency system is monetary expansion or inflation. Yet the process can work dangerously in reverse, causing deflation, especially when the Fed tightens, or there is panic out of foreign currencies into the dollar (the Asian crisis, 1996–2002, and the euro crisis, 2012). Illiquidity abroad can cause foreign official dollar reserves to be resold or liquidated in very large quantities, reducing the global monetary base, as occurred in 1929–33 and recently in 2007–09.

In the absence of government rules that favor inconvertible paper and credit money, the historical evidence shows that gold, or paper and credit money convertible to gold, was preferred and accepted in trade and exchange from time immemorial. Until recent times the gold standard also underwrote, indeed required, global trade rebalancing, now the subject of empty exhortations by the International Monetary Fund and political authorities. But to desire a goal without the effective means to attain it -- namely, the true gold standard -- is to court political and financial disaster. In the absence of prompt balance-of-payments settlements in gold, the undisciplined official reserve currency systems have immobilized the international adjustment mechanism. The result has been increasing trade imbalances, ever-rising debt, and credit leverage at home and abroad. Under the world dollar standard, other nations have gained desired dollar reserves only as the United States becomes an increasingly leveraged debtor through balance-of-payments deficits. Whereas under the gold standard, the global economy may actually attain

balance-of-payments surplus as a whole vis-à-vis worldwide gold producers.

Among its monetary virtues as the least imperfect monetary system of civilization, the true gold standard, without official reserve currencies, is the sole rule-based monetary order that reliably and systematically rebalances worldwide trade and exchange among all participating nations.

How to Get From Here to There

Step 1. The president announces unilateral resumption of the gold monetary standard on a date certain, not more than four years in the future. Unilateral resumption means that the U.S. dollar will be defined by law as a certain weight unit of gold. The Treasury, the Federal Reserve, and the entire banking system will be obligated to maintain the gold value of the dollar. On the date of resumption, Federal Reserve banknotes and U.S. dollar bank demand deposits will be redeemable in gold on demand at the statutory gold parity. Further use by foreign governments of the dollar as an official reserve currency will entail no legal recognition by the United States.

Step 2. The president issues an executive order eliminating all taxes imposed on the buying, selling, and circulating of gold. Another executive order provides for the issuance of Treasury bonds backed by a proportional weight of gold. Since Federal Reserve notes and bank deposits (money) are not taxed by any jurisdiction, the executive order specifies that gold, being legal tender, is to be used as money and thus to go untaxed. Gold can be used to settle all debts, public and private. The Treasury and authorized private mints will provide for the creation and wide circulation of legal tender gold coin in appropriate denominations, free of any and all taxation.

Step 3. Shortly after announcing the intent to go forward to a modernized gold standard, the United States calls for an international monetary conference of interested nations to provide for the deliberate wind-up of the dollar-based, official reserve currency system and the consolidation and refunding of foreign official dollar reserves. The international agreement to be negotiated will inaugurate the reformed international monetary system of multilateral convertibility of major countries' currencies to the gold monetary standard. Stable exchange rates would be the result. The value of each participating currency would be a function of its stipulated gold parity.

Step 4. The conference, attended by representatives of the Bank for International Settlements, International Monetary Fund, World

Trade Organization, and the World Bank, would establish gold as the means by which nations would settle residual balance-of-payments deficits. The agreement would designate gold, in place of reserve currencies, as the recognized international monetary reserve asset. Official foreign currency reserves, to a specified extent, would be consolidated and refunded.

Step 5. A multilateral, international gold standard -- the result of the conference convertibility Agreement -- would effectively terminate floating and pegged-undervalued exchange rates. The reformed monetary system without official reserve currencies, the true international gold standard, would establish and uphold stable exchange rates and free and fair trade, based upon the mutual convertibility to gold of major national currencies.

Now we are able to formulate an authentic, bipartisan program to restore 4 percent American economic growth over the long term. Tax rate reductions with an enlarged tax base, government spending restraint aimed at a balanced budget, simplification of business regulation designed to empower entrepreneurial innovation -- these reforms can be made effective for America and the world by a modernized gold standard and stable exchange rates. This is the very same platform which uplifted 13 impoverished colonies by the sea in 1789 to leadership of the world in little more than a century.

EXPERT COMMENTARY

ROBERT P. MURPHY, Ph.D.
COLUMNIST, ECONOMIST, AND
SENIOR FELLOW IN BUSINESS & ECONOMICS
PACIFIC RESEARCH INSTITUTE

THE FED AND BUSINESS CYCLE

Dr. Ron Paul has arguably done more than any other person to educate Americans on the perverse connection between the Federal Reserve and the business cycle. Dr. Paul's understanding is based on the explanation of business cycles set forth by Austrian economist Ludwig von Mises and elaborated most famously by Nobel laureate Friedrich Hayek.⁹⁹

I am an economist with a Ph.D. in economics from New York University, where I studied under the Austrian economists Israel Kirzner and Mario Rizzo. I taught economics (including courses specifically on Austrian economics) at Hillsdale College for three years, but I also have experience working in the financial sector. Further, I have written several study guides on the works of Mises and his disciple Murray Rothbard, for the Ludwig von Mises Institute.

In this essay I will explain (for the lay audience) the basics of Austrian business cycle theory in the context of the United States. I will then show how the theory can explain the Fed's role in the unsustainable housing bubble of the 2000s, and refer the reader to

⁹⁹ Mises originally laid out his "circulation credit theory of the trade cycle" in *The Theory of Money and Credit* (English translation of the title of the 1912 German work). A succinct exposition is contained in his 1949 English language magnum opus, *Human Action*. These two works are available in free PDF form at <http://mises.org/document/194/The-Theory-of-Money-and-Credit> and <http://mises.org/document/3250>.

other Austrians who explain the Fed's role in the stock market bubble of the 1920s. Thus the Fed was an accomplice in both the Great Depression and the Great Recession.

I. HOW THE FED “SETS” INTEREST RATES

When reporters say the Fed did such-and-such to “interest rates,” they are specifically referring to the Fed's target for the federal funds rate. The Federal Reserve itself is neither a borrower nor a lender in this market; the fed funds rate is the interest rate that banks charge *each other* for overnight loans of reserves. In our fractional reserve banking system, the Fed mandates that banks keep a certain amount of reserves (either cash in the vault or deposits with the Fed itself) in order to “back up” their total outstanding deposits. At any given time, so banks have more reserves than they need, while others have less. The banks with excess reserves can thus loan them to those with deficient reserves, and the (annualized) interest rate is the fed funds rate.

A further complication is that the Fed itself *does* lend reserves to banks, but it does this at the so-called discount window, and the relevant interest rate is the discount rate. In modern times the Fed has typically maintained a margin between the fed funds target and the discount rate, in order to encourage banks to borrow from each other, rather than coming hat in hand to the (more expensive) Fed. As the housing bubble collapsed the Fed slashed the discount rate and encouraged banks to borrow from it, in an effort to restore liquidity and calm to the credit markets.

It is clear enough how the Federal Reserve can set the discount rate—since the Fed is the one loaning these reserves, it can insist on any rate it wants. (Of course if the rate were too high it might not get any takers.) But how does the Fed influence the federal funds rate, if it doesn't directly participate in this market? Is the target enforced the way, say, the government in some areas controls apartment rents or minimum wages?

The process is much more complicated. To put it briefly: The Fed can control the quantity of reserves held by banks, and thus indirectly can control the price the banks charge each other for lending out reserves. If the Fed thinks banks are charging each other too much for reserves—in other words, if the actual fed funds rate is higher than the target—then the Fed will engage in an “open market operation,” buying assets such as U.S. Treasury bonds from banks. The Fed pays for these purchases by adding numbers to the accounts the selling banks have with the Fed.

This is the precise point of entry for the new money that the Fed creates out of thin air. To repeat: When the Fed buys (say) \$1 million in bonds from Bank XYZ, Bank XYZ surrenders ownership of the bonds but sees that its deposits of reserves at the Fed go up by \$1 million. But the Fed didn't transfer this money from some other account. No, it simply increased the electronic entry representing Bank XYZ's total reserves on deposit. There is no offsetting debit anywhere in the banking system. Bank XYZ now has \$1 million more in reserves, while no other bank has less. Bank XYZ is now free to go out and loan more reserves to other banks, or to make loans to its own customers. (In fact, due to the fractional reserve system, the bank legally could make up to \$10 million in new loans to customers.) The money supply has increased, putting upward pressure on prices measured in dollars.

But back to our original theme, the injection of reserves obviously increases their supply and thus (other things equal) pushes down the rate Bank XYZ will charge other banks who might want to borrow reserves from it. The open market operation has thus achieved the Fed's goal of pushing the actual fed funds rate down to the desired target. Of course, going the opposite way, if the actual fed funds rate were too low, the Fed would sell assets to the banks, thereby destroying some of the total reserves in the system.

II. AUSTRIAN BUSINESS CYCLE THEORY

According to Ludwig von Mises and his followers, the boom-bust cycle is *not* inherent in the free market, but is rather caused by the government's interference in the credit markets, specifically its manipulation of interest rates. The government causes the boom period when it injects new credit into the system (pushing down rates), and then the unsustainable, non-economic investment projects put into motion necessitate a bust at some future date. Interest rates serve a genuine economic function, effectively telling firms how "impatient" consumers are and therefore how long their projects can tie up scarce resources, waiting for the finished products or services to be delivered to the customer. By pushing rates down to artificial levels, the Fed can certainly "stimulate" the economy, but the boom is unsustainable because people have not saved and acquired the real resources to carry society through a longer production period.

The following chart [Figure 33] illustrates the Misesian explanation over a long stretch of postwar U.S. history.

Generally speaking, the chart indicates an inverse relationship between the two series. This accords with the commonsense view

Figure 33

that cutting interest rates provides a stimulus while hiking them is contractionary. However, what the Austrian approach provides is the understanding of the real forces behind the boom-bust cycle. In other words, most financial commentators think that today's interest rates inadequate capital structure to complete).

To put it another way, many commentators seem to believe that if the Fed held interest rates low indefinitely, then we'd never have high unemployment, just rampant price inflation. And yet, the collapse of the housing bubble shows that this is dead wrong. The Fed didn't cause the problems by "responsibly" hiking interest rates. No, rates had been steady at 5.25% for some time, and then the housing bubble burst and the mortgage market faltered, thus "forcing" the Fed to take action.

Looking back at the chart above, we can see why the Great Recession has been so severe. In (price) inflation-adjusted terms, the early-2000s levels of the actual fed funds rate is the lowest since the Carter years. And many readers may recall the severe recessions of 1980 and 1982 that followed that period.

Many students of Austrian economics (including Dr. Ron Paul and also the present writer) used the Mises-Hayek business cycle theory to predict that the housing and stock markets were in a bubble before this was common knowledge—certainly before Ben Bernanke acknowledged the dire situation. We believed that interest rates serve a vital function in a market economy, and that the Fed's artificial manipulation of them gives false signals to entrepreneurs to expand their operations and start unsustainable projects.

III. FURTHER EVIDENCE OF THE FED'S ROLE IN THE HOUSING BUBBLE

Many critics of the Austrian explanation argued that the Fed under Alan Greenspan had little to do with the housing bubble and bust. In this section I present some simple graphs to show that the Mises-Hayek theory fits the facts quite well.

Some apologists for Greenspan's Fed claim that nominal interest rates are misleading, because he had done such a good job containing price inflation expectations. Yet as the below graph indicates [Figure 34], even if we adjust the federal funds rate for the (forward-looking) actual annual rates of price inflation that occurred, rates were still remarkably low after the dot-com crash. One has to go back to the 1970s to see an "easier" monetary policy.

In addition to looking at interest rates, we can also add plots of money growth rates over time. The figure below [Figure 35] contrasts

Figure 34

Year/Year Monetary Base Growth Versus Federal Funds Target Rate, Monthly

Figure 35

the federal funds target rate with the annual growth rate in the monetary base (i.e. total bank reserves plus currency).

The figure above [Figure 35] seems to be the textbook illustration of how the Federal Reserve conducts its open market operations: When it cuts the federal funds target rate, it pumps reserves into the system, i.e. expands the monetary base. On the other hand, when the Fed raises interest rates, it slows the rate of monetary expansion. Except for the large blips due to the Y2K scare—when the Fed flooded the system with liquidity and then sucked it right back out—the early 2000s fit the pattern perfectly. That is, when Greenspan cut the target rate from January 2001 through June 2003, the monetary base grew rapidly. Eventually the base growth came back down to moderate territory, but that was when the Fed was ratcheting up interest rates, just as we would expect.

Indeed, to see just how inflationary the Fed's monetary policy was during the early 2000s, we can consult the next figure below [Figure 36]. This shows a longer plot, this time of annual growth rates in both the monetary base and M1 (i.e. monetary base plus demand deposits).

Studying this latest figure [Figure 36], it is hard to make sense of the claim that Greenspan exercised restraint in the early 2000s. When the Fed was (I allege) irresponsibly fueling the housing boom from 2000 to 2004, both the monetary base and M1 grew at annual rates that were comparable to the experience of the 1970s. (In addition to the Y2K blips up and down, there was also a sharp injection and pullback due to the September 11, 2001 attacks that make the black line bounce around.) Unless Greenspan apologists want to argue that the Fed conducted a tight policy throughout the 1970s, it seems their defense of the chairman falls apart.

Finally let's address the objection that the Greenspan Fed either had nothing to do with low mortgage rates, or that the mortgage rates couldn't be responsible for the housing bubble. The following chart [Figure 37] plots the 30-year conventional mortgage rate against year-over-year increases in the S&P/Case-Shiller Home Price Index.

Thirty-year mortgage rates plummeted from about 8.5% in mid-2000 to below 5.5% three years later. The connection certainly isn't robotic, but this period also saw a spike in monetary base growth (thus leading us to suspect Greenspan's influence, not just Asian savers as many allege) and the acceleration in the housing boom. On this last point, consider that mortgage rates dropped from about 7% down to about 5.5% from April 2002 to April 2003. Even with

Monetary Base and M1 Yr/Yr Growth Rates, Monthly

Figure 36

**Conventional 30-Year Mortgage Rates (Blue, Left) vs.
Year/Year Percentage Growth in Home Prices (Red, Right)
(monthly data)**

Figure 37

“perfectly rational” consumers—where people start with a desired monthly mortgage payment and then look at 30-year mortgage rates to figure out “how much house” they can buy—that would be expected to raise home prices about 17%. And lo and behold, over this same period the home price index rose about 14.5%.

IV. CONCLUSION

Dr. Ron Paul has been a tireless champion of sound money and education of the true nature of central banking. He understands that not only price inflation but the business cycle itself ultimately stems from government intervention into money and banking, two areas that were initially handled by the market. In this essay I have discussed the theoretical and empirical connection between the Fed and the housing bubble, while other Austrian economists have explained the Fed's role in the famous Crash of 1929 (and ensuing Great Depression).¹⁰⁰ If Americans wish to preserve the purchasing power of their money and escape from the recurring boom-bust cycle, they must heed Dr. Paul's advice and learn at least the principles of Austrian economics.

IMPROVING THE FEDERAL RESERVE SYSTEM: EXAMINING LEGISLATION TO REFORM THE FED AND OTHER ALTERNATIVES

Tuesday, May 8th, 2012

WITNESSES

- Brady, Hon. Kevin, a Representative in Congress from the State of Texas
- Frank, Hon. Barney, Ranking Member of the Financial Services Committee and a Representative in Congress from the State of Massachusetts
- Herberner, Jeffrey M., Ph.D., Professor of Economics and Chairman, Department of Economics, Grove City College
- Klein, Peter G., Ph.D., Associate Professor, Applied Social Sciences and Director, McQuinn Center for Entrepreneurial Leadership, University of Missouri
- Taylor, John B., Ph.D., Mary and Robert Raymond Professor of Economics, Stanford University and George P. Schultz Senior Fellow in Economics, Hoover Institution
- Galbraith, James K., Lloyd M. Bentsen, Jr. Chair in Government/Business Relations, Lyndon B. Johnson School of Public Affairs, The University of Texas at Austin
- Rivlin, Alice M., Senior Fellow, Economic Studies, Brookings Institution

*B*ACKGROUND

The Subcommittee on Domestic Monetary Policy and Technology held a hearing entitled “Improving the Federal Reserve System: Examining Legislation to Reform the Fed and Other Alternatives” at 10:00 a.m. on Tuesday, May 8, 2012 in Room 2128 of the Rayburn House Office Building.

The informal working title of the hearing was: “The Federal Reserve System: Mend It or End It?” This hearing examined six legislative proposals to either reform or abolish the Federal Reserve System. This was a two-panel hearing with the following witnesses:

Panel I

- Representative Kevin Brady (R-TX)
- Representative Barney Frank (D-MA)

Panel II

- Jeffrey M. Herbener, Ph.D., Chairman, Economics Department, Grove City College
- Peter G. Klein, Ph.D., Associate Professor, Applied Social Sciences and Director, McQuinn Center for Entrepreneurial Leadership, University of Missouri
- John B. Taylor, Ph.D., Mary and Robert Raymond Professor of Economics, Stanford University and George P. Schultz Senior Fellow in Economics, Hoover Institution
- James K. Galbraith, Ph.D., Lloyd M. Bentsen, Jr. Chair in Government/Business Relations, LBJ School of Public Affairs, University of Texas at Austin (joint witness)

- Alice Rivlin, Ph.D., Senior Fellow, Economic Studies, Brookings Institution, and former Vice Chair, Federal Reserve Board of Governors (witness for the Minority)

History

The Federal Reserve System is the central bank of the United States. It was created in 1913 “to provide for the establishment of Federal reserve banks, to furnish an elastic currency, to afford means of rediscounting commercial paper, to establish a more effective supervision of banking in the United States, and for other purposes.”¹⁰¹ The Federal Reserve sets monetary policy, supervises and regulates banks, and provides a variety of financial services to depository financial institutions and the federal government. The Federal Reserve has been ceded authority over money supply and monetary policy. It also issues Federal Reserve Notes which are legal tender currency in the United States.

The Federal Reserve System consists of three parts: (1) the Board of Governors of the Federal Reserve, a government agency whose Governors are appointed by the president and confirmed by the Senate; (2) the twelve regional Federal Reserve Banks, which are owned by nationally- and state-chartered banks that are members of the Federal Reserve System; and (3) the Federal Open Market Committee.

Established in 1933, the Federal Open Market Committee (FOMC) is the monetary policy-making body of the Federal Reserve System. It was created in order to centralize the policymaking while retaining the input of the regional Reserve Bank presidents, who are supposed to be attuned to the needs of their districts. The FOMC consists of up to twelve voting members: the seven members of the Board of Governors, the President of the Federal Reserve Bank of New York, and, on a rotating basis, four of the remaining 11 regional Federal Reserve Bank Presidents. The FOMC meets at least eight times a year to establish monetary policy. Its decisions are implemented by the Federal Reserve Bank of New York through its transactions with a network of private financial institutions known as primary dealers.

Monetary Policy

Congress has charged the Federal Reserve with three objectives in its conduct of monetary policy: (1) maximum employment, (2) stable prices, and (3) moderate long-term interest rates. The first two

¹⁰¹ Federal Reserve Act, Statement of Purpose

are commonly referred to as the Federal Reserve’s “dual mandate,” and have existed in statute since 1978.

The Federal Reserve has several tools at its disposal to effect the monetary policy adopted by the FOMC. Its primary tool is the target federal funds rate, which is the rate at which banks lend to one another on an overnight basis. To achieve the target federal funds rate, the Federal Reserve conducts open market operations in which the Federal Reserve Bank of New York buys and sells assets—typically government bonds—on the open market through its primary dealers. These open market operations change the amount of liquidity in the system—the money supply—which in turn raises or lowers the federal funds rate, affecting interest rates throughout the economy. The purchase of assets is supposed to stimulate economic activity by increasing the money supply and lowering interest rates; selling assets is supposed to slow economic activity by decreasing the money supply and raising interest rates.

Calls for Monetary Policy Reform

Calls for reforming various aspects of the Federal Reserve System have existed since its inception. However, with the onset of the financial crisis of 2008-2009 and during the prolonged recession, calls for reform have escalated. During the financial crisis of 2008-2009, the Federal Reserve responded with unconventional monetary policy tools such as emergency lending facilities in an attempt to provide credit to the marketplace, since the federal funds rate was already at or near zero. Publication of the recipients and amounts of those loans fueled public controversy and led to Congressional hearings.

The Federal Reserve’s balance sheet grew by nearly \$2 trillion since 2008, while the monetary base increased from \$800 billion to over \$2.6 trillion, leading some to claim that the Federal Reserve is doing too much to stimulate economic growth and setting the stage for sustained inflation when the economy recovers. Slow economic growth, however, has led others to claim that the Federal Reserve is not doing enough and must be more accommodative in its conduct of monetary policy. Despite the differences on how the Federal Reserve should be reformed, the proposals which the Committee is examining fall into four broad categories: (1) reforming the structure of the FOMC; (2) ending the Federal Reserve’s dual mandate; (3) adopting a rules-based monetary policy; and (4) abolishing the Federal Reserve.

Reforming the Structure of the FOMC

As the monetary-policy making arm of the Federal Reserve, the FOMC exerts significant influence over the economy. Because the FOMC consists of both the members of the Board of Governors (who are appointed by the president and confirmed by the Senate) and regional Federal Reserve Bank presidents (who are selected by the Reserve Bank's private member banks), some reformers have called for changes to the FOMC's composition. Some reform proposals have called for all of the FOMC's members to be appointed by the president and confirmed by the Senate, to make the FOMC more accountable to elected representatives as well as to avoid the possibility that private interests represented by regional Federal Reserve Bank presidents can influence monetary policy in their favor. By contrast, those who are concerned that monetary policy suffers from a Washington-centric focus that is not responsive to the concerns and needs of the nation as a whole would prefer greater regional representation on the FOMC. Some reformers also believe that the permanent voting seat held by the Federal Reserve Bank of New York gives undue influence to Wall Street interests, to the detriment of the rest of the country.

Ending the Dual Mandate

Some reformers seek to remove the full employment mandate and focus the Federal Reserve on price stability. These reformers believe that by focusing solely on price stability, the Federal Reserve can limit inflation (or deflation), thus ensuring a stable money supply and a more constant purchasing power for the dollar. This monetary policy focus is seen as providing more stability to the economy and generating long-term growth. In addition, those who have called for ending the dual mandate have pointed out that the level of employment is determined by nonmonetary factors that affect the structure and the dynamics of the labor market.

Those opposed to ending the dual mandate think the Federal Reserve should be able to respond to changing employment conditions in setting monetary policy. Some proponents of retaining the dual mandate believe that there is a trade-off, at least in the short term, between inflation and unemployment. This inverse relationship between inflation and unemployment is known as the Phillips curve, and some believe that the Federal Reserve should be permitted to raise inflation targets in response to economic shocks that result in high unemployment. Those who favor retaining the full employment mandate believe that the Federal Reserve should be granted the discretion to engage in accommodative (inflationary) monetary policy to spur employment and generate economic growth and stability.

Because inflation and employment often move in tandem, some have maintained that the price stability and full employment mandates are complementary. During economic downturns, inflation and employment both fall; the orthodox response is to pursue an expansionary monetary policy. During booms, inflation and employment both rise; the orthodox response is to pursue a contractionary policy. In the 1970s and 1980s, however, the economy was beset by both high inflation and high unemployment, which demonstrated that the Phillips curve did not accurately describe the relationship between inflation and unemployment in all circumstances, and that tolerating higher inflation did not necessarily lead to higher employment. As a result, most economists have rejected simpler versions of the Phillips curve, and have concluded that over the long term, monetary policy has little or no effect on employment. Nonetheless, many mainstream economists still maintain that there exists a relationship among inflationary monetary policy, economic activity, and employment in the short term, and continue to believe that accommodative monetary policy is beneficial when the economy is not at full employment.

Rules-Based Monetary Policy

The Federal Reserve has been given independent discretionary authority over the nation's monetary policy. To evaluate the Federal Reserve's conduct of monetary policy, some economists have called for the adoption of a rules-based system in which the outcomes of monetary policy can be judged against specific metrics or indices. Some economists have also recommended constraining the Federal Reserve's discretion by means of a rule, such as the "Taylor rule," which determines interest rates according to a formula that uses objective measures of changes in inflation, gross domestic product, and potential output. The intent of a rules-based monetary policy is to provide parameters for setting interest rates, using econometric modeling that supposedly balances the goals of economic growth and price stability. Reformers who favor a rules-based policy believe that greater economic and price stability can be achieved by replacing the Federal Reserve's discretionary authority over monetary policy with a rules-based authority. Such reforms are often called for in conjunction with creation of a single mandate for price stability.

Federal Reserve Abolition

Those who have called for the abolition of the Federal Reserve fall into two camps: (1) those who want to abolish the Federal Reserve but maintain government control over monetary authority; and (2)

those who favor both abolishing the Federal Reserve and ending government control over monetary authority.

Those who wish to maintain government control over monetary authority have called for the abolition of the Federal Reserve and the transfer of its functions to the Treasury Department. Under such a regime a new monetary unit would be issued by the Treasury Department, which issued its own notes from 1862 to 1971, in place of Federal Reserve Notes. Proponents of this structure believe that the federal government should retain control over the creation and issuance of currency, rather than the banking system or a partially private central bank like the Federal Reserve.

Those who favor abolishing the Federal Reserve and ending government control of monetary policy believe that there is no need for a central bank, and that the government's conduct of monetary policy itself is detrimental to the economy. Central banks engage in monetary policy through manipulation of interest rates, which are the price of credit. When central banks target an interest rate that is below the market rate of interest, the subsequent credit expansion distorts the structure of production in the economy. As a result of this distortion, capital that would have been put to use in meeting consumer demand is instead diverted into less productive uses, which is known as malinvestment. Credit expansion forms the boom of the business cycle, while revelation of malinvestment forms the bust. Until those malinvested resources are put to better use, economic hardship will ensue. Because credit expansion inflates the money supply and devalues the purchasing power of the monetary unit, consumers are harmed by a reduction in their standard of living. Many proponents of abolishing the Federal Reserve propose a free market monetary system: one that they believe allocates resources, including money and credit, to their best and most productive uses through the pricing mechanism of the free market, thus generating economic stability and growth.

Legislative Proposals

H.R. 245

Introduced by Rep. Mike Pence, H.R. 245 amends the Federal Reserve Act to remove the full employment mandate.

H.R. 1094: "Federal Reserve Board Abolition Act"

Introduced by the Chairman of the Domestic Monetary Policy and Technology Subcommittee, Rep. Ron Paul, H.R. 1094 abolishes the Board of Governors of the Federal Reserve System and the regional

Federal Reserve Banks, and repeals the Federal Reserve Act one year after enactment of the bill, during which time the affairs of the Board and the Reserve Banks are to be wound down. All remaining assets and liabilities of the Federal Reserve System are then transferred to the Department of Treasury.

H.R. 1401: “Democratizing the Federal Reserve System Act of 2011”

Introduced by Rep. Marcy Kaptur, H.R. 1401 reduces the terms of the members of the Federal Reserve Board of Governors from fourteen years to seven years. The regional Federal Reserve Bank representation on the FOMC is increased from five to six members, and the rotation schedule is revised to ensure that each Reserve Bank president serves on the FOMC every other year, with the New York Fed president no longer holding a permanent seat. The Vice Chairman of the Board of Governors must be chosen from a member currently on the Board who has served at least one year on the Board. The Chairman is chosen in the same manner, but must have served at least two years on the Board.

H.R. 2990: “National Emergency Employment Defense Act of 2011”

H.R. 2990, the “National Emergency Employment Defense Act of 2011,” or NEED Act, was introduced by Rep. Dennis Kucinich. The bill replaces the Federal Reserve Note with United States Money (USM), which is to be legal tender. The creation of USM through fractional reserve banking is criminalized. The Treasury Secretary is prohibited from borrowing money, and federal agencies and departments may borrow money only from the Treasury Secretary. Any funding shortfalls are to be met with the issuance of USM. All U.S. debt instruments are to be retired by redeeming them with USM. The Treasury Secretary is directed to purchase all net assets in the Federal Reserve System. A new Monetary Authority is created within the Treasury Department, which is to establish monetary supply policy and monitor the nation’s monetary status. A Bureau of the Federal Reserve is to be created within the Treasury Department to administer the origination and circulation of USM. The Monetary Authority will also instruct the Treasury Secretary to disburse monetary grants to states for public infrastructure, education, health care and rehabilitation, pensions, and paying for unfunded federal mandates. H.R. 2990 also sets a ceiling on interest rates.

H.R. 3428

Introduced by Financial Services Committee Ranking Member Barney Frank, H.R. 3428 replaces the five Reserve Bank presidents who sit on the FOMC with FOMC members appointed by the president and confirmed by the Senate. FOMC members are to be selected with due regard to a fair representation of financial, agricultural, industrial, commercial, consumer, and labor interests, and the geographical diversity of the U.S. No more than one additional member may be appointed from any particular Federal Reserve district.

H.R. 4180: “Sound Dollar Act of 2012”

Introduced by Rep. Kevin Brady, H.R. 4180 establishes long-term price stability as the Federal Reserve’s single mandate. The Federal Reserve Board and the FOMC are directed to define long-term price stability and establish metrics by which to measure the achievement of long-term price stability—in consideration of or with respect to various indices and asset prices. The Federal Reserve is to establish a clear lender of last resort policy. Voting membership of the FOMC is expanded to include a representative from each of the 12 regional Federal Reserve Banks. Transcripts of FOMC meetings are to be released no later than three years after each meeting. Asset purchases by the Federal Reserve are limited to government bonds only, and only those with a maturity of less than six months; other assets may be purchased in unusual and exigent circumstances upon a vote of two-thirds of the FOMC members. The Exchange Stabilization Fund is divested of all non-Special Drawing Right (SDR) assets so that it holds only SDRs and no other assets for foreign exchange. The Consumer Financial Protection Bureau is subjected to the Congressional appropriations process.

*T*RANSCRIPT

The subcommittee met, pursuant to notice, at 10:05 a.m., in room 2128, Rayburn House Office Building, Hon. Ron Paul {chairman of the subcommittee} presiding.

Members present: Representatives Paul, Luetkemeyer, Huizenga, Hayworth, Schweikert; Clay, Maloney, and Green.

Also present: Representatives Garrett and Ellison.

Chairman PAUL. This hearing will come to order.

Without objection, I ask unanimous consent that those nonsubcommittee members who are present be recognized if they wish to give opening statements or ask questions.

I now recognize myself for 5 minutes for an opening statement.

First, I want to thank our two colleagues for being here today, and they will be recognized shortly.

But as many Members know, the subject of the Federal Reserve (the Fed) and monetary policy is something I have been interested in for a long time, believing that it has a great deal of significance with regards to a healthy economy. Today, we will be discussing the various proposals to address the subject of some of the shortcomings of the monetary system.

I think what has happened here in these last 5 years is that it has been recognized by many that monetary policy and the Federal Reserve has a lot to do with the creation of some of our problems and their shortcomings when it comes to solving these problems. The Federal Reserve has been around for almost 100 years—100 years next year—and, of course, it has gone generally under the radar. Not too many people have talked precisely, because it was always said that it should not be interfered with by the Executive Branch or the Legislative Branch.

But lately, there has been more concern. With the help of Congressman Frank, we were able to get some transparency of the Fed, and he was obviously quite helpful in moving that along. From my viewpoint, we still have more to do on that, but it is very clear whether we decide exactly what constitutional money is and how it comes about. I don't think many people reject the idea that the Congress does have responsibility of oversight and figuring out exactly how to handle that.

So with the crisis that came about in the last 5 years ago, I think an attitude changed dramatically. I think this is the reason that we had strong support in the last session for auditing the Fed and more information has come out because of the lawsuits.

But the way I see the monetary policy, and I think it is generally neglected, is most people realize how big the economy is and they know by supply and demand of all products and goods and services and labor—but, generally, they don't talk a whole lot about the other half of the equation, and that is the monetary issue. The monetary issues are one half of all the transactions. So to duck the issue and pretend it is not important, I think, has been a mistake.

I personally believe that over these many decades, the Federal Reserve has gotten a free pass because if we had good times, if they were able to stimulate the economy and have easy credit, and we had good times, they got the credit. Then if the predictable slumps would arrive and something had to be done, Congress would generally act and the Federal Reserve would act, and they would get the credit for getting us out of this slump.

But I think that has changed in the last 5 years because of the seriousness of the crisis, how global it is, and how—one of the consequences has been this excessive debt, and then the bailing out that occurred.

And so what the Congress did on the bailouts was significant but minor compared to how much the Federal Reserve was able to do. For this reason, so many people want to know a lot more about what is going on.

Not only do we want to know about policy—and a lot will be discussed today about the particular policies and how to guide that policy—but one thing we should not forget about is the nature of money. If we are trying to describe how we manage a monetary system, it seems to be most difficult, in my view—you have to be able to define money, and define the dollar, which has not been done for a long, long time. We use the Federal Reserve note as the unit of

account, but there is no legal definition of a Federal Reserve note, and that is a pledge to pay something.

So a note being something precise, and then you have to have management and it doesn't work well, then we think, we just need more regulations and everything will work out smoothly. I have a lot of reservations about that because I think we have a lot of inflation, we have a lot of instability in prices. And even when the reports come out that the prices are rather stable, they seem to ignore the fact that the cost of living for many is going up significantly. The price of energy goes up, the price of medical care goes up, the price of education goes up.

So even when the CPI and the PPI might not be revealing what is happening, there still is a lot of destruction of the value of money. For this reason, now, we have been in a decade or so where the real wages have not been able to keep up, which really is the bottom line, I believe—the unemployment factor and keeping up with the cost of living and keeping up with real wages.

So I am very pleased to have the various Members here today, as well as the second panel of witnesses to discuss what I consider to be a very, very important issue.

Now, I would like to yield 5 minutes to Mr. Clay.

Mr. CLAY. Thank you, Chairman Paul, especially for holding this hearing on improving the Federal Reserve System and examining today six pieces of legislation to reform the Federal Reserve System. One piece to abolish the Federal Reserve, sponsored by our chairman, Mr. Paul, and another one, as sponsored by Mr. Kucinich, would make the Federal Reserve an arm of the Treasury.

The other bills would make various changes either to the mandate or to the Federal Open Market Committee's governance. As ranking member of this subcommittee, I want to focus on the Federal Reserve's dual mandate of maintaining stable prices and full employment for monetary policy.

The Full Employment and Balanced Growth Act of 1978, better known as the Humphrey-Hawkins Act, set four benchmarks for the economy: full employment; growth and production; price stability; and the balance of trade and budget.

To monitor progress towards these goals, the Full Employment and Balanced Growth Act of 1978 mandated that the Board of Governors of the Federal Reserve System present semiannual reports to Congress on the state of the U.S. economy and the Nation's financial welfare. The Humphrey-Hawkins Act charges the Federal Reserve

with a dual mandate, both maintaining stable prices and full employment.

Currently, the unemployment rate is 8.1 percent. Since President Obama took office in January of 2009, the unemployment rate has gone from 7.8 percent around the Inauguration, to 10 percent as the impact of the financial crisis spread, to 8.1 percent today. I do believe that the U.S. economy is heading in the right direction. With the proper nudge, it could probably improve even more.

As of March, the consumer price index was 2.7 percent over the past year, a decline from February of this year of 2.9 percent. During the same period, the energy index had risen 4.6 percent, and the food index had increased 3.3 percent.

Both increases are smaller than last month. In contrast, the year change in the index for all items, less food and energy, which was 2.2 percent in February, edged up to 2.3 percent in March.

All of these factors play a very important role in getting America back to economic growth and prosperity, and I look forward to the witnesses' testimony.

Mr. Chairman, I yield back.

Chairman PAUL. I thank the gentleman.

Now, I yield 5 minutes to Dr. Hayworth.

Dr. HAYWORTH. Thank you, Mr. Chairman. It is with great pleasure that I anticipate the testimony from our distinguished colleagues, and we have a great challenge before us because obviously a central bank—our central bank, the Federal Reserve, has—we have cherished its independence in implementing monetary policy and yet at the same time, obviously the Congress has to establish monetary goals and hold the Federal Reserve responsible, and we have obviously, as a Congress, the express power to coin money and regulate the value thereof.

There is this dynamic tension, obviously, between the independence of the Fed and its accountability to us. So it is going to be very interesting to hear your proposals as to how we make that—reach that balance.

But in specific, with regard to the dual mandate, Chairman Bernanke has said many times that he does not perceive—in effect, he said he does not perceive an inherent conflict, if you will, in the dual mandate because, as I have understood him, serving the goal of price stability clearly works favorably toward having an economy that will work and that will enhance the employment prospects for all those who need work.

Yet we see that his warning, which he has expressed very diplomatically regarding our fiscal policy, having implications for monetary policy that it cannot overcome forever and ever by accommodation, we see that his warnings seem to be borne out in the fact that several years of accommodating monetary policy have not resulted in the kind of enhancement in our economic statistics that we would like to see.

So I look forward to your testimony and thank you for all the work that you have done on this very crucial topic. Thank you, Mr. Chairman. I yield back.

Chairman PAUL. I thank the gentlelady.

Mr. CLAY. Mr. Chairman, if I may, I would like to ask unanimous consent that the gentleman from Minnesota, Mr. Ellison, be allowed to sit in.

Chairman PAUL. We already asked for that unanimous consent, but without objection, it is so ordered.

Now, if the gentleman from Minnesota would like to make an opening statement, he can do that right now.

Mr. CLAY. Thank you.

Mr. ELLISON. Very briefly, Mr. Chairman, thank you for your chance to make an opening statement and to address this really important topic.

I really don't have so much of a statement as I have some questions that I would like to just put out on the table for discussion, and I hope we can resolve them during the course of our afternoon.

Is the dual mandate the problem? The fact is, to the degree that we have had challenges to monetary policy, has the dual mandate been responsible? If not, why the focus? I am curious, if anybody could point to an instance in the last 30, 40 years when the dual mandate required the Fed to downplay their preferred anti-inflation approach to concern about unemployment?

It seems to me that these are perfect. The dual mandate has been working. If it hasn't, I would be curious to know when it has let us down and when the dual mandate has been the cause of flawed monetary policy.

I am also curious to know, how have we have been doing with the dual mandate? Have we really been pursuing both, and to the degree that the statute would call for? Has unemployment gotten a short shrift?

I am concerned that we live in a time when we are getting used to an unemployment rate of about 8 percent, and that might be all we can ever aspire to get down to. I think this is a national disgrace and

an outrage, and I think our country needs to do much more to pursue both prongs of the dual mandate. I am concerned that unemployment has not been getting its full due.

So these are some questions that I have, some concerns that I would like to see addressed. And even though I am not on the subcommittee, I am grateful to be allowed to be on it today, and I hope that we can explore these important topics. Thank you, Mr. Chairman. I yield back.

Chairman PAUL. I thank the gentleman.

I now yield time to Mr. Schweikert from Arizona for an opening statement.

Mr. SCHWEIKERT. Thank you, Mr. Chairman, I will try to do this very quickly.

Since being placed on your subcommittee, this has actually become an area of great interest to me. One of the sides you are trying to get your head around—and as we walk through the pieces of legislation—is what the Fed does in regard to monetary policy. Has this, as part of unintended or intended consequences, allowed those of us here in Congress to engage in really bad fiscal policy? In many ways, is it an institution through its actions that allows us to get away with bad acts?

And secondly, even though this is one off, but in the discussions—the Fed is heading, their holdings are heading towards what, \$2.9 trillion? What is the plan? At some point, when do they move back to normalization of their portfolio, and what are the potential cascade effects when moving back to a normalized portfolio?

With that, I yield back.

Thank you, Mr. Chairman.

Chairman PAUL. I thank the gentleman. Now, I want to move to our first panel.

[PANEL I]

First, I want to introduce Representative Kevin Brady from Texas, an 8-term Republican Congressman representing the Eighth District. He is the sponsor of H.R. 4180, the Sound Dollar Act of 2012. He is also the vice chairman of the Joint Economic Committee.

Also with us today is the ranking member of the Financial Services Committee, Representative Barney Frank, a 16-term Democratic Congressman representing the Fourth District of Massachusetts. He is the sponsor of H.R. 3428.

I will now recognize Congressman Brady for his opening statement.

**STATEMENT OF THE HONORABLE KEVIN BRADY¹⁰²
REPRESENTATIVE, 8TH DISTRICT OF TX
U.S. HOUSE OF REPRESENTATIVES**

Mr. BRADY. Thank you, Chairman Paul, Ranking Member Clay, and members of the subcommittee. Before discussing the Sound Dollar Act, I would like to acknowledge the work that Dr. Paul has done on this subcommittee. He is a long-time former member of the Joint Economic Committee who has worked to bring sound dollars to the forefront of the public debate.

Inflation has been called many things, a hidden tax, a government-sponsored reduction in workers' paychecks or, as Dr. Paul often says, theft, and more and more Americans understand the absurdity of a monetary policy that ultimately devalues our own currency.

We agree on three key points: preserving the value of the dollar is essential to economic growth and prosperity in America; the Federal Government must not be allowed to monetize its debt; and our financial system should serve the interests of all Americans, not just the interests of Washington and Wall Street.

Again, I would like to thank the chairman for your steadfast commitment to bringing those issues to the forefront of the public debate.

I am pleased to testify on behalf of the Sound Dollar Act. I want to thank the members of this subcommittee who have already co-sponsored this important legislation: Mr. Jones; Mr. Lucas; Mr. Luetkemeyer; Mr. Huizenga; and Mr. Garrett.

The problem today is that according to some, the 1800s was the British century, the 1900s was the American century, and the 2000s, the 21st Century, may well be China's century. Well, not so fast. But, for America to continue its preeminence in the global economy, it is important that we get the role of the Federal Reserve right.

As we know, the Federal Reserve veered from the successful rules-based policies that brought the great moderation of the 1980s and the 1990s and instead, adopted an interventionist approach and helped to inflate the unsustainable housing bubble and led ultimately to a global economic crisis during the last decade. This interventionist approach, justified by the unemployment half of the dual mandate, continues today, and I believe it is a contributing factor to this anemic recovery.

¹⁰² [The prepared statement of Representative Brady can be found on page 670.]

The Federal Reserve's interventionist policies are felt by the single mom who goes to the grocery store and finds her paycheck doesn't go as far because inflation is robbing her of the value of the hard-earned dollar, and she also finds the same thing as she fills her gas tank.

These interventionist policies are also felt by the unemployed. The uncertainty generated by the Fed's unprecedented intervention is discouraging business investment in new buildings, equipment, and software, which drives job creation in America.

If you look at the fact of the numbers, government spending is where it was before the recession, and consumer spending is where it was before the recession, but business investment is not and the Fed has played a role in that.

For America to remain the world's leading economy in the 21st Century, Congress must give the Fed a single mandate for price stability, ensure that it is independent from political pressure, and hold it accountable for results.

Critics charge that focusing on a sound dollar implies the Fed will ignore the unemployment needs of America. They are wrong. America can only maximize our real output in employment with long-term price stability. Protecting the purchasing power of the dollar over time provides the strongest foundation for lasting economic growth and job creation.

Critics also react as if a single mandate is a shocking proposal, because we know the United States won World War II, enjoyed 3 decades of prosperity, and put a man on the moon without the dual mandate. It is not a fundamental part of our constitutional fabric.

It is a 1977 policy directive based on discredited Phillips curves and Congress can change it.

While it may be politically appealing, the current dual mandate asks the Fed to do something that it simply cannot do. Chairman Ben Bernanke has testified before JEC that in the long run, the only thing the Fed can control is inflation. In the long run, low inflation is the best thing we can do for growth. In a Federal Open Market Committee statement, he said basically the same thing, that the maximum level of employment is largely determined by nonmonetary factors. Further, using monetary policy as a short-term tool—the speed growth may actually harm the economy in the long term.

Let me skip to the end and make the point here that among other provisions in the Sound Dollar Act, we grant a permanent vote to all the regional Federal Reserve bank presidents. Because as important as important as New York and Washington are, there is much more

to America's economy, and therefore, FMC should better reflect our geographic diversity.

We require the Fed for the first time to articulate this lender of last resort policy in order to reduce uncertainty and instance of moral hazard and speed the release of the transcripts from 5 years to 3 years to create more timely information and transparency, and we make sure the new Consumer Financial Protection Bureau is accountable to hardworking Americans by funding it the same way as other agencies do during Congress.

Mr. Chairman, I have included my full testimony for the record as well.

Chairman PAUL. I thank the gentleman.

Now, Mr. Frank is recognized.

**STATEMENT OF THE HONORABLE BARNEY FRANK¹⁰³
RANKING MEMBER OF THE FINANCIAL SERVICES COMMITTEE
AND REPRESENTATIVE 4th DISTRICT OF MASSACHUSETTS
US HOUSE OF REPRESENTATIVES**

Mr. FRANK. Thank you, Mr. Chairman. I appreciate your acknowledgment of the work we did together. It actually was work, as you know, that began with one of your Texas colleagues, Mr. Gonzalez, who works down with us who was a pioneer in forcing the Federal Reserve to be open. He made them release information that they claimed didn't exist. It was kind of a magical feat.

But one of the things that ought to be noted, in every instance, beginning with Mr. Gonzalez and maybe before I was here and the work we did, as the information flow has increased, it has been beneficial. There have been none of the negative effects on people they are worried about.

At the same time, it ought to be clear that the release of all this information has, I think, helped dispel the notion that there were nefarious things going on. We have gotten a lot of information out under the legislation we have. There will be no transactions the Federal Reserve engages in with private companies that won't, at some point, be made public. I think that has reflected well on what they have done and again, suggestions that there was something untoward going on haven't been proven true.

I filed legislation to remove the regional presidents from the voting power that they have. It was pointed out to me that that would have a problem of diminishing geographic representation. So I submitted an amended version that would have appointees to the board

¹⁰³ [Representative Frank did not submit a prepared statement.]

wanted by the President, confirmed by the Senate from the various regions.

The problem you have now is this: The regional Federal bank presidents are picked by bankers. It is an extraordinary power that the FOMC has, and I think everyone agrees. And I cannot think of another element in American government where there is formal, binding, legal power given to the representatives of the industry that is in question.

I don't think the American people are unaware of the undemocratic nature of this, to have bankers pick the regional president, who, in turn, picks boards which are primarily from industry and with the financial industry dominate them. The statistics show that. To have them setting the policy seems to me to be greatly mistaken. So I think you can get to a presidential set of appointments without diminishing geographic diversity, and that is what we have done.

Beyond that, I do feel somewhat compelled to come to the defense of the Bush Administration. The single most important economic appointment made by President Bush was, of course, Chairman Bernanke.

Mr. Bernanke was his economic adviser, chairman, and then he became head of the Fed. And frankly, I think people have been unfairly critical of Mr. Bernanke. He obviously has been reappointed and reconfirmed by the Senate.

But once again, there have been predictions that haven't been borne out. The interventions by the Fed to deal with the problems that we had from the financial crisis have not led to inflation. Inflation is not at the point where it has become a serious problem for people.

The loans that they have made, the intervention they have made, have actually made money for the Federal Government; they have not added to the deficit. And as I said, the openness shows they haven't caused problems in terms of any kind of conflict of interest.

Now, we did make some changes in the legislation that was passed. We mandated much more openness. We repealed that part of the law which said the Fed could give money whenever it thought it was important to do so if they thought they might get paid back, and of course, the best example of that was AIG, a unilateral intervention by the Federal Reserve in 2008. We still are owed some money. We have replaced that with some other ways to go.

Finally, I think it would be a grave error to repeal the dual mandate. Yes, it is true that in the long run, monetary policy means what people have said. But as we know, the fact that something means

something in the long run does not mean that is the only run, that there are not times in the shorter run and the intermediate run when a balance is necessary.

And I would say this: I can make a procedural point. I have a bill dealing with the presidents. I would be content to see that put aside because I think we have a central issue here in the bill that my colleague from Texas has put forward, and I will agree with him on one point, when he said that the dual mandate is not in the Constitution. I agree, even with the Federal Reserve.

We made up, in about 1912—it wasn't in the Constitution. In fact, Alexander Hamilton tried to put it in there, and got his brains beat out a couple of time.

But the question is this: There are very big differences, and to some extent, they are partisan. Partisan differences can be carried too far and they can become embittering, but they are also at the heart of democracy. It is entirely legitimate to have contending groups with different views, and there is clearly a major party difference in that those of us on the Democratic side think that unemployment is a very serious problem that deserves being addressed explicitly.

And so I would urge you, Mr. Chairman, let's take the bill of the gentleman from Texas. Let's put it out there, let's have a committee markup. Let's bring it out, and let's debate that one before the election. Let's have it be a stealth presence to the American people to take away the concern with employment after the election.

Chairman PAUL. I thank the gentleman.

I thank both Members for their opening statements.

I ask unanimous consent to include in the record written statements from the sponsors of the legislation being considered by the subcommittee today. Without objection, it is so ordered.

[PANEL I: QUESTIONS & ANSWERS]

I will now yield myself 5 minutes for questions. The first question I have is for Congressman Brady, and I love the title of your bill, the Sound Dollar Act. That is something I think is so important, but it seems to get a sound dollar, we need to have something we can define. Do you have a definition in order to give us an idea what our goals are, divorced, maybe, from the policy? How do we define the unit of account, because it was precisely defined for a good many years.

As a matter of fact, up until 1971 in a relative way it always had a precise definition. So do you have, in your own mind, a definition for a sound dollar?

Mr. BRADY. I do, in my mind. We didn't include it in the legislation. Right now, the Fed has identified a 2 percent inflation, split inflation target, which seems reasonable over time. But the truth of the matter is we want a rules-based inflation targeting.

We want the Fed to stop, the go-stop policies, the interventionist policies and to focus on staying within the lines, both on inflation and deflation. Your point that is the strongest foundation for economic growth.

Mr. Frank likes to point out this is an either/or. It is not. The Fed does not do and cannot do a good job at job creation, as the chairman and the members agree. But over time, in fact, preserving the purchasing power of the dollar does create the strongest economy for the United States, or at least the opportunity for it, the strongest job creation so, no, there is not an explicit target in the bill itself.

Chairman PAUL. So in a way, you defined the dollar by achieving a price level or price stability?

Mr. BRADY. We don't choose a strong dollar or a weak dollar, a sound one.

Chairman PAUL. Consider that there are many free market economists who don't concentrate on that. They, as a matter of fact, want a flexible pricing level, not a fixed pricing level.

For instance, how would this have been interpreted, or how would the monetary policy have been altered, say, in the 1920s because a lot of people say that there is no inflation because prices are relatively stable because productivity goes up. So if prices are relatively stable and due to productivity, but then there still are distortions in the stock market, say the stock market that, of course, led to the 1930s, can't you be deceived if you concentrate on prices rather than looking at the total picture of the amount of investment?

I know you did mention about not monetizing debt, so how would you adjust for the fact that the price level doesn't give you the information because even today, a lot of prices, in spite of the monetary inflation, some prices are going down like in electronics. At the same time, the cost of an education skyrockets. So how would you adjust for that?

Mr. BRADY. Thank you. One, I have, long ago, learned never to discuss Fed history with you, Dr. Paul, since you are as knowledgeable as anyone on the planet about it.

But looking a little closer in history the last 40 years, what we saw in the 1970s was a great lesson. We were told we couldn't have high unemployment and high inflation at the same time; it couldn't happen. As we know, not only did it happen, but the Fed's inter-

vention go-stop, go-stop actually created a very volatile economy with very deep and frequent recessions.

When the Fed focused back on a single mandate of price stability in 1979, that changed. And for almost 20 years, we had not only strong economic growth, but we had very short, very shallow recessions. So we saw the benefits of that focus on price stability.

In the 2000s, we saw the Fed keep interest rates too low for too long. It helped to inflate a credit-fueled housing bubble and helped create a global financial crisis; and, to sort of wrap that up to your immediate question, within the Sound Dollar Act, not only do we focus on rules-based inflation targeting, but we require the Fed to monitor and report back on these potential asset bubbles, to monitor the price of gold, other commodities, equities, bonds, commercial real estate, agriculture, real estate industrial, real estate as well—and we don't force them to act on that because that circumstance will vary.

But we want to ensure to your point that not just the price index of the goods and services, but those potential asset bubbles would not only be monitored but reported to you and to me and to the public as well.

Chairman PAUL. I have a question for Mr. Frank, but I am out of time. I think there is going to be a second round, so hopefully I can get my question asked. I now yield to Mr. Clay.

Mr. CLAY. Thank you so much, Mr. Chairman.

Let me ask both witnesses, currently, the unemployment rate, according to the Labor Department, is 8.1 percent. What can the Federal Reserve and Congress do to put Americans back to work? Mr. Brady, do you have any thoughts or views on that?

Mr. BRADY. I do. One, I think the Fed is trying to do too much. They are trying to make up for, I think, some failed economic policies, in my view, from the White House. And I also believe they are sort of like the doctor who gives you a pill every 5 minutes and say how are you feeling? Take another one. How are you feeling? Take another one, as a result of actually creating uncertainty.

I believe the more the Fed does, the less responsibility Congress and the White House are taking for getting the right fiscal decisions, getting the right tax policy, to balance regulations, ensuring the right spending levels and entitlement reforms that actually create that uncertainty.

So I really believe as the Fed does more, Congress is doing less, and in the long term, that slows our recovery.

Mr. CLAY. Don't you think that Congress could be doing something now as far as passing a transportation bill, which would be a job starter?

Mr. BRADY. Mr. Chairman, Ranking Member Clay, I think it is important, especially long term to get our transportation policy right. I think that would be helpful. I also think taking off the table this discussion of higher taxes, just a tsunami of regulations hitting these businesses.

The President's health care plan, in my view, is right now a real deterrent to new job creation in America. So, yes, there are a lot of things Congress can do right. And there is a reason the Fed said in the end, we are not setting an employment target, because in the end we can't control employment.

Mr. CLAY. Mr. Frank, what do you think the Federal Reserve and Congress could do to put Americans—

Mr. FRANK. The Federal Reserve cannot do a great deal more. I think they have been very helpful, and the policy that I think Mr. Brady still would prohibit in the future, we would have been worse off if it hadn't have been for them.

I think the interventions the Fed has taken in two levels have been helpful to us, first of all in helping to provide the funding that has helped our economy. Secondly, and I think this is a real point of difference between the parties, I was surprised by it, I think the role of the Federal Government, is the Federal Reserve has been working with the European Central Bank, has been helpful in avoiding the kind of serious downturns in Europe which will have negative effects on us.

I think the Federal Reserve—

Chairman PAUL. Check your microphone.

Mr. FRANK. Thank you, Mr. Chairman. With the European Central Bank, have been very helpful and to have prevented the Federal Reserve from that kind of cooperation, increasing the chances of trouble in Europe would have been, I think, a very grave error.

Secondly, as far as Congress is concerned, we have the major activity. We should be following a two-step procedure, long-term deficit reduction with some shorter-term stimulus. The fact is that the employment rate is higher than it would have been if we had not forced, by a variety of fiscal policies, State and local governments to fire 600,000-plus teachers and firefighters and public works employees and police officers.

I think that has been a very, very grave error. They have been hurt because many of them are financed primarily by property taxes.

Property values went down. I think forcing those reductions by inappropriate Federal policy is a great mistake. Yes, it is important for us to reduce a deficit long term.

Unlike many of my Republican colleagues who think the President wants to get out of Afghanistan too quickly, I think he wants to stay there too long. I think there is a great deal of room for reduction in the military budget.

I think that we should be—and we will be fighting about this in the budget. Do we cut the military or restrain the military or do we cut our Medicare and Medicaid? So I would be for a short-term increase in spending and stimulus at the Federal level here, including primarily to the States. You give money to the States, and they are going to hire some people who, in turn, will be spending money.

As for taxes, I heard the argument that higher taxes were going to kill the economy in 1993 when I voted for the tax proposal put forward by President Clinton. And in the years afterward, we had a very good economy. I don't have to claim that the higher taxes, and marginal rate increase, a fairly small amount, caused that good economy, but it clearly didn't interfere with it.

I think if you talk about people who are making more than a million dollars a year, that for every thousand dollars they make over that, tax them \$56, it is inconceivable to me, and I think it has been proven by economic history, that it has no negative effect and it allows us to do a long-term deficit reduction with some short-term help for the economy.

Mr. CLAY. Thank you so much.

Chairman PAUL. I yield 5 minutes to Mr. Schweikert from Arizona.

Mr. SCHWEIKERT. Mr. Chairman, would you like me to yield you a couple of minutes to finish your previous question?

Chairman PAUL. Pardon me?

Mr. SCHWEIKERT. Would you like me to yield you a couple of minutes to finish where you are at?

Chairman PAUL. Oh, thank you, yes, absolutely, thank you very much.

Mr. BRADY. Mr. Chairman, I would rather be grilled by Mr. Schweikert than yourself, if that is okay.

Chairman PAUL. No, I saved this one for the ranking member.

Mr. BRADY. Okay, go ahead.

Chairman PAUL. The big argument is, dual mandate or one mandate. I am pretty much of a skeptic on what we get from the Fed, and I think they generally can find an excuse to do whatever they want to

do, so I know that is an important argument, and it is going to go on for a while. But I am not hopeful that, in itself, will solve the problem, because I think they are rather independent in what they do.

And I want to ask—I asked you a question, Mr. Frank, about the appointees, whether they are approved by the Senate or not, because a lot of people that I talked to are very interested in this subject. They are very concerned about the fact that this isn't a government operation. This is a private operation and they don't like the private.

Now, do you think you fully answer that, or do you partially answer the questions by saying people have to be approved by the Senate? Does this become less private and less sinister? Or how would you, frankly—

Mr. FRANK. Actually, I wouldn't say that, sir. I wouldn't say "sinister." I don't think the people on the Federal Reserve regional boards who are predominantly from the financial industry in terms of influence, when they pick a president, who in turn picks the new people, it is not sinister. They are people of good will, but it has an obvious bias.

Yes, I diminish the sector, which is the private sector, by not having a vote.

There is another thing we can do, Mr. Chairman. You were absent—understandably, you had a couple of other things on your mind when we voted here during the reconciliation markup on whether or not to subject the Federal Reserve to the appropriations process, not monetary policy.

But there was a proposal, as you know, to subject the Consumer Financial Protection Bureau to the appropriations process. It would seem to be another step that could be taken. I am not for it myself, but for those who are worried, I would think consistency would say, why not subject the Federal Reserve, including the regional entities to the appropriations process?

So I think that if you said that—now, there is an alternative in terms of the regional presidents, which would have them Senate-confirmed, I think that might be worse. So, yes, I think I partially—I diminish the private sector element. I think except for people who are concerned about it more than me, would subject them to appropriations.

Chairman PAUL. I am sorry, I don't want to use all of Congressman Schweikert's time. I yield back my time to David.

Mr. FRANK. You aren't going to comment on the appropriations process, Mr. Chairman?

Chairman PAUL. Tomorrow.

Mr. SCHWEIKERT. He is just sorry he wasn't here. Thank you, Mr. Chairman.

One of the things I have been trying to get my head around is with the dual mandate, and this is for both of our honored Members here, does it ultimately, do you think, because—okay, here we are chasing inflation, here we are chasing unemployment, but through the back door, does that also allow us, as Members of Congress, often to avoid tough decisions, whether they be on, particularly on fiscal policy?

Mr. FRANK. I don't see how it does. First of all, I reject the notion that we, as elected officials, should be blaming the Fed, oh, it is the Fed's fault. No, it is our fault if we don't step up.

To be honest, I don't think, in fairness to us, that we are avoiding those. The problem is we have very different views about how to do it. That is democracy. Some people want to raise taxes on the wealthy and restrain the military and make some domestic restraints. Others want to do other things. I literally don't know anybody who doesn't have views on this. But, no, I don't see the fact that there is a responsibility somewhere else in any way allows us to avoid anything. Our responsibility is the same.

Mr. SCHWEIKERT. Ranking Member Frank, thank you. I did say one truism and that is ultimately, it is our responsibility.

Mr. FRANK. Yes.

Mr. SCHWEIKERT. And in my, what, 16 months here, I find policy-wise, we do lots of trying to push it off to regulators and others. You do the work and that way we have sort of this plausible deniability.

Mr. FRANK. But let me just say, I think that is especially the case with regard to military activity. In my 32 years here, when I have seen, I said, get involved in military activity without congressional authorization, it has been not been so much executive overreach as congressional ducking.

Mr. SCHWEIKERT. Okay. I am going actually agree with you on that one.

Mr. BRADY. The answer is yes, absolutely. As the Fed tries to do more, Congress, frankly, is using that and the White House as an excuse not to take the key steps necessary to create the business climate for recovery.

If, in fact, the dual mandate is the right answer, and the Fed is in charge of the economy, it is certainly not doing a good job—the weakest recovery since the Great Depression, lowest number of workers in the workforce, we, despite the stimulus, the bailouts, auto bailout, housing bailout, stimulus to Cash for Clunkers, there are

actually fewer Americans working today than when President Obama took office. At the end of the day, it is our responsibility.

Mr. SCHWEIKERT. Mr. Chairman, thank you for yielding back to me.

Chairman PAUL. I thank the gentleman.

I now yield 5 minutes to Congresswoman Maloney from New York.

Mrs. MALONEY. Thank you very much, and thank you for calling this hearing.

I would like to ask Mr. Brady to respond to a statement from Alan Blinder and Mark Zandi. In their paper of 2010, they argued that the Federal Reserve's actions in the area of monetary policy during the economic crisis were more powerful and effective than anything that Congress did fiscally through the stimulus, and I would argue that the Fed's pursuit of the dual mandate contributed to avoiding an all-out economic collapse and helped fuel our economy.

So I would specifically like to ask my colleague, can you cite any example of how the dual mandate in any way hindered the recovery? Most economists believe that it was helpful in the recovery.

Mr. BRADY. I think that there are a couple of key issues here. One, the Fed's actions in the mid-2000s, keeping interest rates too low for too long helped bring about the crisis in which they later intervened.

Secondly, I do think—

Mrs. MALONEY. But that happened during Chairman Greenspan's days.

Mr. BRADY. We are talking the Fed as it is today and its actions over the last 4 decades, truly.

Secondly, I think the Fed—

Mrs. MALONEY. But we are discussing it, just because I want to make sure you are answering the question. On this point, if I could make it clear, what we are looking at now is the recovery, the actions that took place by Chairman Bernanke and others in response, and you were saying the interest rates were too low. Would keeping interest rates high to avoid inflation have been a sensible policy during the crisis when we were looking for recovery in 2008 and 2009?

That is the time that we are looking at, how the dual mandate responded to the economic crisis, and I would argue that it was helpful.

But my question specifically—

Mr. BRADY. I actually wanted to give you a "yes" answer to your question.

Mrs. MALONEY. Oh, really.

Mr. BRADY. During the financial crisis, I think the Fed frankly helped fuel it. Some of the actions they took during the financial crisis truly did calm those waters, but stop there and look at the economic recovery since. In my view, you were pursuing the dual mandate, in some ways for the first time, identifying it as a way to not only intervene, for example, in the housing market and then continuing to intervene as well rather than allowing exiting of that market, continuing to allocate credit around the United States, creating this uncertainty on what will the Fed do next has actually, in my view, hindered the recovery.

So if you look at three points: Did they help fuel the financial crisis? Yes. Were they helpful during it? Yes. Is the recovery on in truth? No.

In my view, we are not at the job levels we should be, in part, because it is Congress' role to set the fiscal policy to create the business climate so recovery can occur.

Mrs. MALONEY. If the Fed had been constrained because they did not have the dual mandate in moderating inflation only, and would the recovery be what we are experiencing now, they were able to keep the—if all they had to do was look at inflation, they would have been raising interest rates.

They lowered them in 2008 and 2009, which was very important because they had the dual mandate. And if they were constrained and moderating only inflation, if that was the only thing they could have looked at, then they wouldn't have been lowering the rates. Having the dual mandate, most economists are arguing, gave them the flexibility to react quickly to the marketplace.

I would also like to hear from the ranking member, Mr. Frank.

Mr. BRADY. At some point, I would like to respond to that, because I think I can shed a little light on it.

Mr. FRANK. First, I want to talk about the comment about the Fed's role in inflating things during the Greenspan years. I agree, but not by keeping interest rates in general down, but by explicitly refusing to follow the mandate this Congress gave the Federal Reserve in 1994 in the Home Ownership and Equity Protection Act.

And in subsequent efforts, many of us did believe that loans were being made imprudently to people who couldn't pay them back.

There were two ways to deal with that. One was, some argued, to deflate the economy as a whole. I think that would have been a mistake. There was an option. It was to use the authority the Fed was given to ban imprudent loans to people who couldn't afford them, and

Mr. Greenspan flatly refused to do that, and lately acknowledged that was an error in front of Mr. Waxman's committee. And then in that period, in 2004 and 2005, some of us on this committee—myself, Mr. Watt, and Mr. Miller—tried to re-legislate that.

So, yes, I do think that there was a problem from the Fed, but it wasn't for not causing a deflation in the economy or less economic activity in general. It was refusing to use a specific tool they were given to stop the bad loans from being made.

Mrs. MALONEY. My time has expired. Thank you.

Chairman PAUL. I thank the gentlewoman.

I now recognize Mr. Luetkemeyer from Missouri for his 5 minutes.

Mr. LUETKEMEYER. Thank you, Mr. Chairman.

Congressman Brady, thank you for your efforts on this Sound Dollar Act. I really like some of the things that you have in there.

I am just kind of curious, do you believe that we need the Federal Reserve as a lender of last resort? Do we need a lender like that, some entity that can be the entity that puts the finger in the dike when something starts to happen?

Mr. BRADY. The answer is yes, and your question, in some regards, addresses Mrs. Maloney's question, which is under a single mandate, focused on the purchase power of the dollar, could the Fed intervene in times of emergency? The answer is absolutely yes. They would still be the lender of last resort, still provide liquidity to those banks that just have a liquidity problem but are solvent. And, of course, they have the ability to increase or decrease the interest rates to tighten or loosen the money supply.

So they would still be under a single mandate, and have the ability to intervene in very unusual and exigent situations. What they would not be allowed to do is to continue to intervene far beyond that financial crisis which, again, is contributing to the uncertainty today.

Mr. LUETKEMEYER. It would seem that, looking at the last 20, 30 years, their ability to impact our economy is greatly exaggerated on both ends. It would seem to me that they can nibble around the edges on these things, but if they actually had the ability to control unemployment, we wouldn't have the situation we have today.

If they control inflation, I don't think that we would have had some of those situations we have had over the last several years. As long as we have an economy that is rolling along very stable, it seemed like they can tweak it around the edges, but it doesn't appear they can do much more than that. So I really liked your approach here.

One of the questions that I had with regards to title 4 of your bill, with regard to exchange rate responsibility, can you explain just a little bit about that section and why you put it in here and what you want to try to accomplish with that?

Mr. BRADY. Is this dealing with the special drawing rights ending that that slush fund?

Mr. LUETKEMEYER. Yes, the exchange rate policy, bringing in the exchange, to exchange stabilization fund.

Mr. BRADY. We have, unfortunately, over time created, in effect, a slush fund within the Federal Reserve, both from historical— about \$100 billion in there, half of that about from historical dollars here and the other half, more recent. And unfortunately, Mr. Luetkemeyer, what has happened is that both Republican and Democrat Administrations related to the Fed have used that, in effect, to circumvent the power of Congress.

The Clinton Administration used those dollars to provide a bailout to Mexico after Congress rejected it. The current Fed uses the guaranteed money market funds. Those may have been the appropriate efforts, but those decisions should have been made by Congress, not by the Federal Reserve.

So under this bill, we end that as a slush fund. We apply the \$50 billion to reduce the deficit and we, in effect, return the Fed to what the Fed should do and retain for Congress, our constitutional role, to act in those matters of emergency.

Mr. LUETKEMEYER. So what you are trying to do is rein them in and go back to establish principles or mission of what they originally should have been and get it more in line with what most people think the Fed's mission should be?

Mr. BRADY. Yes, sir.

Mr. LUETKEMEYER. Thank you. Congressman Frank, just quickly with regard to the bill that you have, why do you believe that it is important to have—I am kind of curious, all of the Fed members, the appointees versus the Fed regional president is going to replace those with appointees. Why do you think that is important?

Mr. FRANK. First, let me just say one thing in response to your previous question, the biggest power the Federal Reserve had to intervene freely with Section 13.3 of the Federal Reserve Act, which actually came from the early 1930s under the Hoover Administration, and we repealed that in the financial reform bill. So they can no longer do what they did with AIG on an entity-by-entity basis.

Secondly, the chairman asked me did I think it should be less privatized? Yes. I understand the importance of geographical rep-

resentation. I think we should have people who live in the regions be the appointees, but I can't think of a comparable case of formal governmental power, the right to set interest rates, and the impact they can have on regulation where the entity primarily concerned picks its own people.

Mr. LUETKEMEYER. Yes, but you are assuming from your comment there that this is a government entity when it really is a quasi-government—

Mr. FRANK. Oh, I think it should be a government entity.

Mr. LUETKEMEYER. —and has a lot of private implications from its independence. Don't you think it should be more independent in its structure as well?

Mr. FRANK. Independence, independence from the—I think you get independence with 7-year terms and 14-year terms, but I don't think that the financial industry, which really dominates the selection of the regional presidents, should be independent from the whole society in setting the policy which governs it. And, no, I think when you talk about setting interest rates, that is a governmental function, yes.

And I didn't say, by the way, that they don't exist to the extent that they have some local economic functions; they would still be there. I specifically say they shouldn't be voting to set interest rates to the Federal Open Market Committee, and I would be very surprised if someone thought that was not a governmental function.

Mr. LUETKEMEYER. I see my time is up. Thank you, Mr. Chairman.

Chairman PAUL. Thank you. I now recognize Mr. Ellison from Minnesota for his 5 minutes.

Mr. ELLISON. Thank you, Mr. Chairman.

Congressman Frank, could you describe—and you already have alluded to it a little bit—but could you elaborate further on what benefit you see from ensuring greater representation of people of diverse experience on the Federal Reserve's Open Market Committee?

Mr. FRANK. I have a fundamental belief in the electorate ultimately making the decisions, and it is very anomalous. There is nothing comparable.

As a matter of fact, today, with there being some vacancies on the Board of Governors, half the votes, I think, on the Open Market Committee are cast by people, and we did a check of who are the members of the boards? It is a kind of a closed system.

The board members are selected to—with a great input from the presidents—they, in turn, pick the regional presidents, and it is

private sector governance of an important part of what we do. And, again, I am not talking about what they do in their regions and their economic activity.

The bill says they should not vote on monetary policy, and I just don't understand what the rationale is for letting private sector people with the financial industry generally, not in every case, being the predominant influence, pick the people who come to Washington and vote on one of the most important governmental policies. That has been the whole premise of much of what we have been talking about.

Mr. ELLISON. Congressman Frank?

Mr. FRANK. Yes.

Mr. ELLISON. I have some information on the board, by profession.

Mr. FRANK. The regional boards?

Mr. ELLISON. Yes. One person from labor. You have four academics, you have 41 people from banks, and 47 people from other for-profit corporations.

Mr. FRANK. I think that is just a mistake, and it is not that bankers are bad people or others. It is that we generally don't say it is kind of a corporatism. It is kind of let the profession govern itself, and I think that is a mistake when you have a large number from the financial industry, and they tend to be very influential in all of this. There ought to be a broader representation.

Again, in voting on monetary policy, not what is done in terms of regional economic activity. These people come to Washington.

Now I understand people want some geographic diversity. We should do that, but it is very surprising to me, we don't do that for any other Federal agency.

We don't say that the people in the energy industry, or we don't say that votes on labor policy are set by boards where unions are the predominant influence. The President appoints people to the NLRB. A Republican President will appoint people differently than a Democratic President, but they are Presidential appointees subject to Senate confirmation.

And I have picked—half the notes on the NLRB don't come from groups that are dominated by labor unions. That is the analog to the FOMC votes from the presidents.

Mr. ELLISON. Mr. Frank, I have a little time left.

On this issue of more diversity on the board, you just talked about professional diversity, but also, it seems like there has been some lack of ethnic and racial diversity too.

Do you think that including more voices from consumers who are from urban areas, rural areas, people who have dealt with hard-hit neighbors, neighborhoods with foreclosure, do you think some, these kinds of experiences are—

Mr. FRANK. I think that would be good on the boards. But even with that, even if I picked the boards personally, I wouldn't want them voting on Federal Government policy. I do not think that private citizens should pick other private citizens with no intervention from any electoral process. There is no appointment by someone who was elected. There is no confirmation by the Senate. It is really, as I said, anomalous for people who believe in democratic self-governance. And, yes, I would like to have more—better representation on these local boards, but even with that, I would not want them—and by the way, they tend to be sort of self-selected. I wouldn't want them, again, voting to set important national policy. Everybody acknowledges the monetary policy is very important. Some people think it has been too loose. I don't understand the justification for that.

I would say, and I would say again to the chairman, I know he wasn't here when we were voting on it, but you also have this situation about whether or not they should be subject to appropriation.

I think if you had all Presidential appointees and Senate confirmation, that would be okay. But I think others might say, well, gee, shouldn't they be subjected to the appropriations process? But in any case, as I said, I cannot think of a comparable situation where the people in the industry most affected by public policy get to pick a significant number of the formal official policymakers with no intervention by anybody who is elected to anything.

Mr. ELLISON. I yield back

Chairman PAUL. Thank you.

I now recognize the gentleman from New Jersey, Mr. Garrett.

Mr. GARRETT. Thank you, and I will just run down a series of questions. Start at the very beginning.

Mr. Brady, the question I'm not sure I heard the answer to, in my mind, your definition under the bill—I am the cosponsor—of a sound dollar, is that just the language of saying that if we hit our 2 percent inflationary, as opposed to anything else?

Mr. BRADY. It doesn't set an explicit target of 2 percent. It does not.

Mr. GARRETT. Is that something that should be looked at and clarified in the bill before it goes forward?

Mr. BRADY. I am very open to that. I would like to see Congress set that type of target in a rules-based system.

Mr. GARRETT. Does the ranking member have a comment on that point by any chance?

Mr. FRANK. No. You mean to define what is the sound—I don't know how—I would be concerned about how you would do that statutorily. We are in a world where the dollar has several roles. It has a domestic role and an international role. The international role of the dollar is very significant, especially since we are confronting competitors in the world, the People's Republic of China primarily, who use the currency.

Mr. GARRETT. For other purposes.

Mr. FRANK. And I would not want to disable ourselves from dealing with that aspect.

Mr. GARRETT. So that goes to the next question, I guess, for both of you. If you did pass legislation similar to this, how do we know whether they are meeting the standard if we don't set a standard?

And then, secondly, is there a consequence of not meeting the standard we haven't set?

Mr. FRANK. That is a very good question and proves why we shouldn't pass the bill.

Mr. GARRETT. Now, the rest of the story.

Mr. BRADY. Yes, for the rest of the story. I think setting a clear mandate, whether we set the explicit target or not and it is certainly open to that and then holding them accountable to that, I think, is key.

And, Mr. Garrett, one point I would like to make, that going forward, and I think it is a terrible mistake to require all of the Federal Reserve Bank presidents to be appointed and confirmed by the Senate. One, it will further politicize the Federal Reserve Board, including leading to vacancies as we have today, and it will concentrate more power on Wall Street and Washington.

I think it will be less independent as a Fed, because as you know, the regional bank presidents have an independent staff so they can actually not rely just on the chairman's staff, but on their own to assess economic policy.

And then, as you know, finally, the Board of Governors actually approves these regional reserve bank presidents. So we already have accountability within the system.

Mr. GARRETT. I guess I could sit here and wonder, maybe as the chairman does, what our role is under either one of your scenarios. You are saying the reason you don't have that appointment—under the ranking member's position, it would go through Presidential appointment. I can see some benefit to that. But then I can also see

we in Congress if that is all up in the Senate as far as monetary policy, we are sort of left out, except to hear the chairman occasionally come and testify and say, this is what they are doing and we have no standing—

Mr. FRANK. I understand that, but I assume that is what you wanted when you voted not to subject them to the appropriations process—may I respond?

Mr. GARRETT. Reclaiming my time. On that, I just wanted to delve into a little bit more than what we just did in the few minutes that we had there.

Mr. FRANK. I did offer an amendment—which I wasn't for because I wasn't concerned, but you voted against subjecting it to the appropriations process that would seemingly to have dealt with the issue you just raised—

Mr. GARRETT. I am open to the idea.

Mr. FRANK. Open to the idea in the sense that the roof is off. I mean, open to the idea, I think there is going to be very much openness for a very long time.

Mr. GARRETT. We are just trying to do things a little bit differently from the last session where we moved hundreds of pages at a time of a piece of legislation—

Mr. FRANK. I move, Mr. Chairman—

Mr. GARRETT. Reclaiming my time, Ranking Member Frank, you did raise one other question that I thought the chairman would raise in here. You said with regard to the process, and that is the constitutionality of it. And you had made, I think, a good point saying that it would make it perhaps more constitutional if we had the Presidential appointment here that it becomes not in the private sector but more public sector. But it raises the fundamental question that I thought the chairman would raise, which is where is the constitutionality for either one of the proposals that are before here?

Mr. FRANK. First, Mr. Garrett, the suggestion that we rushed things through 2 years ago, I think we had dozens of roll calls, a lot of meetings. I gather you have some concerns about your own vote. But I don't think you should ever be concerned about the process.

Mr. GARRETT. I was never concerned about my own vote, but rather I was concerned about legislation being dropped in at 3 a.m. in a conference committee that we obviously did not have any hearings on. That is not the debate we are having here—

Mr. FRANK. I understand you don't want to talk about your vote against subjecting it to appropriations. Let me say this to the constitutionality—

Mr. GARRETT. I only want to discuss what we are supposed to be discussing here and not the way that things were held in the past. That is part of the reason why we are here today.

Mr. FRANK. I will answer your question. The constitutionality of my provision is what it says in the Constitution, that important government officers should be appointed by the President, subject to confirmation by the Senate. And I think that voting on monetary policy is indisputably an important public policy and ought to be executed by public officers in the constitutional manner.

Mr. GARRETT. Mr. Brady, for the last word, do you care to chime in?

Mr. BRADY. Congress holds the constitutional responsibility for monetary policy. We have, through history, contracted that out to the Federal Reserve Bank with a clear mandate, now, lately, a more muddled mandate. And to make the point, first, I don't think we want to envision a day where 535 Members of Congress are setting monetary policy in America. Second, America is really an outlier here. Of the 47 central banks and monetary authorities around the world, only two give equal weight to unemployment, only two have, in effect, a muddled mandate. The others have set price stability as either the primary or the hierarchically the single mandate for their central authority.

Mr. FRANK. Mr. Chairman, may I have one sentence?

I thought my Republican colleagues were in favor of American exceptionalism.

Mr. BRADY. And I wish we would have dealt with that on Fannie Mae and Freddie Mac years ago. And I do thank Chairman Garrett for his efforts to actually solve the problem—

Mr. FRANK. Would the gentleman yield?

Mr. BRADY. To this crisis—

Mr. FRANK. If the gentleman would yield—

Mr. BRADY. —in history—

Mr. FRANK. The Republicans have been in power since January 2011 and have done zero on Fannie and Freddie. What is holding you back?

Chairman PAUL. I would like to reclaim the Chair's time.

Mr. BRADY. You have been in power.

Mr. GARRETT. I wish that you wouldn't.

Chairman PAUL. But I do. This will conclude the first panel, and I do want to thank our two colleagues for a lively discussion. I appreciate you very much for being here. I now ask the second panel to be seated.

[PANEL II]

I would like to introduce the witnesses on our second panel: Dr. Jeffrey Herbener is the chairman of the Department of Economics at Grove City College; Dr. Peter Klein is associate professor of applied social sciences, and director of the McQuinn Center for Entrepreneurial Leadership at the University of Missouri; Dr. John Taylor is the Mary and Robert Raymond Professor of Economics at Stanford University, and the George P. Schultz Senior Fellow in Economics at the Hoover Institution; Dr. James Galbraith is the Lloyd M. Bentsen, Jr. Chair in Government/Business Relations, and professor of government at the Lyndon B. Johnson School of Public Affairs at the University of Texas at Austin; and Dr. Alice Rivlin is the senior fellow in economic studies at the Brookings Institution and is a former Vice Chair of the Federal Reserve Board of Governors.

Without objection, your written statements will be made a part of the record. You will now each be recognized for a 5-minute summary of your testimony.

And we will begin with Dr. Herbener.

**STATEMENT OF JEFFREY M. HERBENER, PH.D.¹⁰⁴
PROFESSOR OF ECONOMICS
GROVE CITY COLLEGE**

Mr. HERBENER. Chairman Paul, Ranking Member Clay, and distinguished members of the subcommittee, it is an honor to appear before you.

Left to the market, the production of all goods, including money, passes the profit and loss test of socially beneficial production. Like all private enterprises, a gold mining company produces if the revenue from the sale of its output exceeds the cost of buying its inputs. Its production is socially beneficial because the value of inputs in producing the output to satisfy its customers exceeds the value of those inputs in producing other goods to satisfy other customers.

In the market, money production is regulated by profit and loss. Changes in demands bring forth more production. If the demand for money increases, making the value of gold coins rise, then minting companies would increase production to capture the profit. As the supply of gold coins increase, their value would decline, and as the demands for resources increase, their prices would rise. The profit

¹⁰⁴ [The prepared statement of Dr. Herbener can be found on page 680.]

would dissipate and resource allocation into and production of money would be optimal for society at large.

The production of fiat paper money and fiduciary media cannot be regulated by profit and loss. It is always profitable for a central bank to produce more fiat paper money since larger denomination bills have the same production cost as smaller denomination bills. It is always profitable for a commercial bank to issue more fiduciary media through credit creation since the interest it earns on the loan made always exceeds the nominal cost of issuing fiduciary media. Although the production of fiat money and fiduciary media cannot be justified by passing the market test of optimal production, it is claimed that an elastic currency will render an outcome superior to that of a monetary system of commodity money and 100 percent reserve money substitutes.

Let me address three such claims for an elastic currency. First, that it can keep the price level stable. There is no social benefit from a stable price level. Entrepreneurs earn profits and avoid losses by anticipating changes in prices of all goods, including money, and elastic currency makes the entrepreneurial task more difficult by adding another dimension of uncertainty to the purchasing power of money.

Second, it is claimed that an elastic currency can prevent price deflation. There is no social benefit from preventing price deflation. Faced with lower prices for their outputs, entrepreneurs reduce their demands for inputs, and their prices fall also. This leaves profit production and real incomes intact.

Looking at the evidence across 17 countries over 100 years, Andrew Atkinson and Patrick Kehoe in a 2004 American Economic Review article demonstrated that there is no correlation between price deflation and economic downturns.

The third claim for an elastic currency is that it can accelerate economic growth. There is no social benefit from attempting to accelerate economic growth beyond the rate people prefer. Instead of building up the capital structure of the economy more fully, monetary inflation through credit expansion generates the boom-bust cycle. In the research on the performance of the Fed published in Cato Working Papers in 2010, George Selgin, William Lastrapes, and Lawrence White concluded that under the Fed, the economy has suffered more instability than in the decades before the Fed's establishment, and that even its post-World War II performance has not clearly surpassed that of its predecessor, the National Banking System. Economic theory and historical evidence demonstrate that an

elastic currency system confers no benefit on society at large. Instead, it causes financial instability and business cycles.

The Fed should be abolished, and a market monetary system of commodity money and money certificates should be established. A direct route to achieve this end is to convert Federal Reserve Notes into redemption claims for gold with a 100 percent reserve of gold and to redeem the portion of reserve deposits banks hold at the Fed into cash so that banks hold 100 percent cash reserves against their checkable deposits. At that point, production of money and money substitutes should be done by private enterprises under the general laws of commerce. Thank you.

Chairman PAUL. I thank the gentleman.

I now recognize Dr. Klein for his 5-minute opening statement.

**STATEMENT OF PETER G. KLEIN, PH.D.¹⁰⁵
ASSOCIATE PROFESSOR OF APPLIED SOCIAL SCIENCES
AND DIRECTOR OF THE MCQUINN CENTER FOR
ENTREPRENEURIAL LEADERSHIP
UNIVERSITY OF MISSOURI**

Mr. KLEIN. Thank you, Mr. Chairman, and members of the subcommittee for the opportunity to discuss such an important topic.

My testimony analyzes the Fed and the reforms considered today from the perspective of an organizational economist. How does the Federal Reserve system measure up as an organization? Are its objectives, as mandated by current law, achievable and appropriate for a government agency? Are these objectives consistent with a healthy and growing economy? Is the Fed effectively structured, managed, and governed? Do key decisionmakers have the information and the incentives to make good decisions? Are they penalized for making mistakes?

My answers to these questions are very strongly negative. The Fed has been given a task, managing and stabilizing the U.S. economy, that is impossible for any government planning board. The Fed has vast authority and very little accountability. The Fed can take actions that do enormous harm to the U.S. economy.

Since 2008, the Fed has done exactly that. It has pumped money into the financial system at unprecedented rates. It has kept interest rates near zero, thus discouraging prudent behavior among consumers, entrepreneurs, and government actors, while encouraging

¹⁰⁵ [The prepared statement of Dr. Klein can be found on page 693.]

reckless spending and the accumulation of vast public and private debts.

The Fed has done everything it can to prevent the market adjustments needed for recovery from the financial crisis. All of this has happened without oversight, without external checks and balances, and without public discussion and debate. This kind of set-up is a recipe for disaster.

Everything we know about organizations with vast authority and without external checks and balances tells us that they cannot possibly work well.

Industrial planning fails because planners cannot, and should not, pick winners and losers among firms and industries. Likewise, monetary planners lack the incentives and information to make efficient decisions about open market operations, the discount rate, and reserve requirements. The Fed simply does not know the optimal supply of money or the optimal intervention in the banking system. No one does.

Add the problems facing any public bureaucracy—inefficiency, waste, mission creep—and it is increasingly hard to justify giving so much discretion to a single unaccountable independent entity.

Mismanagement of the money supply not only affects the general price level, it also distorts the relative prices of goods and services. This makes it more difficult for entrepreneurs to weigh the costs and benefits of alternative actions, encouraging them to invest in the wrong activities, that is, to make investments that are not consistent with what consumers are willing and able to buy.

Devaluing the currency and raising prices by injecting liquidity into the financial system rewards debtors while punishing savers, just as artificially low interest rates reward some market participants at the expense of others. Instead of winner-picking, we should allow market forces to determine the value of money, the price of loans, the levels of borrowing and saving, and the direction of investment.

I do support eliminating the dual mandate, getting the Fed out of the full employment business. But I would drop the price stability requirement also.

The belief that we need a central bank to fight inflation is based on a misunderstanding of the nature and causes of inflation. Price levels rise because the central bank has created too much money, not because the economy is somehow overheating, needing the government to cool it off. Central banks don't fight inflation; they create it.

Nor do we need a lender of last resort, which protects not mom-and-pop savers and investors but incompetent bank executives and their financial partners.

I agree with Mr. Brady that a discretionary bailout policy encourages moral hazard. But an explicit, transparent, and evenhanded lender-of-last-resort policy has the same result. If you know the government stands ready to bail you out, you will take risks you should not take. Instead, we should allow banks to compete with each other and succeed or fail based on their ability to satisfy their customers.

Reforms such as increasing the number of Fed Governors, shortening their terms, or changing how they are selected are fine but do not get at the root of the problem. Instead, we should replace the old-fashioned central bank with a modern, progressive, market-based alternative, such as a commodity standard or competition among currencies. A market-based system would free entrepreneurs from the unpredictable and seemingly arbitrary whims of government planners, unleashing entrepreneurs to invest, innovate, and grow the economy, not only in the long run, but now when we so desperately need it. Thank you.

Chairman PAUL. Thank you.

I recognize Dr. Taylor for 5 minutes.

**STATEMENT OF JOHN B. TAYLOR, PH.D.¹⁰⁶
MARY & ROBERT RAYMOND PROFESSOR OF ECONOMICS
STANFORD UNIVERSITY
AND GEORGE P. SCHULTZ SENIOR FELLOW IN ECONOMICS
STANFORD'S HOOVER INSTITUTION**

Mr. TAYLOR. Thank you, Mr. Chairman, and Ranking Member Clay for the opportunity and thanks for bringing these important issues for public discussion.

In your opening remarks, Mr. Chairman, you mentioned that we have nearly 100 years of Federal Reserve history to learn from, and it seems to me the lesson is very clear. Highly discretionary policy leads to problems and poor performance. More systematic, rules-based policies, steady-as-you-go policy, leads to far superior performance.

In the Great Depression, the Federal Reserve cut the growth rate of the money supply. That raised unemployment to unprecedented levels.

¹⁰⁶ [The prepared statement of Dr. Taylor can be found on page 707.]

In the 1970s, a discretionary go-stop policy led to double-digit unemployment, eventually double-digit inflation, low economic growth, and double-digit interest rates.

In the 1980s and 1990s, a more focused policy, more systematic, more rules-based, in my view, led to long expansions, low inflation, declining unemployment, and eventually, higher economic growth.

And, unfortunately, more recently, we have moved back to a more interventionist, discretionary policy, much less systematic, and the results have been a major financial crisis, a major recession and now an abysmally low-growth recovery.

So you can look at the details, but it seems to me the evidence is pretty clear that we need to improve the degree to which monetary policy is rules-based rather than discretion.

I think the legislation to change the dual mandate and focus on price stability, which is in Congressman Brady's bill, and also in Congressman Pence's bill, would help in this regard. So many of these interventions have been based on an effort to address unemployment, and the result has been exactly the opposite. It created these discretionary actions, which has been harmful.

So for those who are worried that removing the dual mandate will actually increase unemployment, I think the historical evidence is exactly the opposite. You can look at the 1970s: This highly interventionist policy, very little systematic behavior, led to very high unemployment.

You looked at the period in the 1980s and 1990s was less interventions, less focus, and the Chairman of the Federal Reserve, at that point Paul Volcker, explicitly tried to interpret the dual mandate in a way that focused more on price stability. The results were dramatically better unemployment.

And of course, now you have the Federal Reserve citing the dual mandate more than it has ever had before to justify these interventions.

So I think the evidence is clear, and the idea is this unemployment rate is unacceptable. It is way too high, and I think part of the reason for that is monetary policy.

Now I agree, Mr. Chairman, that the dual mandate is not the whole answer. So I would also encourage the Congress to require that the Federal Reserve go back to the reporting requirements that were removed in 2000. There were requirements that the Fed had explicitly to report its goals for money growth and credit growth. And those were removed for whatever reason. But things like that could be replaced, a requirement that the Federal Reserve explicitly report

its strategy for setting the instruments of policy, whether it is money growth or interest rates, whatever they want to do.

It is their job to determine that strategy, of course, not yours. And in fact, if there is an emergency, and they want to deviate from it, that is their business. But they need to explain why. They need to come back here and say why we deviated from the strategy which we told you we would follow earlier.

There seem to be these kinds of changes in addition to the restrictions that the Federal Reserve not purchase vast quantities of private securities, or the idea that we balance the voting responsibility among all the presidents, not just give special voting responsibility to some of the presidents, I think those reforms in Congressman Brady's bill would also help a lot.

And in general, it seems to me these kinds of reforms go a long way to having the Congress exercise its responsibility for oversight of an independent agency and at the same time not get involved in the day-to-day operations, micromanaging that agency.

Thank you very much, Mr. Chairman.

Chairman PAUL. I thank you.

And I now recognize Dr. Galbraith for his statement.

STATEMENT OF JAMES K. GALBRAITH, PH.D.¹⁰⁷
LLOYD M. BENTSEN, JR. CHAIR
IN GOVERNMENT AND BUSINESS RELATIONS
LYNDON B. JOHNSON SCHOOL OF PUBLIC AFFAIRS
THE UNIVERSITY OF TEXAS AT AUSTIN

Mr. GALBRAITH. Chairman Paul, Ranking Member Clay, it is an honor to be here, especially given that I am a former member of the staff of this committee and I served on the team who drafted the Humphrey-Hawkins Full Employment and Balanced Growth Act.

I wish to speak mainly today in defense of the dual mandate, the plural mandate, the flexible and practical language of present law. That law was drafted at a time of acute theoretical conflict in economics.

And on the staff. I was a young full employment liberal. One of our colleagues, James Pierce, former Federal Reserve Research Director, was a mainstream Keynesian at the time. Two other colleagues, Robert Auerbach and Robert Weintraub, were Chicago monetarists trained by Milton Friedman.

We compromised on language that gave clear reporting transparency and accountability requirements to the Federal Reserve in

¹⁰⁷ [The prepared statement of Dr. Galbraith can be found on page 713.]

the presence of ultimate objectives but that did not impose anyone's theoretical views. Had we done so, I fear the oversight process would have failed long ago, perhaps when mainstream economics adopted the concept of a natural rate of unemployment in the early 1980s, perhaps when classical monetarism and the relationship between money and prices fell apart shortly after that.

Instead, being flexible, the process has survived for over 35 years, even though the theories come and go.

Now price stability is written into current law as an objective of monetary policy. It is the presence of the maximum employment objective, alongside price stability, in my view, that gives the Federal Reserve leeway to pursue inflation targeting at some rate other than zero if it chooses to do that.

Similarly, if in some alternate universe, the Federal Reserve were to pursue a full employment strategy at all costs, the presence of the price stability language would give you legitimate cause to question its policy and the reasoning behind it.

Having price stability alone in the charter would put the Federal Reserve in the position presently occupied by the European Central Bank, a very difficult position, obliged to pretend to ignore unemployment, even as that issue becomes increasingly important in the politics of the region that it is responsible for; obliged to pretend to respect its charter when circumstances dictate that, in fact, it deviate from it; and it would put the Federal Reserve in a perpetually difficult, I think false, position before Congress, really make it very difficult for the Federal Reserve to report forthrightly on what it is doing; and I think it would equally put the Congress in an extremely difficult position as, unlike the European Central Bank, which is an independent entity, the Federal Reserve is not and cannot be independent of Congress. It is a creature of Congress under the Constitution.

I think also that creating a single rigid price stability mandate would bring back the technical difficulties that we experienced in the 1970s and 1980s over the definition of money. The definition of price stability would become similarly problematic. If one looked at the notional definitions of inflation presently in use, I think you would find that the Federal Reserve did not, in fact, violate its price stability mandate in the run up to the great crisis. It would be very hard to know before the fact when it was doing something that was not consonant with that mandate.

Finally, this is a time of ferment in economics, once again, as the 1970s were. The profession fell into complacency before the great

crisis, and the crisis delivered a shock from which economics has not recovered. Issues of the cost of resources, of the as yet I think unfinished project of financial reform, remain unresolved. Unemployment is not going away as many prominent forecasters believed it would have by now. And there are limits to what the Federal Reserve can achieve.

Reasonable price stability, which was the language in the Humphrey-Hawkins preamble, as I recall, is an important objective, but so is full or maximum employment. And I think Congress would be well advised not to commit to either one at the sacrifice of the other.

I do urge Congress to continue to pursue the goals of oversight, accountability, and to probe deeply what the Federal Reserve is doing but within the framework of present law. Thank you very much.

Chairman PAUL. I thank you.

Now, I recognize Dr. Rivlin

**STATEMENT OF ALICE M. RIVLIN, PH.D.¹⁰⁸
SENIOR FELLOW, ECONOMIC STUDIES,
BROOKINGS INSTITUTION AND
FORMER VICE CHAIR, BOARD OF GOVERNORS OF
THE FEDERAL RESERVE SYSTEM**

Ms. RIVLIN. Thank you, Mr. Chairman.

I am happy to have this opportunity to testify before this subcommittee as you consider the diverse set of bills about the Federal Reserve.

I will concentrate my remarks on the dual mandate. I believe that the dual mandate has served the United States well and that it would be a mistake to restrict the Fed's policy actions to fostering stable prices alone.

I would like to make clear at the outset, Mr. Chairman, that I believe in a strong, independent central bank. Without a strong, independent central bank functioning to mitigate economic and financial instability, I believe the United States would have a weaker, far more chaotic economy, and would lose its leadership position in the global economy.

The objective of economic policy, including monetary policy, should be a rising standard of living for most people over the long run. Controlling inflation is a crucial element of the larger objective because high and especially rising inflation is a serious threat to sustained growth.

¹⁰⁸ [The prepared statement of Dr. Rivlin can be found on page 726.]

I believe the dual mandate is simply a reflection of what average citizens ought to expect their central bank to do: Let the economy create as many jobs as possible, but don't let inflation interfere with that job growth.

Economists translate that commonsense exhortation into a monetary policy aimed at keeping the economy as close as possible to its long-run potential growth without seriously overshooting in either direction. This concept is enshrined in Professor Taylor's famous rule.

The problem for the Federal Reserve decisionmakers is that the potential growth is not observable because it depends on trends and productivity growth, which can shift unexpectedly. In the stagflation of the 1970s, hindsight indicates that monetary policy-makers overestimated potential growth and did not tighten soon enough to avoid the acceleration of inflation at the end of the decade.

In the 1990s, when I was at the Fed, we faced a happier version of the same uncertainty. We had unemployment that was very low but no inflation. We held off tightening the presumption, which proved correct, that accelerating productivity growth had raised potential growth and reduced the risk of inflation.

Partly thanks to the Fed, we had a very good decade in the 1990s. We also balanced the budget. The sooner we get back to those conditions, the better.

But the late 1990s also illustrated the inadequacy of the Fed's tool kit in response to asset price bubbles. The dot-com bubble, if the Fed had raised interest rates to deal with the dot-com bubble, I think it would have tipped the economy into recession, punishing workers and companies across the country for no good reason.

Influencing the Federal funds rate through open market operations is simply not an effective way of calming an asset price bubble. We learned that lesson again in the early 2000s.

While we should not have needed a catastrophe to learn this lesson, the Dodd-Frank Act gives the Fed and the Financial Stability Oversight Council responsibility for financial stability and new tools with which to help achieve it.

The dual mandate is not inconsistent with strong emphasis on controlling inflation when appropriate and even with an explicit target for inflation. Indeed, last January, the Fed confirmed a long-run inflation goal of 2 percent.

Operating under the dual mandate, the Fed has successfully controlled inflation for 3 decades. To change the language of the law to imply that the Fed's only concern should be inflation would send a misleading signal to a public rightly concerned with jobs and growth

as well as inflation. It would imply that inflation is a serious current threat to American prosperity, which seems to me unwarranted.

What we need now is a continuation of accommodative monetary policy plus fiscal policy that combines additional investment in long-run growth in jobs with credible long-run action to stabilize the debt.

In short, monetary policy, as executed by the Fed under the dual mandate, has a positive track record and is currently appropriate. I would urge the Congress not to tamper with legislative language that has served us well. Thank you.

[QUESTIONS & ANSWERS]

Chairman PAUL. I thank the panel, and I now yield myself 5 minutes for questioning.

First off, I would like to address my question to Dr. Herbener and Dr. Klein.

Today, with our previous panel and this panel, we have heard a lot about the dual mandate, and it seems like that is what we have spent most of our time on today.

Could you put that in perspective? How crucial is that? How much difference would it make? I know you have a different opinion about the overall picture and the monetary system, but if we are—we are not on the verge of having a commodity standard and restraint on the authorities, but how crucial do you think this debate is, and how much difference does it make whether there is a single or a dual mandate?

Dr. Herbener?

Mr. HERBENER. I don't see too much evidence—

Chairman PAUL. Make sure I can hear you.

Mr. HERBENER. I don't see too much evidence that in the performance of the Fed, the concentration on one wing of the mandate or another has changed their actual performance. So the Fed was in the 1980s concentrating on price stability more than the unemployment mandate, and yet they inflated to the extent of creating the bubble, the stock market bubble of 1987 that burst and gave us a recession in 1990, 1991.

In other eras where they have concentrated more on unemployment, their performance likewise has not been spectacular. It has been somewhat similar, I think. And so, I don't think in practice that the dual mandate has been effective in restraining the Fed's monetary policy or improving it one way or the other.

Chairman PAUL. Dr. Klein, do you have anything to add on that?

Mr. KLEIN. I agree with that.

I would add that if you look at the incentives of the central bank, the central bank always has a stronger incentive to increase, to be accommodative and increase credit rather than to be contractionary. So I would be more concerned about an emphasis on full employment, which sort of encourages the Fed to go in the direction that it wants to go anyway, and I would be less concerned about it, relatively speaking, on an emphasis on price stability, which would tend to constrain the Fed and go against the direction that it naturally wants to go.

Chairman PAUL. Of course, the argument that it didn't restrain them is precisely the reason they like the mandate because it allows them to expand money at will and of course we see this as a problem.

Quick question for Dr. Taylor, you are emphasizing some of these monetary rules, and even more monetary statistics, would you be in favor of the Fed once again issuing a report on the size and growth of M3?

Mr. TAYLOR. I would be in favor of the Fed doing that. I think the more emphasis on money statistics, the better, in my view. They didn't pay enough attention to that.

But I would say from the point of view of the Congress, it seems to me you want the Fed to report on its strategy, not to dictate exactly what the strategy should be. So that is the Fed's job. You come to this hearing and report the strategy explicitly like they did about the M3, which was I think constructive. But it also requires the Congress, this committee, to ask the questions about the strategy. I think that dialogue is very important. I wish we would go back to that.

Chairman PAUL. Dr. Galbraith, I tend to agree with you about the constitutionality of appointments to the Federal Reserve Board. We always have a different opinion about what we should be doing, monetary policy and the Federal Reserve. But where does this authority come from, constitutional authority, since you addressed the Constitution, the constitutional authority to actually emit the bills of credit, which is prohibited by the Constitution, the creation of a fiat monetary system. Where does that authority come from exactly?

Mr. GALBRAITH. I believe, Mr. Chairman, and I would be cautious about tangling with you on this, but the authority for the Federal Reserve Act simply comes from the authority given to Congress to coin money and regulate the value thereof and that the Federal Reserve Act has been a functional piece of American law for over a century now, so it would be a surprise to me if it were, per se, unconstitutional on that ground.

Chairman PAUL. Of course, if there is a prohibition in the Constitution, you can't change the Constitution by the Federal Reserve Act.

But Dr. Rivlin, I think the removal of the report on M3 came after you left the Fed, I am not sure. But why was that dropped?

What would it have harmed us to know a little bit about the broad money supply? It seemed like it emphasizes a point of money growth and many believe still that the true price inflation is a consequence of money growth. Is there any reason that we shouldn't have that figure presented to us? Why was it canceled out?

Ms. RIVLIN. I don't know. I believe that was after I left. But I am always in favor of more information rather than less.

But the emphasis on the monetary aggregates was declining, for a good reason. They weren't stable with respect to anything, and we have had all sorts of different kinds of money created in the last few decades, and the idea that it was mostly checking accounts and savings accounts has just disappeared.

Chairman PAUL. I, of course, would like to see more attention given to the stableness or the definition or explanation or defining what the monetary unit is rather than trying to concentrate on the consequences of an unstable currency. But we don't have much time to get into that, so now I am going to yield 5 minutes to Mr. Clay.

Mr. CLAY. Thank you, Mr. Chairman.

Welcome back, Dr. Rivlin.

Dr. Rivlin, at any time during your tenure on the Board of Governors, did the dual mandate interfere with the Board's ability to set monetary policy?

Ms. RIVLIN. No, I don't believe it did, Mr. Clay.

Setting monetary policy is really difficult. And you are always weighing different considerations. But we were very focused, when I was there, on what was happening to productivity growth, which was something of a mystery. We weren't very worried about inflation because it was falling, and so we continued, I think, thinking we were in conjunction with both mandates to keep interest rates relatively low.

Mr. CLAY. And inflation was falling because the economy was robust. It was growing jobs, and that was because the Administration was working with Congress to help the economy along. Is that correct?

Ms. RIVLIN. We had strong growth in the economy. We had a restrictive fiscal policy in that period. We were trying to get back to a balanced budget, which sounds like a fantasy now, and we did it. So

the Fed's job was easier at that moment because the fiscal policy was quite restrictive.

Mr. CLAY. Thank you for that response.

And Dr. Galbraith, as an architect of the dual mandate, can you share with this committee the vision and the need that the two legislative authors had for the dual mandate then, back then, Senator Humphrey and Congressman Hawkins?

Mr. GALBRAITH. Yes, Congressman. I had the privilege of working directly with Congressman Hawkins at that time. Of course, an economic policy mandate was not a new thing for the United States. We had the Full Employment Act of 1945, which stipulated maximum employment production and purchasing power as the goals of United States economic policy for the whole of the government.

The Humphrey-Hawkins Full Employment and Balanced Growth Act sought to modernize and to make a little more ambitious and a little clearer the objective, particularly with respect to employment. And it also ended up clarifying what was meant by purchasing power, that is where the reasonable price stability came into the preamble. So it was a way of broadly specifying economic policy objectives for the entire government. But also with respect to the Federal Reserve, this was the moment that codified what we had set up through H. Con. Res. 133, in 1975, a process of dialogue with the Federal Reserve, regular oversight hearings, which goes on. And the Humphrey-Hawkins Act Federal Reserve provisions placed those into law and set a regular procedure, and that included, of course, as Professor Taylor said, goals for the growth of various monetary aggregates, which over time, as Dr. Rivlin has just said, became less useful because the relationship between those objectives or those statistics and anything you ultimately cared about became much noisier and less reliable.

Mr. CLAY. Thank you for that response.

Dr. Klein, being from Missouri, my home State, let me ask you about something that Americans are concerned about, and that is the rise in gasoline prices at the pump, especially the working class.

What measures could the Federal Reserve take to stabilize the recent rise in gas prices? Any suggestions?

Mr. KLEIN. The price of gasoline and the price of oil fall a little bit outside the mandate of the monetary authority. So certainly rising energy prices is one manifestation of a monetary policy that is overly accommodative. But on the whole, energy prices, especially for oil, gas, and so forth are set primarily in global energy markets over which U.S. policymakers have relatively little control. There are

measures about increasing supply and so on that might be within the purview of Congress or the Executive Branch, but in my view, there is not much that the Federal Reserve System can or should be doing about that.

Mr. CLAY. Thanks for your response.

I yield back.

Chairman PAUL. I now recognize the gentlelady from New York, Dr. Hayworth.

Dr. HAYWORTH. Thank you, Mr. Chairman, and thank you again for holding this hearing and for your leadership on this crucial question.

I would like to ask this question of the panel: Is it fair to say that we probably would not have to debate as vigorously and as urgently as we do, and legitimately so, under these circumstances, the role of the Fed were it not for the fact that the Fed has, as our central bank, had to contend over the decades with an increasingly incontinent Federal fisc? To me, it strikes me that we talk about the mandates for the Fed and the way in which it operates, and again thinking about our conversations with Chairman Bernanke, that so much of what the Fed has felt compelled to do, if you will, I realize I am using a somewhat loose interpretation, has been in response to the fact that we have a Federal Government that fundamentally has continued, and at an accelerating rate over the past few years, to mismanage, if you will, large segments of the economy.

Dr. Klein, perhaps you could start with that, please?

Mr. KLEIN. I certainly think it is the case that the job that is given to the Fed becomes more difficult under the circumstances that you describe. But I am not sure it is right to think of other branches of the Federal Government, the Treasury, Congress and so on, and the Fed as being sort of antagonists, competing against each other or playing off each other.

One of the major functions performed by, in open market operations, is, as has already been discussed earlier this morning, monetizing the debt, so the Fed facilitates government expenditures and government borrowing that otherwise would not be politically feasible if the Fed were not there to monetize the debt.

I think the Fed and the rest of the Federal Government are much more likely to be seen as working hand-in-hand than opposing each other.

Dr. HAYWORTH. Which actually, is exactly what I meant. The Fed has been the government's enabler to a certain extent, the Federal Government's enabler, and that is part of our problem. It is very

difficult to use monetary policy to endlessly accommodate what we have taken on.

Mr. KLEIN. Yes, I agree with that.

Dr. HAYWORTH. Thank you sir. Dr. Herbener?

Mr. HERBENER. Yes, I agree, as well. It creates a certain type of moral hazard to be able to appeal directly to a printing press or to some agency that would monetize debts that are issued. I would be profligate as well, anyone would, relative to not having that kind of accommodation.

Dr. HAYWORTH. Absolutely.

Dr. Taylor. Thank you.

Mr. TAYLOR. Yes. I think, if you hold out your shingle and say you are open for business, then people will come. I think that is what basically has happened. The Federal Reserve has provided what you describe as an alternative to some actions. It bought 77 percent last fiscal year of the debt issued by the government. That is a big, big intervention.

I think monetary policy is itself part of the problem now, given what it has done, but fiscal policy obviously is a problem, as is regulatory policy. So there is a whole gamut of policies. I think each of those should be addressed separately. Monetary policy can be improved and so can fiscal policy and regulatory policy. But the idea of working hand-in-hand, I think, leads to the kind of problems we have seen already. That is why I think questions about the mandate are important.

Dr. HAYWORTH. That indeed is why I myself have become a co-sponsor of Representative Pence's bill, because of that moral hazard issue.

I am eager to hear from Dr. Galbraith and Dr. Rivlin.

Mr. GALBRAITH. I think many of our problems now are due to a disastrous deregulation and desupervision of the financial sector which led to a catastrophic meltdown of that industry and of the solvency of much of the American middle class, and the consequences, the effects that we see in the Federal budget are largely a consequence, not a cause, of that phenomena—tax revenues fall. Unemployment payments go up. Other kinds of stabilizing payments go up. We are much better off actually for having a large Federal Government, a Federal budget that can stabilize the economy in this situation than we would be if we didn't have it.

We didn't have it in the 1930s, and our output fell by about one-third. The overall decline was much less this time around, and that

was because incomes were substantially stabilized by the fiscal actions of the government.

Dr. HAYWORTH. Wow, we have a lot of food for thought there, Dr. Galbraith. You have defined the crux of the contrast between the two sides of this dais, and I realize we are out of time.

Thank you, Mr. Chairman, very much. I yield back.

Chairman PAUL. I now recognize the gentleman from Arizona, Mr. Schweikert.

Mr. SCHWEIKERT. Thank you, Mr. Chairman.

First, forgive me, but this is sort of an esoteric question, and no pointing and laughing, particularly for all of you with Ph.D.s. We take a look back over the last 30 years at many of the different asset bubbles, whether it be real estate or even certain commercial bubbles, whether it be the Internet bubble, where it was often large amounts of resources going in and inflating value beyond.

Is it theoretically possible to have a bubble on the Fed's balance sheet by acquiring so much U.S. sovereign paper, so much mortgage backed, MBS? At some point, does it create a type of distortion in the market, either by creating dramatically artificially low interest rates over here, and at some point, that is a bond bubble—it is a cascade effect—or actually on their own holdings itself? And is that just as—right now, we have the discussion about, are we heading towards a student loan bubble because we are \$1 trillion there? We are heading to \$3 trillion on the Federal balance sheet. It is a little esoteric, and it is not as—but is it one off?

Dr. Herbener, please, share with me, is my concern just sort of unfounded?

Mr. HERBENER. I think the Fed balance sheet, of course, exhibits the source of the bubbles that manifest in the economy. So when we see the Fed's balance sheet, they engage in open market operations, or they buy mortgage-backed securities from the banks and so on and generate reserves in the banking system, then it creates the possibility of the banks just creating credit on the basis of these reserves and channeling this credit into particular lines of activity where the bubbles arise. And so this is the very process by which the asset-priced bubbles are generated in the economy. We can't always tell exactly what lines they will be generated in just by looking at the Fed's balance sheet because the banks, of course, can generate credit in different lines.

Mr. SCHWEIKERT. Dr. Rivlin, I owe you—you will not remember, but many years ago, I ran into you walking down the street and you were very, very kind to me. You spent literally 10, 15 minutes just

talking to me on the street about a couple of esoteric issues, so I have always been very appreciative of your time.

Ms. RIVLIN. Thank you. I am glad you have that memory.

I think asset bubbles are a real problem for the Fed, but not because of the balance sheet effect. Because monetary policy is not a good tool for dealing with asset price bubbles. It is a good tool for dealing with general price inflation.

So the Fed needs different tools, credit, specific credit controls and controls on excessive leverage to deal with bubbles. And the Dodd-Frank Act does put them in that business, and I think that is good.

Mr. SCHWEIKERT. Could current Fed action, and I would like Dr. Galbraith's opinion, could the current Fed sheet balance sheet, the mechanics there, could it also be leading to a bond bubble right now if we start to move toward more normalized interest rates, have we created so much paper that that is in many ways artificial rates? Does it create a cascade when we start to move?

Ms. RIVLIN. I don't think it has to. I think the Fed can get its balance sheet down quickly. It is always much easier for the Fed to be less accommodative than more. And I am not worried about this astonishing balance sheet. It is very big, but right now, the reason to worry would be to, that we had general inflation, and we don't.

Mr. GALBRAITH. I think it would be very hard for the Federal Reserve to raise interest rates rapidly. And I don't think it is likely to do so. One way to interpret your question is to ask whether there is a situation in which the markets might sell off U.S. bonds rapidly without that being controllable by monetary policy action. I think that is also unlikely under present conditions.

What the markets have shown us is that in adversity, people want to hold U.S. bonds. They want to hold U.S. bonds over practically any other asset because we are the largest, most liquid, and completely reliable market in the world for safe liquid asserts.

Mr. SCHWEIKERT. I am sorry, but how much more capacity do you believe is pragmatic for the Fed to continue to grow at? Do they go to \$4 trillion, \$5 trillion? How big do these balance sheets get?

Mr. GALBRAITH. That is a very interesting question for which, Congressman, I have to tell you, I don't have an answer.

Mr. SCHWEIKERT. Thank you for yielding to me, Mr. Chairman.

Chairman PAUL. We are going to have a brief second round if you are able to stay.

But I have a question for Dr. Rivlin and also for Dr. Klein. I don't want to get into so much on the cause, but I am trying to get an

assessment of how serious you think the world financial crisis is? A lot of us put a lot of blame on monetary policy and the Federal Reserve and the dollar reserve standard and excessive debt and these issues. We are not going to resolve that today, who is to blame.

But do you consider the world financial situation to be a mess or just something that will be taken care of soon and there is not that much to worry about?

Ms. RIVLIN. I am very worried about Europe. I think the austerity policies are the wrong policies at the moment, that they— and they will make the situation worse, and that could be bad for us. The long-run debt situation in Europe is serious, but at the moment, I would focus attention on their getting out of the recession.

For us, I think we have to get out of this recession too, but we have to get our long-run debt under control. I think we can, but we haven't.

Chairman PAUL. Could you follow up, Dr. Klein, give me your assessment?

Mr. KLEIN. I think it is a huge crisis, both in Europe and in the United States, with tremendous consequences, not only the crisis itself but in my view, the response to the crisis by the monetary authority. The hugely accommodative policy, the zero interest rates and so on have taken a bad situation and sown the seeds for making that situation much, much worse. Of course, we haven't seen substantial rises in the overall price level since 2008. But if you look at the amount of money that has been pumped into the system, the increase in bank reserves and so on, there is simply no theoretical model of which I am aware, no empirical study that I can cite, in which those kinds of actions do not have very serious, long-run consequences on price inflation. So I think we haven't seen the worst of the results that our current policy is bringing about.

Chairman PAUL. Thank you, and I yield to Mr. Clay.

Mr. CLAY. Thank you, Mr. Chairman. I would like to start with a panel-wide question. Perhaps you can briefly try to answer it, starting with Dr. Herbener, do you think the Federal Reserve's monetary policy execution would be more effective if it set explicit inflation targets and was held accountable to those targets?

Mr. HERBENER. Not really. I think when the Fed engages in any kind of expansionary monetary policy, they always generate the same ill effect in the economy. They always generate some kind of credit expansion, which leads to a pattern of malinvestments, even when they keep overall price levels stable. They generate asset price inflation within the general price level, and these lines of

malinvestment is the sort of thing that we saw in the 1920s, very similarly also in the 1980s.

So even if there were stable price-level targets that the Fed could hit, they would still generate the same kind of financial instability and patterns of malinvestments and then the necessary liquidation that we see in the bus.

Mr. CLAY. How about, Dr. Klein, your opinion?

Mr. KLEIN. Yes, sir, I think posing the problem as a trade-off between, say, inflation targeting as opposed to targeting nominal income is sort of a false dichotomy. Something that Representative Paul mentioned in the first round was the idea of increased productivity resulting in decreases in prices as, of course, we see in many industries, computers, information technology and so on.

There is no reason that we should expect or desire, “stable price level” of 2 percent a year or whatever. In a growing economy, we might easily expect the price level to fall. That is exactly what happened during the 19th Century in the United States, which is the period of the strongest sustained economic growth in U.S. history, that increased growth, which was driven by productivity improvements resulted in a decreasing, and decreasing average price levels. There is no reason for policy to try to prevent that.

Mr. CLAY. Thank you, Dr. Taylor.

Mr. TAYLOR. We already have an inflation target that is announced, 2 percent. But in the meantime we continue to do this highly interventionist policy, so it seems to me that is not enough, and that is why people are talking about the dual mandate. That is why I am talking about returning to reporting about the strategy of the Fed. So I think you need more than that to get out of the terrible situation we are in now.

Mr. CLAY. Thank you. Dr. Galbraith?

Mr. GALBRAITH. I think explicit targets can be useful. In the Humphrey-Hawkins law, there was an interim target for 4 percent unemployment, 3 percent inflation to be achieved after 4 years. It took 22 years until Alice Rivlin was running things and it actually happened. But the difficulty, I think, was in setting too ambitious a target and allowing too long a timeframe for there to be real accountability.

If you are going to set targets, it should be on an interactive basis and something where you can come back in a year and say, look, how did you do in relation to those targets, and what have you learned about the world from your experience? That would make a useful contribution, it seems to me.

Mr. CLAY. Dr. Rivlin, your opinion?

Ms. RIVLIN. I would agree with that. I think that the 2 percent target is about right. I wasn't a big enthusiast of setting an explicit target, but 2 percent is about right as long as you don't take it too seriously, because there might be reasons to deviate in one direction or another.

Mr. CLAY. Thank you so much.

Mr. Chairman, I yield back.

Chairman PAUL. I now recognize the gentleman from Arizona for a follow-up.

Mr. SCHWEIKERT. Thank you. We were sort of heading on the question, I was going to start with Dr. Taylor and then move to Dr. Klein. How big can the balance sheet get?

Mr. TAYLOR. I already think it is too big. I think the quantitative easings, QE-1 and QE-2, are not appropriate, and that is why the balance sheet is as big as it is. If we had just done the interventions during the panic period, the balance sheet would already be back to normal.

I don't think see any evidence that those have been helpful, I have done research on QE-1, and I think that it is already too big. I do worry about the size of it already because it has to be pulled out, or there will be a bubble. In fact, right now we are already running the risk of a bubble because of the commitment to hold rates so low for so long.

I think, when you talk about bubbles, and we talk about the Fed's efforts to stop bubbles, I think the problem really is more is the Fed causing bubbles rather than the responsibility to deal with them.

So that, I see that concern in the housing bubble, I see some other bubbles in the past, and when you think about bubbles, let's not forget the fact that the Fed itself can and, in fact, has in the past caused bubbles and it may be doing that again right now.

Mr. SCHWEIKERT. Dr. Klein?

Mr. KLEIN. Yes. I agree strongly with what Dr. Taylor has said about the Fed being the cause of bubbles and the idea that the Fed needs additional tools to be able to pop bubbles when they emerge is taking the wrong view of the nature and sources of those bubbles. But as to your question about the balance sheet, I agree with Dr. Taylor, but would add that it isn't just the overall size of the balance sheet that matters, it is the composition of the balance sheet.

And my concern, as a microeconomist in looking at quantitative easing and other interventions by the Fed, is not so much their effect on the Fed's overall balance sheet, but the effect on particular firms

and industries. The winner picking, preventing restructurings that are needed to get the economy back on the right track is just as important as looking at the overall size of the balance sheet.

Mr. SCHWEIKERT. Dr. Galbraith, and then we are going to bounce back. Do you have a comment on, first, how big the balance sheets can get, and second, does the mix or the size or both create a distortive effect on the allocation of capital?

Mr. GALBRAITH. As I said earlier, I don't have a clear view on how big the balance sheet might get. I do think that as one looks at the composition of the balance sheet, what is in the portfolio, one has to evaluate the quality of the assets. And that is a process which has ramifications for the financial structure going forward. There comes a point when you do need to address those questions.

Mr. SCHWEIKERT. Okay. Dr. Herbener?

Mr. HERBENER. I would just add one thing. I think most of us would agree that the real problem is how exactly is the Fed going to unwind the balance sheet, not how big is it going to get, but what will be the process by which they take these assets off of their books, and what will the repercussions be in the markets when they begin this process seriously of unwinding things?

Mr. SCHWEIKERT. There goes my bond bubble concern. That is, what do I know. Dr. Rivlin, you also have been outspoken both on fiscal policy and that has always been appreciated to have other voices out there saying we are—we have some great difficulties.

Has the fact that the Fed has been able to grow its balance sheets to such extraordinary levels, has, in many ways, has that been a way to help Congress avoid fiscal policy?

Ms. RIVLIN. I don't think so. I think the Congress has not wanted to face up to the hard choices.

Mr. SCHWEIKERT. It is the same thing.

Ms. RIVLIN. And the Fed's buying bonds is a small part of the whole world buying bonds. As Dr. Galbraith said, counter to reality, the world believes that we are a very safe investment.

Mr. SCHWEIKERT. But in U.S. sovereign debt issues over the last 24 months, hasn't the Fed represented close to half?

Ms. RIVLIN. I don't know exactly what the figure is, but right now, we can't have a rapid reduction in our national borrowing because it would derail the recovery.

So I don't think the Fed has much of a choice. I would be cautious about increasing the balance sheet much further. I don't think there is an answer to your very good question about how big can it get, but right now, I think we need a double kind of fiscal policy.

It shouldn't be too severe in the short run, but we have to get the long run debt under control.

Mr. SCHWEIKERT. Mr. Chairman, thank you so kindly.

Chairman PAUL. I now recognize Mr. Green from Texas.

Mr. GREEN. Thank you, Mr. Chairman. I thank you and the ranking member for calling this hearing today, and I thank the witnesses for being in attendance.

Mr. Chairman, I also want to thank you because I am one of the Members who signed the letter requesting such a hearing, and I thank you for honoring the request to the witnesses.

Let's start with something very basic.

The bills that we have range from tweaking to the abolishing of the Fed, and I am curious as to how many of you are of the opinion that we should totally eliminate the Fed? Is there anyone who thinks that it should be abolished, one, two persons think we should abolish the Fed. And, if you could, just give me a quick, if you can, summary of why you think the Fed should be abolished. And then I would like to hear from your colleagues as to why you think we should maintain it, just quickly, because obviously time is of the essence.

And I will start with you, Dr. Herbener.

Mr. HERBENER. The Fed should be abolished because the conduct of monetary policy under the Fed can bring no benefit to society at large, as I mentioned in my previous remarks.

Mr. GREEN. The Fed will make bad decisions every time? There will be no good decisions made? It just can't have the positive impact on the economy?

Mr. HERBENER. Yes. I would say that there is no other instance where the government has completely monopolized the production of something on the market to impact society at large.

Mr. GREEN. All right. I am going to take that as your answer and move on to the next person. Dr. Klein?

Mr. KLEIN. Yes. We can talk about the Federal Reserve System per se as an example of the central bank or the institution of central banking more generally. And in my written testimony, I give some reasons why the institution of central banking is not only unneeded, but is also harmful to a market economy.

Mr. GREEN. But in your opinion, there should not be a central bank in the United States of America?

Mr. KLEIN. Yes, sir, we don't have a central automobile manufacturer or a central dairy or a central computer company.

Mr. GREEN. How do you juxtapose that with the central banks around the world, where major countries in the world all have central banks?

Mr. KLEIN. What I am expounding is certainly not the majority view among policymakers, but that hardly makes it incorrect.

Mr. GREEN. I think that is a fair statement. Dr. Taylor?

Mr. TAYLOR. Continuing, I think we should reform the Fed. I think the evidence, especially in the last few years, is that the policy is not working. I look back in history, and I see the 1980s and 1990s, a part of the time where Alice Rivlin was on the Fed and things worked pretty well.

They had—it wasn't intervening like it is doing now. It had a more steady-as-you-go policy. It had a lot of focus on the overall stance of policy, and it worked.

So I think we need to get back to that. I call it a rules-based policy, not a more systematic policy, and I think some of the reforms we are discussing today will help us get back to that.

Mr. GREEN. Dr. Galbraith?

Mr. GALBRAITH. I think on the whole, Congressman, that the 20th Century was better than the 19th Century, and that having a central bank was a modest, useful part of the institutional structure that gave us a very successful century.

I am very cautious about taking radical institutional steps when there is very little going on in the world that would give us confidence that they would be stabilizing rather than destabilizing.

Mr. GREEN. Dr. Rivlin?

Ms. RIVLIN. I feel strongly that we need a strong and independent central bank. I think the evidence of the 19th Century is not as encouraging as some would think, and the idea that the world's greatest economy could make due without a central bank, without a lender of last resort, without a monetary policy seems to me quite bizarre.

Mr. GREEN. Thank you. Let me go back now in reverse order. I will start with you, Dr. Rivlin, first.

The question is, would we be at a disadvantage if we had no central bank and other major economic powers have central banks?

Ms. RIVLIN. I think we would be, and I think we would lose our preeminence as a great—

Mr. GREEN. Currency supremacy. The dollar, as you know, is a fairly well-accepted currency around the world. Would it have an impact on the dollar?

Ms. RIVLIN. Yes. I think it would.

Mr. GREEN. Okay. Let me go to the next person please.

Mr. GALBRAITH. Yes, I think it would clearly have an impact. It would make the dollar, U.S. Treasury bonds much riskier.

Mr. GREEN. Mr. Taylor, and then I am going to go quickly because my time is about up.

Mr. TAYLOR. I don't recommend abolishing the Fed, I would recommend reforming the Fed.

Mr. GREEN. Would we be at a disadvantage, sir, Mr. Klein, if we had no central bank and other countries did?

Mr. KLEIN. Of course, it would depend on how such a reform would be implemented but, look, right now people are fleeing from the dollar and heading toward hard assets, like precious metals.

Mr. GREEN. Dr. Herbener?

Mr. HERBENER. If the dollar was backed by gold, I don't see how that could harm our—

Mr. GREEN. But you would back the dollar with gold?

Mr. HERBENER. Yes, sir.

Mr. GREEN. Thank you, Mr. Chairman.

Chairman PAUL. Thank you.

I now recognize the gentlelady from New York.

Dr. HAYWORTH. Thank you, Mr. Chairman.

I have a thought for us as we conclude, and I thank you so much for your insights, each of you. It strikes me that the size of the Fed's balance sheet is going to be largely determined given the structure of our representative democracy by the will of the American people to take in hand what we have created for ourselves at this juncture in our history.

Is there any sense that it is really going to take a lot of political will, if you will, to get our fisc in order for us really to, unless there is some significant change in the role of the Fed or the structure of the Fed. I think so much of it is going to lie in how we manage our Federal budget going forward.

Dr. Rivlin, since I missed you last time?

Ms. RIVLIN. I strongly agree with that. I served on the Simpson-Bowles Commission and the Domenici-Rivlin Commission and there have been other groups that have all come to the conclusion that we really need to get our fiscal house in order so that the debt is not rising faster than our economy can grow, and that is going to take hard decisions, but we have to do it.

Dr. HAYWORTH. Thank you, Dr. Rivlin. Thank you for your service. It is much appreciated.

Dr. Klein, I will flip back around.

Mr. KLEIN. Of course, I agree, this is a tremendous political challenge. Whether it takes a major crisis to bring, call forth the political will to make the necessary changes, I don't know, but I would hope that this body and others would be able to push things in the right direction without waiting for the bottom to fall out.

Dr. HAYWORTH. Right. Now, Dr. Herbener, do you think what we are viewing in Europe, we should take as a portent of things to come if we don't do something?

Mr. HERBENER. I think our situation is perhaps even more precarious than theirs, given what the Fed has done in the wake of the crisis to bail out the banking system. So, again, it is going to take strong action against some of the political interests that exist here to turn things around before. As Dr. Klein said, there is a crisis, and then we have to do something.

Dr. HAYWORTH. All right. Dr. Taylor, your thoughts?

Mr. TAYLOR. Fiscal policy is certainly a mess right now, and it has to be fixed, or we will be like Europe. But please don't forget about monetary policy. It tends to be arcane, it tends to be too narrow, it is difficult, but it is essential right now to get it right.

I don't want to see a future where quantitative easing becomes the new monetary policy. When the economy slows down, we do gigantic quantitative easings. We don't even know their effect. We don't even know how large it should be; it is very dangerous. I think it will take some oversight exercise by Congress to prevent that in the future.

Dr. HAYWORTH. In view of what you have said, Dr. Taylor, regarding the Fed's purchase of Treasuries and the proportion of Treasuries that have gone to the Fed, is there a certain crowding-out effect that we might also be witnessing.

Mr. TAYLOR. Eventually, of course, but in the meantime, actually, the figure is 77 percent.

Dr. HAYWORTH. Yes.

Mr. TAYLOR. The amount of debt increase in Fiscal Year 2011, 77 percent of that was the Fed and that is a gigantic amount. And so crowding out, I believe there is crowding out about that, even though the economy is weak. Yes, crowding out in a weak economy.

Dr. HAYWORTH. So there are Federal budget concerns and the Federal investments are crowding out the private markets.

Mr. TAYLOR. Crowding out occurs because of the deficits and the borrowing. And even in a weak economy, I believe it occurs, but as the economy picks up, it will be even more of a concern.

Dr. HAYWORTH. And more so artificially, if you will, in a sense because of what the Fed is endeavoring to do or artificially making the picture for Treasuries look perhaps a bit rosier than it would be if we had a real marketplace for them.

Mr. TAYLOR. Actually, the way I think about what the Fed is doing now with respect to oversized balance sheets and effectively dictating what the short-term interest rate will be, it doesn't set it in the market. It dictates by telling what the Reserve's interest rates will be on reserves.

So it is effectively, as the Fed has replaced the entire money market with itself, and I tell you, we just don't know all the implications of that. Nobody on this panel knows the implications of that.

So the sooner we get back to normal where the supply and demand for money is dependent to determine that interest rate, and the interest rate is set according to reasonable methodology and reported to the Congress, the strategy for doing that, the better off we will be.

Dr. HAYWORTH. It is not really a central bank, it becomes an uber bank in a sense.

Mr. TAYLOR. Yes.

Dr. HAYWORTH. Thank you. Thank you all. Thank you again, Mr. Chairman.

Chairman PAUL. Thank you very much. I want to thank the panel today for your time and your testimony. I found the hearing very fascinating because even though we might not agree on the cause and exactly what we have to do, it seemed like there was a general consensus that we do have a problem and we have to deal with it. It is not just the United States; it is worldwide.

And my guess is that someday we will seriously not only look at the management of a central bank or whether or not we really need a central bank, but ultimately I think what we will have to do is talk about the nature of money, the definition of money, because it is pretty hard to manage something you can't even define. But, once again, thank you very much for coming today.

The Chair notes that some Members may have additional questions for this panel, which they may wish to submit in writing. Without objection, the hearing record will remain open for 30 days for Members to submit written questions to these witnesses and to place their responses in the record.

[Whereupon, at 12:30 p.m., the hearing was adjourned.]

STATEMENTS

STATEMENT FOR THE RECORD
HON. RON PAUL¹⁰⁹
REPRESENTATIVE, 14TH DISTRICT OF TX
CHAIRMAN, SUBCOMMITTEE ON
DOMESTIC MONETARY POLICY & TECHNOLOGY
U.S. HOUSE OF REPRESENTATIVES

Although it has taken nearly a century, it seems that the entire spectrum of the American political establishment has finally realized the destructive power of the Federal Reserve System. Whether left, right, or libertarian, politicians are lining up to attack Ben Bernanke and the Fed's destructive monetary policy. Where there is disagreement or lack of understanding, however, is on why the Fed's monetary policy is destructive, how it harms the economy, and what should be done about it. Today's hearing will examine the various proposals that have been put forth both to mend and to end the Fed. It is my hope that this hearing will spur a vigorous and long-lasting discussion about the Fed's problems, a discussion which will lead to concrete actions once and for all to rein in the Fed.

Much confusion exists over what the Federal Reserve System actually is. Some people claim that is a secret cabal of elite bankers, while others claim that it is part of the federal government. In reality it is a bit of both. The Federal Reserve Board is a government agency, while the Federal Reserve Banks are privately-run government-chartered institutions, and monetary policy decisions are made by the

¹⁰⁹ Attached to Representative Paul's statement for the record were excerpts from the *The Minority Report of the Gold Commission*, also published separately as *The Case for Gold*. Those excerpts, Chapters 2 & 3 on the history of money in the U.S., can be found in Appendix A.

Federal Open Market Committee, which has members from both the Board and the Reserve Banks.

The Federal Reserve System is the epitome of crony capitalism. It exemplifies the collusion between big government and big business to profit at the expense of the taxpayers. The Fed's bailout of large banks during the financial crisis propped up poorly-run corporations that should have gone under, giving them an advantage that no other business in the United States would have received. The bailouts continue today, as banks maintain \$1.5 trillion worth of excess reserves at the Fed, reserves which were created through the Fed's purchase of worthless securities from banks. The trillions of dollars that the Fed has injected into the system have the goal of forcing down interest rates. But the Fed fails to realize that interest rates are a price, the price of money and credit, and that forcing interest rates down will only create an even bigger bubble and an enormous economic depression when this entire house of cards comes falling down.

The Federal Reserve is statutorily required to focus on three aims when engaged in monetary policy: full employment, stable prices, and moderate long-term interest rates. In practice, only the first two have received any attention, the so-called "dual mandate." Some reformers have called for the full employment mandate to be repealed, in order to allow the Fed to focus solely on stable prices. But these critics ignore the fact that stable prices are not a desirable goal. After all, with increasing productivity and technological innovation, the natural trend for most goods is for prices to decrease. By calling for the prices of goods to remain stable, the Fed would have to inflate the money supply in order to counteract this trend towards price declines, pumping new money into the system and creating economic distortions. This is exactly what happened during the 1920s, as the Fed's monetary pumping was masked by rising productivity. The result was stable prices, but the malinvestment caused by the Fed's loose monetary policy became evident by 1929. There is no reason to expect that focusing on stable prices today would have a dissimilar outcome.

Other reformers have called for changes to the composition of the Federal Open Market Committee, the body which sets the Fed's monetary policy objectives. On Constitutional grounds, the FOMC is undoubtedly problematic, as government appointees and the heads of the private Federal Reserve Banks work together to set monetary policy objectives that directly impact the strength of the dollar. While all of the members of the FOMC ought to be confirmed by the Senate,

debates about the size of the FOMC or whether Reserve Bank Presidents should make up a majority of the members or whether they should even serve at all are largely a sideshow. While the only dissent to monetary policy decisions in recent years has come from Reserve Bank Presidents, there is no reason to think that expanding the FOMC to include more Reserve Bank Presidents would lead to any greater dissent or to any substantive changes to the conduct of monetary policy.

Another proposal for reform is for outright nationalization of the Fed or its functions. No longer would the Fed create money; that function would be taken up by the Treasury, issuing as much money as it sees fit. No longer would the Treasury issue debt to cover fiscal deficits, it would just issue new money to cover budget shortfalls. If what the Fed does now is bad, allowing the Treasury to print and issue money at will would be even worse. These types of proposals harken back to the days of the first greenbacks, which the U.S. government began issuing in 1863. A pure fiat paper currency, unbacked by silver or gold, the greenbacks were widely reviled. Only once the greenbacks were made redeemable in gold were they accepted by the American people. The current system of Federal Reserve Notes is even worse than the greenback era in that there is no hope that they will ever be redeemable for gold or silver. The only limiting factor is that the Federal Reserve System only creates new money when purchasing assets, normally debt securities. Allowing the federal government to print money without at least a nominal check on the amount issued would inevitably lead to a Weimar-like hyperinflation.

So what then is the solution? The Fed maintains that a paper standard can be adequately managed without causing malinvestment, inflation, or other economic distortions. If the Fed were omniscient and knew the wishes, desires, and future actions of all Americans, this might be possible. But the Fed cannot possibly aggregate or act on the information necessary to engage in monetary policy. The actions of hundreds of millions of individuals, all seeking to better their position in life, acting purposefully towards that aim, cannot possibly be compiled into aggregates or calculated through mathematical equations or econometric models. Neither a single person, nor the members and staff of the FOMC, nor millions of people with millions of computers working in a new Goskomtsen will ever be able to accumulate, analyze, and act upon the information required to create a centrally planned monetary system. Centrally

planned fiat paper standards such as the one currently in place in this country are doomed to failure.

This brings us to the question of the gold standard. The era of the classical gold standard was undoubtedly one of the greatest eras in human history. For a period of several decades in the late 19th century, largely uninterrupted by war, the West made enormous advances. Economic productivity increased, art and culture flourished, and living standards rose so that even the poorest citizens lived a life their forebears could have only dreamed of.

But the problem with the gold standard is that it was run by the government, which exercised a monopoly over monetary affairs. The temptation to suspend gold redemption, so often resorted to by governments throughout history, reared its head again with the outbreak of World War I. Once the tie to gold was severed and fiscal restraint thrown to the wind, undoing the damage would have required great fiscal austerity on the part of governments. Emancipated from the shackles of the gold standard, the Western world proceeded to set up a gold-exchange standard which lasted not even a decade before the easy money policies it enabled led to the Great Depression. While returning to the gold standard would certainly be far better than maintaining the current fiat paper system, as long as the government retains the power to go off gold we may end up repeating the same mistakes that occurred from 1934 to 1971 as the government went first off the gold coin standard and finally off the gold bullion exchange standard.

The only viable solution for monetary stability is to get government out of the money business permanently. The way to bring this about is through currency competition: allowing parallel currencies to circulate without any one currency receiving any special recognition or favor from the government. Fiat paper monetary standards throughout history have always collapsed due to their inflationary nature, and our current fiat paper standard will be no different. The Federal Reserve is currently sowing the seeds of its own destruction through its loose and reckless monetary policy. The day of reckoning may still be many years in the future, but given the lack of understanding on the part of the Federal Reserve's decision makers, it is quickly coming upon us.

It is imperative that the American people be educated on the dangers of the Fed and the importance of restoring sound money. Now that nearly 50 years have elapsed since silver was removed from circulation, fewer and fewer Americans have firsthand familiarity with real money. The laying of the groundwork must begin today, so

that the American people will be prepared for the day when the mirage the Fed has created evaporates completely.

WITNESS TESTIMONY

**WRITTEN TESTIMONY OF
HON. KEVIN BRADY¹¹⁰**
REPRESENTATIVE, 8TH DISTRICT OF TX
U.S. HOUSE OF REPRESENTATIVES

Thank you, Chairman Paul, Ranking Member Clay, and Members of the Subcommittee.

Before discussing the *Sound Dollar Act*, I would like to acknowledge the work that Dr. Paul has done on this subcommittee and as a long-serving former Member of the Joint Economic Committee to bring sound money to the forefront of the public debate. Inflation has been called many things—a hidden tax, a government-sponsored reduction in workers' paychecks, or "theft" as Dr. Paul often says. The American people understand the absurdity of a monetary policy that is designed to debase our currency.

We agree on three key points:

- (1) Preserving the value of the dollar is essential to economic growth and prosperity;
- (2) The federal government must not be allowed to monetize its debts; and
- (3) Our financial system should serve the interests of all Americans, not just the interests of Washington and Wall Street.

Again, I would like to thank you, Mr. Chairman, for your

¹¹⁰ [Attached to Rep. Brady's testimony was a Joint Economic Committee staff commentary titled "United States Monetary History in Brief," which can be found in Appendix A.]

steadfast commitment to bringing these issues to the forefront of the public debate. Your voice will be missed.

I am pleased to testify on behalf of the *Sound Dollar Act*, H.R.4180, and want to thank the Members of this Subcommittee who have already cosponsored this important legislation: Mr. Jones, Mr. Lucas, Mr. Luetkemeyer, and Mr. Huizenga.

When it comes to the global economy, some have characterized the 1800's as the British century, the 1900's as the American century and the current one as China's century. I reject that prediction.

It is clear though, that to ensure the 21st century is another American century we must renew our commitment to what works well—our free market system—and reform what does not—our inefficient federal government.

Looking to our economic future, our goal should be clear: ensuring that America has the world's strongest economy throughout the 21st century. To do that, we have to get our monetary policy right and our fiscal policy right so that our free market system can flourish.

A sound dollar is the sure and strong foundation for long-term economic growth. A sound dollar creates certainty and facilitates new business investment and long-term job creation. I believe the focused role of the Federal Reserve should be to protect the purchasing power of the dollar by maintaining long-term price stability.

Are there many other actions that Congress and the President must take to retain America's economic preeminence for the next 100 years? Of course—we must:

- Make our tax system simpler and more internationally competitive by lowering marginal tax rates and eliminating distortions that pick winners and losers;
- Reform important entitlement programs—including Social Security, Medicare, and Medicaid—to make them sustainably solvent so that they can continue to serve those Americans dependent upon them;
- Transform our regulatory system so that we can achieve our common goals—including a clean environment and safe workplaces—in more efficient, balanced, and less destructive ways; and
- Aggressively pursue trade agreements to open foreign markets to sell more American goods and services to the 95 percent of the world's population that lives outside of our borders.

However, these reforms by themselves will be insufficient if the

Federal Reserve fails to maintain the purchasing power of the dollar over time. You only need look to the Great Depression of the 1930's and the Great Inflation of the 1970's to see that price deflation and price inflation are twin evils that reduce real output and employment.

Learning from the past and looking to the future, Congress must select the right monetary policy mandate, maintain a Fed independent of political pressure, and hold the Fed accountable for the results.

So let us examine what monetary policy should be going forward.

In 1977, Congress mandated that the Federal Reserve pursue monetary policy “so as to promote effectively the goals of maximum employment, stable prices, and moderate long-term interest rates.”¹¹¹ Since inflationary expectations affect long-term interest rates, the goals of stable prices and moderate long-term interest rates are interrelated. This is why the Federal Reserve is described as having a dual mandate for both price stability and full employment.

The employment half of the dual mandate reflects the *Employment Act of 1946*, which required

the federal government to pursue economic policies that “promote maximum employment, production, and purchasing power.”¹¹² The price stability half of the dual mandate reflects the rising public concerns about price inflation in the 1970's.

Given the experiences of the past forty years and the unprecedented Fed actions of the past four, it is time for Congress and policy-makers to have a thoughtful, constructive debate about the dual mandate and the role of the Fed in our economic future.

Nobel Laureate economist Robert Mundell observed: “To achieve a policy outcome, you must use the right policy lever.”

In the Federal Open Market Committee (FOMC) statement of January 25th of this year, Chairman Ben Bernanke and the other members recognized that monetary policy is the

right lever to maintain the purchasing power of the dollar by declaring, “The inflation rate over the longer run is primarily determined by monetary policy.”

In contrast, the FOMC acknowledged that monetary policy is the wrong lever to promote job creation by declaring “The maximum level of employment is largely determined by nonmonetary factors.” The

¹¹¹ *The Federal Reserve Reform Act of 1977*, Pub.L. 95-188, 91 Stat. 1387, enacted November 16, 1977 as modified by the *Full Employment and Balanced Growth Act of 1978*, Pub.L. 95-523, 92 Stat. 1887, enacted October 27, 1978.

¹¹² Pub.L. 79-304, ch. 33, Sec. 2, 60 Stat. 23, enacted February 20, 1946.

FOMC is right on both counts: inflation is influenced by monetary policy and long-term employment is not.

While the dual mandate may be politically appealing, it makes no sense for Congress to charge the Federal Reserve with controlling what it cannot. Except in the very short term, monetary policy cannot boost real output and job creation.

Instead, using monetary policy as a short-term tool to speed growth may actually harm the economy in the long run. As Richard Fisher, President of the Federal Reserve Bank of Dallas, recently warned, the U.S. economy does not need any more “monetary morphine” that temporarily eases pain but does nothing to cure the underlying disease.

His point – and I agree – is that the President and Congress, not the Federal Reserve, can and should control the budget, tax, regulatory, and trade policies that create the business climate which drives sustainable economic growth and job creation.

Our global competitors already recognize this. Since Congress gave a dual mandate to the Fed, governments in many other countries have revised the charters of their central banks to focus either on a single mandate for price stability or a primary mandate for price stability with other goals clearly subordinated. Among the 47 central banks and monetary authorities in major countries surveyed by the Bank for International Settlements, only the Bank of Canada and the Federal Reserve have organizational laws that give other goals equal weight to price stability.¹¹³

Getting the mandate right is only half the job. How the Federal Reserve pursues its mandate is equally important.

According to Stanford University economist John Taylor, the key choice is between a discretionary regime and a rules-based regime. A discretionary regime generates uncertainty because it relies upon the subjective assessments of central bank policymakers. By contrast, a rules-based regime reduces uncertainty because it follows well-established rules, based on observable economic data, with a clear focus on a long-term goal.

Inflation-targeting is a rules-based regime under which a central bank establishes a target inflation rate expressed in terms of a broad-based price index of goods and services. A central bank tightens monetary policy when the actual inflation rate rises above its target and loosens monetary policy when the actual inflation rate falls below its target.

¹¹³ Ortiz, Guillermo and Yam, Joseph (Chairs of the Central Bank Governance Group), *Issues in the Governance of Central Banks*, Bank of International Settlements (May 2009).

The last four decades of U.S. monetary policy demonstrate the advantages of a rules-based regime over a discretionary one. During the 1970's, the Federal Reserve had “go-stop” policies, in which monetary policy quickly swung from ease to tightness and back again. This incoherence produced a highly volatile real economy and a rising inflation rate.

A sea change occurred with the appointment of Paul Volcker as Fed Chairman in 1979. Under Volcker the FOMC aggressively tackled price inflation by controlling the growth of the money supply. This successful strategy was a significant step forward toward a rules-based monetary policy. While the economy did suffer back-to-back recessions,¹¹⁴ inflation dropped from 13.3 percent in 1979, the year Volcker became Chairman, to 3.8 percent in 1982.¹¹⁵

Between 1983 and 2000—the period known as the Great Moderation—the Federal Reserve continued to pursue price stability through an increasingly rules-based monetary policy, effectively ignoring the second half of its dual mandate. Two long economic booms resulted, with very low inflation. The booms were only interrupted by a short, shallow recession related to the first Persian Gulf War.

Unfortunately, between 2002 and 2005, the FOMC deviated from this successful rules-based regime, moving to a discretionary regime by keeping interest rates too low for too long. This loose monetary policy contributed to the inflation of an unsustainable housing bubble that eventually triggered a global financial crisis.

Since the height of the financial crisis in the fall of 2008, Washington has increasingly become dependent on the Federal Reserve to take unusual, interventionist actions—such as tripling the size of its balance sheet under QE1 and QE2 by purchasing the debt and residential mortgage-backed securities (RMBS) issued by Fannie Mae and Freddie Mac as well as Treasuries. Indeed, the FOMC justified these extraordinary actions by invoking—for the first time ever in late 2008—the employment half of the Federal Reserve’s dual mandate.

Ultimately the FOMC took these actions, in part, to compensate for President Obama’s failure to

establish a strong, sustainable recovery. And just as low borrowing costs continue to mask the true pain of our nation’s

¹¹⁴ The back-to-back recessions were January 1980 to June 1980 and July 1981 to November 1982.

¹¹⁵ The annual inflation rate as measured by the consumer price index.

historically high federal budget deficits, the Federal Reserve's monetary experimentation has allowed the White House and Congress to shirk their responsibility to enact fiscal policies that create a competitive business climate which unleashes investment and spurs job creation.

The Federal Reserve's monetary experimentation of the last decade must end. Congress should give the Federal Reserve a single mandate for price stability, and the Federal Reserve should return to a rules-based system of inflation targeting to achieve that mandate.

To provide a foundation for long-term economic growth, I recently introduced the *Sound Dollar Act*, H.R.4180, in the House of Representatives. Senator Mike Lee of Utah, an articulate and studious member of the Joint Economic Committee, has introduced a companion bill, S.2247, in the Senate. The measure was introduced after many months of vetting with interested economists, current and former Fed staff as well as current and former members of the Federal Reserve Board of Governors – including discussions with Chairman Bernanke.

The *Sound Dollar Act* seeks to reform the Federal Reserve in several important ways. Specifically, the *Sound Dollar Act* replaces the dual mandate with a single mandate for long-term price stability; increases the Federal Reserve's accountability and openness; diversifies the FOMC; ensures credit neutrality for future FOMC purchases; and institutes congressional oversight of the Consumer Financial Protection Bureau.

As expected, critics have quickly charged that focusing on a sound dollar implies the Federal Reserve will ignore the employment needs of Americans. They are wrong. America can only maximize its real output with long-term price stability. Protecting the purchasing power of the dollar over time provides the strongest foundation for lasting economic growth and job creation.

Others have reacted as if a single mandate is a shocking proposal—an affront to all that is right and good. But as we know, the United States won World War II, enjoyed three decades of prosperity, and put a man on the moon without a dual mandate. It is not a fundamental part of our constitutional fabric or carved in granite—it is a 1977 policy directive based on the discredited “Phillips Curve” that Congress can and should change to ensure the future prosperity of our nation.

A mandate for price stability gives the Federal Reserve the right goal. Moving away from a discretionary regime and back toward a rules-based regime will help ensure the Fed achieves price stability.

In January 2012, the FOMC announced an inflation target of 2 percent defined in terms of the price index for personal consumption expenditures. I strongly applaud Chairman Bernanke and the other members of the FOMC for this step toward a rules-based, inflation-targeting regime.

However, this is merely a policy statement that could be reversed. Therefore, the *Sound Dollar Act* mandates that the FOMC continue inflation targeting over the long term.

Accurately measuring inflation is not easy. In the last decade, we clearly saw that price indices of goods and services do not always record all of the price movements in our economy, allowing asset bubbles to inflate undetected. The FOMC's current inflation target relies only upon the price index for personal consumption expenditures.

This index is the primary indicator that the Federal Reserve uses for measuring inflation. However, to identify incipient asset bubbles before they inflate to dangerous levels, the *Sound Dollar Act* also requires that the FOMC monitor and report to Congress on: (1) the prices of, and returns on, broad classes of assets including equities, corporate bonds, state and local government bonds and agricultural, commercial, industrial and residential real estate; (2) the price of gold; and (3) the foreign exchange value of the U.S. dollar.

To be clear, the *Sound Dollar Act* does not prescribe any specific action that the Federal Reserve must take if it detects an asset bubble. The appropriate responses are highly dependent upon circumstances. They might include a tightening of monetary policy, supervisory suasion, or regulatory actions to reduce the flow of credit to fund purchases of the bubbling asset.

Discretion with respect to the best response should be left to the FOMC. However, identifying potential asset price bubbles earlier may help to avoid the overinvestment and the malinvestment that must eventually be liquidated at a heavy cost in terms of lower real output and lost jobs.

Some supporters of the *Sound Dollar Act* concept express a concern that the FOMC could misinterpret monitoring asset prices as a mandate to control asset prices. To address that concern, we have made the legislative language clear and will make it clearer if need be. To quote the bill's language, the FOMC will merely observe asset prices to determine whether such price indices "are comprehensively reflecting price movements in the economy; and whether any

price movements not captured by the price indices of goods and services are causing a significant misallocation of capital in the

United States economy.”

Simply put, monitoring asset prices is intended as a check against inflation slipping through the cracks.

Another reform broadens input and geographic diversity in FOMC decision-making. The *Sound Dollar Act* grants a permanent vote on the FOMC to the presidents of each regional Federal

Reserve Bank. As important as New York and Washington are, there is much more to America’s economy and the FOMC should better reflect that.

Today—as a result of a decision seventy years ago—only the Federal Reserve Governors and the President of the Federal Reserve Bank of New York have permanent votes. While all of the regional Federal Reserve Banks participate in the discussions, just four of the remaining eleven presidents vote at any one meeting—rotating on and off the FOMC.

There may be other ways to achieve this diversity—and I am open to them—but I am seeking change that will provide Main Street with a greater voice in determining monetary policy.

I am firmly committed to the independence of the Federal Reserve in conducting monetary policy. Expanding the voting membership of the FOMC is one method the *Sound Dollar Act* uses to insulate the Fed from political forces. But, I am particularly troubled by the FOMC decision in September 2011 to reinvest the proceeds from maturing federal agency debt and RMBS into new federal agency RMBS—instead of allowing these holdings to decline as originally intended. This policy reversal occurred amid intense pressure from special interest groups for federal actions to support the ailing housing market.

When the FOMC deals in securities other than Treasuries, repurchase agreements, and reverse repurchase agreements for the System Open Market Account, the Federal Reserve is allocating credit among different sectors of our economy. Credit allocation exposes the Federal Reserve to political interference. And in Washington, D.C. subsidies die hard.

To maintain the independence of the Federal Reserve, the *Sound Dollar Act* requires the FOMC to deal only in Treasuries, repos, and reverse repos for the System Open Market Account unless the FOMC finds by a 2/3 vote that “unusual and exigent circumstances” exist. The FOMC could then purchase other securities for the account so long as they are liquidated within five years after the end of the emergency.

Next, the *Sound Dollar Act* requires the Federal Reserve to

publish its lender-of-last-resort policy. In nearly a century of existence, the Federal Reserve has never articulated this critical policy.

Dr. Allan Meltzer, author of *A History of the Federal Reserve*, describes the problems this void creates:

*The absence of a [lender-of-last-resort] policy has three unfortunate consequences. First, uncertainty increases. No one can know what will be done. Second, troubled firms have a stronger incentive to seek a political solution. They ask Congress or the administration for support or to pressure the Federal Reserve or other agencies to save them from failure. Third, repeated rescues encourage banks to take greater risk and increase leverage. This is the well-known moral hazard problem.*¹¹⁶

Each of these problems became manifest in 2008. And while some believe the *Dodd-Frank* legislation provided the solution to the next crisis, I do not believe that is the case.

To be reasonable, the bill does not call for a precise tactical plan. As President Dwight D.

Eisenhower observed regarding the complicated engagements of war: “Plans are worthless, but planning is everything.”¹¹⁷ Similarly, while the Federal Reserve cannot anticipate every nuance of the next financial crisis, publishing a lender-of-last-resort policy has merit and could help reduce market uncertainty.

Next, I applaud Chairman Bernanke for his steps to increase transparency in monetary policy decision-making, but there is an additional step that the Federal Reserve should take. The *Sound Dollar Act* speeds the release of transcripts of FOMC meetings from five years to three years. Currently, if a President nominates a Fed Chairman for a second four-year term, Senators cannot review any of the FOMC transcripts during his or her tenure.

Some have expressed concerns that this would inhibit free discussion at FOMC meetings. But in a time when information flows globally in the blink of an eye, three years is an eternity.

Given the quality of the individuals serving on the FOMC, I am not concerned about legacy building in FOMC meetings. What I am concerned about is a future Senate being asked to confirm a second

¹¹⁶ Ciorciari, John D. and Taylor, John B. (Eds.), *The Road Ahead for the Fed*, Hoover Institution (November 2009).

term for the Fed Chairman with no real insight into the critical decision-making of that Chairman in FOMC deliberations. Results matter, and so does the thought process behind them.

The *Sound Dollar Act* also eliminates a slush fund that has been misused by Secretaries of the Treasury in both Democratic and Republican administrations. In 1934, Congress placed the profits from the nationalization of privately owned gold and the subsequent devaluation of the

U.S. dollar in the Exchange Stabilization Fund and authorized its use to intervene in foreign exchange markets.¹¹⁸ In 1968, Congress placed the special drawing rights (SDRs) issued by the International Monetary Fund into the Exchange Stabilization Fund.¹¹⁹ After the Bretton Woods system of pegged exchange rates collapsed in 1971, the Treasury has used the non-SDR assets in the Exchange Stabilization Fund for purposes that Congress never intended, such as bailing out Mexico in 1995 and guaranteeing money market mutual funds in 2008. To prevent misuse in the future, the *Sound Dollar Act* transforms the Exchange Stabilization Fund into a Special Drawing Rights Fund; liquidates all of the \$50 billion of non-SDR assets over three years; and uses the proceeds to reduce federal debt.

Finally, the *Dodd-Frank Act* funded the Consumer Financial Protection Bureau (CFPB) by diverting Federal Reserve profits, which would otherwise be paid to the Treasury, to the CFPB. This is a dangerous precedent, leaving the CFPB unaccountable to Congress and ultimately hardworking American taxpayers. Nothing other than the operating costs of the Federal Reserve should be paid out of its revenue. Thus, the *Sound Dollar Act* ends this diversion and requires that the CFPB seek annual appropriations from Congress—just as other federal agencies do.

In summary, the *Sound Dollar Act* helps the United States retain its economic preeminence by preserving the purchasing power of the U.S. dollar, charging the Federal Reserve to pursue a single mandate for price stability and strengthening the Federal Reserve's independence even as the *Act* increases the Federal Reserve's accountability.

**WRITTEN TESTIMONY OF
JEFFREY M. HERBENER, Ph.D.**
PROFESSOR OF ECONOMICS AND CHAIRMAN
DEPARTMENT OF ECONOMICS
GROVE CITY COLLEGE

Production of Money on the Market

In a seminal article published in 1920, Ludwig von Mises demonstrated that there is only one test of whether or not production of something conveys a benefit on society at large.¹²⁰ It must be shown that resources have greater value when used to produce a good to satisfy the preferences of some people than when they are used to produce a different good to satisfy the preferences of other people. Production left to the market satisfies the profit and loss test of socially beneficial production. For Tim Cook to obtain computer chips, glass screens, labor and other resources to produce iPads, he must bid them away from other entrepreneurs who would have used them to produce other goods. By incurring the costs of production, Apple Inc. compensates the owners of resources for the value of the other goods they could have produced to satisfy a different group of consumers. Apple then uses the resources to produce iPads, which consumers of its products value more highly as demonstrated by their generating enough revenue for Apple Inc. to more than cover its costs.

The profit and loss test applies to all production in the market, including mining gold and minting coins. A gold mining company will produce when the revenues from the sale of its output exceed the costs of buying its inputs. The company moves labor, mining equipment, land, and other resources away from uses consumers find less valuable into gold mining, which consumers find more valuable. A minting company will produce when the revenues from the sale of its service in certifying gold exceed the costs of buying its inputs. The company moves labor, minting equipment, land, and other resources away from uses consumers find less valuable into minting coins, which consumers find more valuable.

Like the production of all other goods, production of money left to the market is regulated by profit and loss. Additional money is produced when demand for money increases or demand for other

¹²⁰ This is an implication of Mises's famous argument that central planners cannot economize the use of resources in society. See Ludwig von Mises, *Economic Calculation in the Socialist Commonwealth* (Auburn, Ala.: Mises Institute, 1990 [1920]) and Mises, *Human Action*, scholar's edition (Auburn, Ala.: Mises Institute, 1998 [1949]), pp. 685-711.

goods produced by the same resources decreases. If the demand for money increased, the value of gold coins would rise. Minting companies would increase production to capture the profit. As they increased the supply of certification service, its price would decline and as they increased their demands for resources to certify gold, resources prices would rise and the profit would dissipate. If demand for other goods declined, input prices would fall. Minting companies would increase production to capture the profit and, by doing so, eliminate profit from further production. In this way production of money in the market is socially optimal.¹²¹

The profit and loss test also applies to the production of money certificates in the market.¹²² Money certificates are titles of ownership to money issued by banks that serve as money substitutes. People may find convenience and safety in using checking account balances instead of commodity money when making trades. Banks will produce and maintain checking accounts for customers if they are willing to pay fees to banks that generate revenues sufficient to cover the costs of managing the accounts. If the demand for checking accounts increased, then banks would expand them to capture the profit. As they increased their supply of checking account services, the fees would decline. And as they increased their demand for the resources to manage checking accounts, their prices would rise. As a consequence, profit would dissipate and additional production would cease at the socially optimal point.

The profit and loss test also applies to financial intermediation. Banks perform a middleman function in credit markets by borrowing from savers and lending to investors. They provide the services of pooling the savings, checking the credit worthiness of investors, and bearing the risk of loan defaults. If customers of banks find these services valuable, they will be willing to accept lower interest rates for lending to banks than investors will be willing to pay banks to borrow. Banks will provide financial intermediation services, if the revenues earned from the interest rate differential are large enough to cover the costs of producing the services. If demand for these services increases, banks will increase production of them. Their increased demand to borrow from savers and supply to investors will reduce the interest rate differential. Their increased demand for the

¹²¹ Mises wrote that making money production conform to profitability and not politics, "is not a defect of the gold standard; it is its main excellence," *Human Action*, p. 471.

¹²² On bank production of money certificates and credit intermediation, see Jesús Huerta de Soto, *Money, Bank Credit, and Economic Cycles*, trans. Melinda Stroup (Auburn, Ala.: Mises Institute, 2006 [1998]), pp. 1-36.

resources will raise their prices. Profit will dissipate and additional production will cease at the socially optimal point.

By subjecting all production, including that of money and banking, to the test of profit and loss, the market renders an integrated system of production that economizes the use of all resources for society at large.

Monetary Inflation and Credit Expansion

An elastic currency breaks the integration of production on the market by being an element foreign to the test of profit and loss. An elastic currency has two characteristics: a central bank empowered to issue fiat paper money and commercial banks empowered to issue fiduciary media.¹²³ The production of fiat paper money cannot be regulated by profit and loss. It is always profitable to produce more. In 2011, the average cost of the 5.8 billion Federal Reserve Notes produced was \$0.091.¹²⁴ So a profit of around \$4.90 is made by printing and spending a \$5 bill. If the Fed continued order the printing of FRNs as long as it was profitable, then eventually prices of inputs would rise so that it cost more than \$5 to print a \$5 bill. Then the Fed could order the printing of \$50 bills instead and so on indefinitely as we have witnessed in hyperinflations like Zimbabwe's. To avoid destruction in hyperinflation, production of fiat paper money must be regulated by policy, by a rule that is arbitrary with respect to economizing production for society at large.

The production of fiduciary media cannot be regulated by profit and loss.¹²⁵ Fiduciary media are redemption claims for money which are fractionally backed by a reserve of money. Banks issue fiduciary media by creating loans. For example, a customer applies at his local bank for an auto loan of \$25,000. If the bank agrees to extend the loan, it just writes a \$25,000 balance into the customer's checking account. The loan generates interest revenue for the bank while the cost of issuing fiduciary media is nominal. It is always profitable for the bank to create another loan by issuing fiduciary media. If a bank issues more fiduciary media by creating credit as long as it is profitable, it will become illiquid and insolvent and end in collapse. To avoid such destruction, a bank must regulate its issue of fiduciary

¹²³ On elastic currency, see Murray Rothbard, *The Case against the Fed* (Auburn, Ala.: Mises Institute, 1994).

¹²⁴ Bureau of Engraving and Printing.

(moneyfactory.gov/uscurrency/annualproductionfigures.html). April 27, 2012.

¹²⁵ On fiduciary issue and credit creation, see Murray Rothbard, *The Mystery of Banking* (Auburn, Ala.: Mises Institute, 2008 [1983]).

media via credit creation by policy, by a rule that is arbitrary with respect to economizing production for society at large.

Advocates of an elastic currency realize that its production cannot even be subjected to, let alone pass, the profit and loss test. As F.A. Hayek wrote, “There is no justification in history for the existing position of a government monopoly of issuing money. It has never been proposed on the ground that government will give us better money than anybody else could.”¹²⁶ Advocates of an elastic currency merely assert that it can achieve a desirable outcome that a system of commodity money and money certificates cannot. There are three such claims for an elastic currency. First that it can keep the price level stable. Second, that it can prevent price deflation. And third, that it can accelerate economic growth.

Maintaining Price Stability

There is no social benefit from keeping the price level stable. The alleged benefit is that price stability prevents wealth transfers between creditors and debtors and between workers and capitalists. But such transfers assume that entrepreneurs fail to anticipate changes in money’s purchasing power. Entrepreneurs can earn profits and avoid losses by anticipating these changes just as well as changes in prices of other goods. If they anticipate rising prices for goods overall, then they will increase their demands for resources today bidding up wages today. Likewise, lenders will insist on higher interest rates today. An elastic currency adds another dimension of uncertainty to changes in money’s purchasing power. It makes the task of entrepreneurs more, not less, difficult. In extreme cases, an elastic currency can result in wildly unstable prices that paralyze entrepreneurial decision making and destroy production on the market. Being regulated by profit, production of commodity money responds only to changes in people’s demands. If money demand rises, the resulting increase in money’s purchasing power would bring forth more production of money and moderate falling prices. The modest price deflation over time in a market economy is integral part of its economizing production.

Moreover, in practice the advocates of price stability aim at price inflation of around two percent per year. But, if entrepreneurs can adjust their expectation to cope with a two percent per year price inflation in an elastic currency system, then certainly they can

¹²⁶ F.A. Hayek, *Denationalization of Money*, 2nd edition (London: Institute of Economic Affairs, 1978 [1974]), p. 7.

properly anticipate and deal with a two percent per year price deflation under a commodity money system.¹²⁷

Finally, two of the periods of most rapid economic growth in U.S. history were from 1820-1850 and 1865-1900. In each of these periods, the purchasing power of the dollar roughly doubled.¹²⁸

Preventing Price Deflation

There is no social benefit from preventing price deflation. There are two claims to the contrary. The first alleged benefit is that if prices begin to fall, then people form expectations that they will fall further and they put off spending today which pushes prices down even further which re-enforces deflationary expectations. The collapse of spending discourages production and employment. But, the downward spiral of prices is merely the logical implication of assumptions about expectations within formal economic models. If you assume that the agents operating in an economic model suffer from expectations that are self-reinforcing, then the model will produce a downward spiral. But, people in the real world can only obtain the services of goods by buying them. They choose at some point, to buy a good even if they expect its price to fall further. This happens every day in markets for consumer electronics as people buy tablet computers, cell phones, and so on knowing that prices will be lower and quality higher in the future.

Because there is demand for goods and hence prices, whether people expect prices to increase, decrease, or stay the same, speculation earns profit and avoids loss by accurately anticipating the level of future prices. If people anticipate a significantly lower price for a good in the future and withhold their demands for it today, the price quickly falls to the level they anticipated and then they buy the good. Speculation moves prices before they would move without speculation, but not further than they would move without it. This happens every day in financial markets as speculators move prices up and down without generating upward or downward spirals.

The second alleged benefit is that price deflation pushes down output prices but input prices are sticky; therefore, profits evaporate and entrepreneurs cut production and fire workers. But entrepreneurs choose the degree of price stickiness that their customers and employees prefer. In many cases consumers prefer prices of goods to remain more stable from day to day or hour to hour

¹²⁷ The annualize rate of increase in the purchasing power of the dollar from 1815-1850 was 2.24 percent and from 1865-1900 was 1.75 percent.

¹²⁸ Murray Rothbard, *A History of Money and Banking in the United States* (Auburn, Ala.: Mises Institute, 2002), pp. 42-179.

or minute to minute instead of fluctuating with every increase and decrease in demands. In other cases, buyers prefer complete flexibility in prices. Entrepreneurs can earn profits and avoid losses by catering to these preferences. In many cases, workers prefer to have their wages set over a period agreed upon with the entrepreneurs instead of having them move daily or hourly with the movements in demand for the goods they help produce. In cases where workers desire more flexibility in their compensation, an entrepreneur will make stock in the enterprise part of their compensation. When circumstances change, it is in everyone's interest to modify the normal arrangements. Entrepreneurs offer deep discounts of their goods when demand permanently falls. They renegotiate contracts with workers and other input suppliers when losses accumulate. In this way, the degree of price stickiness in markets can be changed to avoid adverse effects.

Moreover, entrepreneurs earn profits and avoid losses by anticipating these changes. If they anticipate falling prices of their outputs, they will reduce their demands for inputs today pushing their prices down. When output and input prices fall together, profit and production are maintained. The symmetric process occurs during price inflation. If entrepreneurs anticipate higher output prices, they will increase their demands for inputs today pushing their prices up. As a result, output and input prices move up together and profit and production are maintained.

Even if the prices of inputs entrepreneurs buy remain sticky downward, the effect on their profit and production is cushioned by the decline in the value of the assets they own. The market value of their assets adjusts downward with the decline in the prices of their outputs as investors reduce their demands to hold claims to these assets in financial markets. A decline in the value of their assets restores the profitability of production. Entrepreneurs with superior foresight in anticipating declines in the prices of their output will invest sufficient equity in their enterprises to cushion the blow and provide time for adjustments in the prices of their inputs.

UCLA economist, Andrew Atkinson, and Minneapolis Federal Reserve Bank economist, Patrick Kehoe, in a 2004 *American Economic Review* article, have shown that there is no correlation between deflation and depression.¹²⁹ Looking at the evidence across

¹²⁹ Andrew Atkinson and Patrick Kehoe, "Deflation and Depression: Is There an Empirical Link," *American Economic Review Papers and Proceedings* 94 (May 2004): 99-103. They define deflation "as a negative average inflation rate" and depression "as a negative average real output growth rate." *Ibid.*, p. 99.

17 countries over more than 100 years, they concluded, “A broad historical look finds more periods of deflation with reasonable growth than with depression, and many more periods of depression with inflation than with deflation. Overall, the data show virtually no link between deflation and depression.”¹³⁰ Even for the Great Depression, they find that while all 16 countries for which there were data experienced deflation only 8 of them had a depression. And the relationship between deflation and depression was not statistically significant. For all other periods, beginning in 1820 for some countries, 65 of 73 deflation episodes had no depression and 21 of 29 depressions had no deflation. They wrote, “In a broader historical context, beyond the Great Depression, the notion that deflation and depression are linked virtually disappears.”¹³¹ When all periods are put together, they found that “a 1-percentage-point drop in inflation is associated with a drop in the average real growth rate of just 0.08 of a percentage point, say, from 3.08 to 3.00.”¹³² Finally, when they break the data into Pre-WW II and Post-WW II, they find a stronger correlation between deflation and depression for the early period, but a correlation between inflation and depression in the later period.

Stimulating Economic Growth

There is no social benefit from attempting to accelerate economic growth. The alleged benefit is that monetary inflation through credit expansion builds-up the capital structure of the economy more fully than otherwise. Monetary inflation and credit expansion generate the boom-bust cycle, however, not economic growth.¹³³ The capital structure of the economy is the stages of production from extraction of raw materials to the production of intermediate capital goods to the production of consumer goods. Iron is mined out of the ground, then steel is made, then fenders for an automobile, then the automobile is assembled. In a market economy, not only is each production process justified by passing the profit and loss test, but the entire capital structure satisfies people’s inter-temporal, or time, preferences. The degree to which they desire to postpone their current consumption by saving and investing to build up capital capacity across the capital structure in order to enjoy more and better consumer goods in the

¹³⁰ *Ibid.*, p. 102.

¹³¹ *Ibid.*, p. 101.

¹³² *Ibid.*, p. 102.

¹³³ On the boom-bust cycle, see Mises, *Human Action*, pp. 535-583; de Soto, *Money, Bank Credit, and Economic Cycles*, pp. 265-395; F.A. Hayek, *Prices and Production and Other Works* (Auburn, Ala.: Mises Institute, 2008 [1931]); and Murray Rothbard, *America's Great Depression* (Auburn, Ala.: Mises Institute, 2000 [1963]).

future is satisfied in the market. If people intensely desire present consumption over future consumption, then the premium they place on the present, that is, the interest rate, will be high and the amount of their saving and investing will be small and their consumption will be large. Only a small number of investment projects will be profitable; therefore, the capital structure will not be built up extensively. If people lower their time preferences, then the interest rate will fall and they will save and invest more and consume less in the present. With more resources at their command, entrepreneurs will build up the capital structure more extensively. The greater productivity of the expanded capital structure results in the production of more and better consumer goods. This is the process of economic growth. And, as with other aspects of production in a market economy, people get the amount of economic growth that they prefer.

Credit expansion suppresses interest rates below the levels determined by people's time preferences and increases funds for investment beyond the amount determined by people's preferences for saving. When the borrowers spend the additional money, they bid up the prices of the goods they are buying. Prices of houses and cars, for example, are pushed up by the additional demand of consumers made possible by credit creation. Prices of producer goods are also bid up by the additional demand of entrepreneurs made possible by credit creation. Prices for auto factories, lumber mills, are pushed up and the capital goods across the capital structure used to produce goods in the expanding areas, iron mines, timber lands, and so on. Monetary inflation through credit expansion makes it possible for borrowers to demand more assets without lenders reducing demands for other goods. Therefore, rising asset prices increase the profitability of their production while the profitability of other goods need not decline. Not enough resources are released from the production of other goods to complete all of the projects made profitable by the credit expansion. With a market monetary system, the proper amount of resources are made available because an increase in the supply of credit can only be brought about by people saving more and consuming less. The additional investment projects made profitable by the increase in saving are balanced by the projects no longer profitable because of the reduced consumption. But with an elastic currency system, the build-up of capital capacity and other investment projects financed with created credit do not wind up satisfying people's time preferences. The build-up of the capital structure during the boom is unsustainable. It ends in the liquidation of the build-up in the bust.

What brings the boom to an end is the re-establishment of people's time preferences and preferences for saving. People do this through the disbursement of their incomes. The credit created during the boom is spent by the borrowers to buy goods, houses, factories, etc. The entrepreneurs who produce these goods then receive the new money as revenues for selling the goods. They pay producers to buy the resources used to produce the goods. The new money is then income for the producers. People disburse their income to satisfy their preferences, including their time preferences. They prefer to save only a fraction of their incomes. Although the entire amount of the new money issued starts out increasing the supply of credit, only a fraction of it winds up as supply of credit. Monetary inflation and credit expansion runs counter to people's time preferences and market economies operate to satisfy people's preferences.

Another factor working against the sustainability of the boom is that the further credit expansion extends the riskier the projects and the less credit worthy the borrowers become. As financial intermediaries, banks economize credit, lending to the highest return, most secure projects and the highest interest rate, most credit-worthy borrowers. Additional credit must be extended to lower return, less secure projects and lower interest rate, less credit-worthy borrowers. If monetary inflation and credit expansion go on far enough, investors refuse to accept the additional risk and sell out of the lines of production expanded during the boom. Since the prices of assets in the more sound projects have been bid up along with the prices of projects in the less sound projects, investors in the more sound projects will also lose wealth if they continue to hold their investments.

Once people restore interest rates and asset prices to the levels that reflect their preferences, the particular lines of production in which mal-investments have been made in building-up the capital structure during the boom are revealed. The bust consists of reconfiguring the malformed capital structure to best satisfy people's preferences. Mal-invested assets must be sold to entrepreneurs in lines of production that will prove to be profitable. Labor must be re-allocated away from boom lines into production supported by people's preferences. As with all production decisions, these can be made in the most economizing fashion by entrepreneurs earning profits from their superior foresight in satisfying preferences and suffering losses for their inferior foresight.

An elastic currency is the cause of financial crises and economic downturns. Supplant it with a market system of commodity money

and money certificates and there would be no crises and downturns. The residual business fluctuations would not justify government intervention to solve the social problems associated with crises and downturns.

As the monetary system has become more elastic in American history, booms and busts have worsened. George Selgin, William Lastrapes, and Lawrence White conclude, in their 2010 *Cato Working Paper*, that recent research demonstrates that the Fed has not lived up to its original promise.

Selgin, Lastrapes, and White summarize their findings on the performance of the Fed in these words: “Drawing on a wide range of recent empirical research, we find the following: (1) The Fed’s full history (1914 to present) has been characterized by more rather than fewer symptoms of monetary and macroeconomic instability than the decades leading to the Fed’s establishment. (2) While the Fed’s performance has undoubtedly improved since World War II, even its postwar performance has not clearly surpassed that of its undoubtedly flawed predecessor, the National Banking system, before World War I. (3) Some proposed alternative arrangements might plausibly do better than the Fed as presently constituted. We conclude that the need for a systematic exploration of alternatives to the established monetary system is as pressing today as it was a century ago.”¹³⁴

I concur with their conclusion. Economic theory and historical evidence demonstrate that a central bank confers no benefit on society at large. The Fed should be abolished and a market monetary system of commodity money and money certificates should be established.

Monetary Reform

The goal of monetary reform is to make money production subject to the profit and loss test of socially beneficial production. Money production must become an integral part of the market economy. There may be several viable paths of transition to a system of market production of money, but any such path must take account of Carl Menger’s famous demonstration that an item can only arise as money consistently with what people are actually using as the most widely

¹³⁴ George Selgin, William Lastrapes, Lawrence White, “Has the Fed Been a Failure?,” *Cato Working Paper* Dec. 2010, p. 1.

traded good.¹³⁵ After the transition, a monetary system integrated into the market economy could begin.¹³⁶

Federal Reserve Notes are money in the American economy. Thus, the most direct way to establish a market monetary system is to reestablish FRN as redemption claims for commodity money. The most widely-recognized commodity money today is gold coins. The primary step in monetary reform, then, is to turn FRNs into 100-percent-reserve redemption claims for gold coins.

The other step along this path to a market monetary system is to establish a 100 percent reserve of money against bank issued fiduciary media. The Fed's tripling of its balance sheet in response to the crisis of 2008 makes this part of the transition easier. Banks now hold reserves against their checkable deposits in excess of 100 percent. In early April, banks held \$1,587 billion in total reserves against \$1,204 billion in total checkable deposits. Fifty billion dollars of their total reserves consisted of vault cash and \$1,537 billion reserve balances in accounts with the Fed. Therefore, banks would need to build their cash reserves up to 100 percent of their checkable deposits of \$1,204 by redeeming \$1,154 billion of their reserve balances at the Fed for cash. The Fed could acquire the cash needed by selling some of the more than \$2 trillion in assets it built up on its balance sheet during the crisis or by printing more FRNs or some combination of the two. Whatever the total value of FRNs was at the point where checkable deposits are 100 percent backed by a reserve of cash, the redemption value of all FRNs could be set by calculating the ratio of FRN to the gold holdings of the Fed. If no change in the stock of FRNs outstanding was necessary to accomplish the transition, then the calculation would be as follows. The Fed is showing on its balance sheet of April 18, \$11.041 billion in gold holding. Valued at \$42.22 per ounce, this is 261.5 million ounces of gold. On the same balance sheet, the Fed shows \$1,100,160 million in currency in circulation. Thus, the redemption ratio would be \$4,207 per ounce of gold. The actual calculation, however, could only be done after an audit of the Fed and

¹³⁵ Carl Menger, "On the Origin of Money," *Economic Journal* 2 (1892): 239-55; Peter G. Klein and George A. Selgin, "Menger's Theory of Money: Some Experimental Evidence," in John Smithin, ed., *What Is Money?* (London: Routledge, 2000), pp. 217-34.

¹³⁶ On such monetary reform, see Rothbard, *Mystery of Banking*, pp. 247-268; Salerno, *Money, Sound and Unsound*, pp. 333-363; and de Soto, *Money, Bank Credit, and Economic Cycles*, pp. 736-745.

the process of establishing a 100 percent cash reserve, described above, were completed.¹³⁷

Once this transition was accomplished, the government should permit private production of money and money certificates according to the general laws of commerce. Mining and minting companies would produce commodity money that people made profitable by their demands. To earn profit, entrepreneurs would produce coins from the metals, in the weights, and with the designs people preferred. They would keep their costs down and invest and innovate when people's demands made it profitable. Scholars have chronicled many historical episodes of private production of coins. Recently, George Selgin, in his book *Good Money*, has recounted the production of private coinage in England in the late 18th and early 19th centuries. As he shows, private coinage thrived until the British government outlawed it in 1821.¹³⁸

Banks, too, should be put under the general laws of commerce including those relating to warehousing money by holding a 100 percent reserve of money against their money substitutes. Banks would earn profit by producing the amounts and types of money substitutes that satisfied people's demands. To earn profit, they would keep their costs down and invest and innovate when people's demands made it profitable. The operation of 100 percent reserve banking is described in Jesús Huerta de Soto's book, *Money, Banking, and Economic Cycles*. As he documents, money warehouse banks thrived in Amsterdam for over a hundred years in the 17th and 18th centuries.¹³⁹

Conclusion

No one can describe today the configuration of commodity money and money certificates that entrepreneurs would bring about if permitted to operate private enterprises in their production any more than one could have predicted in 1900 the development of the 21st century automobile industry or predicted in 1950 the 21st century consumer electronics industry. What we do know is that their production would be regulated by profit and loss and therefore, would result in the satisfaction of people's preferences. The monetary inflation and credit expansion of our elastic currency system would be

UNIVERSITY OF MISSOURI**

Introduction

I specialize in the economic theory of organizations—their nature, emergence, boundaries, internal structure, and governance—a field that is increasingly important in economics and was recognized with the 2009 Nobel Prize awarded to Oliver Williamson and Elinor Ostrom. (Ronald Coase, founder of the field, is also a Nobel Laureate). Much of my recent research concerns the economics of entrepreneurship and the entrepreneurial character of organizations, both private and public. Like business firms, public organizations such as legislatures, courts, government agencies, public universities, and government-sponsored enterprises seek to achieve particular objectives, and may innovate to achieve those objectives more efficiently.¹⁴⁰ Public organizations, like their for-profit counterparts, may act entrepreneurially: They are alert to perceived opportunities for gain, private or social, pecuniary or not. They control productive resources, both public and private, and must exercise judgment in deploying these resources in particular combinations under conditions of uncertainty. Of course, there are important distinctions between private and public organizations—objectives may be complex and ambiguous, performance is difficult to measure, and some resources are acquired by coercion, not consent.

In the remarks below I evaluate the Federal Reserve System—and the institution of central banking more generally—from the perspective of an organizational economist. While I strongly disagree with many of the key policies of the Federal Reserve Board both before and after the Financial Crisis and Great Recession, my argument does not focus on particular actions taken by this or that Chair and Board. The problem is not that the Fed has made some mistakes—perhaps addressed by restating its statutory mandate, scrutinizing its behavior more carefully, and so on—but that the very

¹⁴⁰ Peter G. Klein, Anita M. McGahan, Christos N. Pitelis, and Joseph T. Mahoney, "Toward a Theory of Public Entrepreneurship," *European Management Review* 7 (2010): 1-15.

institution of a central monetary authority is inherently destabilizing and harmful to entrepreneurship and economic growth.

A central bank is a government entity in charge of the monetary system—an entity that “controls the money supply,” in layman’s terms—with the task of maintaining “price stability,” achieving a “full employment” of the economy’s resources, and other national economic performance objectives. (The Federal Reserve System is charged explicitly with achieving both price stability and full employment, the so-called “dual mandate” now challenged by proposals from Representatives Pence and Brady.¹⁴¹) The Fed, like other modern central banks, also serves as a “lender of last resort” tasked with protecting the financial system from bank runs and other panics by standing ready to make loans to commercial banks, using funds that are created instantly, from nothing, at the click of a mouse.

The central bank’s job, in short, is to “manage” the monetary system. As such, it is the most important economic planning agency in a modern economy. Money is a universally used good and the loan market, through which newly created money enters the economy, is at the heart of the investment process. Ironically, though economics clearly teaches the impossibility of efficient resource allocation under centralized economic planning, as demonstrated (theoretically) in the 1920s and 1930s by economists such as Ludwig von Mises and F. A. Hayek,¹⁴² and (empirically) by the universally recognized failure of centrally planned economies throughout the twentieth century, many people think that the monetary system is an exception to the general principle that that free markets are superior to central planning. When it comes to money and banking, in other words, it is essential to have a single decision-making body, protected from competition, without effective oversight, possessing full authority to take almost any action it deems in the best interest of the nation. The organization should be run by an elite corps of apolitical technocrats with only the public interest in mind.

And yet, everything we know about organizations with that kind of authority, without oversight, or any external check or balance, tells

¹⁴¹ H.R. 245 and H.R. 4180, respectively. Some observers refer to a “triple mandate” that also requires “moderate long-term interest rates.”

¹⁴² Ludwig von Mises, “Economic Calculation in the Socialist Commonwealth” [1920], in Hayek, ed., *Collectivist Economic Planning* (London: Routledge and Sons, 1935); F. A. Hayek, “Economics and Knowledge,” *Economica* NS 4(13): 33–54; Hayek, “The Use of Knowledge in Society,” *American Economic Review* 35(4): 519–30.

us that they cannot possibly work well. Just as economy-wide central planners lack the incentives and information to direct the allocation of productive resources, monetary planners lack the incentives and information to make efficient decisions about open-market operations, the discount rate, and reserve requirements. The Fed simply does not know the “optimal” supply of money or the “optimal” intervention in the banking system; no one does. Add the standard problems of bureaucracy—waste, corruption, slack, and other forms of inefficiency well known to students of public administration—and it becomes increasingly difficult to justify control of the monetary system by a single bureaucracy.¹⁴³ This is especially true when the good in question is money, the only good that exchanges against all other goods, meaning the good in which all prices are quoted. Mismanagement of the money supply not only affects the general price level, but distorts the relative prices of different goods and industries, making it more difficult for entrepreneurs to weigh the benefits and costs of various forms of action, leading to malinvestment, waste, and stagnation. Price inflation rewards debtors while punishing savers, just as artificially low interest rates reward homeowners while punishing renters. Instead, market forces should determine levels of borrowing and saving, owning and renting, and entrepreneurial activity. Put differently, the monetary system is so important that it cannot be entrusted to a government agency—even a scientifically distinguished, nominally independent, prestigious organization like the Federal Reserve System.

Critics of discretionary monetary policy have argued for fixed rules, such as Milton Friedman’s famous recommendation of a fixed rate of money-supply growth, or Professor Taylor’s more accommodating set of countercyclical rules.¹⁴⁴ Others debate whether inflation targeting or nominal-income targeting is a more straightforward and realistic policy for the Fed.¹⁴⁵ However, none of these proposals is as effective as eliminating the monetary authority

¹⁴⁵ Christina D. Romer, “Dear Ben: It’s Time for Your Volcker Moment,” *New York Times*, October 29, 2011.

altogether, and relying on the voluntary decisions of market participants to determine the money supply and interest rates. A commodity standard, for example, removes even the possibility of central government intervention in the monetary system. If rules are better than discretion, the best policy is to eliminate all discretion, and to achieve a monetary standard that is wholly independent of political or technocratic interference.

The Fed's Performance Before and After 2008

My own views on monetary theory and policy derive from the “Austrian school” of Ludwig von Mises, F. A. Hayek, Murray N. Rothbard, and other important scholars and analysts.¹⁴⁶ From this perspective, the cause of the housing bubble was not irrational exuberance, corporate greed, or lack of regulation but the highly expansionist monetary policy of the Fed under Chairmen Greenspan and Bernanke.¹⁴⁷ After the dot-com crash the Fed turned on the printing presses, increasing the monetary base by 5.6% in 2001, 8.7% in 2002, and 6.3% in 2003, while MZM rose by 15.7%, 13.0%, and 7.3% during those years. Greenspan slashed the federal funds rate from 6.5% in January 2001 to 1% by June 2003, keeping it at 1% until late 2004, a level not seen since 1954. This infusion of credit led to overinvestment in housing and other capital-intensive industries, aided by federal government policies designed to increase the rate of home ownership by relaxing underwriting standards.¹⁴⁸

The correct response to the collapse of Lehman Brothers on September 16, 2008, and Washington Mutual ten days later, would have been to let these insolvent institutions fail and to encourage a

Rothbard, *America's Great Depression* (Princeton, N.J.: D. Van Nostrand, 1963); Douglas W. Diamond and Raghuram G. Rajan, “Illiquidity and Interest Rate Policy,” NBER Working Paper No. 15197, July 2009.

¹⁴⁷ The monetary and financial system is one of the most regulated sectors of the US economy, and there hasn't been any “deregulation” since the Gramm-Leach-Bliley Act of 1999, which if anything mitigated the harm of the financial crisis by allowing acquisitions, such as Bear Stearns by JP Morgan Chase and Merrill Lynch by Bank of America, that shielded bondholders from losses.

¹⁴⁸ Marek Jarocinski and Frank R. Smets, “House Prices and the Stance of Monetary Policy,” *Federal Reserve Bank of St. Louis Review* (July 2008): 339–66; Stanley J. Liebowitz, “Anatomy of a Train Wreck: Causes of the Mortgage Meltdown,” in Randall G. Holcombe and Benjamin Powell, eds., *Housing America: Building Out of a Crisis* (Oakland, Calif.: Independent Institute, 2009); Johan Norberg, *Financial Fiasco: How America's Infatuation with Home Ownership and Easy Money Created the Economic Crisis* (Washington, D.C.: Cato Institute, 2009).

massive de-leveraging of the economy and an increase in savings and investment. An economic crisis represents a misallocation of productive resources, and the best policy response is to allow market participants to redirect resources from lower- to higher-valued uses. In short, once investments are revealed to be mistakes, it is critical to let the market *liquidate the bad investments as quickly as possible* to make them available for other purposes.¹⁴⁹ Of course, physical and human resources cannot be instantly and costlessly reallocated to alternative uses. However, contracting parties should be allowed to renegotiate resource use without central banks getting in the way. Existing mechanisms for liquidating existing investments and organizations, such as bankruptcy, should be used where appropriate.

The Fed, working hand-in-hand with the Treasury department under the Bush and Obama Administrations, has done precisely the opposite, bailing out insolvent financial institutions and industrial concerns, driving interest rates to zero, and injecting trillions of dollars into the financial system—increasing the monetary base, for example, by an average of 33.7% per year between 2008 and 2012, a cumulative increase of 198%. In short, the Fed’s philosophy has been *to prevent, as much as possible, entrepreneurs from liquidating any bad investments*—indeed, to perpetuate those bad investments as long as possible. Insolvent financial institutions, rather than go through bankruptcy and reorganization, with poorly performing executives replaced by better ones, have received billions of dollars of free money. Incompetent executives remain at the helm.

The Fed Has Too Much Power

The Fed’s defenders acknowledge that its recent actions are controversial. But, they say, that is the nature of the beast. Someone has to be in charge of the monetary system, and during a crisis, leaders have to make tough decisions. If not the Fed chairman and staff—intelligent, competent, well-trained economists—who else? Who better than the distinguished Princeton macroeconomist Ben Bernanke?

Economist Lawrence Ball produced an interesting paper in February of this year on the psychology of the chairman.¹⁵⁰ Ball

¹⁴⁹ Rajshree Agarwal, Jay B. Barney, Nicolai Foss, and Peter G. Klein, “Heterogeneous Resources and the Financial Crisis: Implications of Strategic Management Theory,” *Strategic Organization* 7, no. 4 (2009): 467–84.

¹⁵⁰ Lawrence M. Ball, “Ben Bernanke and the Zero Bound,” NBER Working Paper No. 17836, February 2012.

traced the evolution of Bernanke's thinking between 2000 and 2012, arguing that, since 2008, "the Bernanke Fed has eschewed the policies that Bernanke once supported." Ball attributes to the change in Bernanke's thinking to groupthink and to the chairman's own personality, which Ball describes as shy, withdrawn, and unassertive.

Without intending to, Ball makes powerful arguments against discretionary monetary policy itself, which relies on a small, elite group of powerful technicians, interest-group representatives, and political advisers to design and implement rules and procedures that affect the lives of millions, that reward some (commercial and investment bankers, homeowners) while punishing others (savers, renters), that shape the course of world events. Under central banking, there are no rules, only discretion. Do we really want a system in which one person's personality type has such a huge effect on the global economy?

Yes, the Fed's defenders insist. It is vital, they say, that the Fed not be constrained in any way from pursuing whatever policies it deems best. Federal Reserve officials are regarded as Plato's philosopher-kings. When a group of distinguished economists expressed skepticism in 2008 about what became the Troubled Assets Relief Program—the government rescue of inefficient, badly managed financial firms, Harvard's Gregory Mankiw offered the following response:

I know Ben Bernanke well. Ben is at least as smart as any of the economists who signed that letter or are complaining on blogs and editorial pages about the proposed policy. Moreover, Ben is far better informed than the critics. The Fed staff includes some of the best policy economists around. In his capacity as Fed chair, Ben understands the situation. . . . If I were a member of Congress, I would sit down with Ben, privately, to get his candid view. If he thinks [the bailout] is the right thing to do, I would put my qualms aside and follow his advice.¹⁵¹

One can hardly imagine a more dangerous perspective on government decision-making. It ignores differences in theoretical frameworks between, say, Keynesian, Austrian, monetarist, new classical, and other economists. It ignores differences in the interpretation of data, which is a matter of *judgment*, not intelligence. It ignores the possibility that key decision-makers, including Fed and Treasury officials, have private and conflicting interests. And of

¹⁵¹ N. Gregory Mankiw, "If I Were a Member of Congress," Greg Mankiw's Blog, September 26, 2008 (<http://gregmankiw.blogspot.com/2008/09/if-i-were-member-of-congress.html>).

course it ignores normative concerns—some citizens may oppose rewarding incompetent managers with taxpayer funds, regardless of the efficiency consequences. More generally, Mankiw’s argument would seemingly apply to any and all forms of government economic planning. Why have markets at all, if we can have smart, well-informed planners directing the allocation of resources?

Sadly, Mankiw is hardly alone in holding to this worldview.¹⁵² It is the implicit philosophy underlying the institution of central banking. And, to be sure, “Ben” did exactly the wrong things. Contrary to a popular storyline that the Fed and other central banks prevented financial catastrophe, and made the Great Recession less harmful than it otherwise would have been, the Fed’s actions have made a bad situation much worse, by perpetuating the very structural imbalances that brought about the Recession in the first place. The problem with the US economy today is hardly a lack of effective aggregate demand, as Keynesian economists like to say, but a structural imbalance brought about by two decades of cheap credit, imbalances the Fed is working hard to make permanent (e.g., keeping the discount rate close to zero, and promising to do so through the end of 2014). And needless to say, the issue here is not Chairman Bernanke himself, but the impossible situation he faces as Fed chair.

Fed Independence

In 2009 a group of economists circulated a petition in support of Federal Reserve “independence,” and against Congressional attempts to exercise increased oversight and governance.¹⁵³ The idea that the Fed must be independent of any external constraint and must not be audited, governed, or supervised in a serious manner has become a shibboleth of contemporary macroeconomic policy. But it should be challenged. I declined to sign the petition, for two reasons:

First, proponents of Fed independence focus exclusively on monetary policy, as if the Fed’s Congressional critics simply want to know how the Federal Funds Rate is set. But the Fed conducts not only monetary policy but fiscal policy as well, increasingly so since 2008. If the Fed can buy and hold any assets it likes,¹⁵⁴ if it works

¹⁵² Alan Blinder recently dismissed concerns about inflation resulting from the massive increase in the money supply since 2008: “To create the fearsome inflation rates envisioned by the more extreme critics, the Fed would have to be incredibly incompetent, which it is not.”

¹⁵³ “Petition for Fed Independence,” *Wall Street Journal*, July 15, 2009 (<http://blogs.wsj.com/economics/2009/07/15/petition-for-fed-independence/>).

¹⁵⁴ While the Fed primarily holds US Treasuries, it is legally permitted under Section 13(3) of the Federal Reserve Act to hold other assets under “unusual and exigent circumstances,” a

hand-in-hand with the White House and the Treasury to coordinate bailouts in the hundreds of billions of dollars, if it facilitates trillion-dollar deficits by buying all the treasuries the federal government wants to sell, isn't it reasonable to have a bit more oversight? (And don't forget bank supervision. Even the Fed's defenders recognize a need to separate its monetary-policy and bank-supervision roles. But as long as the Fed continues as a bank regulator, shouldn't someone should be watching the watchmen?)

Second, and more generally, the Fed is a national economic planning agency, and it performs about as well as every national economic planning agency in history. Have we learned nothing from the collapse of centralized economic planning in the Eastern Bloc, its demise in China, and its crippling hold on places like North Korea? "Independence," in this context, simply means the absence of external constraint. There are no performance incentives and no monitoring or governance. There is no feedback or selection mechanism. There is no outside evaluation. Why would we expect an organization operating in that environment to improve overall economic performance? The Fed is run by men, not gods.

Supporters of independence argue that Congressional or other oversight will pressure the Fed to pursue short-term goals (boosting output) at the expense of long-term performance (controlling inflation).¹⁵⁵ But these arguments ignore what economists, following Ronald Coase and Harold Demsetz, call "comparative institutional analysis."¹⁵⁶ Of course, there are potential hazards associated with Congressional oversight, but also potential benefits of stronger governance and greater transparency. For instance, exposing monetary policy (and the Fed's other controversial actions, e.g. bailing out foreign central banks) to Congressional scrutiny could put pressure on the Fed to service short-term political goals, but under the present system, the Fed can make trillion-dollar bets without any monitoring and feedback system. Unfortunately, cost-benefit analysis is usually forgotten where the Fed is concerned. Consider Mark Thoma's defense of independence: "The hope is that an independent

provision liberally exploited under the Bernanke Fed. See Christian A. Johnson, "Exigent and Unusual Circumstances: The Federal Reserve and the U.S. Financial Crisis," *European Business Organization Law Review* (forthcoming).

¹⁵⁵ See, for example, Anil K. Kashyap and Frederic S. Mishkin, "The Fed Is Already Transparent," *Wall Street Journal*, November 9, 2009.

¹⁵⁶ Ronald H. Coase, "The Regulated Industries: Discussion," *American Economic Review* 54 (1964): 194–97; Harold Demsetz, "Information and Efficiency: Another Viewpoint," *Journal of Law and Economics* 12, no. 1 (April 1969): 1–22.

Fed can overcome the temptation to use monetary policy to influence elections, and also overcome the temptation to monetize the debt, and that it will do what's best for the economy in the long-run rather than adopting the policy that maximizes the chances of politicians being reelected.”¹⁵⁷

This naive wish is simply that, a hope. Where is the argument or evidence that a wholly unaccountable Fed would, in fact, “do what's best for the economy in the long-run”? What are the Fed officials' incentives to do that? What monitoring and governance mechanisms assure that Fed officials will pursue the public interest? What if they have private interests? Maybe they are influenced by ideology. Suppose they make systematic errors. Maybe they are unduly influenced by the banking industry or other special-interest groups. To make a case for independence, it is not enough to demonstrate the potential hazards of political oversight. You have to show that these hazards exceed the hazards of an unaccountable, unrestricted, ungoverned central bank. A naive faith in the wisdom of central bankers to do what's right just isn't good enough.

Do We Need a Central Bank?

Without a central bank, how can a monetary system work? Don't we need a central bank to create bank reserves? Isn't the Fed necessary to maintain stable prices? Don't we need the government to create and regulate money? Actually, the reverse is true.

One of the first scientific analyses of the nature and origin of money, Carl Menger's 1892 essay “On the Origin of Money,” explains how money—a generally accepted medium of exchange—emerges from the trading patterns of individual market participants.¹⁵⁸ Menger was challenging the then-dominant “state theory of money,” which held that money must be created, *ex nihilo*, by benevolent central planners. Rather, as decades of research in monetary theory and history have shown, there is no need whatsoever for government participation in the monetary and financial system. Money—whether a physical commodity like gold or silver or their paper equivalents—is essentially a commodity that is selected and “governed,” so to speak, by the choices of entrepreneurs and consumers in the market. This is

¹⁵⁷ Mark Thoma, “Why The Federal Reserve Needs To Be Independent,” *CBS Moneywatch*, November 12, 2009 (http://www.cbsnews.com/8301-505123_162-39740151/why-the-federal-reserve-needs-to-be-independent/).

¹⁵⁸ Carl Menger, “On the Origin of Money,” *Economic Journal* 2 (1892): 239–55; Peter G. Klein and George A. Selgin, “Menger's Theory of Money: Some Experimental Evidence,” in John Smithin, ed., *What Is Money?* (London: Routledge, 2000), pp. 217–34.

as true today, in an era of paper currencies and electronic payments, as it was under the international gold standard. There is no need for a government agency to increase or decrease the supply of money. Indeed, according to the Austrian school, government attempts to control the money supply create distortions in the economy by interfering with relative prices and warping the capital structure, encouraging the bad investments that manifest themselves over the course of the business cycle. Rather, the value of money should be determined on the market, as part of the normal, day-to-day process of exchanges between money and goods and services.

How, then, is price stability to be maintained? The answer is that the economy doesn't need "stable" prices, just market prices. Some of the proposals discussed at this hearing suggest removing the Federal Reserve Act's language about "maximum employment," keeping just the part about "stable prices." Eliminating the dual mandate would be a step in the right direction, as it would reduce the Fed's incentive to increase the money supply when unemployment rates rise beyond some arbitrary threshold. But the requirement of price stability should be removed as well. The idea that a central bank is needed to maintain a stable or modestly rising price level—to prevent high levels of inflation, in other words—is based on a misunderstanding of inflation. In a growing economy, with a stable or slightly growing money supply (as under a commodity standard), prices will tend to fall, as in the US during the 19th century, when the US experienced dramatic increases in production and living standards. Price levels rise because the real economy is shrinking or—as is almost universally the case in practice—because the money supply is increasing faster than the increase in real production. Inflation is not caused by an "overheated" economy that the government needs to somehow cool off. Inflation, as Milton Friedman famously put it, is everywhere and always a monetary phenomenon. Central banks don't fight inflation; they create it.

But isn't it vital that a government agency try to control interest rates, keeping interest rates sufficiently low to generate economic growth? Not at all. Interest rates are prices, prices that clear the markets between suppliers and demanders of loans. Increasing the money supply in an attempt to lower interest rates can indeed give the economy a short-term "boost," but at the cost of channeling resources into areas—housing, for instance—where the market does not want them to go. Driving down interest rates below their market-clearing rates does not create real economic growth, but only distortions, by making it more difficult for entrepreneurs to

anticipate the future goods and services that consumers will want to purchase, and thus be profitable.¹⁵⁹ Credit expansion shifts wealth from savers to borrowers (and, in the case of mortgage lending, from renters to owners), from less time-sensitive investment projects to more time-sensitive ones; and from those who are last to receive the new money to those who are first in line.¹⁶⁰ In short, activist monetary policy always, whether intentionally or not, picks winners and losers, increases uncertainty, and destroys real wealth.¹⁶¹ We don't want a government agency setting the price of tomatoes or shoes or forklifts or computer software; why do we want a government agency setting the price of loans?

What about the need for a lender of last resort? Even proponents of central banking recognize that the lender-of-last-resort function encourages what economists call “moral hazard”: banks take on more risk than they would if they had to bear the full consequences of their portfolio decisions. The presence of a central bank, armed with an infinite supply of “liquidity,” ready to supply liquidity to any bank in financial distress, discourages prudent behavior.¹⁶² Diamond and Rajan link the Financial Crisis to “the actions of the Federal Reserve earlier in the decade, not only in convincing the market that interest rates would remain low for a sustained period following the dot-com bust because of its fears of deflation, but also in promising to intervene to pick up the pieces in case of an asset price collapse—the so-called Greenspan put.”¹⁶³

More generally, a dynamic, wealth-creating market economy relies on the power of competition—what Joseph Schumpeter famously called “creative destruction”—to sort between high-valued and low-valued use of resources, including the displacement of less

¹⁵⁹ In Mises's terminology, credit expansion that lowers interest rates, increases price levels, and alters relative price ratios “falsifies economic calculation.” Ludwig von Mises, *Human Action: A Treatise on Economics* (New Haven: Yale University Press, 1949), pp. 549 and 553.

Baker, Nicholas Bloom, and Steven J. Davis, “Measuring Economic Policy Uncertainty,” Working paper, Chicago Booth School of Business, 2011.

¹⁶² Indeed, programs such as the Troubled Assets Relief Program are forms of corporate welfare that redistribute resources from the more prudent financial institutions—for example, banks that stayed out of the market for mortgage-backed securities—to the more reckless ones.

¹⁶³ Diamond and Rajan, p. 33.

efficient firms by their more efficient rivals. The banking industry is no different. If a bank, like any other business, cannot profitably produce goods and services that its customers demand, it should be liquidated and its assets made available to entrepreneurs who can do a better job. Bailouts, subsidies, and other forms of special privilege for particular entrepreneurs hinder the market process of directing productive resources to their highest valued uses. As Luigi Zingales reminds us, the price of bailouts is “billions of dollars in taxpayer money and, even worse, the violation of the fundamental capitalist principle that she who reaps the gains also bears the losses.”¹⁶⁴ Besides explicit bailouts, implicit subsidies from “too-big-to-fail” guarantees stymie the entrepreneurial selection process, not only by protecting unsuccessful entrepreneurs and entrepreneurial ventures, but also by rewarding lobbying and other forms of rent-seeking, directing investment toward subsidized activities (at the expense of consumer preferences), and discouraging entry by nascent entrepreneurs who lack political connections.

These principles apply fully to the banking industry. Of course, financial firms are closely linked through complex transactions and instruments such as derivatives and other contracts. The failure of a particular financial institution imposes costs on various counterparties, including other financial institutions. But the production of virtually every good and service in a mature industrial economy is characterized by a complex, interlocking web of transactions, mutual obligations, and contractual relationships. Banking is not unique in this regard. Yet we do not worry about contagion effects sweeping the computer hardware or retail clothing or dairy industry should one or two leading firms go bankrupt. Moreover, the extent to which parties expose themselves to counterparty risks, in banking or any other industry, depends on the protections offered by the regulatory system. If a computer hardware company knows that it is Too Big to Fail, or that a Computer Industry Resource Provider of Last Resort stands ready to supply labor, machines, and raw materials in case of trouble, that company will engage in all kinds of risky behaviors it would have otherwise avoided.

Alternatives to Central Banking

Many scholars and practitioners support the Federal Reserve System, and central banking more generally, because they cannot conceive of any alternative. “If we got rid of the Fed,” they ask, “who would control the money supply?” Of course, to ask the question that way is to answer it: the market would control the money supply, just as it “controls” the tomato supply, the shoe supply, the forklift supply, and the Angry Birds supply.

Exactly how a market-based monetary system would function, what form it would take, and how an economy can transition from government-controlled to market-based money, are interesting and important subjects that have stimulated large and growing academic and practitioner literatures.¹⁶⁵ Most proponents of market-based money favor a commodity standard, though competing paper currencies have been suggested as well.¹⁶⁶ All these schemes have the basic advantage of taking the value of money out of the hands of government planners, allowing it to be determined by supply and demand, as with every other good and service in a market economy.

Another advantage of a commodity standard is that it prevents allowing a central bank to monetize the government’s debt by purchasing government bonds (and reducing debt payments by generating price inflation). In the interest of transparency, it is far better to require that federal government spending be financed through taxation or borrowing from the public. Wouldn’t this constrain the federal government’s ability to “stimulate” the economy with increased spending during times of recession? Yes, and that’s exactly the point—a commodity standard imposes fiscal discipline, something the US economy desperately needs. Such discipline would rescue entrepreneurs from the unpredictable and often arbitrary whims of monetary planners, freeing them to invest, innovate, and create economic growth—not just in the long run, but in the short run as well.

¹⁶⁵ Murray N. Rothbard, “The Case for a 100 Per Cent Gold Dollar,” in Leland Yeager, ed., *In Search of a Monetary Constitution* (Cambridge, Mass.: Harvard University Press, 1962), pp. 94–136; Friedman, *A Program for Monetary Stability*, pp. 4–8; George A. Selgin and Lawrence H. White, “How Would the Invisible Hand Handle Money?” *Journal of Economic Literature* 32, no. 4 (1994): 1718–49; Rothbard, *The Case Against the Fed* (Auburn, Ala.: Ludwig von Mises Institute, 1994), pp. 146–51.

Conclusion

There is an old joke about a central bank official picking up a pizza. (Perhaps it's Chairman Bernanke, on his way home after a long day of quantitative easing.) The clerk asks, "Do you want it cut in six slices, or eight?" The central banker responds: "I'm feeling extra hungry today; better make it eight."

Of course, dividing the stock of goods and services by a larger quantity of money does not create wealth. One of the most important lessons of economic theory is that the only way for a society to generate economic growth is to consume less than it produces. The surplus (real savings) can be invested in the production of capital goods (and innovation) that allows for greater production in the future. Conversely, one of the oldest economic fallacies is the idea that the economy sometimes gets "stuck" with low production and high unemployment due to a shortage of money, and that the way to get it unstuck is to print more money to increase "total spending"—to consume more than the economy produces. Some sixty years ago Ludwig von Mises ridiculed this as the "spurious grocer philosophy" (the merchant's view that his products aren't selling because buyers lack enough currency), noting that this fallacy is essentially the philosophy of Lord Keynes, the twentieth-century apostle of central banking and macroeconomic stabilization policy.

Keynes was wrong. Cheap credit does not help bring an economy out of recession (particularly when it was cheap credit that caused the recession in the first place). More generally, a monetary system controlled by an all-powerful central bank is inherently destabilizing and harmful to economic growth. The mistakes made by the Fed before and after 2008 are not isolated incidents, mistakes that can be corrected by making minor changes to the Fed's charter, structure, or independence. They are the predictable result of giving control of the monetary and financial system to a government agency. The best option is to replace the central bank and let the market be in charge of money.

The position advocated here is often dismissed as radical or extreme, a kind of "market fundamentalism" (to use a derogatory term). But it is a reasonable, pragmatic, realistic view. Economics and management scholarship teach that monopoly providers are inefficient and ineffective, and a government monopoly on money is no different. Markets are not perfect, but neither are Fed chairs. It's time to make the supply of money independent of political interference.

**WRITTEN TESTIMONY OF
JOHN B. TAYLOR, Ph.D.**

MARY AND ROBERT RAYMOND PROFESSOR OF ECONOMICS
STANFORD UNIVERSITY
AND GEORGE P. SHULTZ SENIOR FELLOW IN ECONOMICS'
HOOVER INSTITUTION

Chairman Paul, Ranking Member Clay, and other members of the subcommittee, I thank you for the opportunity to testify at this hearing on improving the Federal Reserve System. I especially appreciate the efforts of this subcommittee to bring these crucial monetary policy issues to a prominent place in the public debate. As you requested, I will first explain why there is a need for improvement and then consider whether this need is addressed by six reform bills:

- *H.R. 245* introduced by Rep. Mike Pence,
- *H.R. 1094* introduced by Rep. Ron Paul,
- *H.R. 1401* introduced by Rep. Marcy Kaptur,
- *H.R. 2990* introduced by Rep. Dennis Kucinich and John Conyers,
- *H.R. 3428* introduced by Rep. Barney Frank, and
- *H.R. 4180* introduced by Rep. Kevin Brady and others.

A Need for Improvement

Nearly a century of experience under the Federal Reserve Act has provided plenty of evidence that more systematic rules-based monetary policies work and more unpredictable discretionary policies don't. The Fed's well-known mistake of cutting money growth in the Great Depression which led to very high unemployment is now part of a much larger body of evidence. From the mid-1960s through the 1970s, the Fed intervened with discretionary go-stop changes in money growth that led to frequent recessions, high unemployment, low economic growth, and high inflation. In contrast, through the 1980s and 1990s and until recently the Fed ran a more predictable, systematic policy with a clear price stability goal, which eventually led to lower unemployment, lower interest rates, longer expansions, and stronger economic growth.

Recently, however, the Fed has returned to unpredictable discretionary policies with disappointing results. Starting in 2003-

2005 it departed from the more systematic policies it followed in the 1980s and 1990s. It held interest rates too low for too long and thereby encouraged excessive risk-taking and the housing boom. It then overshot the needed increase in interest rates which worsened the bust. Since then the interventions have been truly extraordinary, even if you ignore actions during the 2008 panic—including the bailouts of the creditors of Bear Stearns and AIG—and consider only quantitative easing—the large scale purchases of mortgage-backed securities and longer term treasuries in 2009 and later.

In fact, the Fed's discretion is virtually unlimited. To pay for its large-scale securities purchases, it simply credits banks with electronic deposits—called reserve balances. The result has been an explosion of reserve balances. Before the 2008 panic, reserve balances were about \$10 billion. Now they are \$1,493 billion. If the Fed had stopped with the emergency responses of the 2008 panic, instead of embarking on quantitative easing, reserve balances would now be back to normal levels. This large expansion of reserve balances creates risks. If it is not undone, then the bank reserves will eventually pour out into the economy, causing inflation. If it is undone too quickly, banks may find it hard to adjust and pull back on loans.

The very existence of quantitative easing as a policy tool creates unpredictability, as traders speculate whether and when the Fed will intervene and guess what the impact will be. That the Fed can intervene without limit into any credit market—not only mortgage-backed securities but also securities backed by automobile loans or student loans—creates more uncertainty and raises questions about why an independent agency of government should intervene in these areas at all. In the spirit of the Constitution, they are best left to the Congress and the president through the appropriations process.

Reform Proposals

For all these reasons, there is a great need for improvement in the degree to which the Federal Reserve follows rules rather than discretion. To achieve this end, some argue that we should abolish the Fed, as does *H.R. 1094*, repeal the Federal Reserve Act, and perhaps replace it with a commodity standard. The goal of such legislation is to move American monetary policy away from discretion and toward rules. However, a more practical and effective approach, in my view, is to reform the Federal Reserve and create strong incentives for rule-like behavior.

The starting place for such a reform is the recognition that a clear well-specified goal usually results in a consistent and effective strategy for achieving that goal. Too many goals blur responsibility and accountability, causing decision makers to choose one goal some times and another goal at other times in an effort to chart a middle course. In the case of monetary policy, multiple goals enable politicians to lean on the central bank to do their bidding and thereby deviate from a sound money strategy. More than one goal can also cause the Federal Reserve to exceed the normal bounds of monetary policy—moving into fiscal policy or credit allocation policy—as it seeks the additional instruments necessary to achieve multiple goals.

Despite these obvious pitfalls, a multiple mandate for the Fed swept in during the great interventionist wave of the 1970s, when Congress passed the Federal Reserve Reform Act of 1977. This law explicitly gave the Federal Reserve the goals of promoting both “maximum employment” and “stable prices.” This was the wrong remedy for the inflationary boom-bust economy at the time, and monetary policy worsened for a while.

Paul Volcker reversed policy when he became chairman in August 1979, focusing on inflation like a laser beam. Of course he had to interpret the law in a way consistent with this reversal. To achieve maximum employment, he argued that he had to reduce inflation even if that increased unemployment in the short run. While that approach eventually worked well, it also set a precedent that the dual mandate was open to interpretation by Fed officials. In recent years the dual mandate has been used by the Fed to justify massive interventions on the questionable grounds that these will reduce unemployment in the short run.

Thus, an important step toward a more rule-like policy would be to remove the dual mandate and bring focus to a single goal as does *H.R. 4180*, introduced by Rep. Kevin Brady and others, in which the goal is “long-run price stability” or *H.R. 245*, introduced by Rep. Mike Pence, in which the goal is “stable prices.” In my view, the adjective “long-run” is useful because it clarifies that the mandate does not mean that the Fed should overreact to minor short-run ups and downs in inflation from month to month or even quarter to quarter. The single mandate wouldn't stop the Fed from providing liquidity when money markets freeze up as they did after the 9/11 terrorist attacks, or serving as lender of last resort to banks during a panic, or reducing the interest rate in a recession.

Some worry that a focus on the goal of price stability would lead to more unemployment. But history shows just the opposite. One

reason the Fed kept its interest rate too low for too long in 2003-05 was the concern that higher rates would increase unemployment, contrary to the dual mandate. If the single mandate had prevented the Fed from keeping interest rates too low for too long, then it would likely have avoided the boom and bust which led to very high unemployment.

Recent history shows that a single mandate would help to avoid excessive discretionary interventions. Since 2008 the Fed has explicitly cited the dual mandate to justify its unusual interventions, including the quantitative easing from 2009 to 2011. During the 1980s and 1990s, Fed officials rarely referred to the dual mandate, even during the period in the early 1980s when unemployment rates were as high as today. When they did so, it was to make the point that achieving price stability was the surest way for monetary policy to keep unemployment down. In fact, until the recent interventionist period, written policy statements and directives from the Fed did not mention the “maximum employment” part of the dual mandate in the Federal Reserve Act. There was not a single reference from 1979 until late 2008, just as the Fed was about to embark on its first bout of quantitative easing. It increased its references to maximum employment in the fall of 2010 as it embarked on its second bout of quantitative easing.

While a single mandate would reduce excessive discretionary interventions and encourage more rule-like policy, it would be wise to supplement the existing legislative proposals with additional incentives for the Fed to place greater emphasis on the strategy or rule for setting the monetary policy *instruments* (the interest rate or the monetary aggregates). Until the year 2000 the Federal Reserve Act had a specific reporting requirement about the growth of the monetary aggregates. It called for the Fed to submit a report to Congress and then testify about its plans for money growth for the current and next calendar years.

The reporting requirement was fully repealed in 2000, because the data on money growth had become less reliable as people found alternatives to money—such as credit cards or money market mutual funds—to make payments. The Fed thus focused more on the interest rate, but the problem was that nothing about reporting on its interest rate policy was put in its place of its reporting about money growth.

In order to further encourage more rule-like monetary policy, the Congress could reinstate the reporting requirements. But rather than focus only on money growth, it would also focus on the

systematic response of the interest rate that changes in money growth bring about. In doing so, it would not require that the Fed choose any particular rule for the interest rate, only that it establish some rule and report what the rule is. But if the Fed deviates from its chosen strategy, it must provide a written explanation and testify at a public congressional hearing.

In addition to the change in the mandate and enhanced reporting requirements, overall restraints on the composition and the size of the Federal Reserve's portfolio would reduce monetary policy uncertainty. It is therefore appropriate, in my view, to limit asset purchases by the Fed to U.S. Treasury securities, as called for in **H.R. 4180** with exceptions as provided in that bill. This would also clarify that the Fed's responsibility is monetary policy not credit allocation policy, and thus strengthen the independence of the Fed. In contrast **H.R. 2990**, introduced by Rep. Kucinich, would effectively reduce the independence of monetary policy decisions by creating a new monetary authority under the general oversight of the Secretary of the Treasury.

Improving the balance of voting rights on the Federal Open Market Committee (FOMC) would also reduce the likelihood of harmful discretionary actions. Giving all Federal Reserve district bank presidents voting rights at every FOMC meeting, as called for in **H.R. 4180**, would better balance voting power across the entire economy and reduce the tendency for policy decisions to favor particular regions, sectors, firms, or groups over others. **H.R. 1401**, introduced by Rep. Marcy Kaptur, also improves the balance among the district banks and Federal Reserve Board members by having the voting authority of all the presidents rotate on and off in the same manner and by reducing the length of terms of the members of the Board of Governors. **H.R. 3428** introduced by Rep. Barney Frank would worsen the balance, in my view, by replacing the district bank presidents who vote on the FOMC with additional Fed Board members thereby concentrating more power in Washington and likely increasing the discretionary power of the Federal Reserve.

In sum, legislative reforms which clarify the Fed's mandate, enhance reporting requirements about its strategy or rule for the monetary instruments, restrict the nature of the its purchases of securities, and balance voting rights on the FOMC would allow Congress to exercise appropriate political control without becoming involved in day-to-day monetary policy operations or otherwise micromanaging the Fed. In my view the reforms would enhance the independence of the Fed by adding reassuring accountability

appropriate for an independent agency of government and clarifying that its overall responsibility is monetary policy not fiscal policy or credit allocation policy. History and basic economics tells us that such reforms would greatly improve employment and price stability and would help restore America's prosperity.

**WRITTEN TESTIMONY OF
JAMES K. GALBRAITH, Ph.D.**
LLOYD M. BENTSEN, JR. CHAIR IN
GOVERNMENT AND BUSINESS RELATIONS
LBJ SCHOOL OF PUBLIC AFFAIRS
UNIVERSITY OF TEXAS AT AUSTIN

Chairman Paul, Ranking Member Clay, Members of the Subcommittee, it is always an honor as a former member of the Banking Committee staff to appear before you. Today I feel particularly privileged as I was on the staff from 1975 through 1980 and on the team that drafted the Humphrey-Hawkins Full Employment and Balanced Growth Act of 1978. I drafted the Federal Reserve oversight sections of that act, and it was my responsibility to organize the hearings on the Conduct of Monetary Policy in those years, beginning with the enactment of H. Con. Res. 133 in 1975.

Let me join in the frustration that underlies the bills before you. The Constitution gives to Congress the right “to coin money, regulate the value thereof.” The Congress correctly delegates the exercise of that power, but it also maintains its authority to set goals and to supervise the execution of policy. It has been a long struggle to establish the right relationship between Congress and the Federal Reserve, and to bring the right degree of openness, responsiveness and accountability to that relationship.

I endorse H.R. 3428, which would remove the Presidents of the District Federal Reserve Banks from voting status on the Open Market Committee. The Presidents are not duly constituted “Officers of the United States” under the appointments clause of the Constitution. Their status as monetary policy-makers is anomalous, and as the Supreme Court ultimately declined to grant certiorari when the issue was litigated by Chairman Reuss and Senator Riegle many years ago, the only remedy is legislation. HR. 3428 would take a useful step along the path to a better central bank.¹⁶⁷

¹⁶⁷ HR 1401 would shorten the terms of the Governors and rearrange the memberships of Presidents on the FOMC; it offers improvement over current arrangements but it does not address the constitutional issue. For this reason I would prefer the solution proposed in HR 3428. Another solution would be to vest the entire voting power on monetary policy in the Board of Governors, and constitute the Presidents as a non-voting Advisory Committee. This would solve the constitutional question while making the smallest adjustment to present arrangements, since all the Presidents (or their representatives) attend the FOMC meetings in any event. In comparison, I can see no compelling reason to create full-time positions at the Board of Governors for functionaries whose entire job would be to contemplate a short-term interest rate that may not deviate from zero for years and years. On the history of

That said, we cannot escape the need for a central bank. The United States before the Federal Reserve Act suffered from chronic deflation and financial panics; for this reason the period from 1873 to 1896 was known as the Great Depression, until the 1930s got that title. In the past century only the communist countries dispensed with central banks and private banking firms, and this arrangement did not serve them well.¹⁶⁸ For this reason, I cannot join in supporting bills that would repeal the Federal Reserve Act or bar lending by commercial banks.¹⁶⁹

The key issue on which I would like to comment today is not whether to have a central bank or who should vote on policy. It is what mandate Congress should give to the central bank. This is an issue fraught with politics and ideology – and worse, with economic theory.

When I served on this staff, my colleagues included the Chicago monetarists Robert Weintraub and Robert Auerbach. We worked together under Chairman Reuss to develop the “dual mandate,” which was expressed as “to promote full employment, production, and real income, balanced growth, adequate productivity growth, proper attention to national priorities, and reasonable price stability” in the

congressional lawsuits against voting participation by the District Bank Presidents on the FOMC, see Robert D. Auerbach: <http://tinyurl.com/7bw93cs>, especially this paragraph: *“...during the 1980s, four lawsuits were brought to require the presidents of the twelve Federal Reserve Banks to be Constitutional officers: Presidential nomination and Senate confirmation. The complainants believed that individuals who vote on the nation's money supply -- and also vote on loans to foreign governments and warehousing funds for the Treasury, both bypassing Congress -- should not be internally selected without displaying their views and credentials in a public Senate confirmation hearing. The complainants were House Banking Chairman Henry Reuss, (Democrat, Wisconsin), Senate Banking Chairman Donald W. Riegle Jr. (Democrat, Michigan), Senator John Melcher (Democrat, Iowa) and The Committee for Monetary Reform (President and Chairman Randall E. Presley of a coalition of 95 corporations and 779 individuals). Two former staffers on the Democratic staff of the House Banking Committee assisted: Grasty Crews argued these cases and I was an expert advisor. The lawsuits failed and the use of internally appointed people to make government policies is still a contentious issue as is exemplified in the 2010 Reform Act's provision for the Inspector General of the new Bureau of Consumer Financial Protection.”*

¹⁶⁸ The case of Hong Kong is celebrated by opponents of monetary discretion, but Hong Kong was a colony before it was returned to China in 1997. I also pass over such countries as Panama and Ecuador which have adopted the US dollar, and the zone franc countries of West Africa, which rely on Paris. All major industrial countries in the world today have central banks and private banking systems; to depart from this norm would be, at least, a substantial experiment.

¹⁶⁹ I confess I do not yet fully understand the thrust of HR. 2990, which I received only this past Friday. The bill accurately calls attention to the dire conditions faced by many Americans and calls appropriately for action. But the apparent direction of action, to forbid “lending against deposits,” seems to overlook the fact that bank loans create deposits in the first place. However, I have not had time to study the later sections of this bill in detail.

preamble of the Humphrey-Hawkins Act and as “maximum employment, stable prices and moderate long-term interest rates” in the Federal Reserve Act.

My staff colleagues were committed monetarists. They believed that the Federal Reserve should pursue a policy of monetary control, to contain inflation. But they did not try to dictate that to the Federal Reserve. Nor would I have tried to dictate the pursuit of full employment over all other policy goals. Writing economic theory into law is dangerous and we steered clear of it as best we could.

The purpose of the Full Employment and Balanced Growth Act in this area was instead to open a sustained dialog between the Federal Reserve and Congress, with honest and forthright reporting on economic conditions, on the outlook and on the goals and instruments of policy at any given time. We understood that conditions change. We realized that economic ideas flow in and out of fashion. We felt that the goals of Congress were best served by stressing the element of dialog and oversight, within a broad framework of agreed objectives.

The Humphrey-Hawkins Act did require the Federal Reserve to specify the range of growth rates of the major monetary aggregates that it believed consistent with its economic goals and objectives. This provision was not intended to impose a strategy of monetary control on the Federal Reserve. The intent was to permit the Banking Committees to monitor the Federal Reserve's forecasting and modeling. We felt that to allow the Federal Reserve to report in terms of economic forecasts alone would make it too easy to evade discussion of what might and should be done under differing conditions.

To stipulate an intermediate target range in terms of interest rates would, at that time, have been highly controversial. Money-growth target ranges were something conservatives could accept, because of monetarism, and that the Federal Reserve could tolerate because they were not the operational tool of open market policy. Then in the mid-1980s the relationship between money growth and prices collapsed and so did the idea that target ranges for money growth were a useful indicator of Federal Reserve policy. However, because the law had been drafted to be intellectually flexible, the congressional oversight procedures survived this statistical and academic upheaval.

This system has been in place for 37 years since H. Con. Res 133; 34 years since Humphrey-Hawkins. It has been used effectively on some occasions, less so on others. But it has stood the test of time. It

has withstood changes in the wording of the law governing the hearings and reporting process. It is a robust procedure because it serves the interests of Congress, of the central bank, and of the public.

Two bills before you would now strike the employment objective presently found in the Federal Reserve Act, leaving only “price stability” and (in the case of HR 245) “moderate long-term interest rates” as statutory goals. In this they would emulate the model of the European Central Bank, whose charter stipulates price stability as the predominant mandate for that institution. HR. 4180 would be less flexible than the charter of the ECB, which permits the pursuit of other goals so long as the primary objective of price stability is met.

The presence of “price stability” among monetary policy objectives is established law; the question is whether it should be (apart from “moderate long-term interest rates”) the sole stated objective. The case that this is so rests on a technical hypothesis, known as the “natural rate of unemployment” or “nonaccelerating inflation rate of unemployment” (NAIRU). This hypothesis was advanced by Milton Friedman and by Edmund S. Phelps in 1967, and it has been a staple of textbooks, but also of controversy, ever since.

In a nutshell, the Friedman-Phelps natural rate hypothesis held that the labor market would settle the rate of employment and output, that money is “neutral” in the long run, and that any effort to create jobs with expansionary monetary policy would lead to runaway inflation. (The theory has bells and whistles, including “adaptive” or “rational” expectations and a “vertical Phillips Curve,” but that is the essence of it.) From this it follows that the best strategy for monetary policy is to pursue a steady rate of inflation; other matters will take care of themselves. And from there one can argue that the best steady rate of inflation is a zero rate. It is this that HR 4180 and HR 245 would now write into law.

A variant on this position is called “inflation targeting,” which has been supported by Chairman Bernanke, at least in academic work. The theoretical target under inflation targeting is a *stable* rate of inflation, not necessarily a *zero* rate. Advocates argue that inflation targeting is consistent with the dual mandate, because (in their view) that rate of employment at which inflation is stable is the maximum sustainable rate. If that is correct, then the employment part of the dual mandate causes no harm and there is no cause to remove it. In a sense, under this view, the presence of “maximum employment” in the mandate is what *permits* non-zero-inflation targeting to be an accepted policy.

“Price stability” is a stricter standard. To remove “maximum employment” from the mandate would seem to imply a directive from Congress to pursue *zero inflation at whatever cost to jobs*. In a world where wages normally vary with the changing age structure of the population (they tend to rise as workers get older) and where some important prices are set outside the country, this is a mandate to generate unemployment, so as to force internal devaluation, in response to practically any form of internal change or external stress.

We can see a policy of this type at work in Europe, where there is a two-percent inflation standard. It is producing a relentless debt-deflation, under which unemployment rises, social institutions such as education, health care and transport are destroyed, and yet public deficits and the ratios of debt to GDP continue to soar. The unemployment rate in Spain today is twenty-five percent. At a meeting in Berlin in April, a high official of the European Central Bank stated that the ECB had been “fully faithful” to its mandate. Members of Congress might not be happy, should the Federal Reserve say the same thing at a moment when twenty-five percent of Americans were out of work. Unlike the ECB, the Federal Reserve is a statutory agency for which, ultimately, Congress is responsible.

HR 4180 makes an explicit commitment to certain ideas, including the NAIRU¹⁷⁰, the “neutrality” of money in the long run¹⁷¹ and the accelerationist hypothesis. It makes debatable empirical assertions about the efficacy of a price-stability mandate; I attach for the record a book review from *Foreign Affairs*, showing that not even Ben Bernanke and his distinguished co-authors could make this case with conviction¹⁷². HR 4180 also admits that the concept of “price stability” is not easily measured; it sets out an array of statistical issues that would have to be resolved. This recalls the “definition of money” problem that bedeviled us when monetarism was in

¹⁷⁰ See my article, “Time to Ditch the NAIRU” *Journal of Economic Perspectives*, Vol 11, Number 1, Winter 1997, 93-108. Available at: <http://tinyurl.com/7cf8jer>

¹⁷¹ HR 4180 thus denies the possibility of hysteresis, or path dependency, a concept that long-term outcomes are influenced by the course of short-term decisions. Hysteresis is fundamental to an evolutionary (which is to say scientific) view of economic process. It has been widely debated, and substantially accepted by many leading economists in recent years, undermining the concept of a long-run equilibrium for employment determined by non-monetary matters. However, these properly remain academic issues; Congress would be wise to avoid interjecting itself into debates of this kind.

¹⁷² “The Inflation Obsession: Flying in the Face of the Facts” a review of Ben S. Bernanke, Thomas Laubach, Frederic S. Mishkin and Adam S. Posen, [Inflation Targeting: Lessons from the International Experience](#), *Foreign Affairs*, January-February 1999, 152-156.

fashion¹⁷³, calling to mind Goodhart's Law, which holds that as soon as an economic statistic is used for policy purposes, the meaning of the statistic will change.

Welcome to Hamelin, in other words. Economists do not know as much as some assert. The recent record of the profession, which massively failed to anticipate the great financial crisis, especially does not inspire confidence. But let me now try to step outside the narrow parsing of terms in statutes and textbook economics, to say a few words about the real world.

Back in the 1970s, we economists did feel that the Federal Reserve held vast powers over inflation and employment. That was a legacy of the post-war American self-image, of our power, wealth and influence, combined with the influence of brilliant polemicists such as John Maynard Keynes and Milton Friedman on many people.

Many economists hold a more reserved view now. Given the financial crisis and our deplorably slow recovery from it, many recognize that having honest, well-regulated banks is important – and that the damage done by catastrophic deregulation and desupervision cannot be repaired easily. So jobs will not easily recover, simply because interest rates to banks are low. To us, the fact that quantitative easing has been a disappointment is no surprise.

Many economists also now recognize that when inflation disappeared in the early 1980s it was not simply because of the powerful personality of Paul Volcker or the fact that Congress started transmitting the Federal Reserve's views to the public via the Humphrey-Hawkins hearings. Disinflation was global. The high dollar, world debt crisis, collapse of commodity and especially oil prices, collapse of the Soviet Union and rise of manufacturing in China were part of the reason. Once these causes were set in motion, the Federal Reserve had little control over the course of events. Statements by Federal Reserve officials in recent decades on their anti-inflation vigilance look silly now. Here we had a reverse King Canute, standing on the beach at low tide, congratulating himself.

The global economy is a fact. The financial debacle is a fact. We cannot escape from either one. In years ahead we may well face continuing trouble with resource prices. We surely face a future of fewer jobs, especially so long as we do nothing about debts and banks.

These are matters over which monetary policy, as such, has little

¹⁷³ The economist Kenneth Boulding summarized this in verse: "We must have a good definition of money/For if we have not/Then what have we got/But a Quantity Theory of no-one-knows-what?"

influence. They cannot be fixed by fiddling with interest rates. They could not be fixed by returning to money-growth targets. We are in a realm where the appropriate response of monetary policy is not clear; it will depend, in part, on what happens in the world and on the decisions that Congress takes on other matters, such as financial sector reform, bank supervision, energy policy and job creation.

This reality should make us a bit less inclined to play King Canute, even if today there is a risk the tides may rise again. It should make us more inclined to study, learn, discuss and review, between Congress and the Federal Reserve, both the prevailing situation and the many lines of policy that will bear on the outcome. Whether to pay the cost of achieving any particular policy goal – including price stability – should depend on what that cost actually is. And that will depend on circumstances, which, as a point of notorious fact, you cannot rely on economists to predict.

Today in economics our pressing need is for a fresh look at theory, and a thorough revision of doctrines that have dominated the subject for decades. In view of this, any law prescribing a single line of thought for the Federal Reserve would be a serious step in the wrong direction.

Were we writing today the preamble of the Humphrey-Hawkins Act, or Section 2a of the Federal Reserve Act, it's likely that we would choose different language. But the language that is there, with its multiple goals and objectives, is flexible and pragmatic; it permits discussion to continue in times of uncertainty, when learning is needed. It does not lock either side into a rigid formula that it will then become necessary to evade. It is serviceable. That is the enduring value of the process now in place.

I close therefore by reminding you of the words of the immortal American poet, Ogden Nash:

“If there is one principle to Americans unknown, It is: leave well enough alone.”

Thank you for your time and attention.

THE INFLATION OBSESSION
BY JAMES K. GALBRAITH

James K. Galbraith is Professor at the Lyndon B. Johnson School of Public Affairs at the University of Texas at Austin, as a Senior Scholar of the Jerome Levy Economics Institute. His new book is *Created Unequal: The Crisis in American Pay*.

Ben S. Bernanke, Thomas Laubach, Frederic S. Mishkin and

Adam S. Posen, *Inflation Targeting: Lessons from the International Experience*, Princeton: Princeton University Press, 1999, 365 pp., bibliography, \$24.95.

Should a central bank address a broad agenda of economic growth, price stability and full employment? Or should it focus single-mindedly on controlling inflation? This debate is mounting in Europe, where calls from social democratic governments for lower interest rates are growing louder as the continent prepares for a central bank. In the United States, where federal law stipulates full employment as a policy goal, Republican proposals to require that the Federal Reserve focus only on inflation surface regularly in Congress.

Ben Bernanke and his colleagues, each a veteran of the Federal Reserve Bank of New York research staff, make the case for inflation targeting, in a book that is a manifesto in everything but its tone. The tone is, rather, the worried one familiar to followers of the recurrent debates over competitiveness, which cater to national vanity in similar terms:

... the United States has lagged behind other industrial countries in considering monetary policy frameworks and institutions that might help ensure good economic performance in the long term.

One might say that we face a frameworks-and-institutions gap.

Since the early 1980s, a handful of countries have declared formally that low and stable inflation should be the overriding objective of monetary policy. These countries, which include New Zealand, Canada, the UK and Sweden, are the main focus of this book. *Inflation Targeting* uses them as examples, to argue that inflation targeting would also enhance American “economic performance in the long term.”

The authors have a curious view of the phrase “economic performance in the long term.” They do not use it to refer to rising living standards, full employment, declining inequality in pay, or similar recent improvements in American well-being. Indeed, they explicitly deny that monetary policy should be praised for these blessings, since, they argue, such gains of an expansionary monetary policy are temporary and unsustainable. Hence, they cannot be counted as among the benefits of monetary policy “in the long term.”

In other words, America’s present affair with full employment is sure to end badly, in accelerating inflation followed by recession. The right strategy is to keep unemployment high enough all the time -- at the natural rate -- to prevent inflation from emerging. A central bank which allows itself to be distracted by the pursuit of economic growth

and full employment is therefore to be condemned. A central bank that achieves price stability but with chronic high unemployment -- as in Germany -- has done its highest duty. The European Central Bank, charter-bound to price stability whatever the cost, represents the pinnacle of monetary policy architecture. Next to it our own Federal Reserve -- unmentioned in the Constitution, subservient to Congress, obliged to report on unemployment -- seems a pathetic weakling among central banks.

Off Target?

The case for inflation targeting, as Bernanke and his colleagues present it, rests on a theory that links monetary policy exclusively to inflation control and denies central banks any important role in determining economic growth or employment. They favor inflation targeting not simply as the better choice among strategies, but as the *only* strategy consistent with sound economics.

But are their principles correct? Oddly, this book does not provide an answer. Bernanke and his colleagues merely tell us that these truths were presented by Milton Friedman in 1967, refined by Robert Lucas in 1976, and consequently accepted by most economists. The theme of consensus crops up time and again. We read that “most macroeconomists agree” that the inflation rate is the only variable that monetary policy can affect in long run (because unemployment will tend always to return to the natural rate), that there is “by now something of a consensus that even moderate rates of inflation are harmful,” that there “is a growing belief among economists and central bankers” that low inflation is good for efficiency and good for growth. For Bernanke and his colleagues, this case is closed; a consensus of economists has settled the issue.

But in fact, no such consensus exists and none has ever existed. To take just a few examples, Robert Eisner, a former President of the American Economics Association and a renowned macroeconomist, has never accepted the Friedman/Lucas view. Neither has James Tobin, Paul Samuelson or Robert Solow, or the late William Vickrey, all Nobel Laureates. Neither did Ray Fair at Yale, James Medoff at Harvard, William Dickens at Brookings. Bernanke and his colleagues maintain the illusion of consensus by simple silence about the actual debate, which has grown more intense, not less so, in recent years.

There are two basic reasons why controversy persists. First, while the Friedman/Lucas doctrine has enjoyed academic dominance, the theory rests on a very peculiar philosophical position, which regards the future as only differing by purely random error from the

past. This point of view, for instance, would require us to see the Asian financial crisis not as a failure of policies but as merely a bad lottery outcome -- tough luck, nothing to be done. Many thoughtful economists reject this starting point. Second, the real world has been openly contradicting the theory for years now. Three years ago, every advocate of the natural rate of unemployment doctrine firmly held that unemployment below six percent would spark inflation. Unemployment then fell, but contrary to theory it not only remained below the supposed natural rate but failed to produce inflation. The Friedman/Lucas arguments received a clear empirical rebuke.

Indeed, deflation, not inflation, has reared its head in much of the world this year as the financial crisis spun out of control. The adherents of the natural rate theory were never able to see this threat. They were still arguing for an anti-inflation policy when the Asian crisis broke in 1997, and they were still clinging to it in the summer of 1998, as U.S. financial markets began to crack under the strain. As the case for urgent action grew evident to everyone else, including Federal Reserve Chairman Alan Greenspan, the diehard natural raters inside the Federal Reserve obstructed forceful action. The concrete result: interest rate reductions were at first too slow, and too small, to impress the financial markets or to affect the economy itself, and so the crisis deepened.

Can one have inflation targeting without the natural rate doctrine? Although Bernanke and his co-authors make no effort to separate the two, it would be quite possible to base inflation predictions on something other than the unemployment rate. An inflation-targeter could have argued, at the Fed last August, that the Asian crisis had eliminated inflation risk and that large cuts in interest rates were essential to ward off the threat of price *deflation*. Indeed some of the old-line supply-siders, such as Jude Wanniski, have taken this very position.

This supply-side view may be an improvement. But it is still much less sensible than current practice. Economists opposed to rate cuts would have countered, correctly, that deflation outside the United States will probably not produce general price deflation inside the country. Most American wages, on which most prices still depend, are unlikely to fall in money terms. The serious danger of the Asian crisis is not falling U.S. price levels but falling employment, recession, and rising inequality. A doctrine of inflation targeting, even if not tied to natural rate dogma, would have weakened the argument for interest rate reductions meant to stabilize employment and output, not to mention the financial markets and the banking

system.

A Case for Cuts

In any case, events have already overtaken our authors. The only potentially effective response to the global slump available to the Fed is a sharp drop in U.S. interest rates and concomitant depreciation of the dollar. These measures would slow the flight of capital to the United States, return some confidence to Asian markets, and help to restore the balance sheets of otherwise insolvent Japanese banks. Inflation-targeting would have delegitimized these policy goals, which were, in fact, partly pursued as the crisis deepened in late 1998. The argument for having the Federal Reserve fight inflation exclusively does not just ignore the reality of the crisis but assaults the urgent present priorities of the Fed itself.

What of the claim that inflation-targeting countries have enjoyed superior economic performance, even if employment and growth are omitted and inflation alone is considered? A fair evaluation of this claim would require a comparative perspective, which the authors do not provide. We are left then to review the historical experience and ask, what kind of evidence do Bernanke and his colleagues actually present that inflation targeting has succeeded?

This part of *Inflation Targeting* merits careful reading, for much of the story in detail is interesting and, within the extremely narrow limits that the authors place around their topic, it is competently told. But what is striking is that even the authors admit that inflation targeting in practice has done little actually to fight inflation. In the case of New Zealand, they write, “the decision to announce inflation targets occurred after most of the disinflation... had already taken place.” The same is true for Canada, while Britain also embraced inflation targets when “it was most likely to meet them.” Sweden, “was in deep recession” with inflation “down to a historically low rate of 3% per year,” when its central bank adopted inflation targets.

In other words, the countries in question never introduced inflation targets when inflation posed a serious threat, nor did the adoption of targets reduce the cost of any ongoing inflation fight. In all cases, the declaration of war came after the fighting was over.

So why did the central bankers do it? Bernanke and his colleagues are quite honest about the reasons. Inflation targeting in all cases coincided with high unemployment, and its main effect was to excuse central bankers from addressing that problem. Second, in some cases inflation targeting could substitute for the messy practice of *money-supply* targeting, an earlier misguided enthusiasm that

Britain had once embraced that Germany is still using today. Third, and in sharp contradiction with the first motive, inflation targeting provided in a few cases some camouflage for central bankers who were actually planning to ease policy in order to fight unemployment. It was a case of saying one thing to placate conservatives, and doing another to accommodate the political and economic realities of the hour.

Central bankers, like generals, are often accused of fighting the last war. But as this description of the actual motives behind inflation targeting makes clear, this is different. First, inflation targeting amounts to *a commitment in principle* to the last war -- the war against inflation -- as a way of avoiding conscription into the next one, against unemployment. Second, it is a way to declare *a change of tactics* for the last war, even though it ended. And third, in some cases inflation targeting permits central bankers to assert that the last war is still going on, and to *pretend* to fight it, while in fact sending a small covert force to the actual battle against unemployment. These mechanisms doubtless have their uses from the narrow political and public relations perspective of a central banker, but it cannot be said that they actually related to economic performance, including the pursuit of low inflation.

What should the United States do? The Federal Reserve is an independent executive agency under the authority of Congress. It therefore comes under the Humphrey-Hawkins Full Employment and Balanced Growth Act of 1978, which rewrote U.S. economic policy objectives to specify that they include full employment, balanced growth and reasonable price stability. In particular, the act set interim targets of four percent unemployment and three percent inflation -- goals that have now, within a few tenths of a percentage point, been achieved.

The authors of *Inflation Targeting* do not discuss the Humphrey-Hawkins Act. If they had the chance, however, they would likely rewrite that statute and direct the Federal Reserve to fight inflation alone. They do not say what would then become of the goal of "full employment." In principle, perhaps some other agency could address the task of sustaining full employment, for example through jobs programs funded by tax increases or deficit spending. But it is unlikely that Bernanke and his colleagues have this in mind. One suspects that what they really want is to abandon full employment as a formal objective of American policy.

It is ironic that this book appears just as Alan Greenspan, Alice Rivlin, and the rest of the Fed leadership have demonstrated how

spurious the natural rate doctrine is by proving that full employment, balanced growth and reasonable price stability are not mutually exclusive. This is a remarkable accomplishment, and it is due in part to the willingness of Chairman Greenspan to override the adherents of the Friedman/Lucas view, and to experiment cautiously with continuing reductions in unemployment. In this way, Greenspan and company have affirmed the good sense of the framers of the Humphrey-Hawkins law. The fact that the unfolding crisis of go-go globalization now threatens this accomplishment does not diminish validity or its importance. And in their attempt to stabilize the financial markets and world economy as the crisis of 1998 unfolded, the Fed's leadership has shown far more sophistication, flexibility and common sense than Bernanke, Laubach, Mishkin and Posen show in this evasive, unpersuasive book.

WRITTEN TESTIMONY OF
ALICE RIVLIN, Ph.D.
SENIOR FELLOW OF ECONOMIC STUDIES
BROOKINGS INSTITUTION
AND FORMER VICE CHAIR
FEDERAL RESERVE BOARD OF GOVERNORS

Chairman Paul and Ranking Member Clay:

I am happy to have this opportunity to testify before the subcommittee as you consider a diverse set of bills designed to alter the role, structure, or functioning of the Federal Reserve. I will focus my brief remarks this morning on the importance of preserving the Federal Reserve's dual mandate to target both maximum employment and price stability. I believe that the dual mandate has served the United States well, and that it would be a mistake to restrict the Fed's policy actions to fostering stable prices alone, as proposed by Mr. Brady in HR 4180 and Mr. Pence in HR 245.

I would like to make clear at the outset that I believe a strong, independent central bank is essential to keeping the United States economy functioning as productively as possible without unnecessarily costly swings in economic activity. Market capitalism has proven its ability to produce goods and services efficiently and deliver a rising standard of living, but it is prone to instability. Monetary policy, along with fiscal policy, can help moderate booms and busts, although it cannot erase the business cycle. Leaning against the economic winds, however, often involves unpopular actions, such as raising interest rates as a boom gathers excessive steam. There is always huge uncertainty about how the complex machinery of the economy is actually working and what results monetary policy can expect to achieve. Nevertheless, chances of successful monetary policy are highest when these difficult decisions are delegated to a group of qualified, experienced people, who are as insulated as possible from political pressures to please the public in the short run. Without a strong independent central bank functioning to mitigate economic and financial instability, the United States would have a weaker, far more chaotic economy and lose its leadership position in the global economy.

The objective of economic policy—including monetary policy—should be a rising standard of living for most people over the long run. That means maximizing sustainable economic growth and productive employment. Controlling inflation is a crucial element of the larger objective because high and, especially, rising inflation is a

serious threat to sustained growth. The expectation of rising prices distorts both consumer and investor behavior and can even turn into a destructive, self-perpetuating hyperinflation. Hence, an essential prerequisite for steadily increasing prosperity is a widespread, firmly anchored expectation that reasonably stable prices will prevail in the future.

Hence, I believe the dual mandate is simply a reflection of what average citizens ought to expect their central bank to do: Let the economy create as many jobs as possible, but don't let inflation interfere with that job growth. Economists translate that common sense exhortation into a monetary policy aimed at keeping the economy as close as possible to its long-run potential growth, without seriously overshooting in either direction. This idea is encapsulated in Pro. John Taylor's famous rule that prescribes easing or tightening when observed economic growth appears to be deviating from potential in either direction.

The problem for the Fed's decision makers is that potential growth is not observable, because it depends on trends in productivity growth, which can shift unexpectedly. In the stagflation of the 1970s, hindsight indicates that monetary policy makers overestimated potential growth and did not tighten soon enough to avoid the acceleration of inflation at the end of the decade. The aggressive tightening of monetary policy in 1979—and the deep recession of the early 1980s that followed—might have been mitigated if the Fed had acted more aggressively sooner. In the 1990s, when I was at the Fed, we faced a happier version of the same uncertainty. Unemployment had fallen to levels that past experience indicated could trigger inflation, but inflation was actually falling. We held off tightening on the presumption, which proved correct, that accelerating productivity growth had raised potential growth and reduced the risk of inflation.

Partly thanks to the Fed, the late 1990s illustrated the benefits of very tight labor markets without significant inflation. Marginal workers found jobs, acquired skills, and work experience, while firms had strong incentives to retain workers by training them, using their skills more effectively, and moving them into better paid jobs. We also had appropriately tightening fiscal policy that balanced the budget—a feat far easier to accomplish in a strongly growing economy. The sooner we get back to those conditions, the better!

But the late 1990s also illustrated the inadequacy of the Fed's toolkit in response to asset price bubbles. Some have criticized the Fed for not tightening monetary policy in response to "irrational exuberance" in the dotcom stock bubble of the late 1990s. But raising

interest rates enough to prick that bubble sooner would probably have tipped the economy into recession, punishing workers and companies across the country for no good reason. Influencing the federal funds rate through open market operations is simply not an effective way of calming an asset price bubble. That lesson had to be learned again in the far more dangerous housing price bubble that gathered steam in the 2000's and whose bursting precipitated the financial crash of 2008 and the ensuing Great Recession. Arguably the Fed kept interest rates too low too long, exacerbating the housing bubble, but interest rates were not the main cause of the catastrophe, nor could monetary policy alone have averted it. Among multiple culprits, I fault the Fed for not using its regulatory powers, in conjunction with other regulators, to raise underwriting standards for mortgage lenders, punish predatory lending, and rein in excessive financial leverage. While we should not have needed a catastrophe to learn this lesson, the Dodd-Frank Act now gives the Fed and the Financial Stability Oversight Council (FSOC) responsibility for financial stability and new tools with which to help achieve it.

The dual mandate is not inconsistent with strong emphasis on controlling inflation when appropriate or even with an explicit target for inflation. Indeed, last January the Fed confirmed a long run inflation goal of two percent. Operating under the dual mandate the Fed has successfully controlled inflation for three decades. To change the language of the law to imply that the Fed's only concern should be inflation would send a misleading signal to a public rightly concerned with jobs and growth, as well as inflation. It would imply that inflation is serious current threat to American prosperity, which seems to me unwarranted.

Exclusive attention to inflation and firmly announced inflation targets served central banks well in the last century, especially in small open economies that could ill afford importing inflation through swings in their currencies. But it would be ludicrous for the United States to put sole emphasis on inflation now, when we have slack labor markets and substantial excess capacity in most economic sectors. Some have urged the Fed to try to create more inflation in the current situation, but that would be hard to achieve, even if it were desirable. Our economy is far less inflation prone than it was in the 1970s. It is more flexible, less dependent on energy prices, has easy access to more sources of supply in the face of domestic prices increases, no longer has wages dominated by multi-year indexed labor contracts, and benefits from expectations that reflect 30 years of reasonably stable prices. That recent oil price shocks have had so

little effect on core inflation is evidence of lower inflation risk than the 1970s.

What we need now is a continuation of accommodative monetary policy plus fiscal policy that combines additional investment in long run growth and jobs with credible long-run action to stabilize the debt. In short, monetary policy as executed by the Fed under the dual mandate has a positive track record and is currently appropriate. I would urge the Congress not to tamper with legislative language that has served us well.

Thank you for your attention. I would be happy to answer questions.

EXPERT COMMENTARY

THOMAS E. WOODS, Jr., Ph.D.

AUTHOR AND SENIOR FELLOW
LUDWIG VON MISES INSTITUTE

CAN WE LIVE WITHOUT THE FED?

We have heard the objection a thousand times: why, before we had a Federal Reserve System the American economy endured a regular series of financial panics. Abolishing the Fed is an unthinkable, absurd suggestion, for without the wise custodianship of our central bankers we would be thrown back into a horrific financial maelstrom, deliverance from which should have made us grateful, not uppity.

The argument is superficially plausible, to be sure, but it is wrong in every particular. We heard it quite a bit in the financial press ever since the announcement that Congressman Ron Paul, a well-known opponent of the Fed, would chair the House Financial Services Subcommittee on Domestic Monetary Policy. Fed apologists were beside themselves – a man who rejects the cartoon version of the history of the Fed will hold such an influential position? He must be made into an object of derision and ridicule.

The conventional wisdom runs something like this: without a central bank or its lesser cousin, a national bank, we had frequent episodes of boom and bust, but since the creation of the Federal Reserve System the economy has been far more stable. People who believe in a free market in banking, as opposed to these cartel arrangements, are evidently so uninformed or so blinded by ideology

that they have never heard or internalized this one-sentence encapsulation of 19th- and 20th-century monetary history.

Modern scholarship has not been kind to this thesis. Mainstream economists have begun to acknowledge that the alleged instability of the period before the Federal Reserve has been exaggerated, as the posited stability of the post-Fed period. Christina Romer, who chaired the Council of Economic Advisers under Barack Obama, finds that the numbers and dating used by the National Bureau of Economic Research (NBER, the largest economics research foundation in the U.S., founded in 1920) exaggerate both the number and the length of economic downturns prior to the creation of the Fed. In so doing, the NBER likewise overestimates the Fed's contribution to economic stability. Recessions were in fact not more frequent in the pre-Fed than the post-Fed period.

Suppose we compare only the post-World War II period to the pre-Fed period, thereby excluding the Great Depression from the Fed's record. In that case, we do find economic contractions to be somewhat more frequent in the period before the Fed, but as economist George Selgin explains, "They were also three months *shorter* on average, and no more severe." Thus recoveries were faster in the pre-Fed period, with the average time peak to bottom taking only 7.7 months as opposed to the 10.6 months of the post-World War II period. Extending our pre-Fed period to include 1796 to 1915, economist Joseph Davis finds no appreciable difference between the frequency and duration of recessions as compared to the period of the Fed.

But perhaps the Fed has helped to stabilize real output (the total amount of goods and services an economy produces in a given period of time, adjusted to remove the effects of inflation), thereby decreasing economic volatility. Not so. Some recent research finds the two periods (pre- and post-Fed) to be approximately equal in volatility, and some finds the post-Fed period in fact to be *more* volatile, once faulty data are corrected for. The ups and downs in output that did exist before the creation of the Fed were not attributable to the lack of a central bank. Output volatility before the Fed was caused almost entirely by supply shocks that tend to affect an agricultural society (harvest failures and such), while output volatility after the Fed is to a much greater extent the fault of the

monetary system. (For citations on this point and for the previous paragraphs, see the paper by George Selgin, William D. Lastrapes, and Lawrence H. White, “Has the Fed Been a Failure?” available online.)

The 19th-century boom-bust cycles that are supposed to discredit the idea of a free market in money and banking are in fact consistently attributable to artificial credit expansion, a practice given artificial stimulus by means of the various government privileges granted to the banking industry. According to Richard Timberlake, a well-known economist and historian of American monetary and banking history, “As monetary histories confirm...most of the monetary turbulence – bank panics and suspensions in the nineteenth century – resulted from excessive issues of legal-tender paper money, and they were abated by the working gold standards of the times.” It is the old story of the faults of interventionism being blamed on the free market.

Contemporaries by and large attributed the Panic of 1819, for example, to the inflationary and then rapidly contractionary policies of the Second Bank of the United States. As often happens when the country is flooded with money created out of thin air, speculation of all kinds grew intense, as eyewitness testimony abundantly records.

During the years when the U.S. had no central bank (the period from 1811, when the charter of the first Bank of the United States expired, and 1817), government had granted private banks the privilege of expanding credit while refusing to pay depositors demanding their funds. In other words, when people came to demand their money from the banks, the banks were allowed to tell them they didn't have the money, and depositors would simply have to wait a couple years – and at the same time, the bank was allowed to continue in operation. By early 1817 the Madison administration finally required the banks to meet depositor demands, but at the same time chartered the Second Bank of the United States, which would itself be inflationary. The Bank subsequently presided over an inflationary boom, which came to grief in 1819.

The lesson of that sorry episode – namely, that the economy gets taken on a wild and unhealthy ride when the money supply is arbitrarily increased and then suddenly reduced – was so obvious

that even the political class managed to figure it out. Numerous American statesmen were confirmed in their hard-money views by the Panic. Thomas Jefferson asked a friend in the Virginia legislature to introduce his “Plan for Reducing the Circulating Medium,” which the Sage of Monticello had drawn up in response to the Panic. The plan sought to withdraw all paper money in excess of specie over a five-year period, then redeem the rest in specie and have precious-metal coins circulate exclusively from that moment on. Jefferson and John Adams were especially fond of Destutt de Tracy’s hard-money *Treatise on the Will* (1815), with Adams calling it the best book on economics ever written (its chapter on money, said Adams, defends “the sentiments that I have entertained all my lifetime”) and Jefferson writing the preface to the English-language edition.

While the Panic of 1819 confirmed some political figures in the hard-money views they already held, it also converted others to that position. Condy Raguet had been an outspoken inflationist until 1819. After observing the distortions and instability caused by paper-money inflation, he promptly embraced hard money, and went on to write *A Treatise on Currency and Banking* (1839), one of the great money and banking treatises of the nineteenth century. Davy Crockett, future president William Henry Harrison, and John Quincy Adams (at least at that time) were likewise opposed to inflationist banks; in contrast to the inflationary Second Bank of the United States, Adams cited the hard-money Bank of Amsterdam as a model to emulate. Daniel Raymond, disciple of Alexander Hamilton and author of the first treatise on economics published in America (*Thoughts on Political Economy*, 1820), expressly broke with Hamilton in advocating a hard-money, 100 percent specie-backed currency.

Popular references to the Panic of 1837 today urge us to blame President Andrew Jackson for having dissolved the Second Bank of the United States. The most common argument is this: without a national bank to discipline the state banks, the state banks that received the federal deposits after the closure of the Second Bank went on an inflationary binge that culminated in the Panic of 1837 and another downturn in 1839. This standard diagnosis is partly Austrian, surprisingly, in that it blames artificial credit expansion for giving rise to unsustainable booms that end in busts. But the alleged

solution to this problem, according to modern commentators, is a robust central bank with implicit regulatory powers over smaller institutions.

Senator William Wells, a hard-money Federalist from Delaware, had been unconvinced from the start that the best way to encourage sound practices among smaller unsound banks was to establish a giant unsound bank. “This bill,” he said in 1816,

came out of the hands of the administration ostensibly for the purpose of curtailing the over-issue of Bank paper: and yet it came prepared to inflict on us the same evil, being itself nothing more than a simple paper making machine; and constituting, in this respect, a scheme of policy about as wise, in point of precaution, as the contrivance of one of Rabelais's heroes, who hid himself in the water for fear of the rain. The disease, it is said, is the Banking fever of the States; and this is to be cured by giving them the Banking fever of the United States.

Another hard-money U.S. senator, New York's Samuel Tilden, likewise wondered, “How could a large bank, constituted on essentially the same principles, be expected to regulate beneficially the lesser banks? Has enlarged power been found to be less liable to abuse than limited power? Has concentrated power been found less liable to abuse than distributed power?”

A much better solution recommended by hard-money advocates at the time is what became known as the “Independent Treasury,” in which the federal deposits, instead of being distributed to privileged state banks and used as the basis for additional rounds of credit creation there, were retained by the Treasury and kept out of the banking system entirely. Hard-money supporters believed that the federal government was propping up (and lending artificial legitimacy to) an unsound system of fractional-reserve state banks by (1) distributing the federal deposits to them, (2) accepting their paper money in payment of taxes and (3) paying it back out again. As William Gouge put it,

If the operations of Government could be *completely* separated from those of the Banks, the system would be shorn of half its evils. If Government would neither deposit the public funds in the Banks, nor borrow money from the Banks; and if it would in no case either receive Bank notes or pay away Bank notes, the Banks would become mere commercial institutions, and their credit and their power be brought nearer to a level with those of private merchants.

Contemporary opponents of the Bank have sometimes been portrayed as antimarket, antiproperty populists. “Last time we had a central bank,” wrote a critic of Congressman Paul in 2010, “its advocates were conservative, hard-money businessmen, and its opponents were subprime borrowers and lenders who convinced President Jackson the bank was holding back the nation.” That is as wrong as wrong can be, as we’ll see in a moment. But our critic proceeds from this error to the false conclusion that supporters of the market economy then as now should be supporters of the central bank.

To be sure, opponents of the Second Bank of the United States were no monolith, and even today the central bank is criticized both by those who condemn its money creation as well as by those who criticize its alleged stinginess. On balance, though, the fight against the Second Bank was a free-market, hard-money campaign against a government-privileged paper-money producer. “The attack on the Bank,” concluded Professor Jeff Hummel in his review of the literature, “was a fully rational and highly enlightened step toward the achievement of a *laissez-faire* metallic monetary system.”

In fact, the most important monetary theorist of the entire period, William Gouge, was a champion of hard money who opposed the Bank; he considered these two positions logically coordinate, indeed inseparable. “Why should ingenuity exert itself in devising new modifications of paper Banking?” Gouge asked. “The economy which prefers fictitious money to real, is, at best, like that which prefers a leaky ship to a sound one.” He assured Americans that “the sun would shine, the streams would flow, and the earth would yield her increase, if the Bank of the United States was not in existence.” The conservative *Bankers’ Magazine*, upon Gouge’s death, said that his hard-money book *A Short History of Paper Money and Banking* was “a very able and clear exposition of the principles of banking and of the mistakes made by our American banking institutions.”

Another important hard-money opponent of the national bank was William Leggett, the influential Jacksonian editorial writer in New York who memorably called for “separation of bank and state.” Economist Larry White, who compiled many of Leggett’s most important writings, calls him “the intellectual leader of the *laissez-*

faire wing of Jacksonian democracy.” He denounced the Bank for its repeated expansions and contractions, and for the economic turmoil that such manipulation left in its wake.

The Panic of 1819 had likewise been due to such behavior on the part of the Bank, said Leggett during the 1830s. “For the two or three years preceding the extensive and heavy calamities of 1819, the United States Bank, instead of regulating the currency, poured out its issues at such a lavish rate that trade and speculation were excited in a preternatural manner.” Leggett continues,

But not to dwell upon events the recollection of which time may have begun to efface from many minds, let us but cast a glance at the manner in which the United States Bank *regulated the currency* in 1830, when, in the short period of a twelve-month it extended its *accommodations* from forty to seventy millions of dollars. This enormous expansion, entirely uncalled for by any peculiar circumstance in the business condition of the country, was followed by the invariable consequences of an inflation of the currency. Goods and stocks rose, speculation was excited, a great number of extensive enterprises were undertaken, canals were laid out, rail-roads projected, and the whole business of the country was stimulated into unnatural and unsalutary activity.

As in later crises, banks were allowed to suspend specie payment (a fancy way of saying that the law permitted them to refuse to hand over their depositors’ money when their customers came looking for it) while permitting them to carry on their operations. The knowledge that government could be counted on to bail out the banks in this way created a lingering problem of moral hazard that would affect banks’ behavior in the future.

Leggett blamed artificial credit creation for the Panic of 1837:

What has been, what ever must be, the consequence of such a sudden and prodigious inflation of the currency? Business stimulated to the most unhealthy activity; a vast amount of over production in the mechanick arts; a vast amount of speculation in property of every kind and name, at fictitious values; and finally, a vast and terrific crash, when the treacherous and unsubstantial basis crumbles beneath the stupendous fabrick of credit, and the structure falls to the ground, burying in its ruins thousands who exulted in the fancied security of their elevation. Men, now-a-days, go to bed deeming themselves rich, and wake in the morning to find themselves stripped of even the little they really had. They count, deluded creatures! on the continued liberality of the banks, whose persuasive entreaties seduced them into the slippery paths of speculation. But they have now to learn that the banks cannot help them if they would, and would not if they could. They were free

enough to lend their aid when assistance was not needed; but now, when it is indispensable to carry out the projects which would not have been undertaken but for the temptations they held forth, no further resources can be supplied.

Toward the end of 1837, he added:

Any person who has soberly observed the course of events for the last three years must have foreseen the very state of things which now exists.... He will see that the banks...have been striving with all their might, each emulating the other, to force their issues into circulation and flood the land. He will see that they have used every art of cajolery and allurements to entice men to accept their proffered aid, that in this way they gradually excited a thirst for speculation which they sedulously stimulated until it increased to a delirious fever and men in the epidemic frenzy of the hour wildly rushed upon all sorts of desperate adventures. They dug canals where no commerce asked for the means of transportation, they opened roads where no travelers desired to penetrate and they built cities where there were none to inhabit.

The Panic of 1857 was the result of a five-year boom rooted in credit expansion. The most capital-intensive industries of that decade, railroad construction and mining companies, expanded the most during the boom. States had even backed railroad bonds, promising to make good on those bonds if the railroad companies did not.

President James Buchanan engaged in no vain effort to reflate the economy. He observed in his first annual message, "It is apparent that our existing misfortunes have proceeded solely from our extravagant and vicious system of paper currency and bank credits." The economy recovered within six months, even though the money supply fell, interest rates rose, government spending was not increased, and businesses and banks were not bailed out. But Buchanan cautioned Americans that "the periodical revulsions which have existed in our past history must continue to return at intervals so long as our present unbounded system of bank credits shall prevail."

Buchanan envisioned a federal bankruptcy law for banks that, instead of giving legal sanction to their suspension of specie payments (that is, their failure to honor their depositors' demands for withdrawal), would in fact shut them down if they failed to make good on their promises. "The instinct of self-preservation might produce a wholesome restraint upon their banking business if they

knew in advance that a suspension of specie payments would inevitably produce their civil death.”

Until recently it was customary to refer to the 1870s as the period of the “Long Depression” in the United States. The modern consensus holds that there was no “Long Depression” after all. Even the *New York Times* recently observed:

Recent detailed reconstructions of nineteenth-century data by economic historians show that there was no 1870s depression: aside from a short recession in 1873, in fact, the decade saw possibly the fastest sustained growth in American history. Employment grew strongly, faster than the rate of immigration; consumption of food and other goods rose across the board. On a per capita basis, almost all output measures were up spectacularly. By the end of the decade, people were better housed, better clothed and lived on bigger farms. Department stores were popping up even in medium-sized cities. America was transforming into the world's first mass consumer society.

Farmers, moreover, who panicked at falling prices for agricultural commodities, at first failed to note that other prices were falling still faster. The terms of trade for American farmers improved considerably during the 1870s.

As for historians, they seem to have been fooled by the statistics on consumer prices, which fell an average of 3.8 percent per year. And since the conventional wisdom holds that falling prices and depression are intimately linked – they are not – they concluded that this must have been a time of terrible depression. With the gold standard restored in 1879 after being abandoned during the Civil War, the 1880s were likewise a period of great prosperity, with real wages rising by 20 percent.

The post-Civil War panics in the United States were due in large part to the unit-banking regulations in many states that forbade branch banking of any sort. Confined to a single office, each bank was necessarily fragile and undiversified. Canada experienced none of these panics even though it did not establish a central bank, the establishment's trusted panacea, until 1934. As Milton Friedman was fond of pointing out, when 9,000 banks failed in the U.S. during the Great Depression, not a single bank failure was taking place in Canada, where the banking system was not damaged by these regulations.

Moreover, as Charles Calomiris has noted, the bank failure rate during the pre-Fed panics was small, as were the losses depositors suffered. Depositor losses amounted to only 0.1 percent of GDP during the Panic of 1893, which was the worst of them all with respect to bank failures and depositor losses. By contrast, in just the past 30 years of the central-bank era, the world has seen 20 banking crises that led to depositor losses in excess of 10 percent of GDP. Half of those saw losses in excess of 20 percent of GDP.

Just from an empirical point of view, therefore, the case for the Fed is far weaker than its proponents admit or realize. Still, as in so many other areas, critics of the status quo are reflexively condemned as cranks, and alternatives are dismissed as unthinkable. But they are unthinkable only because we have allowed fashionable opinion to keep us from thinking them. We have been forced into a box that confines our choices to various forms of statism. The movement to end the Fed is an astonishing and most welcome first step toward clawing our way out.

FRACTIONAL RESERVE BANKING AND THE FEDERAL RESERVE: THE ECONOMIC CONSEQUENCES OF HIGH-POWERED MONEY

Thursday, June 28, 2012

WITNESSES

Salerno, Joseph T., Ph.D., Professor of Economics, Lubin School of
Business, Pace University

Cochran, John P., Ph.D., Emeritus Professor of Economics and
Emeritus Dean of the School of Business, Metropolitan State
College of Denver

White, Lawrence H., Ph.D., Professor of Economics, George Mason
University

*B*ACKGROUND

The Subcommittee on Domestic Monetary Policy and Technology held a hearing entitled “Fractional Reserve Banking and the Federal Reserve: The Economic Consequences of High-Powered Money” at 2:00 p.m. on Thursday, June 28, 2012 in Room 2128 of the Rayburn House Office Building.

This hearing examined fractional reserve banking, its relationship to monetary policy, and its effect on the economy. This hearing also explored legislative reforms to create a more stable monetary system. This was a one-panel hearing with the following witnesses:

- John P. Cochran, Ph.D., Emeritus Professor of Economics and Emeritus Dean, School of Business, Metropolitan State College of Denver
- Joseph T. Salerno, Ph.D., Professor of Economics, Lubin School of Business, Pace University
- Lawrence H. White, Ph.D., Professor of Economics, George Mason University

Fractional Reserve Banking

Fractional reserve banking is a form of banking in which banks keep a percentage of deposits on hand as reserves and lend out the remaining deposits to borrowers. When borrowers deposit funds they have borrowed into another bank, that deposit enables further lending by the second bank. In a normally-functioning banking system, this cycle of taking deposits, keeping a fraction, and lending out the remainder continues until loanable deposits diminish to zero and no more money can be lent out. This process creates additional credit, expanding the money supply in the economy.

The fraction of deposits kept as reserves is known as the reserve ratio. The maximum amount of money that can be lent out is known as the “money multiplier,” and it is determined by the percentage of deposits held as reserves. The maximum that the “money multiplier” can reach is the reciprocal of the reserve ratio. For example, if the reserve ratio is 10%, then the money multiplier is 1 divided by .10, or 10. Thus every dollar of deposits can create up to \$10 within the banking system. Similarly, if the reserve ratio is 5%, the money multiplier is 1 divided by .05, or 20, which means that every dollar of deposits can create up to \$20 within the banking system. New or original deposits—those deposits not generated from loans—are often referred to as high-powered money because they begin the money multiplier effect anew. Original deposits are typically generated when depositors receive additional funds from a revenue stream, such as earnings or wages, or from the sale of assets. Assets sold to the Federal Reserve produce the highest-powered money, because the Federal Reserve pays for them with money that is newly created within the banking system.

In the United States, the Board of Governors of the Federal Reserve System mandates the percentage of deposits that banks must keep as reserves, which is known as the required reserve ratio. Currently, the required reserve ratio varies between zero and ten percent, depending on the amount of liabilities a bank holds.

Instability of Fractional Reserve Banking

Fractional reserve banking can lead to instability if a bank has insufficient reserves to make good on claims against its deposits. A simple example is the everyday business of check clearing. If Bank A has \$10,000 worth of deposits and \$1,000 in reserves, \$1,000 in checks drawn on the bank's deposits and presented for redemption will wipe out its reserves, while \$1,001 or more in checks presented for redemption will cause the bank to default, if it cannot sell its assets or borrow against them to obtain the liquidity it needs to redeem the checks presented.

Fractional reserve banks hold on hand only a small percentage of their deposits, so they cannot redeem all their deposits at the same time. Because banks are required to redeem deposits on demand but lack the liquid assets to do so, they are functionally insolvent. Fractional reserve banks can remain in business because the likelihood that at any given time depositors will withdraw enough funds to exhaust the bank's reserves are small, meaning that actual insolvency is a rare occurrence. At the onset of a financial crisis,

however, or if rumors of a bank's instability begin to circulate, depositors may begin to withdraw their funds, weakening the bank and leading to a bank run and possible default.

Averting Fractional Reserve Banking Crises

The instability of fractional reserve banking has resulted in significant government intervention into the banking system. In the past, bank runs were often averted through bank holidays or suspensions of deposit redemptions—or suspension of specie payment since reserves primarily consisted of gold or silver coins. Suspension of specie redemption normally came about through government action, permitting banks to refuse to redeem their banknotes for gold or silver as promised, thus allowing them to keep their gold and silver reserves throughout a financial panic until calm and order returned. Bank holidays were days on which the government closed banks in order to stem bank runs by preventing depositors from withdrawing their funds.

The creation of the Federal Reserve in 1913 was in part meant to deal with the problem of bank runs resulting from the fractional reserve banking system. By serving as a lender of last resort, the Federal Reserve was to be a source of additional funding (reserves) to banks when claims made on bank deposits exceeded bank reserves. Many economists, however, believe that the advent of deposit insurance in the 1930s is the primary reason that bank runs have been largely eliminated, although periodic incidents do still arise, such as the bank runs on Washington Mutual, IndyMac, and Northern Rock during the recent financial crisis. In theory, the existence of deposit insurance means that depositors need no longer be first to pull their money out of a troubled bank because they will still receive their money even if the bank fails.

Benefits of Fractional Reserve Banking

One of the primary purposes served by the banking system is that of financial intermediation. Banks bring together savers and borrowers, dramatically decrease the costs of matching savings and investment, help the economy function more efficiently, and facilitate growth and wealth creation.

Many economists believe that fractional reserve banking increases the ability of banks to provide funds to borrowers by pooling deposits and lending them out. When those loans are deposited anew, additional credit is created for lending, providing more liquidity to the market than would result from simply matching savers and borrowers. Fractional reserve banking is thus perceived as driving

economic activity by increasing the money supply and helping the economy grow faster.

Fractional reserve banking also allows for maturity transformation, by which short-term liabilities, such as banking deposits redeemable on demand, are transformed into long-term assets, such as mortgages and business loans. Maturity transformation increases liquidity in the marketplace, thereby benefitting the economy.

Fractional Reserve Banking and Systemic Risk

While fractional reserve banking can temporarily boost economic activity and growth, it also creates financial instability and precipitates economic crises. As Bank of England Governor Mervyn King stated in a 2010 speech:

It is this structure, in which risky long-term assets are funded by short-term deposits, that makes banks so hazardous. Yet many treat loans to banks as if they were riskless. In isolation, this would be akin to a belief in alchemy – risk-free deposits can never be supported by long-term risky investments in isolation. To work, financial alchemy requires the implicit support of the taxpayer.¹⁷⁴

Given the inherent instability that maturity mismatching poses to the financial system, fractional reserve banking depends on a government safety net. The existence of this safety net, in turn, can create a moral hazard that incentivizes banks to continue engaging in excessive long-term loan creation, because defaults will be covered by a government bailout.

While the banking system is supposed to provide financial intermediation, fractional reserve banking primarily creates credit rather than true financial intermediation. Credit creation and monetary expansion can negatively impact the economy by disrupting price signals, misallocating resources, and increasing leverage. For example, if \$100 in savings is deposited in a bank which has a required reserve ratio of 10%, \$90 of that deposit that could be loaned out would be true financial intermediation. But once that \$90 in loans is deposited into another account, that next bank can create another \$81 in loans. That \$81 in loans does not originate from

¹⁷⁴ Mervyn King, "Banking: From Bagehot to Basel, and Back Again," (Oct. 25, 2010), available at <http://www.bankofengland.co.uk/publications/Documents/speeches/2010/speech455.pdf>. Last accessed December 11, 2012.

savings, i.e., deferred consumption, but from the \$90 already deposited at the first bank. The \$81 in loans, and subsequent loans pyramided on top of further deposits, is credit that has been created through the fractional reserve banking system, not real savings matched with borrowers through financial intermediation.

Many economists in the Austrian School argue that this creation of credit, which is not supported by real savings, leads to a monetary expansion that misdirects resources in the economy, creating malinvestments and sowing the seeds for the artificial economic booms and corrective busts of the business cycle.

Public Perceptions

Although fractional reserve banking is an integral part of the nation's banking system, consumers tend to have a limited understanding of how it works. Consumers believe that banks can simultaneously lend out 90%+ of their deposits yet still be ready to redeem 100% of those same deposits. As a result, consumers may not fully appreciate the economic consequences that result from fractional reserve banking, including the economic booms and busts that result from credit expansion. Critics of fractional reserve banking claim that the backstop provided by government and ultimately the taxpayers—which is needed to sustain the fractional reserve banking system—permits consumers to remain oblivious to the economic consequences of fractional reserve banking. This government backstop also insulates fractional reserve banking from market pressures by concealing its full risks and costs.

Both confusion about the legal ownership of deposits and the advent of deposit insurance have also made it difficult for consumers to understand the risks of fractional reserve banking. Bank deposits are legally considered to be the bank's money because they are in fact loans made to the bank, and depositors are creditors of the bank. Yet few depositors understand that they are bank creditors, because they are and have always been able to withdraw their deposits on demand. The creation of deposit insurance has arguably made it unnecessary for depositors to understand the legal relationship they have with their banks because those deposits are guaranteed by the government. But this government safety net has also distorted the system by blunting market discipline since depositors now have less incentive to be vigilant about the risks banks take with their deposits. Ultimately, the government safety net makes the banking system more fragile.

Survey of Reforms

Narrow Banking

Narrow banking is one alternative proposed to the fractional reserve banking system. Narrow banking would prohibit banks from lending deposits and ensure that lending could only be performed by other financial intermediary institutions. Such proposals include Limited Purpose Banking, a concept advanced by Boston University Professor Lawrence Kotlikoff, which would convert all financial institutions—including insurance companies and hedge funds—into mutual funds, treat them as banks, and require them to engage only in financial intermediation.

100% Reserve Banking

Proponents of 100% reserve banking propose a system in which banks accepting deposits must keep 100% of the deposits they take in as reserves. Essentially, 100% reserve banking would separate deposit banking from loan banking. A deposit bank would serve as a warehouse for storing money for safekeeping, while loan banks would serve as financial intermediaries where savers would place their money for investment purposes and borrowers would seek loans.

Free Banking

Free banking is another proposed alternative to the government-backed fractional reserve banking system. In a free banking system, there are no governmental restrictions on banking. For example, no government charter would be required to enter the banking business, nor would there be any legal reserve requirements or restrictions on bank reserves. In a free banking system, banks would be regulated through market forces, and their risk taking and business practices would be monitored and evaluated by potential depositors, not government agencies. In a free banking system, government would not insure deposits and taxpayers would not pay to bail out the creditors or shareholders of failed banks. Banks would compete for deposits on the strength and soundness of their financial positions. Some scholars argue that free banking would result in 100% reserve banks, while others argue that fractional reserve banks would be accepted by consumers, but that the market would demand higher reserve ratios than currently required under a fractional reserve banking system supported by government safety nets.

*T*RANSCRIPT

The subcommittee met, pursuant to notice, at 2:30 p.m., in room 2128, Rayburn House Office Building, Hon. Ron Paul {chairman of the subcommittee} presiding.

Members present: Representatives Paul, Jones, Luetkemeyer, and Schweikert.

Chairman PAUL. This hearing will come to order.

I now recognize myself for 5 minutes to make an opening statement.

I thank all the Members attending today, and I thank the panel for being here today. I will make a brief statement because we are anxious to get to the testimony.

I find today a very interesting day in our history because there is lots in the news today. There is a contempt vote in the House that will be voted on, as well as there was a major Supreme Court ruling today which has caught the attention of not only people in Washington, but everybody around the country.

But I would like to suggest that the hearing we are holding today is not to be dismissed as insignificant, because we are dealing with a subject that is rarely thought about but has a major impact on our economy, on how deficits are financed, how government grows, and how financial bubbles are formed, and why we have crises, which are the corrections and the depressions. So, for this reason, I think this emphasis today on fractional reserve banking is very apropos, because without the understanding of this and the understanding of the nature of money, we really can't get to the bottom of the business cycle.

There are certainly those who argue that fractional reserve banking is something that is advantageous, it facilitates the market, it makes credit easy, it causes economic growth. Others would choose to say that there is also a downside for fractional reserve banking because there is an encouragement of those who can find credit

rather easily, not coming from savings but from a computer or a printing press or fractional reserve banking, causes problems. It causes problems because it does affect interest rates, it sends out bad signals, it causes malinvestment and overinvestment that, indeed, the marketplace requires that these mistakes be corrected.

And this is the reason why we are having these hearings today, because much has been talked about in the last several years about the influence of the Federal Reserve itself, how it can increase the monetary base and high-powered money, but it doesn't end there. Money continues to expand with the cooperation of the banks with what we call fractional reserve banking. But we also have to deal with and think about exactly where capital comes from in a free market system.

My understanding is that capital should come from work, hard effort, and having a savings; don't consume everything you earned. If you can't save, you can't invest. And that is a big difference if you understand that capital comes from hard work and savings and then investment and it be distributed by the marketplace by the so-called price or the interest rates; compared to saying, savings are unnecessary, don't ever worry, we can always provide the liquidity and the credit either directly from the Fed or indirectly through fractional reserve banking. So if we indeed think about fractional reserve banking, we have to think about actually where capital comes from and where the mistakes come from and what causes them.

But fractional reserve banking is a major contributing factor to the ease with which governmental bodies accumulate debt. And we can also emphasize the importance and nature—and we will talk more about this today—of worry that there is a moral hazard connected to this. So if there is risky financial behavior with the monetary system we have, it is compounded by the fact that there are going to be guarantees in the system, the lender of last resort, the insurance that says that people can be taken care of and actually be rewarded for the mistakes that they made.

It seems to me that the system seems to work on one part of the cycle and it is a total disaster on the downturn of the cycle. And that is something I think every American, every Congressman, everybody who cares about their fellow man and about a healthy economy should think about and consider. Because if, indeed, the business cycle is caused in this manner, there is actually an answer for us and there is something that we can do about it, rather than the demagoguing and the politicizing of these issues as goes on so often.

So I want to pause there and make sure there are no other Members who have an opening statement. And if not, we will proceed to the witnesses.

The first witness I would like to introduce is Dr. Joseph Salerno, who is a professor of economics and chair of the economics graduate degree program at Pace University in New York City. He is also academic vice president of the Ludwig von Mises Institute in Auburn, Alabama; research associate of the Foundation of the Market Economy at NYU; and policy expert for The Heritage Foundation. He has written extensively on monetary policy theory and banking and comparative economic systems. He finished his undergraduate study at Boston College and received his M.A. and Ph.D. in economics from Rutgers University.

Also with us today, we have Dr. John Cochran, emeritus professor of economics and emeritus dean of the School of Business at Metropolitan State College of Denver and a senior scholar of the Ludwig von Mises Institute. He has published numerous scholarly articles on the refinement and development of the Mises/Hayek Austrian theory of the business cycle. He received his Ph.D. in economics from the University of Colorado Boulder.

Dr. Lawrence White is professor of economics at George Mason University, where he specializes in the theory and history of money and banking. Dr. White is one of the leading experts on free banking and is a member of the Financial Markets Working Group at the Mercatus Center. He has been published in the *American Economic Review* and the *Journal of Monetary Economics* and has also authored three books on monetary matters, including, “The Theory of Monetary Institutions.” He received his Ph.D. in economics from UCLA and his undergraduate degree in economics from Harvard.

Without objection, your written statements will be made a part of the record. You will now each be recognized for a 5-minute summary of your testimony.

Dr. Salerno?

**STATEMENT OF JOSEPH T. SALERNO, PH.D.¹⁷⁵
PROFESSOR OF ECONOMICS, LUBIN SCHOOL OF BUSINESS
PACE UNIVERSITY**

Mr. SALERNO. Chairman Paul and members of the subcommittee, I am deeply honored to appear before you to testify this morning on

¹⁷⁵ [The prepared statement of Dr. Salerno can be found on page 781.]

the momentous topic of fractional reserve banking. Thank you for your invitation and attention.

In the short time I have, I will give a brief description of fractional reserve banking, identify the problems it presents for the economy, and suggest a solution.

A bank is simply a business firm that issues claims to a fixed sum of money in receipt for the deposit of ready cash. These claims are cashable on demand and without cost to the depositor. In today's world, these claims may take the form of checkable deposits that are transferred to a third party by writing out a check. They may also take the form of so-called savings deposits that require withdrawal in person at one of the bank's branches or at an ATM machine.

In the United States, the cash for which the claim is redeemable consists of Federal Reserve Notes, the dollar bills that we all are familiar with. Fractional reserve banking occurs when the bank lends or invests some of its deposits payable on demand and retains only a fraction in cash reserves, hence the name "fractional reserve banking." All U.S. banks today engage in fractional reserve banking.

Let me illustrate how fractional reserve banking works with a simple example. Assume that a bank's deposits of \$1 million make \$900,000 of loans and investments. If we ignore for simplicity the capital paid in by its owners, this bank is holding a cash reserve of 10 percent against its deposit liabilities, the assets of the bank or its cash reserves, and various noncash assets. The noncash assets include business loans, credit card loans, mortgage loans, and securities issued by the U.S. Treasury and other financial authorities. These assets are titles to cash receivable only in the near or distant future.

The key to understanding the nature of fractional reserve banking and the problems it creates is to recognize that a bank deposit is not, itself, money. It is, rather, a money substitute—that is, a claim to standard money or dollar bills—widely regarded as perfectly secure. Bank deposits will be routinely paid and received in exchange in lieu of money only as long as the public does not have the slightest doubt that the bank which creates these deposits is willing and able to redeem them without delay or expense. When this is the case, bank deposits are regarded as indistinguishable from cash itself.

The very nature of fractional reserve banking, however, presents a problem for the bank. On the one hand, all of the bank's deposit liabilities mature on a daily basis because it has promised to cash them in on demand. On the other hand, only a small fraction of its assets is available at any moment to meet these liabilities. The rest of

the bank's liabilities will only mature after a number of months, years, or even decades.

In the jargon of economics, fractional reserve banking always involves "term structure risk," arising from a mismatching of the maturity profile of its liabilities with that of its assets. In layman's terms, banks borrow short and lend long.

The inherent problem is revealed when the withdrawal of deposits exceeds a bank's existing cash reserves. The bank is then compelled to hastily sell off some of its longer-term assets, many of which are not readily saleable. Thus, it will incur big losses. This will cause a panic among the rest of its depositors, who will scramble to withdraw their deposits before they become worthless. A classic bank run will ensue, and the bank will fail.

But the failure of fractional reserve banking is only a minor problem. Its effects are restricted to the bank's stockholders, creditors, and depositors, who voluntarily assume the peculiar risks involved in this kind of business.

More important are the harmful effects that fractional reserve banking has on the overall economy. First, fractional reserve banking is inherently inflationary. The issue of money substitutes unbacked by cash expands the money supply and drives up prices. Second, the lending of unbacked money substitutes artificially reduced interest rates below market equilibrium rates. This causes businesses to make unwise and wasteful investments and households to indulge in overconsumption. It destroys wealth, and it creates financial bubbles that end in recession and financial crises.

The inflation and business cycles generated by fractional reserve banking are greatly intensified by Federal Reserve and U.S. Government interference in the banking industry. The most dangerous forms of such interference are the power of the Federal Reserve to create bank reserves out of thin air via open market operations, its uses of these reserves to bail out failing banks in its role as the lender of last resort, and Federal insurance of bank deposits.

In the presence of such policies, the deposits of all banks are perceived and trusted by the public as one homogeneous brand of money substitute, fully guaranteed by the Federal Government and backed up by the Fed's power to print up bank reserves and bail out insolvent banks. Under such a monetary regime, there is absolutely no check on the inherent propensity of fractional reserve banks that borrow short and lend long to issue unbacked money substitutes, to expand the money supply, and to artificially depress interest rates.

The solution to the problem is to treat banking as any other business and permit it to operate in a market completely free of government guarantees of bank deposits and assurance of Fed bailouts. In order to achieve this ideal, the Fed would have to be permanently and credibly deprived of its legal power to create reserves from nothing. The best way to do this is to establish a genuine gold standard, in which gold coins would circulate as cash and serve as bank reserves. At the same time, the Fed must be stripped of its authority to issue notes and conduct open market operations. Also, banks would once again be legally permitted to issue their own competing brands of notes, as they were throughout the 19th Century and even into the 20th Century.

To conclude, in fact, on the banking market as I have described it, I foresee the ever-present threat of insolvency lurking over fractional reserve banks to compel banks to refrain from further lending of their deposits on demand. They would retain in their vaults and ATM machines the full amount of the cash deposits. This means that if a bank wished to make loans of a longer or shorter maturity, it would only do so by issuing credit instruments whose maturities matched their loans. Thus, for short-term business lending, they would issue certificates of deposit with maturities of 3 or 6 months; to finance car loans, they might issue 3- or 4-year short bonds. Mortgages would take the form of 5- to 10-year balloon loans, as they did in the 1930s, and be financed by bonds of 5 or 10 years.

In short, on a free market, fractional reserve banking, with all its inherent problems, would slowly wither away.

Thank you.

Chairman PAUL. Thank you.

Dr. Cochran?

**STATEMENT OF JOHN P. COCHRAN, PH.D.¹⁷⁶
EMERITUS PROFESSOR OF ECONOMICS AND
EMERITUS DEAN OF THE SCHOOL OF BUSINESS
METROPOLITAN STATE COLLEGE OF DENVER**

Mr. COCHRAN. Chairman Paul and members of the subcommittee, thank you for this opportunity to discuss fractional reserve banking, central banking, and its relationship to economic and financial instability.

Fractional reserve banking has historically been viewed by some economists and most monetary cranks as a panacea for the economy, a source of easy credit, and new purchasing power to quicken trade.

¹⁷⁶ [The prepared statement of Dr. Cochran can be found on page 787.]

Better economists, however, recognize fractional reserve banking, with its ability to create credit, as a major source of financial and economic instability.

Credit created by fractional reserve banks—credit extended beyond what could be supported by actual savings—while initially appearing beneficial, output and employment increase in areas supported by the expanding credit is unsustainable and will end in a bust. A secondary consequence of the bust is a financial and banking crisis, the bank run and associated panic.

The establishment of a central bank was often, when not driven by fiscal priorities of a government, an attempt to achieve the first while mitigating or eliminating the second. For the United States in particular, the effort was misguided. Per Vera Smith, “A retrospective consideration of the background and circumstances of the foundation of the Federal Reserve System would seem to suggest that many, perhaps most, of the defects of American banking could, in principle, have been more naturally remedied otherwise than by the establishment of a central bank; that it was not the absence of a central bank per se that was the root of the evil.”

Recent research supports her conclusion. Compared to the pre-Federal Reserve era, the Fed has failed to provide the promised stability and the Fed has guided a significant decline in the purchasing power of the dollar. The dollar currently has a purchasing power of less than 5 percent of the 1913 dollar.

Fractional reserve banks developed from two separate business activities: banks of deposit, or warehouse banking, where banks offering transaction service for a fee; and banks of circulation or financial intermediaries. Circulation banking, if clearly separated from deposit banking, reduces transaction costs and enhances the efficiency of capital markets, leading to more savings, investment, and economic growth. Fractional reserve banking combined these two types of banking institutions into one: a single institution offering both transaction services and intermediation services.

With the development of fractional reserve banking, money creation—either through note issue or deposit expansion—and credit creation became institutionally linked. Banks create credit if credit is granted out of funds especially created for this purpose. As a loan is granted, the bank prints bank notes or credits the depositor on account. It is a creation of credit out of nothing. Created credit is credit granted independently of any voluntary abstinence from spending by holders of money balances.

The existence of a central bank, with its ability to create high-powered or base money, is a necessary prerequisite for excessive credit creation and the resultant boom-bust cycle. While 100 percent reserves could eliminate or reduce the boom-bust cycle and eliminate the threat of bank runs and panics, boom-bust business cycles are really a phenomenon of central banking, not fractional reserve banking per se. Without a central bank, credit creation by fractional reserve banks would be limited in extent. Large misdirections of production caused by credit creation require either newly created base money or the promise to create new base money in the event of a crisis by a central bank.

During the period known as “the great moderation,” roughly 1982 to 2000, the U.S. economy experienced a period of apparent relative stability and prosperity. The U.S. economy was then buffeted by two boom-bust cycles tied directly to credit expansion and low interest rates. While much of the discussion following the recent crisis focused on why the recovery has been so slow, a lesson that should have been learned is that credit-driven artificial booms cannot last. High-powered, money-driven credit expansion, enhanced by the money multiplier of fractional reserves, is a major destructive power that misdirects production, falsifies calculation, even in a period of relatively stable prices, and destroys wealth. Policy-induced booms tend to piggyback on whatever economic development is under way. The interest rate break, which normally would stop the event before they turn into bubbles and booms, is effectively neutered by credit creation.

Central bank response to the most recent crisis has moved in the direction of greater, not lesser, central bank involvement in the economy. Recent trends are troubling. John Taylor recently reported that the Federal Reserve purchased 77 percent of the net increase in the debt by the Federal Government in 2011. The Fed is moving from a monetary policy to a “mondustrial” policy, a policy environment that is not a monetary framework; it is an intervention framework financed by money creation. These trends make a return to sound money, which involves abolishing the central bank and paper fiat money and restoring a commodity money chosen by the market and totally subject to the market, imperative.

Fractional reserve banking supported by a central bank is a cause of the boom-bust cycle, both the dot-com and the 2007 financial crisis and great recession. Elimination of the source of instability requires monetary reform, such as H.R. 1094, which is most consistent with the reforms in the written testimony. H.R. 4180 would be a strong

improvement over current Fed operations, as would H.R. 245, but both of these, while improving monetary policy, would still leave the economy subject to boom-bust cycles.

Chairman PAUL. Thank you.

And now, I will recognize Dr. White.

**STATEMENT OF LAWRENCE H. WHITE, PH.D.¹⁷⁷
PROFESSOR OF ECONOMICS
GEORGE MASON UNIVERSITY**

Mr. WHITE. Thank you, Chairman Paul, and members of the subcommittee.

I want to second what has been said by Dr. Salerno and Dr. Cochran. The problem is not fractional reserve banking per se, but the lack of constraints on fractional reserve banking which have been created by: one, the Federal Reserve system; two, our system of deposit insurance combined with “too-big-to-fail;” and three, other restrictions and privileges placed upon banks.

In my statement, I offer some historical background on the origins of fractional reserve banking, and talk a little about the effect of fractional reserve banking on the money supply. But I think the important issue here is to focus on the problems of bank runs and financial instability and the reforms needed to improve our banking system, so let me focus on that.

Undoubtedly, the leading argument made in favor of government regulation of banks, at least since the 1930s, has been the argument claiming that fractional reserve banking is inherently fragile, and so it needs a lender of last resort; it needs deposit insurance to prop it up. I find that is actually not correct. Uninsured fractional reserve banking is not, in fact, inherently prone to runs; it is not inherently prone to panics. The runs and panics that were a problem in the United States in the late 19th Century and in the Great Depression were due to weakness that was specific to the United States and created by the legal restrictions and privileges that I have mentioned.

It is true that runs have harmful effects, I don't think there is much disagreement about that, at least when a run takes place on a bank that is actually solvent. In a sense, the depositors think there is not enough to go around, but there really is. We would all like to prevent that. But banks would like to prevent that, too, and I will talk about how they can do that.

¹⁷⁷ [The prepared statement of Dr. White can be found on page 806.]

And the supposed remedy of deposit insurance, although it does reduce the number of runs, it does so at a cost that is probably greater than the—I think almost surely greater than the benefit that it provides by doing so, because it not only eliminates the tragic runs but it also eliminates the runs that are healthy, the ones that eliminate insolvent banks. And in the absence of that kind of mechanism, we rely on the good graces of the bank regulators to close banks when they begin to get insolvent, and we have found that they are not actually very good at it. They tend to delay closure, and that creates great moral hazard problems.

So if a fractional reserve bank makes promises to pay on demand more than it has in its vault, then it is possible that enough people will claim their money back that the bank can't pay everyone. And if that happens, as Dr. Salerno said, the bank is forced into hasty liquidation of assets. That is certainly possible. It typically happened, historically, when a bank was already insolvent, so it actually—the run closed the bank that ought to be closed. But it could happen even against a solvent bank.

And because that is a possibility, some economic theorists have jumped to the conclusion that banks in practice are actually fragile. But if we look at the historical record and especially if we look outside the United States, we find that that is not what prompted bank runs. What prompted bank runs was a justifiable fear that a bank was already insolvent.

And that explains the pattern of bank runs over the season, over the business cycle, and it explains why bank runs were more of a problem in the United States than they were in, say, Canada, because the United States had a weak banking system in ways that Canada didn't. And the United States system was weak because we restricted branching for so many years and because we restricted notes issued by banks under the national banking system in ways that made them unable to meet peak demands for currency.

There are two way banks can protect themselves from runs. One is to have a clause in their accounts that says, "If necessary, we can delay redemption until we have enough time to liquidate assets in an orderly manner." That was used by some trust companies in the United States. But, most importantly, banks have to assure their customers that they are solvent, and they have to behave in such a prudent way that there is no doubt about their solvency.

And before deposit insurance, banks did that. They held large capital positions; 20 percent capital was typical. But when the FDIC Act came along, the banks hired—banks used to actually paint in

their window, “This bank has \$5 million in capital.” When the FDIC Act passed, they hired someone to go scrape that paint off the window and put in the FDIC sticker. All right? So, FDIC protection took the place of what should be protecting depositors, namely bank capital. Since then, banks have held as little capital as the FDIC will let them get away with. And the FDIC is not particularly good at monitoring bank capital or discovering when banks have bigger liabilities than they admit on their balance sheets.

So I think our biggest problems today—let me talk about very briefly, in conclusion, about what we need to do. We need to find some way of rolling back and ultimately ending deposit insurance at the Federal level. We need to certainly end immediately the too-big-to-fail doctrine because that compounds the problem and means that even uninsured depositors are not shopping around for a safe bank, so nobody is monitoring banks for prudent behavior. So, some way of ending that needs to be found immediately.

Thank you.

Chairman PAUL. Thank you.

[QUESTIONS & ANSWERS]

I now yield myself 5 minutes for questioning.

I am going to direct this question to Dr. Salerno, but, the rest of the panel, feel free to also answer it.

I wanted to talk a little bit about how, under today’s circumstances when we have the Fed doing what they are doing and we are concerned about fractional reserve banking, we know the Fed had an effect on interest rates and an inflationary impact, certainly on the monetary as well as price inflation.

But is there any way to just roughly maybe separate the two: How much of an impact does fractional reserve banking have on interest rates, and how much does it have an impact on actually the inflationary impact which ends up with prices going up? Is this a major contributing factor or not too relevant because the Fed is to be blamed for everything? Can you put that into a proper perspective?

Mr. SALERNO. Yes.

On a free market, as I said, I don’t think fractional reserve banking would be too problematic. It would eventually, I think, wither away. I disagree with Larry on that.

But when there is the Fed, a lender of last resort, somebody who can print up reserves out of thin air, there is really a symbiotic relationship between the two. The Fed needs fractional reserve banking, and fractional reserve banking needs the Fed.

So when fractional reserve banking, which I believe is inherently stable, gets into trouble, as when Washington Mutual failed overnight, you then have the Fed intervening, of the too-big-to-fail doctrine. And it is the very fragility of fractional reserve banking that caused the Fed, then, to engage in Quantitative Easing 1 and 2.

Without fractional reserve banking, we would not have had these unconventional ways of injecting money into the system. So I think, yes, fractional reserve banking does contribute a great deal to the problem.

Chairman PAUL. But does it affect the interest rates per se?

Mr. SALERNO. Yes, actually, if the government just printed money and issued it, it wouldn't affect interest rates. If the government just printed up money and spent it, it wouldn't affect interest rates. It needs to have fractional reserve banking in order to put down pressure on interest rates and, therefore, cause bubbles and recessions.

Chairman PAUL. Do either of the others have a comment?

Mr. WHITE. Yes, I think the Fed, even in a world without fractional reserve demand deposits, could affect interest rates by going out and buying a huge quantity of government bonds. That kind of open market operation will push up the price of bonds, and push down the yields on bonds. So it is true that fractional reserve banking gives the Fed, in a sense, more leverage.

When it comes to the price level, if the Fed expands the money supply by 10 percent, quantity theory of money tells us—at least, it is an approximation for the long run—the price level will rise 10 percent. And that is true whether you have 100 percent reserve banking or fractional reserve banking.

So the Fed can raise the price level by a given percentage by expanding its own liabilities by that percentage, and whether the commercial banks get involved or not is not really important to that process. The new money comes from the central bank, and it has that power over the price level with or without fractional reserve banking.

Chairman PAUL. Dr. Cochran, I think we can assume that with the system that we have and with the moral hazard of the guarantees insurance and the Fed being the lender of last resort, there are less runs on the bank than we had without those guarantees.

But does that, in itself—if we don't see the runs, where things have to change and go back to a more normal system, does this then encourage the building up of more debt?

Would this be the reason why the world is engulfed with debt? Because most people now do recognize that the world is facing a debt

crisis. People understand it when they look at Greece and these other countries, but look at ourselves, too.

But do you think the fact that there aren't these corrections, we don't have old-fashioned runs on the bank, that we end up with a bigger problem which may be down the road, it takes a little longer to develop, but we end up with this huge debt crisis?

Mr. COCHRAN. That is a tough question to answer in the context of that, but I think, as Joe alluded and Larry has alluded, with the guarantees that we have, we essentially have weakened—one of the control sides—prudence on the side is essentially the lender of funds—and people depositing funds into a bank are lenders, okay—had more restraint on deciding at least who and when and how they lent money when they knew the funds were at risk.

So with some of these restraints that have been taken away, that we have less people paying attention to the safety and soundness of the types of instruments they have invested in, and then with the central banking that can create credit, that once you set an interest rate target, in many ways there is incentive for a bank, even if they don't have the funds currently available, to extend a loan, create the deposit, and then go out and either borrow the reserves in the Federal funds market, and as they borrow in the Federal funds market—and that would put upward pressure on the Federal funds rate—then the Federal Reserve has an incentive to go in and create the reserves to sustain the overextension of credit.

So, yes, I think there is an interaction between the fractional reserve banking, these restraints, or the lack of, essentially, risk on the downside to the depositors from the apparent safety, that has helped us overleverage.

Chairman PAUL. Thank you.

I now want to yield 5 minutes to the gentleman from North Carolina, Mr. Jones.

Mr. JONES. Mr. Chairman, thank you very much.

As I sit here and listen, I really appreciate you sharing your intellectual abilities and helping us better understand the pros and cons of fractional reserve banking. And it leads me to a number of thoughts.

First of all, a week or so ago, we had Jamie Dimon up here trying to explain how he lost \$2 billion in investments. And then, you read in the paper today that it wasn't \$2 billion, it was \$9 billion.

And I listen to your feelings about fractional banking and whether this is a sound policy or not a sound policy and how it plays in. And I think—I am from eastern North Carolina, and I think I listen very

carefully to the people I represent, their concerns about our monetary systems and is it strong, is it challenged, is it weak. And it leads me to a very simple point that I would like your response to.

When the banks failed in the 1930s, the Congress passed what they believed was legislation to create some confidence and some soundness in banking known as the Glass-Steagall Act. I have said many times that in the 18 years I have been in Congress, the two worst votes I ever made were the Iraq war and the repeal of Glass-Steagall.

When I look at all these boutique-type investments that the banks have access to, from the selling of credit defaults, from all these different systems, and fractional banking, how do you get back to some soundness? Because it looks like to me that what we are doing is gambling on Wall Street. And I am talking about the banks as well as the investment banks.

How do we get back? Chairman Paul—I hate to think that he is leaving Congress because I think he has been such an expert, whether you agree with all of his positions on the monetary system. But I think we have allowed a system that is not sound at all. In fact, I think the system is becoming more and more fragile as we continue to move forward.

Do we need to go back to something like Glass-Steagall? Do we need to say to the banks that you have to start banking instead of gambling? Where are we in this process?

I would like all three of you to respond, please.

Mr. SALERNO. I agree with you that repealing Glass-Steagall was ill-considered. It wasn't really deregulation. It only deregulated the banks' assets side. It allowed S&Ls to suddenly begin speculating, not just loaning mortgages but making risky loans in the oil industry and so on. So I agree with you there.

What I suggest is not to put back in place Glass-Steagall but to deregulate the liability side, okay? That is, the ability of banks—bailing out banks and the deposit insurance was what allowed banks to become irresponsible when you got rid of Glass-Steagall.

So I would have kept Glass-Steagall in place, and when Congress was ready to repeal deposit insurance and when the too-big-to-fail doctrine was gotten rid of, then I think banks would become much more careful. They would operate more like money market mutual funds, which don't go bankrupt, which don't have any problems, which have adjusted to market forces.

Mr. WHITE. Yes, I think that the Act passed in the 1930s that has weakened our banking system more than any other is not the Glass-

Steagall Act, and certainly not the repeal of the Glass-Steagall Act, but the FDIC Act.

And when deposit insurance was very closely limited, small amounts and banks, as Dr. Salerno alluded, couldn't gamble with the money, then deposit insurance didn't generate a lot of moral hazard. But now, sort of, everything goes.

And the big problem with the repeal of Glass-Steagall is that it has extended the subsidy of deposit insurance to risk-taking to very creative risk-takers. And so what we need to do to get the genie back in the bottle is to find ways to limit the access of risk-takers to insured deposits. If they want to gamble with their own money, that is fine with me. I don't want to put any restrictions on hedge funds, for example. They are not involved in the payment system. They haven't been considered too-big-to-fail so far; let's hope that continues.

But investment banks sort of fell into this gray area, where traditionally they were not considered part of the Fed's purview even, but 5 years ago, the Fed decided that it needed to jump in and save Bear Stearns from its own foolishness. I think that was a real mistake, and it has led to and encouraged a trend that was already under way toward overleveraging.

So it is not that all leveraging is bad, but, clearly, we have gone too far. We have encouraged banks to go too far, and we need to take away those encouragements.

Chairman PAUL. I thank the gentleman.

Now, I recognize the gentleman from Missouri, Mr. Luetkemeyer.

Mr. LUETKEMEYER. Thank you, Mr. Chairman.

Mr. White, you have been doing most of the discussing here with regards to deposit insurance. And I have just kind of an observation first, and then we will get to a question.

In 2008, in my district, there were a number of runs on banks. And people would go in and they would take out \$10,000, \$20,000 worth of cash, but they also would take their money that was above the \$100,000 deposit insurance level and move that to another bank. And that is a run of sorts, in that it is taking money out of banks and shifting it around, although it didn't go into their pocket or in a tin can in the backyard.

But because of the insurance that was in place, it did put a floor under some of this activity and did show that the consumer had a trust level to that much, at least. And I guess it was a trust in the government, with FDIC insurance backing it up.

So I guess my question is, I understand where you are coming from, but I think if you open it up, make it the wild, wild west with regards to investments out here and it is up to the individual to do his own research, it is going to get kind of hairy.

I know right now—in the past, banks have always had to publish a quarterly financial statement, and everybody could see what their—and it has to be disclosed in the public area so people could see the solvency of the bank. But how many of the average consumers in this room today can read a financial statement or understand it? It is pretty complicated stuff.

So I am questioning, if we are going to continue with fractional reserve banking, I think deposit insurance certainly is a part of that.

And I have a follow-up question when you get done with that.

Mr. WHITE. I think you are right that it would be hairy if we eliminated deposit insurance tomorrow without any preparation, because banks have adopted positions, they have taken risks, they have put themselves in illiquid positions knowing that deposit—or, expecting that deposit insurance will be there tomorrow. So it would take some preparation to even phase it back a little bit, even to introduce coinsurance or—

Mr. LUETKEMEYER. I would assume that if you want to get rid of deposit insurance, you would want to raise capital requirements. Is that one of the ways you want to go?

Mr. WHITE. I would encourage banks to hold more capital. I am not sure I would do it in the form of a requirement.

But if we look over the broad sweep of banking history, we find very solid banking systems that didn't have deposit insurance, where the banks held adequate capital because it was in their interest to do so. So that is sort of the goal I have in mind.

Now, getting to that kind of system, we kind of have a bomb in front of us and we have to snip the wires in the right order. I appreciate that.

Mr. LUETKEMEYER. It is kind of interesting because I was in a discussion this morning with one of the higher-level folks in the Treasury Department, and they are advising the Europeans to try and implement deposit insurance. So I am just kind of like, you have to be kidding me.

But, anyway, I think you made a point a while ago that I thought was excellent. It kind of spurred a thought here, with regards to the home mortgage problem that we had during the early 2000s. And part of it was access to money, lots of money. But the other part of it was the lending, loosening the lending standards. And I think when

the Fed throws money out there, if they would also think about restricting lending standards, I think that is another way to control the access to these funds.

And I think if you see the quality of the new loans being made by the GSEs, you can see that suddenly their balance sheets look pretty good on the loans they have made since this, under new restrictions, going back to the old lending standards, which would seem to me, if we had just done this thing right to begin with, we wouldn't be in this problem.

But I am kind of curious with regards to the 100 percent reserve banking, where you have a bank that takes in all the money and all the deposits and lets it sit there and it is just sort of like a piggyback that goes back and forth, and then we have a separate entity that is a loaning bank. Where does the loaning bank get its money from?

Mr. WHITE. If it can't lend out demand deposits, checking account dollars, it can still lend out savings account dollars. So money that it takes in with certificates of deposit would still be available for lending. But it could restrict the amount of lending banks could do, and the money that people hold—

Mr. LUETKEMEYER. In other words, you still make a deposit into your savings account or certificate of deposit, and that is the money, then, that is loaned out; it is not the checking account money.

Mr. WHITE. That is right.

Mr. SALERNO. If I might interject, the savings deposits would have to be true savings deposits. That is, they would have to have some sort of 30-day maturity or something like that. Today, they technically do, that you are supposed to give 30 days' notice, but that has been a dead letter since the 1920s.

Mr. LUETKEMEYER. Has there ever been in history a system like this?

Mr. WHITE. I think the closest, the most nearby example is the Canadian banking system. Up until the first world war, there was nationwide branch banking, they had very few restrictions on note issue by banks, on deposit making by banks, and there were no panics in the Canadian banking system. They didn't have a panic of 1907. They didn't have a panic of 1930, 1931, or 1932. No banks failed in Canada during the early years of the Great Depression. It is quite remarkable. And yet, they had no deposit insurance, and there wasn't any movement for deposit insurance.

Mr. LUETKEMEYER. Thank you, Mr. Chairman.

Chairman PAUL. Thank you.

I now recognize the gentleman from Arizona, Mr. Schweikert.

Mr. SCHWEIKERT. Thank you, Mr. Chairman.

And I appreciate you all being here because this is one of those—I know sometimes it feels a little esoteric.

But I want to go a little bit to the side and sort of make sure I have my head around part of the global side of where you see the problem. Is it the expansion of liquidity that the design now creates? Is that the simple way to phrase it?

Mr. WHITE. Yes, that loose monetary policy has been a big problem over the last—

Mr. SCHWEIKERT. And that becomes dollars that go in and create bubbles?

Mr. WHITE. That is right.

Mr. SCHWEIKERT. Can we play, sort of, game theory for a moment? Do credit card issuers in some ways, with the way they are chartered and issue credit expansion, do they add to that same sort of liquidity out there?

Mr. SALERNO. I would say “no.” A classic credit card, that money is basically an instant loan, so that the money that is lent to—or, actually, paid to the retailer that you purchased from, that money comes from a loan. It doesn't have to come from a fractional reserve bank.

Mr. SCHWEIKERT. Is there an agreement that organizations organized off of that type of credit—how about a store credit or automobile credit or even a credit line attached to your house? Does that create that same type of multiplier effect of the expansion of money supply?

Mr. SALERNO. A legitimate loan, where someone gives up the amount of money, let's say, an equity loan for 5 years, they don't have the money to spend, and you do have the money to spend. That has no effect on prices and that has no effect on interest rates, so it does not cause bubbles and financial crises and so on. But because everything is so tied up with fractional reserve banking, it ramified into almost all of these loans.

Mr. WHITE. Credit cards are not money. In some circumstances, they are a substitute for spending money. But if the total supply of credit is determined, then it is a matter of what kind of credit is being issued.

Mr. SCHWEIKERT. So if it is on the back end, is saying, look, there is a certain amount of total credit that is able to be offered, and we as the institution have to have that properly capitalized over there.

Mr. WHITE. Right. Yes. But money is an asset to the holder, and having an unused credit card line is not an asset.

Mr. SCHWEIKERT. So, other than, sort of, the ratios of deposit to how much can be lent out, do you see any other types of financial instruments or activity in the American marketplace that also creates that sort of expansion of cash that is out there chasing assets?

Mr. WHITE. Not in a big way—traveler's checks, a tiny bit, not very big.

Mr. SCHWEIKERT. Traveler's checks. So it is basically the Fed, fractional reserve banking, and then maybe a couple of other externalities out there, issuers of certain lines of credit that do it with very little—sort of a hope-and-pay type of system.

Mr. SALERNO. Right now, it is the Fed. It is the Fed pumping liquidity into the system in order to prop up these fractional reserve banks that have extended loans that have gone bad in a massive way. So I think that was what Dr. Paul referred to as the, sort of, complementarity between the Fed and fractional reserve banking.

Mr. SCHWEIKERT. Okay. And this actually sort of ties back into what our chairman has touched on many times before. Let's say we are all sitting here 3 years from now and the Fed is still buying a massive portion of U.S. sovereign debt, we see a credit expansion. What does our world look like 3 years from now? Are we in a massive debasing of the currency? Are we seeing a huge inflationary cycle? Each of you, I would love your prediction of what our world looks like 36 months from now if we continued on this path.

Mr. SALERNO. If we continue on this path and the banks finally begin to lend money out—because they are sitting on a lot of this liquidity that has been injected into the system by the Fed. They have over a trillion dollars of excess reserves. If that is lent out, then we begin to see—I think what we are going to see is, first, a very rapid depreciation of the exchange rate.

And with the overhang of foreign ownership of U.S. sovereign debt, what we are going to see happening is the dumping of that debt, further exchange rate depreciation, which is going to feed on itself, push import prices in the United States through the roof, and, also, interest rates are going to rise tremendously as people just unload U.S. debt.

Mr. SCHWEIKERT. Okay.

Mr. SALERNO. I see that happening.

Mr. COCHRAN. I would tend to echo that, that my biggest fear is not really a total collapse in the currency but really, a return to the economic stagnation and inflation that was a real problem in the mid-1970s through the early 1980s, and I think is overlooked in this current crisis, where people have jumped back and tried to compare

this to the 1930s, and our biggest threat is getting back to a period with significantly high interest rates, with inflation premiums, and double-digit inflation and threatening double-digit unemployment.

Mr. SCHWEIKERT. With your patience, Mr. Chairman, may I have Mr. Wright answer?

Mr. WHITE. Yes, I have the same concern about inflation. I don't know at what rate, but we learned in the 1970s, I thought, that you can have rising inflation even while unemployment is high. The fact that there is slack capacity in the economy doesn't mean that prices can't start to be bid up for the goods and services that people are buying and selling.

Now, of course, the Fed assures us that it will start to pay attention to inflation if it rears its ugly head, but there is a lag in recognizing what the problem is and there is a lag in turning that ship around. So I worry that inflation will rise substantially, maybe between 5 and 10 percent, before they can do anything about it.

Mr. SCHWEIKERT. Within that scenario, do you also see, literally, if you are debasing the currency in that, almost a currency war between sovereigns?

Mr. SALERNO. I think we are in a currency war. I think the United States has been waging a currency war from the 1960s— that is, devaluing its currency in order to help prop up so-called aggregate demand or total spending in the economy to continuously get us out of recessions and so on.

Mr. SCHWEIKERT. All right. Thank you.

And thank you for your patience, Mr. Chairman.

Chairman PAUL. Thank you.

I believe we will have time to go on with a second round of questioning. So I will yield myself 5 minutes.

Suggesting that we could move into something like in the 1970s with low growth and prices going up, history also shows that you can get inflationary depressions, too. The depression actually gets worse, and then you also have a destruction of the currency. And let's hope we can prevent that from happening.

But I wanted to ask the panel, and I will start with Dr. Salerno, about some of the challenges we get, those of us who believe in commodity money or even the gold standard, that they always throw the 19th Century up to us, and they say that the gold standard was a total failure because we had bank runs; that is why we had to have the Fed, and that is why we had to have this system.

But, Murray Rothbard wrote about the booms and the busts in the 19th Century, and he didn't blame the gold standard like they did

in the 1930s. They said that the gold standard was at fault. But he talked about the pyramiding of debt and the deposits.

Would that be saying that there is some blame for fractional reserve banking for contributing to those crises that we had in the 19th Century, and it was that rather than the gold standard that caused those problems?

Mr. SALERNO. Yes, I think that is right, that fractional reserve banking was really to blame for most of those panics and depressions. Particularly after the Civil War, when we had the national banking system, you had this pyramiding not only on gold, but— Wall Street banks pyramided on gold. Gold was concentrated on Wall Street. That was one of the points of the legislation. And then the country banks pyramided not on gold, they didn't hold gold, they held Wall Street bank notes and deposits as their reserves.

So we had this huge, unstable, upside-down pyramid which was ready to topple over at the slightest problem or small—or large default on some loan. And that is exactly what the cause was, not the commodity money standard itself.

Chairman PAUL. Now, if we were back in the 19th Century, what would have been the tool for preventing those bubbles from forming? Would there have been a government role in trying to prevent what you just described?

Mr. SALERNO. Yes, get rid of all of the policies that caused the pyramiding. Let the banks each stand on their own bottom. If they want to have fractional reserve banking, let them hold their own reserves. If they can get a loan from another bank, they may be able to go on for a little while. But that would prevent it.

Chairman PAUL. Do you care to make a comment, Dr. Cochran?

Mr. COCHRAN. Yes. Some of the panics and problems with the banking system at that time were not a result of banks holding commodity reserves and making loans on that, but were actually restrictions put on their note issue that they first had to buy State government debt or, with some of the national banking, Federal Government debt. And it was the government debt that was supposedly backing their note issue, not the commodity reserves.

So there was some very, very strange symbiosis between governments using the banking system to help their fiscal situation that were much more responsible for some of the panics and the financial crisis, particularly the myth of the wildcat banks.

Chairman PAUL. Dr. White?

Mr. WHITE. Yes, I would disagree with Dr. Salerno a little bit on this. I think fractional reserve banking was a necessary condition for

bank runs and panics, but it is not a sufficient condition. And if you look around the world, as I said before, you find other countries that had sound fractional reserve banking systems where the banks were not artificially hamstrung; they were well-diversified, and they did manage their own reserves, as Dr. Salerno said. They didn't have inter-regional banks' deposits of reserves, like country banks into city banks and city banks into New York, because banks were allowed to open their own offices in the financial capital. So they didn't have to put their money in the hands of another bank and then create that instability. But under the national banking system, the reserve requirements were structured in such a way that it encouraged this kind of interbank depositing.

But if you look at Canada, if you look at Scotland—which is my favorite example—if you look at Switzerland, if you look at Sweden, you see systems where banks were on their own two feet, they had the penalty of failure in front of them if they failed to keep enough reserves or to invest prudently, and the banking systems were competitive and they were solvent, they were solid. So that is how I would draw the lesson.

Chairman PAUL. Okay. Thank you.

I now yield to Mr. Jones from North Carolina.

Mr. JONES. Mr. Chairman, thank you.

And I couldn't help but think—in some of your answers, several of you have mentioned other countries and their systems seem to be relatively sound. And I couldn't help but think that is because they probably have a different system of raising money for campaigns. This country—I don't think we could ever do what is right for the banking system or some other systems as long as we have lobbyists. Both parties raise money—and I am guilty of that too, by the way—and they have influence.

When people like yourself, for whom I have great respect—you are professionals, you are intellectuals, this is your area of expertise so to speak, you probably could help us write a really good bill that maybe would make some meaningful changes and make the system a little bit more sound. And yet you, other than hearings like this and other committees, you probably—that is the limit.

And I guess my point is that, I don't know how we are going to ever get the system sound again as long as the paid lobbyists come down here and tell us they like this page of the bill, and they don't like that page of the bill, so you need to change that.

Do you have any thoughts? I really have taken you way off field, so to speak, but do you have any thoughts about a system like ours,

which really doesn't encourage the honesty and integrity to change things for the good of the system but also the good of the people? I will end at that and let you take a shot at it.

Mr. SALERNO. I work in New York. I work at a university in New York City a few blocks away from "Occupy Wall Street." And I think that things will only change, especially in the banking sector, when we have a grassroots movement that shares some of these opinions, that is like "Occupy Wall Street," in that it spreads throughout the constituencies of the United States.

I think that is one of the things that we should be working to do. And I think Congressmen who think—like yourself and Dr. Paul—that things should be changed should encourage these movements to the extent that you can.

Mr. COCHRAN. And the concern is not just limited to banking. I think Adam Smith, as far back as 1776, which I think also is a significant date for this country, really phrased it that, for the economy to operate properly, there needs to be an elimination of all systems of privileges and restraints. And the lobbying comes in both as necessary because of the unnecessary restraints we put on market participants, but also them recognizing that the system that restrains them also can be the system that grants special privileges and monopolies in the true sense, which is a government-protected privilege to offer goods and services to the public.

Mr. WHITE. In the 19th Century, we had a weak banking system because the small banks had the very powerful lobby, and they lobbied for restrictions on their competitors so that they could stay in business. Today, in the 21st Century, it is very different. The main problem of weakness is caused by privileges, and the privileges are being lobbied for by the largest banks. And the weakest banks are no longer the smallest banks; the weakest banks are now the largest banks. And they are the most dependent on these privileges, so they are the ones who are going to be lobbying the most to keep these privileges intact.

And I don't know how to solve that problem, but it has long been a problem that when there—in any area of the economy, if there are privileges and restrictions at stake, there are going to be people who are trying to shape legislation around those things. So there has to be some kind of greater attitude toward letting the banking system operate without privileges and without restrictions.

Mr. SALERNO. Can I just add to that very quickly?

Murray Rothbard, the economist, once said that the way you get true change is to have statesmen and educators who really are in-

terested in the public good reach around the privileged elites and get their message out to the public.

Mr. JONES. I think that maybe the *Citizens United* decision might bring some sanity to the system. It won't happen in my lifetime, but maybe in our children or grandchildren's lifetime, that maybe this would be a system that goes back to being the people's representatives instead of the lobbyist's representatives. And I think it will happen in time. I hope to live long enough, maybe in a retirement home, to see it happen, but I would love to see that happen.

But thank you for your comments.

Chairman PAUL. I thank the gentleman.

Now, I yield to the gentleman from Missouri, Mr. Luetkemeyer.

Mr. LUETKEMEYER. Thank you, Mr. Chairman.

Interesting conversation. I was struck with some of the comments by the gentleman from North Carolina. And it kind of got me thinking about, if we make you king for the day, President for the day, Congressman for the day, whatever, how would you solve our situation now with the weakness that we have in our system? What changes do you think we need to be implementing or working for to get our system back to where it is on solid ground and make it all work? How would you ease it into a more workable solution?

Each one of you?

Mr. SALERNO. I think the first step is to get rid of the too-big-to-fail doctrine wholesale and forthwith. Do it right now. And then phase out—I probably would phase out more quickly than Larry—the FDIC insurance, within the year or something like that, within a year from the date that you get rid of the too-big-to-fail doctrine.

Mr. LUETKEMEYER. So, in other words—

Mr. SALERNO. I think those are the first important steps.

Mr. LUETKEMEYER. So, in other words, what you would suggest is to put the onus back on the banking system for their own—the responsibility for their own decisions. Their own risk has been taken by themselves, not the taxpayer or the FDIC insurance folks and nobody else.

Mr. SALERNO. Right.

Mr. LUETKEMEYER. Okay.

Mr. SALERNO. Because at bottom, all they are, are business firms. They are not special. They should not be special. They should not be privileged. They should operate on the market, bear the burdens of the risks they assume—not only them, but any depositors who want

to put money into a fractional reserve bank. They must realize what the consequences can be.

Mr. LUETKEMEYER. It is interesting, I made the comment the other day in committee that I think for the first time in several years here, people are actually now finding out what banks do. They don't just sit there and take deposits and make loans. They manage risk. That is what they do every day. And, as a result, I think the consumers and the citizens of our country are finally figuring out that, whoa, this is a risky business, and there is some responsibility on somebody's part here to manage that risk. And it is determining who takes the risk, who manages it, that is our dilemma here right now of what is going on.

Dr. Cochran?

Mr. COCHRAN. Yes, I would echo Dr. Salerno's comments that the too-big-to-fail doctrine has to go first and, really, with it, the mentality that bailouts are going to come in across the economy, whether it is banking or others, and protect people from the risk they undertook.

Back to the deposit insurance, when it appeared that some of the money market funds were going to break the buck, we came in and de facto offered insurance for the deposit on the money market funds, which just again reinforces the deal.

And then probably on the monetary side, I would look at eliminating all the restrictions right now that make it difficult for anybody to come in and compete with the system. I think recently, we just had someone arrested for coining gold that could or could not have been used as a medium of exchange in competition. So that we really don't allow people who would even want to choose to contract in something payable other than in Federal Reserve Notes to write a contract that would be enforceable for payment in ounces of gold or other mediums of exchange.

Mr. LUETKEMEYER. Dr. White?

Mr. WHITE. In addition to the points that have already been made, I would say that the Federal Reserve needs to be constrained so that it doesn't create such an unstable environment and so that it doesn't issue what became known as the "Greenspan Put," which was the, sort of, open suggestion that if the stock market starts to go down, we will pump in enough money to keep everybody afloat. That sort of thing leads to a relaxation of prudential standards, and I think that has been a big problem in the banking system.

Now, under this kind of caveat emptor system that we are suggesting, it is true that people will have to shop around for a bank and

people will have to reeducate themselves as to how do that. But people nowadays shop around for a mutual fund. They don't understand exactly how mutual funds operate. They get a prospectus, and they don't really know what to make of it. But they do know who does know, right? They can read Money magazine, they can read investment newsletters, and they can seek out the advice of experts. And people can exercise at least that much prudence when they choose a bank.

Mr. LUETKEMEYER. Very good.

Thank you, Mr. Chairman. I yield back the balance of my time.

Chairman PAUL. I thank the gentleman.

I now recognize Mr. Schweikert from Arizona.

Mr. SCHWEIKERT. Thank you, Mr. Chairman.

Back to our happy part of the discussion, which is how the world comes to an end, looking back to the discussion of, whether it be 3 years or 5 years, whatever the timeframe is, we seem to all have a universal agreement here that with the massive amount amounts of liquidity that are out in the system, we see inflation, we may see a runaway type of inflation.

Okay, each of you just became Federal Reserve Chairman. Congratulations. How would you—actually, I will nominate you. In all sincerity, how would you guide the ship of monetary policy? How would you pull that excessive liquidity out of the system? What proposals would you make to avoid that ugly scenario?

Let's start with Dr. White.

Mr. WHITE. Okay. The same way it went in, it can come out. That is, the Fed can sell off its mortgage-backed securities, and the Fed can sell its Treasury bills back into the market.

Now, at the same time, the Fed can reduce the incentive of banks not to lend by scaling back the interest they pay on reserves. Banks are sitting on more than a trillion dollars in excess reserves, in large part because the interest rate the Fed is paying on those reserves is about the same as the interest rate the banks can earn on T-bills.

Mr. SCHWEIKERT. Would you also, in that same scenario, raise reserve requirements at chartered lenders?

Mr. WHITE. Reserve requirements aren't really relevant these days. They are pretty much not binding. Most banks have more cash in their ATMs than they are required to hold.

Mr. SCHWEIKERT. Okay.

Mr. WHITE. Total required reserves in the system are something like \$80 billion, and banks have more than a trillion dollars in reserves. So reserve requirements are not really going to do the job.

Mr. SCHWEIKERT. Doctor?

Mr. COCHRAN. Yes. And one of the things I would echo is that you can pull out these excess reserves the way they got in by basically, where you purchased, now sell them. One of the dangers going in is that, as they have changed their balance sheet from short-term securities to longer-term securities, that the value of those securities, the mortgage-backed and others, are much more susceptible to decline in value to rising interest rates.

I do think that, given the amount of excess reserves that are in the system, that a possible way to avoid this, besides reducing— as you reduce the interest that they are paying on these excess reserves, that it is possible that a consideration of a significant increase in the required reserve ratio could be an effective tool as you take more time to pull and sell off some of these assets.

Mr. SCHWEIKERT. Okay.

Mr. SALERNO. And once this was reversed, once the excess reserves were sucked out of the system, I would then, if I were the Federal Reserve Chair, just stop open market operations at that point, stop printing up reserves and purchasing government securities. And then, that would stop the next influx of liquidity into the system that would get the whole thing started again.

Mr. SCHWEIKERT. Okay. You are more optimistic than I am, I guess mechanically so.

But one of you doesn't think raising the reserve requirements would be effective, just because of how much margin there is there? And you actually believe that would be one of the tools?

Mr. COCHRAN. I think it should be a consideration. It would not be a first tool, but it could be a tool that could allow more of a phased sale of the securities without allowing the reserves to start flooding excess lending into the system.

Mr. SCHWEIKERT. Okay.

And, Dr. White, you looked anxious there.

Mr. WHITE. Well, it is possible to make reserve requirements binding if you are really determined to do so. But, banks have gotten very good with computers at sweeping the reservable deposits off the books at the end of the day, and that makes it very hard to enforce reserve requirements.

Mr. SCHWEIKERT. Okay.

Mr. Chairman, thank you.

Chairman PAUL. I thank the gentleman.

And I want to thank our witnesses for appearing today. As I said at the opening, I believe these are very important hearings, and I very much appreciate you being here.

The Chair notes that some Members may have additional questions for this panel, which they may wish to submit in writing. Without objection, the hearing record will remain open for 30 days for Members to submit written questions to these witnesses and to place their responses in the record.

This hearing is now adjourned.

{Whereupon, at 3:42 p.m., the hearing was adjourned.}

STATEMENTS

STATEMENT FOR THE RECORD
HON. RON PAUL
REPRESENTATIVE, 14TH DISTRICT OF TX
CHAIRMAN, SUBCOMMITTEE ON
DOMESTIC MONETARY POLICY & TECHNOLOGY
U.S. HOUSE OF REPRESENTATIVES

During a time of economic crisis, when the topic of stability of the banking and financial sector is at the forefront of most people's minds, it is ironic that the most important factor in the development of the modern banking system is precisely the one topic which is almost never mentioned. The elephant in the room is, of course, fractional reserve banking. In a speech in October 2010, Mervyn King, Governor of the Bank of England, referred to fractional reserve banking as “financial alchemy”, an analogy which is particularly apt. Just as alchemists attempted to turn worthless lead into something thousands of times more valuable, modern-day financial alchemists attempt to turn a limited number of bank deposits into an unlimited amount of money and credit. But while the alchemists were never successful in their endeavors, financial alchemists have been all too successful at creating money and credit out of thin air, sowing the seeds for the destructive booms and busts of the business cycle.

Fractional reserve banking is the practice by which banks accept deposits but only keep a fraction of those deposits on hand at any time. In practice, nearly 100% of deposits are loaned out, yet depositors believe that they can withdraw the full amount of their deposit at any time. Loaned funds are then redeposited and reloaned up to the limit of the bank's reserve requirements, compounding the effect. While mainstream economists extol this “money multiplier” as

a nearly miraculous process that results in a robust economy, low reserve requirements actually enable banks to create trillions of dollars of credit out of thin air, a process that distorts the structure of production and gives rise to the business cycle.

Imagine that A deposits \$100 in a bank. The bank keeps 10% on reserve and loans \$90 to B. B deposits that same \$90, the bank keeps 10% on reserve, loans the remainder to A, and the cycle continues on and on. Eventually the bank has a combined deposit total of \$1000. Theoretically there is now \$1000 that can be spent. Yet while the amount of money and credit in the system has increased, the amount of real savings and real production has not changed.

Everyone understands the absurdity of this little example, but once this same process is expanded throughout the economy, the means by which that \$100 deposit turns into \$1000 of credit is treated almost as magic. The fact that ten times as much money is chasing the same amount of goods, that the new credit benefits earlier recipients more than later recipients, and that distortion to the capital structure then ensues, are all completely ignored.

Once the boom phase of the business cycle has run its course and the bust commences, some people will naturally look to hold cash. So they withdraw money from their bank accounts in order to hold physical currency. But bank deposits consist of a huge amount of credit pyramided on top of a small amount of original cash deposits. Each dollar of cash that is withdrawn unwinds the multiplier, resulting in a contraction in credit. And if depositors attempt to withdraw more funds than are available in reserves, the entire house of cards comes crashing down. This is the very real threat facing some European banks today.

Since the amount of deposits always exceeds the amount of reserves, it is obvious that fractional reserve banks cannot possibly pay all of their depositors on demand as they promise – thus making these banks functionally insolvent. While the likelihood of all depositors pulling their money out at once is relatively rare, bank runs periodically do occur. The only reason banks are able to survive such occurrences is because of the government subsidy known as deposit insurance, which was intended to backstop the stability of the banking system and prevent bank runs. While deposit insurance arguably has succeeded in reducing the number and severity of bank runs, deposit insurance is still an explicit bailout guarantee. It thereby creates a moral hazard by encouraging bank deposits into fundamentally unsound financial institutions and contributes to instability in the financial system.

Rather than enhancing stability, deposit insurance creates instability by rewarding risky behavior on the part of banks. Why engage in sound banking and lending practices if the government promises always to bail out your bank and its depositors? Deposits legally are considered loans to the bank, but depositors are promised by the government that they never will lose a penny of their deposits. Therefore depositors need not perform due diligence when selecting a bank with which to do business. Whether the bank is sound or unsound is immaterial, since deposits are guaranteed by the government. Thus risky banks which would be forced out of business in a free market are guaranteed access to funds with which they engage in their financial alchemy.

Throughout much of banking history, bankers and politicians have colluded to their mutual benefit. Bankers fund government wars in exchange for special protections from the government. In the 19th century, U.S. banks were required to purchase government bonds in order to back their issues of banknotes, thus ensuring funding for government boondoggles. And when too many banknotes were issued and depositors sought to exchange them for gold and silver coin, governments suspended specie redemption, allowing banks to keep their gold and silver and refuse redemption of their notes. Ultimately taxpayers and savers were the victims of this unholy alliance.

Unfortunately, not much has changed since then. Banks continue to loan money to the government through purchases of Treasury debt, enabling wars of aggression abroad and a massive police and welfare state at home. And when banks make mistakes they are never forced to take losses or go out of business. Smaller banks are merged by federal regulators into larger banks, while banks that are deemed to be “too big to fail” are given billions of dollars worth of bailouts so that they can live to fail another day.

The solution to the problem of financial instability is to establish a truly free-market banking system. Banks will no longer require government charters in order to operate. They will no longer be forced to comply with arbitrary government reserve regulations that treat money loaned to the government as an asset worth more than gold in the vault. And most importantly, banks will no longer have a government backstop of any sort in the event of failure. Banks, like every other business, should have to face the spectre of market regulation. Those banks which engage in sound business practices, keep adequate reserves on hand, and gain the confidence of their customers will survive, while others fall by the wayside. Banking, like any other financial activity, is not without risk – and the government

should not continue its vain and futile pursuit of trying to eliminate risk. Get government out of the way and allow the market to function. This will result in a more stable system that meets the needs of consumers, borrowers, and investors.

WITNESS TESTIMONY

WRITTEN TESTIMONY OF JOSEPH T. SALERNO, Ph.D.

PROFESSOR OF ECONOMICS
LUBIN SCHOOL OF BUSINESS
PACE UNIVERSITY

Chairman Paul, Ranking Member Clay and members of the Subcommittee, I am deeply honored to appear before you to testify on the topic of fractional-reserve banking. Thank you for your invitation and attention.

In the short time I have: I will give a brief description of fractional reserve-banking; identify the problems it presents in the current institutional setting; and suggest a potential solution.

A bank is simply a business firm that issues claims to a fixed sum of money in receipt for a deposit of ready cash. These claims are cashable *on demand* and without cost to the depositor. In today's world these claims may take the form of checkable deposits, so called because they can be transferred to a third party by writing out a check payable to the party named on the check. They may also take the form of so-called "savings" deposits with limited or no checking privileges and that require withdrawal in person at one of the bank's branches or at an ATM machine. In the United States, the cash for which the claim is redeemable are the Federal Reserve Notes or "dollar bills" that we are all familiar with. These dollar bills are the ultimate cash of the contemporary U.S. monetary system.

Fractional-reserve banking occurs when the bank lends or invests some of its depositors' funds and retains only a *fraction* of the deposits in cash. This cash is the bank's reserves. Hence the name fractional-reserve banking. All banks today both domestically and abroad engage in fractional-reserve banking

Let me illustrate how fractional-reserve banking works with a simple example. Assume a bank with deposits of \$1 million makes \$900,000 of loans and investments. If we ignore for simplicity the capital paid in by its owners, this bank is holding a cash reserve of 10 percent against its deposit liabilities. The deposits constitute the bank's liabilities because the bank is contractually obligated to redeem them on demand. The assets of the bank are its reserves, loans, and investments. Its assets then are ready cash as well as IOUs and securities that give it title to sums of cash payable in the near or distant future. The noncash assets include short-term business loans, credit card loans, mortgage loans and the securities issued by the U.S. Treasury and foreign financial authorities.

Now the key to understanding the nature of fractional-reserve banking and the problems it creates is to recognize that a bank deposit is not itself money. It is rather a "money-substitute, that is, a claim to standard money—dollar bills—that people regard as completely secure. Bank deposits transferred by check or debit card will be routinely paid and received in exchange in lieu of money *for as long as the public does not have the slightest doubt that the bank which creates these deposits is able and willing to redeem them without delay or expense* (either to the depositor or to the party that he has paid by check or debit card). Under these circumstances, bank deposits are eagerly accepted and held by businesses, investors, and workers and are regarded as indistinguishable from cash itself. They are therefore properly included as part of the money supply, that is, the total supply of dollars in the economy.

The very nature of fractional-reserve banking, however, presents a problem for the bank itself. On the one hand, all of a bank's deposit liabilities mature on a daily basis, because it has promised to cash them in on demand. On the other, only a small fraction of its assets is available at any given moment to meet these liabilities. For example, during normal times, U.S. banks effectively hold much less than 10 percent of deposits in ready reserves. The rest of a bank's liabilities will only mature after a number of months, years, or, in the case of mortgages, even decades. In the jargon of economics, fractional-reserve banking always involves "term structure risk" arising from the mismatching of the maturity profile of its liabilities with that of its assets. In layman's terms, banks "borrow short and lend long." The underlying problem is revealed when the withdrawal of deposits exceeds a bank's cash reserves at any moment in time. The bank is then compelled to hastily sell off some of its longer-term assets, many of which are not readily saleable. It will thus incur big

losses. This will cause a panic among the rest of its depositors who will scramble to withdraw their deposits before they become worthless. A classic bank run will ensue. At this point the value of its remaining assets will no longer be sufficient to pay off all its fixed-dollar deposit liabilities and the bank will fail.

A fractional-reserve bank, therefore, can only remain solvent for as long as public confidence exists that its deposits really are riskless claims to cash. If for any reason—real or imagined—the faintest suspicion arises among its clients that a bank's deposits are no longer payable on demand, the bank's reputation vanishes overnight. The bank's brand of money-substitutes is instantly extinguished and people rush to withdraw their deposits in cash—cash that no fractional-reserve bank can provide on demand in sufficient quantity. Thus overnight extinction of its product brand and insolvency is always looming over fractional-reserve banks.

The ever-present threat of insolvency is the least of the problems with fractional reserve banks, however, since its effects are restricted to the bank's stockholders, creditors and depositors who voluntarily assume the peculiar risks involved in this business.

The major problems of fractional-reserve banking are its harmful effects on the overall economy. I will describe two of these problems.

First, fractional-reserve banking is inherently inflationary. When a bank lends its clients' deposits, it inevitably expands the money supply. For example, when clients deposit an additional \$100,000 of cash in the bank, depositors now have an additional \$100,000 in their checking accounts while the bank accumulates an additional \$100,000 of cash (dollar bills) in its vaults. The total money supply, which includes both dollar bills in circulation among the public and dollar balances in bank deposits, has not changed. The depositors have reduced the amount of cash in circulation by \$100,000, which is now stored in the bank's vaults, but they have increased the total deposit balance that they may draw on by check or debit card by the exact same amount. Suppose now the loan officers of the bank lend out \$90,000 of this added cash to businesses and consumers and maintain the remaining \$10,000 on reserve against the \$100,000 of new deposits. These loans increase the money supply by \$90,000 because, while the original depositors have the extra \$100,000 still available on deposit, the borrowers now have an extra \$90,000 of the cash they did not have before.

The expansion of the money supply does not stop here however, for when the borrowers spend the borrowed cash to buy goods or to pay wages, the recipients of these dollars in turn redeposit some or all

of this cash in their own banks, which in turn lend out a proportion of this cash. Through this process, bank deposit dollars are created and multiplied far beyond the amount of the initial cash deposits. (Given the institutional conditions in the U.S. today, each dollar of currency deposited in a bank can increase the U.S. money supply by up to a maximum of \$10.00). As the additional deposits dollars are spent, prices in the economy progressively rise and the inevitable result is inflation with all its associated problems.

Fractional-reserve banking inflicts another great harm on the economy. In order to induce businesses and consumers to borrow the additional dollars created, banks must lower interest rates below the market equilibrium level determined by the amount of voluntary savings in the economy. Businesses are misled by the artificially low interest rates into borrowing to expand their facilities or undertake new long-term investment projects of various kinds. But the profitability of these undertakings depends on expectations that bank credit will remain cheap more or less indefinitely. Consumers, too, are deceived by the lower interest rates and rush to purchase larger residences or vacation homes. They take out second mortgages on their homes to buy big-ticket luxury items. A false economic boom begins that is doomed to turn into a bust as soon as interest rates rise again.

As the inflationary boom progresses the demand for credit becomes more intense and more cash is withdrawn from bank deposits to finance the purchase of everyday goods whose prices are rising. The banks react to these developments by raising interest rates and contracting loans and deposits. During the recession that follows the binge of bad investment and overconsumption is starkly revealed in the abandoned construction projects, empty commercial buildings, and foreclosed homes that litter the economic landscape. At the end of the recession it turns out that almost all households and business firms are made poorer by fractional-reserve bank credit expansion, even those who initially gained by the inflation.

Now the inflation and the boom-bust cycles generated by fractional reserve banking are enormously intensified by Federal Reserve and U.S. government interference with the banking industry. The most pernicious forms of such interference are: the power of the Federal Reserve to create bank reserves out of thin air via open market operations; its use of these phony reserves to bail out failing banks in its role as a lender of last resort; and federal insurance of bank deposits. In the presence of such polices, the deposits of all banks are perceived and trusted by the public as one homogeneous

brand of money substitute fully guaranteed by the Federal government and backed up by the Fed's power to print up bank reserves at will and bail out insolvent banks. Under this monetary regime, there is absolutely no check on the natural propensity of fractional-reserve banks to mismatch the maturity profiles of their assets and liabilities, to expand credit and deposits, and to artificially depress interest rates. We can expect bubbles to continually grow in various sectors of the economy and the subsequent financial crises to continue unabated.

The solution to our problems is to treat banking as any other business and permit it to operate on the free market—a market completely free of government guarantees of bank deposits and of the possibility of Fed bailouts. In order to achieve the latter, the Fed would have to be permanently and credibly deprived of its legal power to create bank reserves out of nothing. The best way to do this is to establish a genuine gold standard in which gold coins would circulate as cash and serve as bank reserves; at the same time the Fed must be stripped of its authority to issue notes and conduct open market operations. Also, banks would once again be legally enabled to issue their own brands of notes, as they were in the nineteenth and into the early twentieth century.

Once this mighty rollback of government intervention in banking is accomplished, each fractional-reserve bank would be rigidly constrained by public confidence when issuing money-substitutes. One false step—one questionable loan, one imprudent emission of unbacked notes and deposits—would cause instant brand extinction of its money substitutes, a bank run, and insolvency.

In fact on the banking market as I have described it, I foresee the ever-present threat of insolvency compelling banks to refrain from further lending of their deposits payable on demand. This means that if a bank wished to make loans of shorter or longer maturity, they would do so by issuing credit instruments whose maturities matched the loans. Thus for short-term business lending they would issue certificates of deposits with maturities of three or six months. To finance car loans they might issue three-year or four-year short bonds. Mortgage lending would be financed by five or ten year bonds. Without government institutions like Fannie Mae and Freddie Mac implicitly guaranteeing mortgages, and in absence of the relentless appreciation of housing prices due to inflation, mortgage loans would probably be transformed into shorter five- or ten-year balloon loans. the bank may retain an option to roll over a mortgage loan when it comes due pending a re-evaluation of the mortgagor's current

financial situation and recent credit history as well as the general economic environment. In short, on a free market, fractional-reserve banking with all its inherent problems would slowly wither away.

WRITTEN TESTIMONY OF
JOHN P. COCHRAN, Ph.D.
EMERITUS PROFESSOR, ECONOMICS
EMERITUS DEAN, SCHOOL OF BUSINESS
METROPOLITAN STATE COLLEGE OF DENVER

Introduction

Fractional reserve banking has historically been viewed by some economists and most monetary cranks as a panacea for the economy—a source of easy credit and new purchasing power to quicken trade. Better economists, however, recognized fractional reserve banking with its ability to create credit, Mises’s (1971, 268-69) circulation credit or Rothbard’s (1994) deposit banking, as a major source of financial and economic instability. The establishment of a central bank was often, *when not driven by fiscal priorities of government*, an attempt to achieve the first while mitigating or eliminating the second. For the United States, in particular, the effort was perhaps misguided. Per Vera Smith (1990 [1936], 166):

A retrospective consideration of the background and circumstances of the foundations of the Federal Reserve System would seem to suggest that many, perhaps most, of the defects of American banking could, in principle, have been more naturally remedied otherwise than by the establishment of a central bank; that it was not the absence of a central bank *per se* that was at the root of the evil, ... there remained [even with a central bank] certain fundamental defects which could not be entirely, or in any great measure, overcome by the Federal Reserve System.

Rothbard (2002) covers the history of money and banking in the U. S. and amply documents periods of instability generated by banking panics associated with fractional reserve banking *sans* an explicit central bank. However, compared to this earlier era, fractional reserve banking supported by ‘scientific’ management of the currency by a central bank has failed to provide the promised stability. Besides the continuing instability, the Fed has guided a significant (massive) decline in the purchasing power of the dollar. The dollar currently has a purchasing power less than 5% of a 1913 dollar. Selgin, Lastrapes, and White (2010), “Has the Fed Been a Failure?” summarize:

Drawing on a wide range of recent empirical research, we find the following: (1) The Fed’s full history (1914 to present) has been characterized by more rather than fewer symptoms of monetary and macroeconomic instability than the decades leading to the Fed’s establishment. (2) While the Fed’s performance has

undoubtedly improved since World War II, even its postwar performance has not clearly surpassed that of its undoubtedly flawed predecessor, the National Banking system, before World War I. (3) Some proposed alternative arrangements might plausibly do better than the Fed as presently constituted. We conclude that the need for a systematic exploration of alternatives to the established monetary system is as pressing today as it was a century ago.

During a period known as the Great Moderation, roughly 1983-2000, the U. S. economy experienced a period of *apparent* relative stability and prosperity. The U. S. economy was then buffeted by two boom-bust cycles tied directly to credit expansion and low interest rates driven by fractional reserve banking supported by central bank activity (Garrison 2012 and 2009, Salerno 2012, Ravier and Lewin 2012, and Cochran 2011). The most recent recession and slow recovery rivals or exceeds the instability of 1970s and early 1980s in severity and is arguably the most significant crisis since the 1930s. While much of the discussion following the recent crisis has focused on why the recovery has been so slow, a lesson that should have been learned is that the economic growth driven by money and credit creation is short term only; an artificial boom cannot last. Ultimately credit creation is a major destructive power that misdirects production, falsifies calculation, even in a period of relatively stable prices, and destroys wealth (Salerno 2012, 32-36). An economy with a complex financial system like the present banking system, which in turn depends on a government monopoly of the supply of money, is prone to cycles and crisis even with the best of either discretionary or rule-based management. Under our current system of interest rate targeting “Policy-induced booms tend to piggyback on whatever economic development is underway” (Garrison 2009). This would be true whether the central bank followed a single, rather than the current dual mandate, such as a policy goal of price stability or adopted nominal GDP targeting (Garrison 2012, 435-36). Under fractional reserve banking supported by a central bank the interest rate brake which would normally stop such events before they turn into bubbles or booms is effectively neutered (Hayek, 1941, pp. 406–10). Because of this neutering, booms and busts remain a significant threat in a “learning by doing” policy framework (Garrison 2009).

Without a foundation of sound money, a market determined money, cycles are inevitable and destructive not only of short-term economic well-being, but potentially destructive of long-term freedom and prosperity. It is urgent that policy makers take seriously Hayek’s proposal, developed during the economic crisis of the 1970s,

for drastic monetary reform, for a “denationalization of money.” This call is echoed by Garrison (2012, 436) who argues future prospects for “achieving long run sustainable growth can only rest on the prospects for decentralizing the business of banking.”

Sound Money¹⁷⁸

After the decline of former socialist countries and under the influence of the apparent prosperity in most market economies during the Great Moderation, most economists recognized the importance of markets and private property for long-term economic prosperity.¹⁷⁹ But markets and private property generate prosperity because only in such an order can monetary calculation facilitate rational economic planning. But for monetary calculation to operate in a way most consistent with consumer sovereignty, calculation and prices must be embedded in a sound monetary system. As expressed by Salerno (2010 [1998], 468):

While there is now a basic recognition by economists that rational allocation of resources necessitates institutional reforms that return resources to private hands and restore genuine markets for productive inputs, there is no such comprehension of the importance of sound money to the processes of economic calculation.

Salerno (473) continues “Sound money, then is simply one which does not lead to systematic falsification of or nullification of economic calculation.” Economic calculation requires money prices, but for calculation to most adequately achieve the goal of solving the economic problem, the money prices used for calculation must reflect the valuations of producers/consumers that are based on their individually unique preferences, knowledge, and resources.

Sound money then is money whose purchasing power and quantity are determined by consumers’ and producers’ valuations; preferences, knowledge, and resources—that is, a market-determined commodity money absent government intervention. As expressed by Mises (1998, p. 225):

Economic calculation does not require monetary stability in the sense in which this term is used by champions of the stabilization movement. The fact that rigidity in the monetary unit’s purchasing power is unthinkable and unrealizable does not impair the methods of economic calculation. What economic calculation requires is a

¹⁷⁸ This section draws on Cochran 2004.

¹⁷⁹ Andrei Shleifer summarized, “Between 1980 and 2005, as the world embraced free market policies, living standards rose sharply, while life expectancy, educational attainment, and democracy improved and absolute poverty declined.” From “The Age of Milton Friedman.” *Journal of Economic Literature*: 2009, 47:1, 123-135

monetary system whose functioning is not sabotaged by government interference. The endeavors to expand the quantity of money in circulation either in order to increase the government's capacity to spend or in order to bring about a temporary lowering of the rate of interest disintegrate all currency matters and derange economic calculation.

Financial Intermediation and Fractional Reserve Banking and Cycles¹⁸⁰

The Austrian business cycle theory (ABCT) is a blend of monetary and capital theory and highlights coordination problems connected to “time and money.” In the framework developed by Ludwig von Mises, banks create money by creating credit. This created credit finances investment in excess of savings, distorts the structure of production, and sets the stage for the boom–bust cycle.

But what is created credit and when and how do banks create credit? Different answers to this question yield different implications for business cycle theory, research, and monetary policy, as well as different monetary reform proposals. In ABCT banks and central banking provide the link between capital markets, money, and economic instability.

Fractional reserve banks developed from two separate, apparently legitimate, business activities: banks of deposit or warehouse banking offering transactions services for a fee, and banks of circulation or financial intermediaries. Economists early on recognized that circulation banking, financial intermediation, reduces transactions costs and enhances the efficiency of the capital markets, leading to more savings, investment, and economic growth.¹⁸¹ Fractional-reserve banking combined these two types of banking institutions into one institution—a single institution offering both transaction services and intermediation services.¹⁸² With the development of a fractional reserve banking system, money creation, either through note issue or deposit expansion, and credit creation became institutionally linked.

¹⁸⁰ The following section draws heavily on Cochran and Call 2000 and 1998 and Cochran, Call, and Glahe 1999.

¹⁸¹ For a counter-argument on term intermediation see Barnett and Block.

¹⁸² Selgin (1988, chap. 2) argues that fractional-reserve banking develops naturally in a free economy as “a result of individuals finding new ways to promote their self-interest.” Banks are pure intermediaries (Selgin 1996, p. 120). Other Austrians have argued that fractional-reserve banks are hybrid institutions that could only develop as the result of special privileges granted to banks by government. The activities of these hybrids are not pure intermediation. The critical economic issue is: Is credit issued by a fractional reserve bank financial intermediation or credit creation? See Mises (1971, pp. 268–77) and Cochran and Call (1998, pp. 33–35).

In an Austrian analysis of money and credit, injection effects matter. The way money enters the economic system—that is the injection—affects the dynamic adjustment process. The spending of those who are initially affected by the monetary disturbance change before the spending plans of those who receive additional money balances only as the effects of the monetary change spread through the economy. In an economy with a developed banking system, monetary changes most often enter the economy as changes in the availability of credit. This analysis, which is the foundation of Austrian business cycle theory, combines the theoretical proposition that injection effects matter with the empirical observation that these effects take place as the banking system extends credit.

Monetary changes that originate through the banking system alter not just bank credit but total credit available in the economy and thus put downward pressure on interest rates. It is not the change in the rate of interest *per se* that is important, but the change in the rate relative to the natural or equilibrium rate.¹⁸³ An equilibrium rate reflects the “ratio of the value assigned to want-satisfaction in the immediate future and the value assigned to want-satisfaction in remoter periods of the future. It manifests itself in the market economy as the discount of future goods as against present goods” (Mises 1998, p. 523). Ordinarily, Mises (1998, p. 534) argues, “The loan market does not determine the rate of interest. It adjusts the rate of interest on loans to the rate of ordinary interest as manifested in the discount of future goods.” Credit creation temporarily suspends this adjustment process. Credit creation alters the money rate of interest relative to the equilibrium rate and disrupts the balance between the “supply and demand” for capital.¹⁸⁴

Mises developed an argument clearly explaining why and how credit creation takes place. Mises (1978, p. 119) cautioned:

One must be careful not to speak simply of the effects of credit in general on prices, but to specify clearly the effects of “increased credit” or “credit expansion.” A sharp distinction must be made between (1) credit which a bank grants by lending its own funds or funds placed at its disposal by depositors, which we call “commodity

¹⁸³ The term “natural rate” is controversial. Following Mises (1971, p. 359 and 1978, pp. 120–30), when I use the term it will be to distinguish between an equilibrium rate and a rate that has been altered by credit manipulation.

¹⁸⁴ While Mises argued that money was neither a consumption good nor a production good (1971, pp. 79–92), he definitely classified ‘money’ as a present good in his discussions on money and credit (pp. 268–77). See particularly (p. 268), “The claim he has acquired by his deposit is also a present good for him. The depositing of the money in no way means that he has renounced immediate disposal over the utility that it commands” and “(t)he note is a present good just as much as the money” (p. 272).

credit” and (2) that which is granted by the creation of fiduciary media, i.e., notes and deposits not covered by money which we call “circulation credit.”

Circulation credit is created credit because “[c]irculation credit is granted out of funds especially created for this purpose by banks. In order to grant a loan, the bank prints banknotes or credits the debtor on deposit account. It is creation of credit out of nothing” (Mises 1978, p. 218). Others in the Austrian tradition who seriously attempted to define credit creation include Machlup and Selgin. Machlup explicitly calls Mises’s circulation credit “created credit.”

I use the term transfer credit if the purchasing power accruing to the borrower is counterbalanced by purchasing foregone by somebody else, such as a voluntary saver or a disinvesting producer. My term “transfer credit” corresponds to Mises’s “commodity credit.” For Mises’s term “circulation credit,” I have substituted the term “created credit,” which clearly conveys the meaning that the purchasing power accruing to the borrower is not counterbalanced by any purchasing foregone by anybody else. (Machlup 1940, p. 224n)

Selgin (1988, p. 66) defines created credit as “credit granted independently of any voluntary abstinence from spending by holders of money balances.”

The Misesian model of credit creation sees modern fractional-reserve banks as hybrid institutions. Some transactions by these banks are financial intermediation, and as such enhance the efficiency of the saving and investment process. Other transactions by these same institutions create credit. Mises (1971, p. 261) describes these two distinct roles as “the negotiation of credit through the loan of other people’s money and the granting of credit through the issue of fiduciary media, i.e., notes and bank balances that are not covered by money.” Transactions in which both a depositor and a borrower retain, temporarily, current claims to money may not be intermediation, but credit creation. According to Mises (1971, 268-69):

It is usual to reckon the acceptance of a deposit which can be drawn upon at any time by means of notes or checks as a type of credit transaction and juristically this view is, of course, justified; but economically, the case is not one of a credit transaction (p. 268) . . . but this is not a credit transaction, because the essential element, the exchange of present goods for future goods, is absent. (p. 269)

The transaction is different in nature from a true credit transaction. In a true credit transaction the lender temporally surrenders “money or goods, disposal over which is a source of satisfaction and renunciation of which is a source of dissatisfaction” (Mises 1971, p. 264).

In this framework money as the medium of exchange is the present good *par excellence*. Since the holding of cash balances, whether in the form of demand deposits or bank notes, does not require the sacrifice of present goods, changes in cash balances financed from current income are part of the allocation of income to provide present utility. Households can use current income for present goods or future goods. If present goods are preferred, the household may choose specific consumption goods or money balances. Hence, the proper economic interpretation of a demand deposit or bank note is that the deposit or bank note is a bailment or warehouse receipt, not a credit instrument.¹⁸⁵ The depositor has not engaged in a true credit transaction because no sacrifice of present utility has taken place. Fractional-reserve banking combined with the creation of circulating credit expands the supply of credit beyond the limits set by prior saving. Banking institutions can and do push interest rates below the natural rate, resulting in spending by ultimate investors exceeding saving.

Created credit eventually causes an economic crisis. The normal operations of the money and banking institutions supported by a central bank generate business cycles by attempting to keep market rates of interest too low for too long. The recession phase of the business cycle is the economic correction of previous monetary excesses and the resulting malinvestment and overconsumption (Salerno 2012).

Alternative Views of Fractional Reserve Banking

In a Keynesian framework (Cochran and Call 1998), banks are viewed as financial intermediaries and money is considered a future, not a present, good; a store of value. This Keynesian framework is what Selgin (1996, p. 119) has labeled the “new view” of money and banking, where banks “are pure intermediaries: they act as brokers of, rather than creators of, loanable funds, and are not an independent cause of investment in excess of *ex ante* saving.” Banks are financial intermediaries that issue a liability that the public willingly uses as a medium of exchange. The problem for such a banking system may not be boom–bust cycles caused by credit creation and malinvestment, but secular stagnation. Such an

¹⁸⁵ See Rothbard (1978, pp. 148–49). If bank deposits are considered a short-term loan from a legal standpoint, then the funds are legally considered the property of the bank, not the property of the depositor. But the legal structure does not change the economic impact of the transaction. If such deposits (or notes) are used as a medium of exchange, they are a readily available source of current purchasing power.

economy would suffer from chronic unemployment as money and banking institutions operated so that the market rate of interest would be too high. Saving would exceed investment.¹⁸⁶

In this Keynesian view, financial intermediation should facilitate the flow of funds from savers to investors. Bank liabilities that do not serve as a medium of exchange are clearly of this type. The owner of the bank liability has loaned the funds to the bank for future considerations. Such intermediation is usually viewed as efficiency enhancing¹⁸⁷. Just as in a credit transaction without intermediation, the ultimate lender has a claim on future money and the borrower has acquired present money. In the new view, deposit banking is also intermediation. The saver prefers liquidity to return and decides to invest in money. The depositor loans funds to the bank and receives a bank I.O.U.—a bank deposit payable on demand. The bank now owns additional loanable funds. As reserves are loaned out, funds are transferred from an ultimate lender (the depositor) to an ultimate investor (the borrower).

Banks, for legal or economic reasons, maintain cash reserves to back these short-term liabilities (demand deposits or bank notes). As a result total lending will be less than total saving. A dollar held in a reserve balance is a dollar saved but not loaned to an ultimate investor. The supply of credit will be less than available saving and the market rate of interest will rise above the natural rate. Investment will be less than saving and the economy may remain below its productive capacity. Fractional-reserve banks and other intermediaries provide intermediation services that increase investment relative to a system without banking, but when these institutions hold significant cash reserves, the amount of investment may consistently be less than ideal. In this view, there exists no market process that ensures that saving will equal investment at full employment levels. A “natural” rate of interest may exist, but it is an equilibrium rate only in the sense that it preserves a *status quo*, a

¹⁸⁶ Selgin and White (1996, p. 101) argue that a consistent application of the Wicksellian framework would recognize not only that money creation can lower rates below the natural rate, but that “unanticipated destruction of money (or a drop in ‘velocity’) can drive the interest rate in the short run above its natural level, and hereby artificially curtail warranted investments.” Here again, the Misesian model leads to a different conclusion. See Mises (1971, p. 360): “The opposite case, in which the rate of interest charged by the banks is raised above the natural rate, need not be considered; if banks acted in this way, they would simply withdraw from the competition of the loan market, without occasioning any other noteworthy consequences.”

¹⁸⁷ For an Austrian critique of term intermediation see Barnett and Block 2011, 2009a and 2009b.

status quo that may not be ideal. A central bank is a necessary addition to the banking system. Central banks can provide new money and credit, high-powered money, to offset the general contractionary tendencies due to a fetish for liquidity which is part of the normal operation of financial markets (Garrison 2001, chapters on Keynes and Keynesians).

Selgin (1988 and 1996) offers a “qualified defense of the new view” that can be considered a middle ground between the Misesian and the new view. While fractional-reserve banking is intermediation, banks can still create credit. Credit is created when credit is “granted independently of any voluntary abstinence from spending by holders of money balances” (Selgin 1988, p. 60). *Extensive credit creation requires not just fractional-reserve banking, but central banking.* In this framework, the creation of fiduciary media that is matched by a willingness to hold the additional fiduciary media is not credit creation, but financial intermediation. Such transactions facilitate the flow of saving into investment. In the case where increased saving (reduced spending on present goods) takes the form of an increased demand for cash in the form of “inside” money, consumption is deferred and the funds are loaned to the banks for at least *short periods*. The extension of bank credit and the creation of new fiduciary media do not, in this instance, reduce the market rate below the natural rate, but instead, allow the market rate to follow the natural rate downward. Investment keeps up with a higher level of saving rather than exceeding a fixed level of saving. Credit creation can take place if banks issue fiduciary media and credit in excess of the demand for fiduciary media. But what mechanism prevents excessive credit creation? Here Selgin and White (1996, p. 103) rely on and build on Mises (1998, p. 440):

Free banking is the only method for the prevention of the dangers inherent in credit expansion. It would, it is true, not hinder a slow credit expansion, kept within very narrow limits, on the part of cautious banks which provide the public with all the information required about their financial status. But under free banking it would have been impossible for credit expansion with all its inevitable consequences to have developed into a regular—one is tempted to say normal—feature of the economic system. Only free banking would have rendered the market economy secure against crises and depressions.

The existence of a central bank with the ability to create high-powered or base money is a necessary prerequisite for excessive credit creation and the resultant boom–bust cycle. Free banking without central banking could provide intermediation services that could

mitigate contractionary pressures arising from monetary disequilibrium while also providing sufficient market discipline to prevent excessive credit creation. Austrian-type business cycles are thus a phenomenon of central banking, not of fractional-reserve free banking¹⁸⁸.

The Market Synthesis

The differences between the Keynesian-based new view and Mises, Machlup, and Selgin are significant and lead to different explanations of macroeconomic instabilities and policy proposals. In the Keynesian form of the new view, banks, including a necessary and benevolent central bank, do not create credit. With a ‘fetish for liquidity’, an economy absent central bank expansion of credit and lower interest rates will be subject to economic stagnation as the rate of interest exceeds the natural rate and investment falls below the level needed to achieve and sustain full employment. Central banking is a needed extra-market solution to a market malady (Garrison 2001).

In contrast, Mises (1971) developed the argument that fractional-reserve banking creates credit. Created credit is the source of the malinvestment of the boom phase of the cycle. But significant malinvestment in the Misesian cycle depends on central bank action or government backed special privileges, either explicit or implied. The central bank either actively provides new base money which banks use to create credit or the central bank passively makes new base money available to provide the needed liquidity (reserves) to an overextended banking system.¹⁸⁹ Without central bank activity, the **credit creation by fractional reserve banks would be limited in extent**. Large misdirection of production caused by credit creation requires either newly created base money or the promise to create

¹⁸⁸ The above argument depends on the caveat that free banking means banks operate in an environment in which banks are subject to the general rules of commercial and civil law and are not the recipients of special privileges and protections granted by the state. As expressed by Mises (1998, p. 440), “What is needed to prevent any further credit expansion is to place the banking business under the general rules of commercial and civil laws compelling every individual and firm to fulfill all obligations in full compliance with the terms of the contract.”

¹⁸⁹ Machlup (1940, pp. 247–48) argues, “Professor Mises believes, furthermore, that commercial banks alone without the support of the central bank can never produce a dangerous credit inflation.” Mises (1998, p. 788) is quite emphatic on this point, “But today credit expansion is an exclusive prerogative of government.”

new base money in the event of a crisis by a central bank.¹⁹⁰ Central banks provide the source of the newly created credit or remove the market barriers to bank initiated created credit.¹⁹¹

Banking freedom can potentially limit the scope of and quickly correct for or reverse any created credit that originates from fractional-reserve banking. Extensive and harmful credit creation is the result of the activity of central banking. The **malady is extra-market**. Created credit distorts the structure of production causing the boom–bust cycle and the remedy, really the preventative, is a return to free markets in money creation. The solution; **eliminate the central bank and restore a free market in money and banking**¹⁹² (Herbener, 2012).

Banking freedom would allow market participants to make the ultimate judgment on what to use as a medium of exchange and where to draw the line between money as a present good and money as a store of value. Bankers would make a judgments on the proportion of their deposits (or notes) that represent saving and the proportion that are currently serving as present money for the holders of the deposits. Only funds held as savings may be safely “invested” or loaned. Consumers of banking services make judgments about the safety and soundness of the banking institutions with which they deal. Successful banks will provide the mix of services that meet the needs of their clients.

Monetary Reform¹⁹³

In an introduction to the most recent issue of the *Cato Journal*, “Monetary Reform in the Wake of Crisis” the editor **James A. Dorn writes:**

¹⁹⁰ See White (2011, 497) for an argument, relative to the most recent crisis, why “A commodity standard with free banking, and **no central bank to distort the financial system** [emphasis mine], would have avoided such a boom-and-bust credit cycle.”

¹⁹¹ The existence of a lender of last resort who can and will create credit with newly issued base or high -powered money leads to a moral hazard problem that gives fractional-reserve banks an incentive to over-extend credit, which can show up as either more credit extended at lower rates of interest or riskier loans extended at unchanged rates of interest.

¹⁹² Herbener recommends 100% reserves for deposits that serve as a medium of exchange or for privately issued bank notes. 100% reserves also would more clearly remove threats of bank runs and panics.

¹⁹³ See Table 1 (elimination of central banking) and Table 2 (reforms retaining a central bank) for a summary of suggested reforms. Reforms are listed from a-f in order of ability to generate increased economic stability, although on this ground a and b are indistinguishable with perhaps a slight edge to b and with b leading to perhaps greater financial stability. Reforms a, b, and c are consistent with *HR 1094*. Reform e is consistent with *HR 4180* or *HR 245*. Reform f is consistent with *HR 245*. If either reform a or b would be adopted, discussion should continue on free banking versus 100% reserves.

At no time since the founding of the Federal Reserve nearly a century ago has it been more important to reconsider the role of monetary policy in a free society. In particular, as F. A. Hayek noted, “All those who wish to stop the drift toward increasing government control should concentrate their effort on monetary policy.”

Central bank response to the most recent crisis and slow recovery has moved in the direction of greater, not lesser central bank involvement in the economy. Recent troubling trends include money creation to finance massive government deficits¹⁹⁴, the Fed engaging in “Mondustrial Policy”¹⁹⁵, and becoming a gigantic financial central planner.

Cochran (2011) describes the Fed reaction:

With this second bust, unlike the first recession of the 21st century, the real economic slowdown was accompanied by a significant financial crisis and if not a public panic, definitely a policy panic. Policy makers feared that the financial crisis would lead to a collapse of the banking and credit system. The fear was deflation. The model was monetary events of 1929 to 1932. The Fed and the federal government responded with an unprecedented bailout of both financial and non-financial firms with the creation and use of new monetary policy tools and Fed-Treasury coordination accompanied by aggressive use of more traditional policy instruments (Duca *et al* 2009). The result has been a massive expansion of the Fed’s balance sheet as well as massive restructuring of the type assets held by the Fed. The picking of winners and losers has moved the Fed very close to a policy which is even more dangerous to liberty and prosperity than an ordinary fractional reserve banking system supported by a central bank; a **mondustrial policy**; monetary policy as an agency not only of irresponsible fiscal policy, but of industrial policy as well.

In an important paper published in the *Independent Review*, “Ben Bernanke versus Milton Friedman: The Federal Reserve’s Emergence as the U.S. Economy’s Central Planner”, Jeffrey Rogers Hummel provides, without explicitly mentioning the term, the intellectual foundations for a “Mondustrial Policy”. Hummel builds his case by illustrating the significant differences in “approaches to financial

¹⁹⁴ Per John B. Taylor, the Federal Reserve purchased 77% of the net increase in the debt by the Federal government in 2011. See <http://johnbtaylorblog.blogspot.com/2012/06/fed-bought-77-of-federal-debt-increase.html>

¹⁹⁵ In early 2009 at the AEA meetings, Stanford economist John Taylor used the term “Mondustrial Policy to criticize the Fed and Treasury response to the financial crisis. Taylor, as quoted in a *WSJ* blog post by Jon Hilsenrath (<http://blogs.wsj.com/economics/2009/01/05/the-feds-outspoken-critic/>), used this “unflattering term” to describe a policy environment that was “not a monetary framework. It is an intervention framework financed by money creation.”

crisis” between the Bernanke approach and a Friedman approach. In addition to exposing the theoretical foundation of this misguided and dangerous policy, Hummel provides a very detailed almost step by step use of this type of policy in response to the major events of the recent crisis. A must read for anyone interested in the details of how and why the Fed’s balance sheet expanded so significantly and how much of what was done did not and does not show explicitly in ‘regularly’ reported monetary aggregates, their sub components, or Fed balance sheet reports.

Hummel argues the differences have been rarely noticed. The impact as “those differences resulted in another Fed failure – not quite as serious as the one during the Great depression, to be sure, yet serious enough – but they have also resulted in a dramatic transformation of the Fed’s role in the economy. Chairman Bernanke has so expanded the Fed’s discretionary actions beyond controlling the money stock that it has become a gigantic, financial central planner.”

It should be clear, that this failed policy response to the current situation has set up future monetary conditions that may be very difficult to unwind without significant inflation and/or a continuing boom-bust pattern.

These trends make a return to sound money which “involves abolishing central banking and paper fiat money and restoring a commodity money chosen by and totally subject to the market” (Salerno 2010 [1998], p. 474) imperative. There is, however, controversy over the means. Does sound money require 100 percent reserve banking or does it allow banking freedom? Mises (1998, 440) opined, “Only free banking would have rendered the market economy secure against crises and depression. [And] [t]here is no reason whatever to abandon the principle of free enterprise in the field of banking.”

However, Rothbard, Salerno, Herbener, Huerta de Soto, Block, and Reisman among others favor 100 percent reserves; a clear separation of deposit banking from loan banking, on the basis of reform proposals made by Mises (1971, pp. 448–57, and 1978, pp. 17–21 and 44–47.) In these proposals, Mises argued for 100 percent backing of any *newly issued notes or checkable deposits*. For reform of a monetary system on the verge of collapse or as a proposal for how we move from our current system toward a sound money system, such a step may be essential. After reform though, it is also essential that “the question of banking freedom must then be discussed again and again, on basic principles” (Mises 1978, p. 45).

H.R. 1094 is consistent with reform recommended in this testimony. *H. R. 4180* would be a strong improvement over current Fed operations as would *H. R. 245*, but both would leave the economy subject to boom-bust cycles as monetary policy would still not prevent a boom-bust which piggy-backs created credit induced growth on top of productivity driven growth. A movement in the right direction would include elimination of all laws restricting private sector initiatives to develop competing medium of exchanges to Federal Reserve notes. New competitive currencies could be facilitated by privatization of all government stocks of precious metals. More detailed proposals for reform can be found in Rothbard (1991 [1962], 65-72), Salerno (2010, 333-363), White (2102), or Herbener (2012). The *Cato Journal* (Spring/Summer 2012, volume 32, number 2) is devoted to “monetary reform in the wake of crisis.” If or while significant reform such as H. R. 1094 is politically impossible, Selgin’s (1997) proposal for a productivity norm, which would greatly reduce the likelihood of significant credit creation in response to a productivity shock, should be given strong consideration as an appropriate guide for improving policy under existing banking arrangements.

Table 1: Summary of Reforms – No Central Bank

a. Commodity Standard with Free Banking	b. Commodity Standard with 100% Reserves	c. Denationalization of Money
<p>Mises (1998, 440): “Only free banking would have rendered the market economy secure against crises and depression. [And] [t]here is no reason whatever to abandon the principle of free enterprise in the field of banking.”</p> <p>Free banking means banks operate in an environment in which banks are subject to the general rules of commercial and civil law and are not the recipients of special privileges and protections granted by the state; placing “the banking business under the general rules of commercial and civil laws compelling every individual and firm to fulfill all obligations in full compliance with the terms of the contract.”</p>	<p>From Huerta de Soto (2012): “(T)heoretical analysis yields the conclusion that the current monetary and banking system is incompatible with a true free-enterprise economy, ... and that it is a continual source of financial instability and economic disturbances.”</p> <p>Three recommended reforms: 1. The reestablishment of a 100 percent reserve requirement as an essential principle of private-property rights with respect to every demand deposit of money and its equivalents; 2. the abolition of all central banks (which become unnecessary as lenders of last resort if reform 1 above is implemented, and which as true financial central-planning agencies are a constant source of instability) and the revocation of legal-tender laws and the always-changing tangle of government regulations that derive from them; and 3. a return to a classic gold standard, as the only world monetary standard that would provide a money supply that public authorities could not manipulate and that could restrict and discipline the inflationary yearnings of the different economic agents.”</p>	<p>Hayek (1978):</p> <p>Elimination of central bank with denationalization of money and competing currencies.</p> <p>Hayek’s proposal for drastic monetary reform: In response to events in the 1970s, Hayek was driven “into proposing the denationalization of money” and a return to a market-determined money” (Hayek in Pizano 2009, 10)</p>

Table 2: Reforms Retaining Central Banking

d. Productivity Norm	e. Policy Rules	f. Price Stabilization (single mandate) with Discretion in Crisis or Nominal GDP Targeting
<p>Selgin (1997, 10): “I submit that a constant that a constant price level, even once in place, would be far from ideal. Instead, <i>the price level should be allowed to vary to reflect changes in goods’ unit cost of production</i> [emphasis mine]. I call ... such a rule for individual price changes a ‘productivity norm.’ Under a productivity norm, changes in velocity would be (as under zero inflation) from influencing the price level by offsetting adjustments in the supply of money.”</p> <p>Productivity norm is consistent with Hayek of the 1930s.</p>	<p>Taylor (2012, 2): “For all these reasons, there is a great need for improvement in the degree to which the Federal Reserve follows rules rather than discretion.”</p> <p>And: “However, a more practical and effective approach, in my view, is to reform the Federal Reserve and create strong incentives for rule-like behavior.</p> <p>The starting place for such a reform is the recognition that a clear well-specified goal usually results in a consistent and effective strategy for achieving that goal.”</p> <p>And : “In the case of monetary policy, multiple goals enable politicians to lean on the central bank to do their bidding and thereby deviate from a sound money strategy. More than one goal can also cause the Federal Reserve to exceed the normal bounds of monetary policy—moving into fiscal policy or credit allocation policy—as it seeks the additional instruments necessary to achieve multiple goals.”</p> <p>Taylor (2012, 4): “(L)egislative reforms which clarify the Fed’s mandate, enhance reporting requirements about its strategy or rule for the monetary instruments, restrict the</p>	<p>Price Stabilization:</p> <p>From Hayek (1979 from lectures delivered 1974 and 1975, 17): “Though monetary policy must prevent wide fluctuations in the quantity of money or in the volume of the income stream, the effect on employment must not be a dominating consideration. <i>The primary aim must again become the stability of the value of money</i> [emphasis original].”</p> <p>But (Hayek 1979, 18): Where policy still generates a boom-bust, then, to prevent “liquidity crises or panics” there is a need “to ensure convertibility of all kinds of near-money into real money” For this, “the monetary authorities must be given some discretion”</p> <p>But (Hayek 1979, 10): “I do not believe we shall regain a system of international stability without returning to a <i>system of fixed exchange rate</i>[emphasis mine], which impose upon national central banks the restraint essential for successfully resisting pressure of the advocates of inflation in their countries ...”</p> <p>Nominal GDP:</p> <p>“The moment there is any sign that the total income stream may actually shrink [during a post-bust deflationary crash], I should certainly not only try everything in my power to prevent it from dwindling, but I should announce beforehand that I would do so in the event the problem arose.”</p> <p>F. A. Hayek in 1975, in reply to</p>

	<p>nature of the its purchases of securities, and balance voting rights on the FOMC would allow Congress to exercise appropriate political control without becoming involved in day-to-day monetary policy operations or otherwise micromanaging the Fed. In my view the reforms [H.R. 4180] would enhance the independence of the Fed by adding reassuring accountability appropriate for an independent agency of government and clarifying that its overall responsibility is monetary policy not fiscal policy or credit allocation policy. History and basic economics tells us that such reforms would greatly improve employment and price stability and would help restore America's prosperity."</p>	<p>a question from his old friend Gottfried Haberler in a talk given at the American Enterprise Institute Posted at http://hayekcenter.org/?p=5401 Accessed 06-26-2012.</p>

WRITTEN TESTIMONY OF LAWRENCE H. WHITE, Ph.D.

PROFESSOR OF ECONOMICS
GEORGE MASON UNIVERSITY

Chairman Paul, Ranking Member Clay, and members of the subcommittee: Thank you for the opportunity to discuss the fractional-reserve character of modern banking, its positives and negatives, its relationship to financial instability, and to offer my thoughts on how to promote greater banking stability. I will begin by describing the historical origins of fractional-reserve banking (hereafter FRB), then move on to the effect of FRB on the money supply process, its connection to bank runs and financial instability, and finally the reforms needed to improve our banking system.

The Origins of Fractional Reserve Banking

A “bank” is a firm that both gathers funds by taking in “deposits” (or creating account balances) *and* makes loans with the funds gathered. A moneylender who draws only on his own wealth is not a banker, nor is a warehouseman who does not lend. A “deposit,” in ordinary modern usage, is a debt claim, an IOU issued by the banker and held by the “depositor,” which the banker is obliged to repay according to the terms of the contract. We can distinguish between a “time deposit,” which the banker is obliged to repay only at a specified date in the future, and a “demand deposit,” which gives the customer the legal right to repayment “on demand,” that is, whenever the customer chooses (on any day the bank is open).

Historically, deposit-taking grew out of the coin-changing and safekeeping businesses. Medieval Italian money-changers would (for a fee) swap coins from one city for those from another. Some traveling merchants, who brought in coins of one type, would chose to hold balances “on account” for the time being, preferring to receive coins of another type later when it was more convenient. The earliest deposit-takers in London were goldsmiths, artisans who made gold jewelry and candlesticks, who were also coin-changers. Like the Italian coin-changers, they provided safe-keeping in the vaults where they kept their own silver and gold.

A key to the development of fractional-reserve banking was that vault-keepers (money-changers and goldsmiths) began to provide *payment services* by deposit transfer. The earliest record of payment by deposit transfer is from Italy around 1200 AD. Before deposits became transferable, suppose Alphonso wanted to pay (say) 100

ounces of coined silver to Bartolomeo, both of them customers of the same vault-keeper. Al would go to the vault-keeper, have him weigh out the requisite amount of coins, and transport the coins to Bart, who would then have to transport the coins back to the vault-keeper to have them weighed again and placed back in the vault. There was great inconvenience, not to say risk, in transporting the coins across town and back. And there were fees to pay for weighing the coins. At the end of the day, Al's account balance or claim on the vault-keeper would be down by 100 ounces (plus transaction fees), and Bart's would be up by 100 ounces (minus transaction fees).

A less burdensome and safer way to accomplish such a payment was for Al and Bart to meet at the bank, and simply tell the banker to transfer 100 ounces *on his books* by writing Al's account balance down and Bart's up. No coins had to be weighed or moved, or even touched at all. Payment was now made not by handing over coins, but by handing over *claims* to coins.

Other methods for authorizing deposit transfer were often more convenient and soon displaced the three-party meeting in the banker's office. For example, Al could sign a written authorization, what we now call a check. Today we have electronic funds transfer, but all of these methods accomplish the same end, which is to make a transfer funds from one account to another.

Some of the earliest deposit-taking was simple warehousing, in which the coins deposited were merely stored, and the exact same coins would be returned to the depositor on demand assuming all storage fees had been paid. (In legal parlance such a claim on the warehouseman is a "bailment" and not a debt.) In the early Middle Ages a customer who wanted this kind of storage would bring the coins to the vault in a sealed bag. The bag was not to be opened by the warehouseman. For each specific bag of coins that could be claimed by Al or Bart, those specific bag of coins were always in the vault. Supposing that the bags' contents were recorded on the books (which they need not have been), we could say that for each ounce of coined silver claimed by depositors there was always an ounce of coined silver in the vault. This arrangement, which resembles the business today of renting safety deposit boxes, is sometimes described as "100 percent reserve banking," although strictly speaking it isn't banking at all, but simply warehousing.

As payment by deposit transfer became popular, goldsmiths and coin-changers found that they could offer a different kind of contract to customers who primarily wanted not storage but economical payment services. In a "fractional reserve" contract, the vault-keeper

becomes a banker, able to lend out some of the funds deposited. In the early Middle Ages a customer who wanted this kind of account would bring loose coins to the vault. The coins could be mingled with other depositors' coins, whereas in money warehousing there is no evident rationale for mingling. The customer would receive a redeemable claim, entitling him to get back *equivalent* coins on demand, but not to receive back the *identical* coins he brought in. The account is now a debt claim and not a bailment. Now the coins in the vault are a fraction of immediately demandable deposits. We can describe them as a reserve for meeting the redemption claims that will actually be made.

Later, beginning perhaps in the 1400s, banks began to issue deposit receipts that could be signed over, making them something like traveler's checks today. For their customers' convenience, they soon provided them in bearer form (no signing-over necessary) and round denominations. These we call banknotes, paper currency claims on banks that were payable to the bearer (whoever presented them), typically on demand. As currency, they could be transferable anonymously, and without bank involvement (unlike deposits transfers, which need to be recorded on the books). London goldsmiths were issuing banknotes in the mid-1600s. Banks also held fractional reserves against the total of their banknote liabilities.

When is a Fractional Reserve Feasible?

For a unique or specific coin, which the customer wants to have back, it isn't. A specific coin lent cannot be instantly recalled from the borrower who has spent it. But for coins that customers regard as *interchangeable* with other coins, it is. Likewise, you count on a coat check stand to keep your specific coat there all evening, and not to lend it out, because you don't want back just any coat of the same size. Unlike coat-checkers, most depositors are willing to treat coins as interchangeable. Depositors do not insist on getting the very same coins back, so any equivalent coin in reserve will be satisfactory.

To avoid defaulting, or breaching the contractual obligation to repay, the bank obviously needs to keep *enough* coins in reserve. How can the bank count on having enough coins to meet all requests? It is a matter of practical calculation: the bank needs to know from experience the probability of any given amount of coins being demand on a given day. If it wants to be 99.99% safe, it needs to hold a reserve (or have ways of replenishing its reserves) sufficient to cover 99.99% of cases.

The economist Ludwig von Mises offered the following illustration. Consider a baker who issues 100 tokens, each stamped “good for one loaf of bread.” Leaving aside lost tokens, it is clear that the baker will need 100 loaves. All the tokens will be redeemed, because using them to get bread is their only use. By contrast, transferable claims to coin (bank deposits or banknotes) are *useful even without being redeemed*. Unlike bread tokens, which cannot be eaten with butter and jam, transferable bank accounts or banknotes *can do the job of the coins* in making payments. Once payment by deposit transfer and banknote becomes popular, the banker will reliably find that *not all deposits notes or deposits are redeemed for coins on a given day*, even if all are used to make payments. Thus a banker who issues \$100 in demand deposits or notes will need less than \$100 in coin to meet all the redemptions that will actually be demanded.

How much less than 100% the banker can hold, and still meet all the redemption demands that he does face, is a problem that the banker must solve by practical statistical calculation. There is no reason to think that a central authority can do the calculation better, and can improve matters by imposing an arbitrary percentage requirement. To provide the right incentive to hold enough reserves, it is important that the imprudent banker who miscalculates, holds too little in reserves, and fails to pay when obligated to pay, be subject to the ordinary legal penalties for breach of contract.

Advantages and Disadvantages of Fractional Reserves

The advantage to the bank from keeping fractional reserves is clear: it earns interest on the lent-out funds. A few commentators have declared that FRB must be a fraud: the gain is all on the bank’s side, and no customer would agree to it if she realized what the bank was up to. But this claim assumes that there are no advantages to the bank’s customers. In fact there are clear advantages to the bank’s customers, *at least under competition*. To compete for customers, all experience shows, banks offering fractional-reserve accounts charge zero storage fees and even pay interest on deposits, up to point where the interest they pay falls short of the interest they earn only by just enough to cover the bank’s operating costs for safekeeping and payment services. In this way FRB creates a *synergy* between payments services (checkable deposits, banknotes) and intermediation (pooling savers’ funds for lending to selected borrowers). When the deposited funds that are not needed as

reserves can be lent out, depositors enjoy lower (or zero) storage fees and interest on checking deposit balances.

By contrast to money warehousing, the savings of fractional-reserve banking do carry a disadvantage in the form of greater default risk. If the bank's investments go sour, the depositor may not be repaid in full. The warehouse, by contrast, makes no investments. So the customer choosing between a bank account contract and a warehousing contract needs to consider: is the saving in storage fees and the interest paid on deposits high enough (relative to the increased risk of not being paid promptly)? Historically, in competitive systems where banks were free to diversify and capitalize themselves well, the answer was yes for most people. Thus *well informed* consumers who want economical payment services typically prefer a fractional-reserve bank to a warehouse. In sound banking systems historically, before deposit insurance, the risk of loss was a small fraction of one percent, while the interest was more than one percent, and the sum of interest and storage fee savings was even higher. Thus FRB can arise and survive without fraud.

The economist George Selgin has examined the record of the London goldsmith bankers, and debunked the myth that they pulled a fraudulent switcheroo, promising 100% reserves but holding less, at the beginning of the practice of FRB. Goldsmith bank accounts became enormously popular in the mid-1600s because they offered interest on demand deposits. The offer of interest is a clear signal that the contract is not a warehousing contract.

For payment by account transfer, FRB offers a more economic way of providing payment services. A money warehouse or 100% reserve institution could also offer payments by account transfer, but its services would be significantly more expensive. The other bank payment instrument, redeemable banknotes circulating in round denominations, simply *cannot exist* without fractional reserves. Banknotes are feasible for a fractional-reserve bank because the bank doesn't need to assess storage fees to cover its costs. It can let the notes can circulate anonymously and at face value, unencumbered by fees, and cover its costs by interest income. An issuer of circulating 100% reserve notes would need to assess storage fees on someone, but would be unable to assess them on unknown note-holders. There are no known historical examples of circulating 100% reserve notes unencumbered by storage fees.

Under a gold or silver standard, the introduction and public acceptance of fractionally backed demand deposits and banknotes means that the economy needs less gold or silver in its vaults to

supply the quantity of money balances (commonly accepted media of exchange) that the public wants to hold. Thus money is supplied at a *lower resource cost*, that is, with less labor and capital devoted to mining or importing precious metals and fashioning them into coins or bars. Looking at the change in balance sheets from money warehouses to fractional reserve banks, the economy can now fund productive enterprises where before it only held metal. Gold can be exported, and productive machinery imported. This development in Scotland was praised by Adam Smith as a source of his country's economic growth. As the economist Ludwig von Mises put it, "Fiduciary media [fractionally backed demand deposits and banknotes] ... enrich both the person that issues them and the community that employs them."

Under a fiat money standard, as we have today with the Federal Reserve dollar, things are different. There are no mining or minting costs saved by holding fractional rather than 100% reserves in the form of fiat money. For commercial banks to hold 100% reserves in the form of fiat money issued by the federal government would, however, change drastically the function of the banks. Instead of funding productive enterprises, the banks would instead only fund the federal government. Fewer loanable funds would be available to the private economy, and more to the government. Private investment would be suppressed, and public spending enlarged.

The Effect of FRB on the Money Supply Process

With banks holding fractional reserves of Federal Reserve dollars (notes and deposit claims on the books of the Fed, whose sum is called "the monetary base"), when the Fed increases the quantity of Federal Reserve dollars by \$1 billion, the banking system ordinarily creates a multiple amount of deposit dollars. The total stock of money held by the public ("M1") increases, say by \$2.3 billion. At the moment, however, we are in an anomalous situation. Banks are sitting on such vast quantities of excess reserves – paid to do so by the Federal Reserve as it pays a relative high interest rate on reserves – that the monetary base is larger than M1. Thus the US banking system today actually has more than 100% reserves against its demand deposits.

The Problems of Financial Instability, Bank Runs, and Crises

Perhaps the leading argument made in favor of government regulation of banks is the argument claiming that a fractional-reserve banking system is inherently *fragile* and so needs deposit insurance. The argument rests on three underlying propositions:

- a) An uninsured fractional-reserve banking system is inherently prone to runs and (due to “contagion”) panics. (A run means that many depositors seek to withdraw at the same time, out of fear of a reduced payoff if they wait. A panic means that many banks suffer runs at the same time.)
- b) Runs and panics have net harmful effects.
- c) Deposit insurance can reduce runs and panics below their laissez-faire level at a cost less than the benefit of doing so.

My research into banking history convinces me that (a) and (c) are actually false, and even proposition (b) requires some qualification.

A run is always *possible* against fractionally backed bank deposits that are unconditionally redeemable on demand. Against such deposits, a run can even, in theory, be *self-justifying*: if a run forces the bank to conduct a hasty sale of illiquid assets, the bank may receive such a reduced value for its assets that it becomes insolvent (liabilities exceed assets), so that all depositors can no longer be paid in full. From this theoretical possibility, some economic theorists have jumped to the conclusion that fractional-reserve banks are *in practice* inherently run-prone. (The best known statement is a 1983 article by Douglas Diamond and Phillip Dybvig.) According to this view, a run can happen at any time, in any place, on any bank, triggered by nothing more than random fears or events that have no basis in the target bank’s solidity.

But are real-world deposit contracts so fragile? Historical evidence says no. Please consider: If real-world deposit contracts really *were* as fragile as the self-justifying-run theory supposes, it would be a mystery how they survived centuries of Darwinian banking competition before the first government deposit insurance schemes began. Wouldn’t a more robust arrangement have come to dominate the field?

The theory of runs that better fits the historical record is that runs occur, not randomly, but when depositors receive bad news indicating that their bank might be *already* (pre-run) insolvent. Receiving such news, depositors run because if assets are already be too small to pay all depositors back, the last in line get little or nothing. Unlike the self-justifying-run theory, the bad-news theory explains why runs typically occurred at onset of recessions (when bad news arrived about the banks’ borrowers declaring bankruptcy), and explains why countries that did not weaken their banks with legal

restrictions (e.g. Scotland, Canada) very seldom experienced runs and almost never panics.

What makes a deposit contract run-prone? Assume that depositors are rational. There must be a greater expected payoff to arriving sooner rather than later to redeem one's deposit. This implies that the deposit is unconditionally redeemable on demand (and that the bank pays on a first-come-first-served basis), *and* that default is likely on last claim serviced. To make an account *non-run-prone* it suffices to modify *either one* of these two conditions. First, the deposit contract can make redemption *conditional* rather than unconditional. An important historical example was the "notice of withdrawal clause" that many savings banks and trust companies included in their deposit contracts. If withdrawals were too great for a bank to satisfy without suffering severe losses from hasty asset liquidation, the banker had the option to defer redemption for 60 or 90 days by requiring notice of intent to withdraw to be given that far in advance.

More importantly, banks made default *unlikely* by providing their depositors with credible assurances that the bank would maintain solvency, that is, assets sufficient to pay in full even the last in line, even under adverse circumstance. To provide credible assurance, banks before deposit insurance held much higher capital than they do today, in the neighborhood of 20%. They invested much more conservatively, so that they faced much less risk of large asset losses. They avoided loans with high default risk, high risk of loss from interest-rate movements, and loans that were illiquid (hard to resell). Banks that relied on demand deposits and banknotes did not make long-term fixed-rate housing loans, for example. They invested primarily in short-term, high-quality, liquid business IOUs, what were then called "bills of exchange" and is today called "commercial paper." In some countries, banks had an additional backstop in the form of the right to call for more capital from their shareholders if otherwise depositors would go unpaid. Shareholders had extended liability, and in some systems unlimited liability, for the bank's debts.

The historical record does of course indicate that runs and banking panics *were* a problem in United States during the pre-Fed or "National Banking" era (1863-1913), and also under the Fed's watch during the early years of the Great Depression. But *few other countries have had similar experiences*. It is therefore clear that run-proneness and panics are not inherent to fractional-reserve banking. If we look for a pattern across countries, this is what we find: countries like Canada, Scotland, Sweden, and Switzerland, where the

banking systems had no more than minimal restrictions on entry, note-issue, branching, and capitalization, had virtually no problem from runs and none from panics, in contrast to the more restricted and hence weaker banking systems of the United States and England.

The US banking system was made fragile by the federal and state ban on interstate branching, and even branching within many states. Branch banking limits reduced diversification of assets and deposit sources, indirectly limited capitalization, and hampered the effective allocation of reserves. Poorly diversified and poorly capitalized banks could not offer credible solvency assurances, which made them more vulnerable to “bad news” runs.

The US system was also made fragile by federal restrictions on banknote issue that prevented banks from meeting peak demands for currency. Because of those restrictions, seasonal demands for currency became scrambles for reserve money that occasionally escalated into panics.

Reforms to Strengthen Our Banking System

The weakness in the US banking system today stems from a different set of government policies than the ban on branching (eroded in the 1980s and finally eliminated in 1995) and restriction on banknote issue (commercial banks stopped being allowed to issue any notes in the 1930s). Today the weakness is due not to restrictions, but to privileges. One indication of that is that the weakest banks today are not the smallest, but the largest banking companies.

Federal deposit insurance, since its birth in the 1930s, has meant that a comparatively risky bank (one with capital less adequate to cover potential losses on its asset portfolio) no longer faces a penalty in the market for retail deposits. Insured depositors have no incentive to shop around for a safe bank, so they no longer demand a higher interest rate to give it their deposits. Risk-taking is thereby effectively subsidized. Attempts to price deposit insurance according to risk, so as to recreate a penalty for holding on a risk bank portfolio, were mandated by the FDIC improvement act, but the attempt has failed. The FDIC insurance fund has been exhausted by bank failures, and now has a negative balance. Taxpayers are on the hook for the morally hazardous banking that the FDIC has fostered. Some way of rolling back and ultimately ending federal deposit insurance must be found.

The “too big to fail” doctrine compounds the problem. It gives even blanket protection even to a bank’s legally uninsured depositors and subordinated debt holders, removing their incentive to shop around for a prudently managed bank. “Too big to fail” treatment went from the exceptional event to the routine event during the last five years, as the Federal Reserve and the FDIC have deliberately declined to close several large insolvent banks. If no large bank is ever allowed to fail, then large depositors flock to the large banks that have the privilege of an implicit guarantee for all. On such a tilted playing field, an unnaturally large share of deposits flows into the largest banks. We are already there. Some way of ending “too big to fail” must be found – quickly.

Conclusion

The evidence shows that a fractional-reserve banking system is not unstable when the banking system is free of hobbling legal restrictions *and* free of privileges. The US banking system in the 19th century was weakened by legal restrictions. In response to that weakness, rather than let the banking system become robust by repealing its restrictions, Congress in the 20th century patched over the problem by creating the Federal Reserve system (to act a “lender of last resort”) and federal deposit insurance. As a result, the US banking system in the 21st century is chronically weakened by government privileges (especially taxpayer-backed deposit insurance and taxpayer-backed “too big to fail” bailouts) that generate moral hazard. Banks take advantage of these guarantees by holding asset portfolios too full of default risk and interest-rate risk. They finance their portfolios with excess leverage (too much debt, not enough equity). Rather than trying to come up with another patch, Congress should seek to dismantle the restrictions and the privileges that have left the American people saddled with an unhealthy banking system.

REFORMING FRACTIONAL RESERVE BANKING: A BRITISH EXPERIENCE

“When you’re one step ahead of the crowd you’re a genius. When you’re two steps ahead, you’re a crackpot.”¹⁹⁶

-Rabbi Shlomo Riskin
Lincoln Square Synagogue, February 1998

“I hold all idea of regulating the currency to be an absurdity; the very terms of regulating the currency and managing the currency I look upon to be an absurdity; the currency should regulate itself; it must be regulated by the trade and commerce of the world; I would neither allow the Bank of England nor any private banks to have what is called the management of the currency.

...

I should never contemplate any remedial measure, which left to the discretion of individuals to regulate the amount of currency by any principle or standard whatever... I should be sorry to trust the Bank of England again, having violated their principle [the Palmer rule]; for I never trust the same parties twice on an affair of such magnitude.”¹⁹⁷

-Richard Cobden
Report from the Select Committee on Banks of Issue
British Parliament, April 1840

¹⁹⁶ Arizona Jewish Post, 18 September 1998

¹⁹⁷ *Report from Select Committee on Banks of Issue*, Ordered, by The House of Commons, to be printed, 7 August 1840.

Introduction

It is a great privilege to write this essay on money and banking reform to mark the retirement of Dr. Paul from Congress. We in the United Kingdom have much to thank Dr. Paul for his tireless campaigning on these issues, especially those raised in the full public glare of two Presidential campaigns, making money and banking reform resonate here as well more than it otherwise would have.

At the Cobden Centre, we have two great parliamentarians, like Dr. Paul also inspired by the Austrian School of Economics: Steve Baker, Member of Parliament (MP) for High Wycombe (my co-founder of the Cobden Centre); and Douglas Carswell, MP for Clacton. Taking the idea of full-reserve free banking, currency competition, honest accounting, and full open liability for bankers, they have produced four bills in Parliament which we will discuss next in summary.

The Financial Services (Deposit and Lending) Bill – 2010

Carswell describes the Deposit and Lending bill as follows:

My bill would give account holders legal ownership of their deposits, unless they indicated otherwise when opening the account. In other words, there would henceforth be two categories of bank account: deposit-taking accounts for investment purposes, and deposit-taking accounts for storage purposes. Banks would remain at liberty to lend on money deposited in the investment accounts, but not on money deposited in the storage accounts. As such, the idea is not a million miles away from the idea of 100% gilt-backed storage accounts proposed by other hon. Members and the Governor of the Bank of England.¹⁹⁸

Currency and Banknotes (Amendment) – 2011

Carswell describes the Currency and Banknotes Amendment as follows:

That leave be given to bring in a Bill to amend the Currency and Banknotes Act 1954 to allow banknotes in addition to those issued by the Bank of England to be legal tender; and for connected purposes. ... My Bill would amend the Currency and Banknotes Act 1954 to enable a range of different currencies to be used as legal tender in Britain. The idea comes from a 1989 Treasury paper from when John Major was Chancellor. What the Treasury proposed as theoretically possible 22 years ago, the internet now makes practically achievable.

The internet has given people unprecedented choice. We have access to a greater range of music, financial services, groceries and

¹⁹⁸<http://www.publications.parliament.uk/pa/cm201011/cmhansrd/cm100915/debtext/100915-0002.htm>

books than ever before, so why do we have legal tender laws that create a monopoly currency?¹⁹⁹

In an email to me, Carswell expressed the influence Congressman Paul has had on his work:

Reading Ron Paul's *End the Fed* gave me the confidence to speak out. I suddenly realised it wasn't just a few of us Brits who doubted the whole fiat money/candy floss currency scam. He has given hope to those of us throughout the West.

Financial Services (Regulation of Derivatives) Bill

Steve Baker, MP compiled the Regulation of Derivatives Bill with the help of Gordon Kerr, Tim Bush, and Prof. Kevin Dowd.²⁰⁰ When he introduced the legislation on 15 March 2011, he described the Bill as requiring “certain financial institutions to prepare parallel accounts on the basis of the lower of historic cost and mark to market for their exposure to derivatives; and for connected purposes.”²⁰¹ Baker explained how the accounting rules for banks incentivize trading in derivatives by enabling *unrealized* profits to be booked upfront, leading to large but unjustified bonuses and dividends.

More broadly, banks are producing accounts that grossly inflate their profits and capital in three ways:

- (1) Using mark-to-market and mark-to-model accounting, banks record unrealized gains in investments as profits.
- (2) International Financial Reporting Standards (IFRS) prevent banks from making prudent provision for expected loan losses by allowing recognition only of incurred losses.
- (3) IFRS encourages banks not to deduct staff compensation from profits.

Taken together, these flaws mean that banks' accounts under IFRS are at once rule-compliant and dangerously misleading. The Regulation of Derivatives Bill²⁰² deals with this broad problem. For

much more detail, see Gordon Kerr's Adam Smith Institute pamphlet, "The Law of Opposites."²⁰³

Financial Institutions (Reform) Bill²⁰⁴

Baker compiled the Financial Institutions Reform Bill with the help of Gordon Kerr and Kevin Dowd. The bill was introduced on Wednesday, 29 February 2012. The key provisions of the bill would:

- (1) Enforce strict liability on directors of financial institutions;
- (2) Enforce unlimited personal liability on directors of financial institutions;
- (3) Require directors of financial institutions to post personal bonds as additional bank capital;
- (4) Require personal bonds and bonuses to be treated as additional bank capital;
- (5) Make provision for the insolvency of financial institutions; and
- (6) Establish a financial crimes investigation unit.

The purpose of this Bill is to minimise moral hazard within the financial system by ensuring that those who take risks are held personally liable for the consequences. Since rules can usually be gamed by financial institutions, a principle underlying this Bill is to minimise scope for evasion.

Steve Baker, MP said,

The public are rightly incensed at the injustices we see across the financial system but our economy must have responsible, innovative and enterprising financial services. It is essential that commercial freedom is maintained while creating a system in which remuneration is a just reward for success, not the unjust product of unrealised profits and bailouts.

My Bill would make directors of financial institutions personally liable for losses. It would ensure that losses came first out of institutions' bonus pools then directors' personal bonds before hitting equity. Directors would also be exposed to unlimited personal liability long before any suggestion of taxpayer bailout.

With key decision makers' own wealth at risk, they would take responsible decisions instead of expecting rewards for failure.

²⁰³ Gordon Kerr, "The Law of Opposites: Illusory Profits in the Financial Sector." <http://www.adamsmith.org/research/reports/the-law-of-opposites-illusory-profits-in-the-financial-sector>

²⁰⁴ <http://www.stevebaker.info/campaigns/the-financial-system/financial-institutions-reform-bill/>

It's time to tell bankers, "Yes, innovate. By all means earn large rewards for providing valuable financial services. But bear your own commercial risks. Don't expect the rest of us to bail you out."²⁰⁵

Public Attitudes to Banking: A Survey Commissioned by the Cobden Centre (2010)²⁰⁶

When we started the Cobden Centre, we all thought we knew about money and banking and all thought we knew what our fellow Brits thought about it all. To the great credit of Prof. Anthony Evans, he said let's do some empirical testing. And so the Cobden Centre commissioned a survey. This research formed the basis of much of the work our parliamentary friends have embarked upon.

The survey was conducted by the market research company ICM with 2,000 participants. The results offer us a rather confusing array of views as to what people think banking is about.

- 74% of respondents thought that they were the legal owner of the money in their current account, as opposed to the bank being the legal owner.
- 66% of respondents answered "don't know" when asked what proportion of their current account was used in various ways by their bank.
- 15% wanted safe-keeping services.
- 67% wanted convenient access.
- 8% knew correctly that they had lent money to the bank.
- 33% think it is wrong that the bank lends out what they view as their money.
- 61% said they would not mind the bank lending if it was done safely.
- 26% wanted reserves to match deposits.

It would seem a sizeable minority percentage would want some form of safe-keeping services. Most would want easy access, which would imply short-term borrowing matched with short-term lending, so as to avoid runs, rather than the current practice of lending long and borrowing short.

The needs of savers and borrowers would be better aligned by requiring depositors to choose, at the time of making a deposit, how

²⁰⁵ <http://www.stevebaker.info/campaigns/the-financial-system/financial-institutions-reform-bill/>

²⁰⁶ <http://www.cobdencentre.org/2010/06/public-attitudes-to-banking/>.

much money they wished to put into plain saving (i.e., savings set aside for safe/precautionary holding as opposed to investment purposes—a distinction made by the Austrian scholar Ludwig von Mises) and how much into capitalist saving (i.e., savings set aside for investment gain as opposed to safe/precautionary savings). This would provide the setting for, and lead to, much more stable and substantial growth.

In a modern setting, the ability for banks to distinguish between plain savings, those savings that people want for safe keeping, and savings for capitalistic investment via the normal savings bonds, time deposit accounts, and so on and so forth, would allow the banking system to mediate more accurately the diverse time preferences of all savers and borrowers. (The Manchester/Lancashire system of full reserve banking and private money creation that we will discuss in the last part of this essay is a good historical example of how mediating only capitalistic savings, and not plain savings, created a system of safe credit—until it was interfered with by the Stamp Act.)

The ICM survey showed all of us that there is a need to sort out what people actually think happens with their money and banking and what actually does happen—as the two things are very different.

The Jesus Huerta De Soto Monetary Reform Proposal in Summary

Some three years ago I was fortunate enough to introduce both of our Parliamentary friends to the greatest of all the living Austrian School economists in the full reserve tradition, Prof. Jesus Huerta De Soto. His 1998 book, translated into English in 2006 as *Money, Bank Credit, and Economic Cycles*, is the seminal treatise on the matter.

In chapter nine, he outlines his reform proposal. (All quotes in this section are taken from chapter nine and the full book can be downloaded at <http://www.cobdencentre.org/tag/downloads/>.) The aims of the reform, as summarized by Prof. Huerta De Soto himself, are as follows:

[O]ur proposal is based on privatizing money in its current form by replacing it with its metallic equivalent in gold and allowing the market to resume its free development from the time of the transition, either by confirming gold as the generally accepted form of money, or by permitting the spontaneous and gradual entrance of other monetary standards.

This second element of our proposal refers to the necessity of revoking banking legislation and eliminating central banks and in general any government agency devoted to controlling and intervening in the financial or banking market. It should be

possible to set up any number of private banks with complete freedom, both in terms of corporate purpose and legal form. ...

Nevertheless the defense of free banking does not imply permission for banks to operate with a fractional reserve. At this point it should be perfectly clear that banking should be subject to traditional legal principles and that these demand the maintenance at all times of a 100 percent reserve with respect to demand deposits at banks. Hence free banking must not be viewed as a license to infringe this rule, since its infringement not only constitutes a violation of a traditional legal principle, but it also triggers a chain of consequences which are highly damaging to the economy.²⁰⁷

The crux of his reform proposal is as follows (the description is mine and made UK-specific by me—read chapter nine in full for the complete version in the Professor's own words):

- (1) All demand deposits are immaterial money, and are not the depositor's money but a liability from the bank they deposit with to pay them back money in the same amount as deposited, on demand.Safdsdfa
- (2) Let the government back all these demand deposits for physical cash and place them as reserves against the existing demand deposits. This is virtually a costless activity on behalf of the state. It is also not inflationary, as the backing, the physical cash, cannot be spent, as it sits in reserves.
- (3) The money supply can neither expand nor contract at this specific point.
- (4) The banks, where they had current liabilities, now no longer have them as they are fully reserved.
- (5) This generates a one-off gain to the banks in terms of their net worth. In short, so much as they had these current demand liabilities, now they have these backed with paper notes for the same value, so their net worth has gone up by the equivalent amount .
- (6) The asset side of the balance sheet, their loan portfolio, stays intact.
- (7) As there are over £1 trillion of demand deposits in the UK banking system, the banking system's net worth would have risen by £1 trillion.

²⁰⁷ Huerta de Soto, Jesus. *Money, Credit, and Economic Cycles*. 2nd edition. Auburn, AL: Ludwig von Mises Institute, 2009, pp. 739-740.

- (8) Why give this one-off gift of largesse to the shareholders and bonus-hungry bankers? Well, don't. Form special purpose vehicles to hold the asset side of the balance sheets of the banks to collect on these outstanding loans and you can contract out the management of this to the existing banks.
- (9) By doing this, the banks' net worth on the day after the reform is still the same as the day before the reform, but the £1 trillion loan repayments are now paying off our national debt obligations. This is a unique one-off gain and is a byproduct of this reform.
- (10) The gold price would need to rise to back all the deposits with gold and then you fix all money in one of its historic anchors: gold (you could also use silver or other successful monies). Since gold increases in physical supply at the rate of approximately 2% per year, if productivity gains run at about this rate you will have stable prices; if productivity rates are greater, then a benign price deflation.
- (11) Let the people spontaneously discover what their most favoured money actually is.

I have suggested my own reform proposal along this line of reasoning here: <http://www.cobdencentre.org/2010/05/the-emperors-new-clothes-how-to-pay-off-the-national-debt-give-a-28-5-tax-cut/>

In short, I would have no-reserve banking, not 100% reserve. By this, I have suggested that all demand deposits should actually be swapped out for physical cash and the current liability of the bank just rubbed out. Then the people would actually own their own money on deposit and not be current creditors, thus I would question the need to perform point number two and substitute along the lines of what I just suggested.

Would 100% Reserve Free Banking be the End of Lending and the End of Commerce as We Know It?

This is the question that gets asked when most people have understood that 100% reserve banking would be the end of bank-created credit. Many credible and distinguished people attribute the creation of bank credit as the source of the Industrial Revolution itself. Such a powerful thing is alleged. The noted Daily Telegraph writer Ambrose Evans-Pritchard says in his 21 October 2012 column:

One might equally say that this opened the way to England's agricultural revolution in the early 18th Century, the industrial

revolution soon after, and the greatest economic and technological leap ever seen. But let us not quibble.²⁰⁸

For those followers of Dr. Paul and those generally interested in monetary reform in this tradition, I did some research into the genesis of the Industrial Revolution to see if this assertion held any merit. I have focused my research into the County of Lancashire and what became the first industrial city of the world, Manchester.²⁰⁹ In this concluding historical section, I will show that in the first third of the Industrial Revolution, private credit, bills of exchange, backed by the goods and services that were being traded for and by gold and silver, was the preferred *modus operandi*. The taxation of this private money by the 1815 Stamp Act led to their slow decline in favour of the privileged note issue of, in particular, the Bank of England. However, by late 1874 some 45%²¹⁰ of all credit was still private credit in the form of bills of exchange. Private credit was the preferred medium of the Industrial Revolution, and not bank-created fiduciary credit.

Early Banking in Manchester

The historian Arthur Redford in his book about merchants and foreign trade in Manchester described the early bankers of the town:

The first Manchester Bank, that of Byron, Sedgwick, Allen, and Place, was opened in 1771, in combination with an insurance office, and the *Mercury* welcomed it with the comment that “from the general Approbation the Scheme has met with amongst all Ranks of People, it is not questioned that it will be of infinite Utility to the Trading Part of the Town, and to the County in general.” It was not the only Manchester banking business, for in 1772 John Jones and Co. were “Bankers and Tea Dealers” and within thirteen years were to have offices in London from which Jones Lloyds sprang. In Liverpool also most of the early bankers, says their historian, “arose out of general merchants, some few from tea dealers, and one from linen merchants.” Even after declaring themselves bankers, the banking business was usually continued along with trading.

²⁰⁸ Ambrose Evans-Pritchard, <http://www.telegraph.co.uk/finance/comment/9623863/IMFs-epic-plan-to-conjure-away-debt-and-dethrone-bankers.html>

²⁰⁹ Although the City of Manchester is now part of Greater Manchester or the Greater Manchester Urban Area, prior to 1835 it was part of the Salford Hundred of the county of Lancashire. By 1853, it had reached full City status. So for the majority of this essay's focus, when Lancashire is referred to, it certainly should be read to be synonymous with what is the heart of Manchester City today. Also, you will see Liverpool mentioned as well, often in the same light as Manchester. This is due to their close geographic connection and the Port of Liverpool being often the import and export venue for the Manchester manufacturers.

²¹⁰ Dun, John. *British Banking Statistics*. London: E. Stanford, 1876, p. 87.

But the use of the term banker was late, and until almost the end of our period the commerce of Liverpool, with its complex dealings in foreign exchange, and the internal trade of Lancashire seem to have been carried on mainly through the bill discounting side of the merchants' and traders' businesses. In Liverpool marine insurance broking was closely allied."²¹¹

The key thing I observe here is that in the first part of the Industrial Revolution the issue of notes (which were the chief means of bank fiduciary credit) was a side issue and bills of exchange were the main mechanism to facilitate this massive explosion in trade. Also, this first bank in the UK's main industrial area was nearly 100 years behind the establishment of the Bank of England and the Scottish public banks.

Data supplied by Prof. Angus Maddison shows us that from 1700 to 1820 there is 338.38% growth in measured economic activity. The next 130 years saw 960.06% growth when the Industrial Revolution was in full flow.²¹² Nevertheless, with the initial explosion of activity in the mid- to late-1700s, to the early 1820s, we see the prime industrial county in the world exist with few or no banks and banks not providing credit services as we know them today, and clearly not to its detriment.

Economic historian T. S. Ashton quotes William Langton (a driving force behind the founding of the Manchester Statistical Society in 1833) writing later in the 19th century:

"It is exceedingly natural," said Langton, "that those banks which still retain the privilege of issuing their own notes should desire to retain it, since it naturally adds to their profits; but it has always been recognised in the great industrial district of Lancashire that it is no essential condition to the wielding of manufacturing and commercial enterprise, and that the banks not possessing this privilege have not stinted their customers of any legitimate accommodation."²¹³

Langton also notes their usefulness vis-a-vis other modes of money:

My personal memory of trade only extends back to the year 1820; but at that time the Liverpool merchants received nothing but bills in payment from Manchester of their cotton invoices; every such payment, if in what was called promiscuous paper,

requiring a calculation of interest to make a settlement per appoint. This practice gradually disappeared with the resumption of cash payments by the Bank of England and the lowering of the standard rate of interest; but if economy of interest of money is to be taken as the special recommendation of any particular kind of circulating medium, this one surely ought to bear the palm!²¹⁴

W.T. Crick and J.E. Wadsworth note the significance of Manchester and the nearby City of Liverpool by observing:

Yet, in spite of Lancashire's advanced industrial organization, banking was rather later to develop than in some other areas. No banks are recorded in Manchester until 1771 or in Liverpool until 1774, and when eventually they were formed, they do not appear to have acquired note circulations except in a few unimportant instances.²¹⁵

Ashton describes the special preference for bills of exchange over notes:

These are reasons explaining the ubiquity of bills of exchange at this period. The special preference of Lancashire for bills rather than notes is a matter deserving of research. It arose, no doubt, out of a high degree of commercial confidence, no less than out of a low degree of trust in note-issuers, and the fact that Lancashire bought raw material from distant places and sold products in distant markets must also have engendered a preference for a document the circulation of which was not confined to the sphere of operations of a local bank. As time went on the domestic bill came to play a smaller part in commercial transactions: the increase of the stamp duties after the Napoleonic War dealt a blow to the system; and the growth of large banks of deposits with many branches, together with the shortening of the customary terms of credit, led to a substitution of cheques for bills in inland trade during the later decades of the nineteenth century. But in the period with which we are concerned cheques were in their infancy and the bill had no serious rival as a medium of exchange between traders.²¹⁶

Ashton also gives us clues as to why they have almost vanished today from the commercial idiom as the stamp duty applied to them was less advantageous vis-a-vis note or chequebook issue as the latter provided quicker redemption in money possibilities.

If we dig a bit further into the historical record we see that these bills arose spontaneously to fulfill a need to be able to facilitate the

smooth transmission of trade. A wonderful book written by Alfred P. Wadsworth & Julia De Lacy Mann, *The Cotton Trade and Industrial Lancashire 1600-1780*, documents this history quite thoroughly:

We have seen Marsden as a manufacturer, putting out cotton and yarn through his agent and debiting the materials and wages against the value of the finished goods. On the other side he maintained a London house, through which he bought his raw materials and sold his fustians, and in connection with which he conducted extensive operations as a bill discounter. Between 1688 and 1690 he was involved in a maze of lawsuits, from which some account of his business may be constructed

....

Having “constantly great and considerable sums of money in his hands” [Marsden] lent money to other dealers in return for their bills on London; or he “furnished them with bills of exchange for payment of considerable sums of money at London to them or their order, or to such persons as they appointed to receive the same,” either receiving cash, or, generally, giving them credit at an agreed rate of interest. When they failed to pay him for the bills he had given them, he would take an assignment of their goods at Liverpool —cotton or linen yarn, promissory notes, or bills drawn on their London debtors. But apart from his own trading credit, he had “for many years past been intrusted or employed with great parte of the monies returned out of the county of Lancaster to London.”²¹⁷

Marsden the industrialist had become the banker as well as the chief remitter of revenues back to Lancashire and the principal collector of taxes. Daniel Defoe, trader, writer, and journalist, remarked in 1727, that:

[A] very great part of the bills drawn out of the several counties in England upon the tradesmen in London, such as factors and warehousekeepers, are made payable to the General Receivers of the several taxes and duties, customs and excise, which are levied in the country in specie, and the money is remitted by those collectors and receivers on account of those duties; this generally appears by the bills or endorsements, which often mention it in these words *for his Majesty's use*.²¹⁸

Thus credit was granted and discounted bills accepted and paid with specie, not with notes or other such fiduciary credit. ***The Crown accepted these bills!***

In commenting upon the various inaccuracies with traders being bankers, after an extensive investigation into the disputes listed in the court records, Wadsworth and Mann conclude:

²¹⁷Wadsworth, Alfred P., and Mann, Julia De Lacy. *The Cotton Trade and Industrial Lancashire, 1600-1780*. Manchester: Manchester University Press, 1931, pp. 92-93.

²¹⁸ Defoe, Daniel, qtd. in Wadsworth and Mann, p. 93.

Much might be said of the use of the bill in the general system of credit, but enough, perhaps, has been suggested in earlier pages to indicate its importance. The bill on London, then as a century later the dominant form, entered at every stage, and into every form of transaction, ran from the smallest to the largest sums, and passed even more freely than cash. The financial mechanism which turned on the bill, the promissory note, and other credit instruments, and has here been summarily illustrated, bulks large in all the commercial manuals of the time. ... It is apt to be forgotten that the credit machinery of industries like the textile trades was hardly less extensive before the foundation of the country banks than it became after.²¹⁹

Unwin, Hulme, and Taylor did a fantastic investigation into the affairs of Samuel Oldknow and his mill at Mellor. There is also some evidence to show why Lancashire rejected bills vs. notes:

Enough has been said to show the almost desperate condition of Oldknow's affairs at the beginning of 1793. He had invested an immense capital—for those days—in the fixed forms of land, buildings, and machinery which could not yield any return without the assistance of commercial credit—and owing to the outbreak of war commercial credit had almost ceased for the time being to exist. No fewer than 872 bankruptcies were recorded between November 1792 and July 1793. The problem of credit currency became acute. The country banks, which had multiplied greatly during the previous decade, had produced an over-issue of notes, some of them for such small amounts as to provoke the derisive issue by a Newcastle cobbler of a note for two-pence. But the notes even of the sounder banks were now returned on their hands and many were obliged to close their doors.²²⁰

The instability that these free banks issuing fiduciary credit afforded the industrialist in the times of crises was very destabilising, as you did not want to become a creditor to a bankrupt banker. This is one way to accelerate your own potential to become bankrupt. So commercial credit, or bills backed by real goods, was sought in preference.

Why did these Lancashire Bills Decline?

Henry Thornton, an economist, banker, and Parliamentarian, commented on the demise of bills to the favour of notes in 1802: “Some Bank of England notes have also been recently employed in the

²¹⁹ Wadsworth & Mann, p. 96.

place of small bills on London, the use of which has been discouraged by the late additional duty on bills and notes.”²²¹

Redford discusses the response of Manchester merchants to the duties and taxes imposed on bills of exchange:

A much more protracted struggle, extending throughout the second quarter of the nineteenth century, was waged by the Manchester merchants against excessive stamp duties on various kinds of legal documents. ... Bills of exchange and promissory notes were first subjected to stamp duties in 1782; a general Stamp Act of 1815 had increased the duties, which thenceforth discriminated between short-dated and long-dated bills. In the post-war period the average duty on all bills of less than £50 was 1/2 per cent.; but this charge was felt to be prohibitive, and had in Manchester caused bills to be almost completely replaced by bank notes. Bank notes, however, were considered to be a much more inconvenient and risky means of payment, since they were payable “to bearer” and not “to order.” The Manchester Chamber of Commerce therefore moved in 1822 for the reduction of the duties, and sent up several petitions on the subject, to the Prime Minister, the Chancellor of the Exchequer, and the Houses of Parliament. The petitioners described the serious inconvenience to business which had resulted from the virtual extinction of “a description of currency of great convenience and security”; they suggested a greatly reduced scale of duties, and argued that, if this were adopted, not only the business community but also the revenue would benefit greatly, because of the increased use of bills of exchange.²²²

The Bank of England (BoE) was still a private bank at the time. However, as the government’s favoured bank it had certain privileges and was always lobbying for more. The 1815 Stamp Act made the reissue of bills of exchange virtually impossible. Some were taxed up to 460% higher than Bank of England note issue, or subject to great penalty that made the issue of private credit by other banks more expensive than BoE note issue. In 1825 the Bank of England set up a branch in Manchester specifically to take advantage of the terrible taxation placed on private bill issue and make sure that those pioneers of the Industrial Revolution had to take BoE credit.

The significance of Manchester as the prime industrial area of the world at the time does make it a meaningful and worthy study area from which we can extrapolate, hopefully, our findings to the wider canvas of today and I submit that in the absence of bank-created credit we, like our ancestors, have nothing to fear. Indeed, like the pioneers of the Industrial Revolution, we should embrace private money solutions such as bills of exchange and rely on the lending of

real savings to provide real capital to entrepreneurs and not bank credit created out of nowhere. Full-reserve systems are not only stable, but growth enhancing. Lending does not die as many advocates of fractional reserve banking dread.

FRACTIONAL RESERVE BANKING AND THE BUSINESS CYCLE

It is a great honor for me to have been invited to present this paper in honor of Ron Paul. I will concentrate on the very negative role the institution of Fractional Reserve Banking has on the free market, in which way it is inseparable from the Central Bank and how it is a continual source of financial instability and economic recessions.

The Fatal Error of Peel's Bank Act

I would like to start off by stressing the following important idea: all the financial and economic problems we are struggling with today are the result, in one way or another, of something that happened precisely in England on July 19, 1844... What happened on that fateful day that has conditioned up to the present time the financial and economic evolution of the whole world? On that date, Peel's Bank Act was enacted after years of debate between Banking and Currency School Theorists on the true causes of the artificial economic booms and the subsequent financial crises that had been affecting England especially since the beginning of the Industrial Revolution.

The Bank Charter Act of 1844 successfully incorporated the sound monetary theoretical insights of the Currency School. This school was able to correctly diagnose that the origin of the boom and bust cycles lay in the artificial credit expansions orchestrated by private banks and financed not by the prior or genuine savings of citizens, but through the issue of huge doses of fiduciary media (in

those days mainly paper banknotes, or certificates of demand deposits issued by banks for a much greater amount than the gold originally deposited in their vaults). So, the requirement by Peel's Bank Act of a 100 percent reserve on the banknotes issued was not only in full accordance with the most elementary general principles of Roman Law regarding the need to prevent the forgery or the over-issue of deposit certificates, but also was a first and positive step in the right direction to avoid endlessly recurring cycles of booms and depressions.

However Peel's bank Act, notwithstanding the good intentions behind it, and its sound theoretical foundations, was a huge failure. Why? Because it stopped short of extending the 100 percent reserve requirement to demand deposits also (Mises 1980, 446-448). Unfortunately, by Peel's day, some ideas originally hit upon by the Scholastics of the Spanish Golden Century had been entirely forgotten. The Scholastics had discovered at least three hundred years earlier that demand deposits (which they called in Latin "chirographis pecuniarium," or money created only by the entries in banks' accounting books) were part of the money supply (Huerta de Soto 2009, 606). They had also realized that from a legal standpoint, neglecting to maintain a 100 percent reserve on demand deposits is a mortal sin and a crime not of forgery, as is the case with the over-issue of banknotes, but of misappropriation.

This error of Peel's Bank Act, or rather, of most economists of that period, who were ignorant of something already discovered much earlier by the Spanish Scholastics, proved to be a fatal error: after 1844 bankers did continue to keep fractional reserves, not on banknotes of course, because it was forbidden by the Bank Charter Act, but on demand deposits. In other words, banks redirected their activity from the business of over-issuing banknotes to that of issuing demand deposits not backed by a 100 percent reserve, which from an economic point of view is exactly the same business. So, artificial credit expansions and economic booms did continue, financial crises and economic recessions were not avoided, and despite all the hopes and good intentions originally put into Peel's Bank Act, this piece of legislation soon lost all of its credibility and popular support. Not only that, but the failure of the Bank Act conditioned the evolution of

financial matters up to the present time and fully explains the wrong institutional design that afflicts the financial and monetary system of the so-called free market economies, and the dreadful economic consequences we are currently suffering.

When we consider the failure of Peel's Bank Act, the evolution of events up to now makes perfect sense: bubbles did continue to form, financial crises and economic recessions were not avoided, bank bailouts were regularly demanded, the lender of last resort or central bank was created precisely to bail out banks and to permit the creation of the necessary liquidity in moments of crisis, gold was abandoned and legal tender laws and a purely fiduciary system were introduced all over the world. So as we can see, the outcome of this historical process sheds light on the wrong institutional design and financial mess that incredibly is still affecting the world at the beginning of the second decade of the 21st century!

The Healthy Process of Capital Accumulation Based on True Savings

Now it is important that we quickly review the specifics of the economic processes through which artificial credit expansions created by a fractional-reserve banking system under the direction of a Central Bank entirely distort the real productive structure, and thus generate bubbles, induce unwise investments and finally trigger a financial crisis and a deep economic recession. But before that, and in honor of Hayek, we must remember the fundamental rudiments of capital theory which up to the present time and at least since the Keynesian revolution, have been almost entirely absent from the syllabus of most university courses on economic theory. In other words, we are first going to explain the specific entrepreneurial, spontaneous and microeconomic processes that in an unhampered free market tend to correctly invest all funds previously saved by economic agents. This is important, because only this knowledge will permit us to understand the huge differences with respect to what happens if investment is financed not by true savings, but by the mere creation out of thin air of new demand deposits which only materialize in the entries of banks' accounting books. What we are going to explain now is nothing more and nothing less than why the

so-called “paradox of saving” is entirely wrong from the standpoint of economic theory (Hayek 1975, 199-263). Unfortunately this is something very few students of economic theory know even when they finish their studies and leave the university. Nevertheless this knowledge applies without any doubt to one of the most important spontaneous market processes that every economist should be highly familiar with.

In order to understand what will follow, we must visualize the real productive structure of the market as a temporal process composed of many very complex temporal stages in which most labor, capital goods and productive resources are not devoted to producing consumer goods maturing this year, but consumer goods and services that will mature, and eventually be demanded by consumers, two, three, four, or even many more years from now... For instance, a period of several years elapses between the time engineers begin to imagine and design a new car, and the time the iron ore has already been mined and converted into steel, the different parts of the car have been produced, everything has been assembled in the auto factory, and the new cars are distributed, marketed and sold. This period comprises a very complex set of successive temporal productive stages. So, what happens if the subjective time preference of economic agents suddenly decreases and as a result the current consumption of this year decreases, for example, by ten percent? If this increase in savings happens, three key spontaneous microeconomic processes are triggered and tend to guarantee the correct investment of the newly saved consumer goods.

The *first effect* is the new disparity in profits between the different productive stages: immediate sales in current consumer goods industries will fall and profits will decrease and stagnate compared with the profits in other sectors further away in time from current consumption. I am referring to industries which produce consumer goods maturing two, three, five or more years from now, their profitability not being affected by the negative evolution of short term current consumption. Entrepreneurial profits are the key signal that moves entrepreneurs in their investment decisions, and the relatively superior profit behavior of capital goods industries which help to produce consumer goods that will mature in the long term

tells entrepreneurs all around the productive structure that they must redirect their efforts and investments from the less profitable industries closer to consumption to the more profitable capital goods industries situated further away in time from consumption.

The *second effect* of the new increase in savings is the decrease in the interest rate and the way it influences the market price of capital goods situated further away in time from consumption: as the interest rate is used to discount the present value of the expected future returns of each capital good, a decrease in the interest rate increases the market price of capital goods, and this increase in price is greater the longer the capital good takes to reach maturity as a consumer good. This significant increase in the market prices of capital goods compared with the relatively lower prices of the less demanded consumer goods (due to the increase in savings) is a second very powerful microeconomic effect that signals all around the market that entrepreneurs must redirect their efforts and invest less in consumer goods industries and more in capital goods industries further from consumption.

Finally, *and third*, we should mention what Hayek called *The Ricardo Effect* (Hayek 1948, 220-254; 1978, 165-178), which refers to the impact on real wages of any increase in savings: whenever savings increase, sales and market prices of immediate consumer goods relatively stagnate or even decrease. If factor incomes remain the same, this means higher real wages, and the corresponding reaction of entrepreneurs, who will try in the margin to substitute the now relatively cheaper capital goods for labor. What the Ricardo Effect explains is that it is perfectly possible to earn profits even when sales (of consumer goods) go down, if costs decrease even more via the replacement of labor, which has become more expensive, with machines and computers, for instance. Who produces these machines, computers, and capital goods that are newly demanded? Precisely the workers who have been dismissed by the stagnating consumer goods industries and who have relocated to the more distant capital goods industries, where there is new demand for them to produce the newly demanded capital goods. This third effect, the Ricardo Effect, along with the other two mentioned above, promotes a longer productive process with more stages, which are further away from current

consumption. And this new, more capital-intensive productive structure is fully sustainable, since it is fully backed by prior, genuine real savings. Furthermore, it can also significantly increase, in the future, the final production of consumer goods and the real income of all economic agents. These three combined effects all work in the same direction; they are the most elementary teachings of capital theory; and they explain the secular tendency of the unhampered free market to correctly invest new savings and constantly promote capital accumulation and the corresponding sustainable increase in economic welfare and development.

The Unsustainable Nature of the Bubbles Induced by Artificial Credit Expansions Created by the Fractional-Reserve Banking Industry

We are now in a position to fully understand, by contrast with the above process of healthy capital accumulation, what happens if investments are financed not by prior genuine savings but by a process of artificial credit expansion, orchestrated by fractional-reserve banks and directed by the lender of last resort or Central Bank.

Unilateral credit expansion means that new loans are provided by banks and recorded on the asset side of their balance sheets, against new demand deposits that are created out of thin air as collateral for the new loans, and are automatically recorded on the liability side of banks' balance sheets. So new money, or I should say new "virtual money" because it only "materializes" in bank accounting book entries, is constantly created through this process of artificial credit expansion. And in fact roughly only around ten percent of the money supply of most important economies is in the form of cash (paper bills and coins), while the remaining 90 percent of the money supply is this kind of virtual money that only exists as written entries in banks' accounting books. (This is precisely what the Spanish Scholastics termed, over 400 years ago, "chirographis pecuniarum" or virtual money that only exists in writing in an accounting book.)

It is easy to understand why credit expansions are so tempting and popular and the way in which they entirely corrupt the behavior of economic agents and deeply demoralize society at all levels. To

begin with, entrepreneurs are usually very happy with expansions of credit, because they make it seem as if any investment project, no matter how crazy it would appear in other situations, could easily get financing at very low interest rates. The money created through credit expansions is used by entrepreneurs to demand factors of production, which they employ mainly in capital goods industries more distant from consumption. As the process has not been triggered by an increase in savings, no productive resources are liberated from consumer industries, and the prices of commodities, factors of production, capital goods and the securities that represent them in stock markets tend to grow substantially and create a market bubble. Everyone is happy, especially because it appears it would be possible to increase one's wealth very easily without any sacrifice in the form of prior saving and honest hard individual work. The so-called "virtuous circle of the new economy" in which recessions seemed to have been avoided forever, cheats all economic agents: investors are very happy looking at stock market quotes that grow day after day; consumer goods industries are able to sell everything they carry to the market at ever increasing prices; restaurants are always full with long waiting lists just to get a table; workers and their unions see how desperately entrepreneurs demand their services in an environment of full employment, wage increases and immigration; political leaders benefit from what appears to be an exceptionally good economic and social climate that they invariably sell to the electorate as the direct result of their leadership and good economic policies; state budget bureaucrats are astonished to find that every year public income increases at double digit figures, particularly the proceeds from Value Added tax, which, though in the end is paid by the final consumer, is advanced by the entrepreneurs of the early stages newly created and artificially financed by credit expansion.

But we may now ask ourselves: how long can this party last? How long can there continue to be a huge discoordination between the behavior of consumers (who do not wish to increase their savings) and that of investors (who continually increase their investments financed by banks' artificial creation of virtual money and not by citizens' prior genuine savings)? How long can this illusion that everybody can get whatever he wants without any sacrifice last?

The unhampered market is a very dynamically efficient process (Huerta de Soto 2010a, 1-30). Sooner or later it inevitably discovers (and tries to correct) the huge errors committed. Six spontaneous microeconomic reactions always occur to halt and revert the negative effects of the bubble years financed by artificial bank credit expansion.

The Spontaneous Reaction of the Market Against the Effects of Credit Expansions: First the Financial Crisis and Second the Deep Economic Recession

In my book on *Money, Bank Credit and Economic Cycles* (Huerta de Soto 2009, 361-384) I study in detail the six spontaneous and inevitable microeconomic causes of the reversal of the artificial boom that the aggression of bank credit expansion invariably triggers in the market. Let us summarize these six factors briefly:

1st The rise in the price of the original means of production (mainly labor, natural resources, and commodities). This rise appears when these resources have not been liberated from consumer goods industries (because savings have not increased) and the entrepreneurs of the different stages in the production process compete with each other in demanding the original means of production with the newly created loans they have received from the banking system.

2nd The subsequent rise in the price of consumer goods at an even quicker pace than that of the rise in the price of the factors of production. This happens when time preference remains stable and the new money created by banks reaches the pockets of the consumers in an environment in which entrepreneurs are frantically trying to produce more for distant consumption and less for immediate consumption of all kinds of goods. This also explains the *3rd factor* which is

3rd The substantial relative increase in the accounting profits of companies closest to final consumption, especially compared with the profits of capital goods industries which begin to stagnate when their costs rise more rapidly than their turn over.

4th *“The Ricardo Effect”* which exerts an impact which is exactly opposite to the one it exerted when there was an increase in voluntary saving. Now the relative rise in the prices of consumer goods (or of consumer industries’ turnover in an environment of increased productivity) with respect to the increase in original-factor income begins to drive down real wages, motivating entrepreneurs to substitute cheaper labor for machinery, which lessens the demand for capital goods and further reduces the profits of companies operating in the stages furthest from consumption.

5th *The increase in the loan rate of interest even exceeding pre-credit expansion levels.* This happens when the pace of credit expansion stops accelerating, something that sooner or later always occurs. Interest rates significantly increase due to the higher purchasing power and risk premiums demanded by the lenders. Furthermore, entrepreneurs involved in malinvestments start a “fight to the death” to obtain additional financing to try to complete their investment projects (Hayek 1937).

These five factors provoke the following sixth combined effect:

6th Companies which operate in the stages relatively more distant from consumption begin to discover they are incurring heavy accounting losses. These accounting losses, when compared with the relative profits generated in the stages closest to consumption, finally reveal beyond a doubt that serious entrepreneurial errors have been committed and that there is an urgent need to correct them by paralyzing and liquidating the investment projects mistakenly launched during the boom years.

The financial crisis begins the moment the market, which as I have said is very dynamically efficient (Huerta de Soto 2010a, 1-30), discovers that the true market value of the loans granted by banks during the boom is only a fraction of what was originally thought. In other words, the market discovers that the value of bank assets is much lower than previously thought and, as bank liabilities (which are the deposits created during the boom) remain constant, the market discovers the banks are in fact bankrupt, and were it not for the desperate action of the lender of last resort in bailing out the banks, the whole financial and monetary system would collapse. In any case, it is important to understand that the financial and banking

crisis *is not* the cause of the economic recession but one of its most important first symptoms.

Economic recessions begin when the market discovers that many investment projects launched during the boom years are not profitable. And then consumers demand liquidation of these malinvestments (which, it is now discovered, were planned to mature in a too-distant future considering the true wishes of consumers). The recession marks the beginning of the painful readjustment of the productive structure, which consists of withdrawing productive resources from the stages furthest from consumption and transferring them back to those closest to it.

Both the financial crisis and the economic recession are always unavoidable once credit expansion has begun, because the market sooner or later discovers that investment projects financed by banks during the boom period were too ambitious due to a lack of the real saved resources that would be needed to complete them. In other words, bank credit expansion during the boom period encourages entrepreneurs to act as if savings had increased when in fact this is not the case. A generalized error of economic calculation has been committed and sooner or later it will be discovered and corrected spontaneously by the market. In fact all the Hayekian theory of economic cycles is a particular case of the theorem of the impossibility of economic calculation under socialism discovered by Ludwig von Mises, which is also fully applicable to the current wrongly designed and heavily regulated banking system.

The Specific Features of the 2008 Financial Crisis and the Current Economic Recession

The expansionary cycle which has now come to a close was set in motion when the American economy emerged from its last recession in 2001 and the Federal Reserve embarked again on a major artificial expansion of credit and investment, an expansion unbacked by a parallel increase in voluntary household saving. In fact, for several years the money supply in the form of banknotes and deposits has been growing at an average rate of over ten percent per year (which means that every seven years the total volume of money circulating in the world could have been doubled). The media of exchange

originating from this severe fiduciary inflation have been placed on the market by the banking system as newly-created loans granted at extremely low (and even negative in real terms) interest rates. This fueled a speculative bubble in the shape of a substantial rise in the prices of capital goods, real estate assets, and the securities which represent them and are exchanged on the stock market, where indexes soared.

Curiously enough, like in the “roaring” years prior to the Great Depression of 1929, the shock of monetary growth has not significantly influenced the unit prices of the subset of consumer goods and services (which are only approximately one third of the total number of goods that are exchanged in the market). The last decade, like the 1920s, has seen a remarkable increase in productivity as a result of the introduction, on a massive scale, of new technologies and significant entrepreneurial innovations which, were it not for the “money and credit injection,” would have given rise to a healthy and sustained reduction in the unit price of the goods and services all citizens consume. Moreover, the full incorporation of the economies of China and India into the globalized market has gradually raised the real productivity of consumer goods and services even further. The absence of a healthy “deflation” in the prices of consumer goods in a stage of such considerable growth in productivity as that of recent years provides the main evidence that the monetary shock has seriously disturbed the whole economic process. And let us remember the “Antideflationist Hysteria” of those who, even during the years of the bubble, used the slightest symptoms of this healthy deflation, to justify even greater doses of credit expansion.

As we have already seen, artificial credit expansion and the (fiduciary) inflation of media of exchange offer no shortcut to stable and sustained economic development, no way of avoiding the necessary sacrifice and discipline behind all high rates of voluntary saving. (In fact, before the crisis and particularly in the United States, voluntary saving not only failed to increase, but even fell to a negative rate for several years.)

The specific factors that trigger the end of the euphoric monetary “binge” and the beginning of the recessionary “hangover” are many, and they can vary from one cycle to another. In this crisis, the most

obvious triggers were first, the rise in the price of commodities and raw materials, particularly oil, second, the subprime mortgage crisis in the United States, and finally, the failure of important banking institutions when it became clear in the market that the value of their debts exceeded that of their assets (mainly mortgage loans erroneously granted).

If we consider the level of past credit expansion and the quality and volume of malinvestment produced by it, we could say that very probably in this cycle the economies of the European Monetary Union are in comparison in a somewhat less poor state (if we do not consider the relatively greater Continental European rigidities, particularly in the labor market, which tend to make recessions in Europe longer and more painful). The expansionary policy of the European Central Bank, though not free of grave errors, has been somewhat less irresponsible than that of the Federal Reserve. Furthermore, fulfillment of the convergence criteria for the monetary union involved at the time a healthy and significant rehabilitation of the chief European economies. Only some countries on the periphery, like Ireland and Spain, were immersed in considerable credit expansion from the time they initiated their processes of convergence.

The case of Spain is paradigmatic. The Spanish economy underwent an economic boom which, in part, was due to real causes (like the liberalizing structural reforms which originated with José María Aznar's administration). Nevertheless, the boom was also largely fueled by an artificial expansion of money and credit, which grew at a rate nearly three times the corresponding rates in France and Germany.

Spanish economic agents essentially interpreted the decrease in interest rates which resulted from the convergence process in the easy-money terms traditional in Spain: a greater availability of easy money and mass requests for loans from Spanish banks (mainly to finance real estate speculation), loans which Spanish banks granted by creating the money ex nihilo while European central bankers looked on unperturbed. Once the crisis hit Spain the readjustment was quick and efficient: In less than a year more than 150,000 companies -mainly related with the building sector- have disappeared, almost five million workers who were employed in the

wrong sectors have been dismissed, and nowadays we can conclude that although still very weak, the economic body of Spain has been already healed. We will later come back to the subject of what economic policy is most appropriate to the current circumstances. But before that, let us make some comments on the influence of the new accounting rules on the current economic and financial crisis.

The Negative Influence of the New Accounting Rules

We must not forget that a central feature of the long past period of artificial expansion was a gradual corruption, on the American continent as well as in Europe, of the traditional principles of accounting as practiced globally for centuries.

To be specific, acceptance of the international accounting standards (IAS) and their incorporation into law in most countries have meant the abandonment of the traditional principle of prudence and its replacement by the principle of “fair value” in the assessment of the value of balance sheet assets, particularly financial assets.

In fact, during the years of the “speculative bubble,” this process was characterized by a feedback loop: rising stock-market values were immediately entered into the books, and then such accounting entries were sought as justification for further artificial increases in the prices of financial assets listed on the stock market.

It is easy to realize that the new accounting rules act in a pro-cyclic manner by heightening volatility and erroneously biasing business management: in times of prosperity, they create a false “wealth effect” which prompts people to take disproportionate “risks”; when, from one day to the next, the errors committed come to light, the loss in the value of assets immediately decapitalizes companies, which are obliged to sell assets and attempt to recapitalize at the worst moment, when assets are worth the least and financial markets dry up. Clearly, accounting principles which have proven so disturbing must be abandoned as soon as possible, and the accounting reforms recently enacted, must be reversed. This is so not only because these reforms mean a dead end in a period of financial crisis and recession, but especially because it is vital that in periods of prosperity we stick to the principle of prudence in valuation, a principle which has shaped all accounting systems from the time of

Luca Pacioli at the beginning of the fifteenth century till the adoption of the false idol of the International Accounting Rules.

It must be emphasized that the purpose of accounting is not to reflect supposed “real” values (which in any case are subjective and which are determined and vary daily in the corresponding markets) under the pretext of attaining a (poorly understood) “accounting transparency.” Instead, the purpose of accounting is to permit the prudent management of each company and to prevent capital consumption, as Hayek already established as early as 1934 in his article “The Maintenance of Capital” (Hayek 1934). This requires the application of strict standards of accounting conservatism (based on the prudence principle and the recording of either historical cost or market value, whichever is lower), standards which ensure at all times that distributable profits come from a safe surplus which can be distributed without in any way endangering the future viability and capitalization of each company.

Who is Responsible for the Current Situation?

Of course the spontaneous order of the unhampered market is *not* responsible for the current situation. And one of the most typical consequences of every past crisis and of course of this current one, is how many people are blaming the market and firmly believing that the recession is a “market failure” that requires more government intervention. The market is a process that spontaneously reacts in the way we have seen against the monetary aggression of the bubble years, which consisted of a huge credit expansion that was not only allowed but even orchestrated and directed by *Central Banks, which are the institutions truly responsible for all the economic sufferings from the crisis and recession that are affecting the world.* And paradoxically central banks have been able to present themselves to the general public not only as indignant victims of the list of ad hoc scapegoats they have been able to put together (stupid private bankers, greedy managers receiving exorbitant bonuses, etc.), but also as the only institutions which, by bailing out the banking system as a last resort, have avoided a much greater tragedy.

In any case, it is crystal clear that the world monetary and banking system has chronically suffered from wrong institutional

design at least since Peel's Bank Act of 1844. There is no free market in the monetary and banking system but just the opposite: private money has been nationalized, legal tender rules introduced, a huge mess of administrative regulations enacted, the interest rate manipulated and most importantly, everything is directed by a monetary central-planning agency: The Central Bank.

In other words, real socialism, represented by state money, Central Banks and financial administrative regulations, is still in force in the monetary and credit sectors of the so-called free market economies.

As a result of this fact we experience regularly in the area of money and credit all the negative consequences established by the Theorem of the Impossibility of Socialism discovered by those distinguished members of the Austrian School of Economics: Ludwig von Mises and Friedrich Hayek.

Specifically, the central planners of state money are unable to know, to follow and to control the changes in both the demand for and supply of money. Furthermore, as we have seen, the whole financial system is based on the legal privilege given by the state to private bankers, who can use a fractional-reserve ratio with respect to the demand deposits they receive from their customers. As a result of this privilege, private bankers are not true financial intermediaries, but are mainly creators of deposits materializing in credit expansions that inevitably end in crisis and recession.

The most rigorous economic analysis and the coolest, most balanced interpretation of past and recent economic and financial events lead inexorably to the conclusion that central banks (which, again, are true financial central-planning agencies) cannot possibly succeed in finding the most convenient monetary policy at every moment. This is exactly the kind of problem that became evident in the case of the failed attempts to plan the former Soviet economy from above.

To put it another way, the theorem of the economic impossibility of socialism, which the Austrian economists Ludwig von Mises and Friedrich A. Hayek discovered, is fully applicable to central banks in general, and to the Federal Reserve and (at one time) Alan Greenspan and (currently) Ben Bernanke in particular. According to

this theorem, it is impossible to organize any area of the economy and especially the financial sector, via coercive commands issued by a planning agency, since such a body can never obtain the information it needs to infuse its commands with a coordinating nature. This is precisely what I analyze in Chapter 3 of my book on *Socialism, Economic Calculation and Entrepreneurship*, which has been published by Edward Elgar in association with the Institute of Economic Affairs (Huerta de Soto, 2010b).

Indeed, nothing is more dangerous than to indulge in the “fatal conceit” – to use Hayek’s useful expression (Hayek, 1990) – of believing oneself omniscient or at least wise and powerful enough to be able to keep the most suitable monetary policy fine-tuned at all times. Hence, rather than softening the most violent ups and downs of the economic cycle, the Federal Reserve and, to a lesser extent, the European Central Bank, have been their main architects and the culprits in their worsening.

Therefore, the dilemma facing Ben Bernanke and his Federal Reserve Board, as well as the other central banks (beginning with the European Central Bank), is not at all comfortable. For years they have shirked their monetary responsibility, and now they find themselves up a blind alley. They can either allow the recessionary process to follow its course, and with it the healthy and painful readjustment, or they can escape forward toward a “renewed inflationist” cure. With the latter, the chances of an even more severe recession (even stagflation) in the not-too-distant future increase dramatically. (This was precisely the error committed following the stock market crash of 1987, an error which led to the inflation at the end of the 1980s and concluded with the sharp recession of 1990-1992.)

Furthermore, the reintroduction of the artificially cheap-credit policy at this stage is hindering the necessary liquidation of unprofitable investments and company reconversion. It could even wind up prolonging the recession indefinitely, as happened in the case of the Japanese economy, which, though all possible interventions have been tried, has ceased to respond to any stimulus involving either monetarist credit expansions or Keynesian methods.

It is in this context of “financial schizophrenia” that we must interpret the “shots in the dark” fired in the last five years by the monetary authorities (who have two totally contradictory responsibilities: both to control inflation and to inject all the liquidity necessary into the financial system to prevent its collapse). Thus, one day the Fed rescued Bear Stearns (and later AIG, Fannie Mae, Freddie Mac or City Group) and the next it allowed Lehman Brothers to fail, under the amply justified pretext of “teaching a lesson” and refusing to fuel moral hazard. Finally, in light of the way events were unfolding, the US and European governments launched multi-billion-dollar plans to purchase illiquid (that is, worthless) assets from the banking system, or to monetize the public debt, or even to buy bank shares, totally or partially nationalizing the private banking system. And considering all that we have seen, which are now the possible future scenarios?

Possible Future Scenarios and the Most Appropriate Economic Policy

Theoretically, under the wrongly designed current financial system, once the crisis has hit we can think of four possible scenarios:

The first scenario is the catastrophic one in which the whole banking system based on a fractional reserve collapses. This scenario seems to have been avoided by central banks which, acting as lenders of last resort, are bailing out private banks whenever it is necessary.

The second scenario is just the opposite of the first one but equally tragic: it consist of an “inflationist cure” so intense, that a new bubble is created. This forward escape would only temporarily postpone the solution of the problems at the cost of making them far more serious later (this is precisely what happened in the crisis of 2001).

The third scenario is what I have called the “japanization” of the economy: it happens when the reintroduction of the cheap-credit policy together with all conceivable government interventions entirely blocks the spontaneous market process of liquidation of unprofitable investments and company reconversion. As a result, the recession is prolonged indefinitely and the economy does not recover and ceases to

respond to any stimulus involving monetarist credit expansions or Keynesian methods.

The fourth and final scenario is currently the most probable one: It happens when the spontaneous order of the market, against all odds and despite all government interventions, is finally able to complete the microeconomic readjustment of the whole economy, and the necessary reallocation of labor and the other factors of production toward profitable lines based on sustainable new investment projects.

In any case, after a financial crisis and an economic recession have hit it is necessary to avoid any additional credit expansion (apart from the minimum monetary injection strictly necessary to avoid the collapse of the whole fractional-reserve banking system). And the most appropriate policy would be to liberalize the economy at all levels (especially in the labor market) to permit the rapid reallocation of productive factors (particularly labor) to profitable sectors. Likewise, it is essential to reduce public spending and taxes, in order to increase the available income of heavily-indebted economic agents who need to repay their loans as soon as possible. Economic agents in general and companies in particular can only rehabilitate their finances by cutting costs (especially labor costs) and paying off loans. Essential to this aim are a very flexible labor market and a much more austere public sector. These measures are fundamental if the market is to reveal as quickly as possible the real value of the investment goods produced in error and thus lay the foundation for a healthy, sustainable economic recovery.

However, once the economy recovers (and in a sense the recovery begins with the crisis and the recession themselves which mark the discovery by the market of the errors committed and the beginning of the necessary microeconomic readjustment), I am afraid that, as has happened in the past again and again, no matter how careful central banks may be in the future (can we expect them to have learned their lesson? For how long will they remember what happened?), nor how many new regulations are enacted (as in the past all of them, and now especially Basel II and III, have attacked only the symptoms but not the true causes), sooner or later new cycles of credit expansion, artificial economic boom, financial crisis and economic recession will inevitably continue affecting us until the world financial and banking

systems are entirely redesigned according to the general principles of private property law that are the essential foundation of the capitalist system and that require a 100 percent reserve for any demand deposit contract.

Conclusion

I began this paper with Peel's Bank Act, and I will also finish with it. On June 13 and 24, 1844 Robert Peel pointed out in the House of Commons that in each one of the previous monetary crises "there was an increase in the issues of country bank paper" and that "currency without a basis (...) only creates fictitious value, and when the bubble bursts, it spreads ruin over the country and deranges all commercial transactions".

Today, 168 years later, we are still suffering from the problems that were already correctly diagnosed by Robert Peel. And in order to solve them and finally reach the only truly free and stable financial and monetary system that is compatible with a free market economy in this 21st century, it will be necessary to take the following three steps:

First, to develop and culminate the basic concept of Peel's Bank Act by also extending the prescription of a 100 percent reserve requirement to demand deposits and equivalents. Hayek states that this radical solution would prevent all future crises (Hayek 1984, 29) as no credit expansions would be possible without a prior increase in real genuine saving, making investments sustainable and fully matched with prior voluntary savings. And I would add to Hayek's statement the most important fact that 100 percent banking is the only system compatible with the general principles of the law of property rights that are indispensable for the capitalist system to work: there is no reason to treat deposits of money differently from any other deposit of a fungible good, such as wheat or oil in which nobody doubts the need to keep the 100 percent reserve requirement.

In relation to this first step of the proposed reform it is most encouraging to see how two Tory mps, Douglas Carswell and Steve Baker, were able to introduce in the British Parliament on September 15, 2010 and under the 10 minute rule the first reading of a Bill to reform the banking system extending the prescriptions of Peel's Bank

Act to demand deposits. This “Customer Choice Disclosure and Protection Bill” had two goals: first to fully and effectively defend citizens’ right of ownership over money they have deposited in checking accounts at banks; and second, to once and for all put an end to the recurrent cycles of artificial boom, financial crisis and economic recession. Of course this first draft of the bill still needs to be completed with some important details, for instance the time period (let us say a month) under which all deposits should be considered demand deposits for storage and not for investment, and the need to clarify that any contract that guarantees full availability of its nominal value at any moment should be considered at all effects a demand deposit for storage. But the mere discussion of these matters in the British Parliament and by the public at large is, in itself, of huge importance. In any case it is exciting that a handful of mps have taken this step against the tangle of vested interests related to the current privileged fractional-reserve banking system. If they are successful in their fight against what we could call the current “financial slavery” that grips the world they will go down in history like William Wilberforce –with the abolition of the slave trade- and other outstanding British figures to which the whole world owes so much.

Second, if we wish to culminate the fall of the Berlin wall and get rid of the real socialism that still remains in the monetary and credit sector, a priority would be the elimination of Central Banks, and particularly the Federal Reserve, which would be rendered unnecessary as lenders of last resort if the above 100 percent reserve reform is introduced, and harmful if they insist on continuing to act as financial central-planning agencies.

And *third*, who will issue the monetary base? Maurice Allais, the French Nobel Prize winner who passed away two weeks ago, proposed that a Public Agency print the public paper money at a rate of increase of 2 percent per year. I personally do not trust this solution as any emergency situation in the state budget would be used, as in the past, as a pretext for issuing additional doses of fiduciary media. For this reason in order to put an end to any future manipulation of our money by the authorities, what is required is the full privatization of the current, monopolistic, and fiduciary state-issued

paper base money, and its replacement with a classic pure gold standard.

There is an old Spanish saying: “A grandes males, grandes remedios”. In English, “great problems require radical solutions”. And though of course any step toward these three measures would significantly improve our current economic system, it must be understood that the reforms proposed and taken by governments up to now (including Basel II and III) are only nervously attacking the symptoms but not the real roots of the problem, and precisely for that reason they will again miserably fail in the future.

Meanwhile, it is encouraging to see how a growing number of scholars and institutions are studying again not only the radical reforms required by a truly honest private money, but also very interesting proposals for a suitable transition to a new banking system, like the one I develop in chapter 9 of my book on *Money, Bank Credit and Economic Cycles*. By the way, in this chapter I also explain a most interesting by-product of the proposed reform, namely the possibility it offers of paying off, without any cost or inflationary effects, most of the existing public debt which in the current circumstances is a very worrying and increasingly heavy burden in most countries.

Briefly outlined, what I propose is to print the paper banknotes necessary to consolidate the volume of demand deposits that the public decides to keep in the banks. In any case, the printing of this new money would not be inflationary, as it would be handed to banks and kept entirely sterilized, so to speak, as 100 percent asset collateral of bank liabilities in the form of demand deposits. In this way, the basket of bank assets (loans, investments, etc.) That are currently backing the demand deposits would be “freed”, and what I propose is to include these “freed” assets in mutual funds, swapping their units at their market value for outstanding treasury bonds. In any case, an important warning must be given: naturally, and one must never tire of repeating it, the solution proposed is only valid in the context of an irrevocable decision to re-establish a free-banking system subject to a 100 percent reserve requirement on demand deposits. However, no matter how important this possibility is considered under the current circumstances, we must not forget it is

only a by-product (of “secondary” importance) compared to the major reform of the banking system we have outlined.

And now to conclude, should in this 21st century a new Robert Peel be able to successfully push for all these proposed reforms, either in the U.S.A. or in the U.K., these great countries would again render an invaluable service not only to themselves but also to the rest of the world. Ron Paul, in his long and fruitful career did his best to push for these reforms. Let us hope that someone continues his efforts with the same wisdom and enthusiasm.

ROAD MAP TO SOUND MONEY: A LEGISLATIVE HEARING ON H.R.1098 AND RESTORING THE DOLLAR

Tuesday, September 13, 2011

WITNESSES

Parks, Lawrence M., Ph.D., Executive Director, Foundation for the
Advancement of Monetary Education

White, Lawrence H., Ph.D., Professor of Economics, George Mason
University

*B*ACKGROUND

The Subcommittee on Domestic Monetary Policy and Technology held a hearing entitled “Road Map to Sound Money: A Legislative Hearing on H.R. 1098 and Restoring the Dollar” at 2:00 p.m. on Tuesday, September 13, 2011 in Room 2128 of the Rayburn House Office Building.

The focus of this hearing was the importance of sound money in the economy, the means by which sound money could be achieved, and the constitutional role of government in money. This hearing also examined H.R. 1098, the “Free Competition in Currency Act of 2011,” which would repeal federal legal tender laws, restrictions on private mints, and taxes on gold and silver in order to permit free-market forces to provide sound money through choice in currency.

This was a one-panel hearing, with the following witnesses:

- Lawrence M. Parks, Executive Director, Foundation for the Advancement of Monetary Education
- Lawrence H. White, Professor of Economics, George Mason University

Summary of the Legislation

H.R. 1098, the “Free Competition in Currency Act of 2011,” was introduced on March 15, 2011, by Subcommittee Chairman Paul, and referred to the Domestic Monetary Policy Subcommittee. H.R. 1098 was also referred to the Committee on Ways and Means and to the Committee on the Judiciary for consideration of the provisions that fall within their jurisdiction. The bill was subsequently referred to the Committee on the Judiciary’s Subcommittee on Crime, Terrorism, and Homeland Security.

H.R. 1098 would repeal the federal law establishing U.S. coins, currency, and Federal Reserve Notes as legal tender for all debts;

prohibit the imposition of taxes on coins, medals, tokens, or gold, silver, platinum, palladium, or rhodium bullion issued by a state, the United States, a foreign government, or any other person; prohibit states from assessing any tax or fee on any currency or other monetary instrument that is used in interstate or foreign commerce and that has legal tender status under the Constitution; repeal provisions of the federal criminal code relating to circulating coins of gold, silver, or other metal for use as current money and making or possessing likenesses of such coins; and abate any current prosecution under such provisions and nullify any previous convictions.

Context for Reform

Since the breakdown of the Bretton Woods system of monetary management in 1971, which tied most international currencies to the partially gold-backed U.S. dollar, most of the world has operated under a pure fiat currency system.²²³ Under a fiat currency system, the amount of money and currency in circulation is left to the discretion of the monetary authority. In the United States, the Federal Reserve System is the monetary authority and it has been given independent authority and responsibility to control the money supply and value of the currency, with a mandate of maintaining full employment and price stability.

In the wake of the near-collapse of the financial system and the looming debt crises facing both Europe and the United States, those who view the pure fiat currency system as a contributing factor to these events have become both more vocal and also more widely acknowledged. These critics of the fiat currency system have concluded that allowing monetary authorities to create money and currency without some form of discipline contributed to unsustainable expansion of debt, growth of inflation, and instability in the global financial system.

Several reforms have been proposed to constrain the creation of fiat currency, including the move to a “hard” currency, one backed by commodities. In the United States, these proposals include limiting the Federal Reserve to a single mandate of price stability or requiring the Federal Reserve to set an explicit inflation target; tying the dollar

²²³ A fiat currency derives its value from legal statute requiring it to be accepted as payment in a transaction, typically referred to as a legal tender statute. Alternatively, a commodity-backed currency has an intrinsic value based on the value of the commodity backing the currency. Both types of currency also derive value from their use as a means of exchange, known as exchange value.

to a basket of commodities; issuing Treasury securities redeemable in gold; restoring some form of gold convertibility to the dollar; and establishing a framework for competing currencies.

Competing currencies are based on the notion that the market for currency is like the market for any other good or service. Markets provide consumers with choices among products, and producers compete for consumers by providing the best, most efficient product. In the currency market, the best, most efficient product would be the one that best satisfies all the properties of money: durability, portability, divisibility, ease of recognition, and stability. Proponents of competing currencies claim that their approach would give monetary authorities an incentive to refrain from the excessive creation of money, in order to maintain a stable value and successfully compete against other currencies. Such a regime would give consumers an option between currencies and the ability to choose the currency that best satisfies their preferences.

H.R. 1098 is a legislative proposal intended to permit currency competition in the United States by eliminating barriers to entry in the currency market. H.R. 1098 seeks three changes in law. First, H.R. 1098 would repeal the legal tender law establishing U.S. coins and Federal Reserve Notes as a legal tender payment for all debts, public and private. Second, H.R. 1098 would remove taxes on precious metals or precious metal monetary instruments that prevent them from circulating as a currency. Third, H.R. 1098 would repeal provisions of the federal criminal code that prevent private mints from issuing coins.

Legal Tender Laws

Legal tender laws provide that a certain currency or certain currencies are “legal tender”: that is, the currency must be accepted when tendered for payments of debts, taxes, duties, etc. Legal tender laws that apply to a certain geographic territory often ensure that the government-issued currency circulates in the economy to the exclusion of other currencies. Some historians and scholars have argued that the federal government does not have the authority under the U.S. Constitution to enact legal tender laws, but merely to coin money and regulate its value. The only reference in the Constitution to legal tender is contained in Article 1, Section 10, which prohibits states from making “any Thing but gold and silver Coin a Tender in Payment of Debts.”

Taxation on Currencies

The capital gains taxes assessed on the appreciation of the metal content of coins have deterred the use of coins made from precious metals as a means of exchange. Under 26 U.S.C. 408(m)(2), coins are declared to be collectibles and they are taxed at rates different from those for other capital assets. Coins held for less than one year are taxed at the short-term capital gains rate, while coins held for longer are taxed at a rate of 28 percent. Given the steadily-increasing dollar value of gold and silver coins, using these coins to pay salaries or to make everyday purchases would require burdensome paperwork and tax payments, which makes it prohibitively expensive for precious metal coins to circulate as a competing currency.

Private Mints

From the founding of the United States to the Civil War, numerous hard money currencies circulated within this country. These currencies were U.S. Mint coins, foreign coins, and privately minted coins that circulated based on their weight in gold and silver. During this time, individuals could bring in an amount of precious metal and have it assayed and minted at branches of the U.S. Mint. Private mints sprang up in areas that were underserved by U.S. Mints and U.S. Assay offices.

Federal laws enacted in the 1860s and 1870s outlawed private mints. As greater centralization of government occurred after the Civil War, there was also a push by lawmakers for greater centralization and government control of money issuance. As legislation was passed to create a national banking system, two provisions—now codified at 18 U.S.C. 486 and 489—were enacted that prohibited the operations of private mints, outlawing the coinage of precious metal coins except by the government. H.R. 1098 would repeal these provisions, which would allow private mints to issue coins that could serve as a competitive currency.

*T*RANSCRIPT

The subcommittee met, pursuant to notice, at 2:35 p.m., in room 2128, Rayburn House Office Building, Hon. Ron Paul {chairman of the subcommittee} presiding.

Members present: Representatives Paul, Jones, Luetkemeyer, and Huizenga.

Chairman PAUL. This hearing will come to order. Without objection, all members' opening statements will be made a part of the record.

Are there any other opening statements? Okay. I will make a brief opening statement and then we will go to our witnesses.

The monetary issue has been an issue that I have been fascinated with and interested in for a long time. I became much more aware of the significance of this issue back in August of 1971, with the breakdown of the Bretton Woods agreement. At that time, I was quite convinced and remain convinced that we have ushered in a special age that probably did not exist in the same fashion ever before. And we now have been living for 4 decades with a total fiat world currency, and it has created a lot of problems for us.

I am convinced also that we are on the verge of a change from the current status. Just as significant as it was in 1971, something had to give, and there was a change. And I think this is what the conflict in the markets and the chaos in the markets is telling us.

But too often, the people in the Congress are looking elsewhere to solve the problems. We, as a Congress, have lived way beyond our means because the people in this country wanted us to live beyond our means, and the monetary issue of course is very significant because it actually facilitates the spending.

So without the type of system of money that we have today, there would have been a limitation on the massive expansion of the size of government, spending, taxes, debt, and the crisis that we are facing right now. But very few are even thinking about monetary policy as a

significant contributor to the economic problems we have today. More attention has been given to the Federal Reserve in recent years than it has in the past but we have a long way to go. But there are more and more people on both sides of this issue who are recognizing that monetary reform eventually will come. The big question is, is will they try to patch this up or transfer this into another system that is not much better than the one we have?

In many ways, that is what we did in 1971. We had a dollar reserve gold standard that broke down, and then we ushered in something actually worse and it probably lasted a lot longer than a lot of people expected. But today, because of the crisis, I think many are just wondering what is going to happen.

I have had a position for a long time about what I think we should do with the Federal Reserve; I don't believe it contributes all that much. But I have also taken the position that if I had the authority to do it, I probably wouldn't take the key, lock the door, and just allow the system to work its way out. I think that would be very chaotic, and that is not my position. So as early on as the Gold Commission in the early 1980s, even up until now, I still believe that the best way to go from one system to another is to try to allow the market to help us.

The British made a serious mistake when they tried to go back on the gold standard in the 1920s at an old ratio of the dollar to the pound and it obviously failed. Of course, it was blamed on the gold, not on the policy of transition.

So the market has to help us on this, the market has to help us if we ever want to relate our currency to gold again. I have been fascinated with some of the work of Hayek and others that talks about allowing currencies to compete with one another, let the markets sort it out. And it is a lot less threatening. Other countries are talking about that. The Mexican Government has talked about it. The Swiss Government has talked about just allowing other currencies to circulate within their own country. And when you think about it, that is what happens internationally all the time. Currencies fluctuate all the time, and that is one of the ways that they were able to keep the system together, is allow the competing currencies to fluctuate on a minute-to-minute basis.

So there is no reason in the world that we couldn't adapt to allowing competing currency within our own country. And then if people just love Federal Reserve Notes and want to spend Federal Reserve Notes and save in Federal Reserve Notes, let them do it. But others who might think that another system is better, I think we ought to talk about legalizing it.

To me, I would like to summarize and say, why don't we legalize the Constitution? The Constitution has been rather clear. It might not have given us the perfect monetary system and we didn't follow it very well. But at least it did indicate that the Founders didn't like paper money. They did not like emitting bills with credit. They did not like fiat money. And if we were to look just to the Constitution, it would mean that we should reconsider commodity money, something that governments can't control, can't monopolize, and let the market work.

So, those are basically my thoughts on this issue. I am anxious to hear the remarks from Dr. Parks and Dr. White on these issues, because I have studied this for many, many years and there are still a lot of questions to answer.

We do have a bill, H.R. 1098, which is far from a perfect bill. But it is a place to get started in talking about what we might do and how we can do it because things could change rapidly. Although many of us have been thinking about this for many, many years, things could move rapidly. Currency destructions, the end of currencies sometimes move much quicker than anybody dreams that it could. So a major crisis could come. It could come next month or next year or in a few years. But to me, there is no guarantee that we have 5 or 10 years to keep studying this. I think that we need to get people engaged in this and talking about it and understanding the monetary issue.

So I am very grateful to our two guests for coming today and for being willing to submit their remarks and answer some questions for us.

I will now go to our first witness. Dr. Lawrence Parks is the executive director and founder of the Foundation for the Advancement of Monetary Education. Dr. Parks has studied money for 30 years and was a student of the free market economist Murray Rothbard. His writings have appeared in *The Economist*, *Pensions and Investment*, and *The Washington Times*, among others. He has authored and produced over 200 educational videos on the U.S. monetary system. Dr. Parks is a member of the United Association of Labor Education and UAW 1981, AFL-CIO. He received his Ph.D. in operations research from the Polytechnic Institute of New York University.

Dr. Parks, please go ahead and give your summary and then we will go to our next witness.

STATEMENT OF LAWRENCE M. PARKS, PH.D.²²⁴
EXECUTIVE DIRECTOR
FOUNDATION FOR THE ADVANCEMENT
OF MONETARY EDUCATION

Mr. PARKS. Thank you very much, Dr. Paul. It is a great honor to be here, and I appreciate the opportunity to testify in support of H.R. 1098, the Free Competition in Currency Act of 2011. I am honored to have been invited.

I know it must sound like hyperbole, but I believe that H.R. 1098 is perhaps the most important piece of legislation ever to come before the Congress, because H.R. 1098 is necessary to make a transition from a certain catastrophic collapse of our unauthorized by the Constitution, dishonest, and unstable legal tender, irredeemable paper-ticket-electronic monetary system.

While I suspect that this committee will be most interested in how this bill will affect jobs, debt, economic growth in capital markets, pensions, and a host of other important and timely topics, I am going to focus my opening statement with an example of the dishonesty, which is the Achilles' heel of the present system, by highlighting one of the many misrepresentations about our money.

There are three take-away points from my testimony. The first is that the system is not in conformity with the Constitution. The second, and very importantly, it is dishonest. And third, it is unstable and in the process of blowing up perhaps while I am testifying here today.

One can be certain of a complete collapse of this monetary system because there is no longer any market-based self-correcting mechanism for increasing debt, increasing the money supply, and increasing leverage. And any system, any physical system, any social system, any system without a self-correcting mechanism blows up. With no exceptions, the history of legal tender irredeemable paper-ticket money is that its purchasing power always approaches its cost of production, which is zero.

I want to explain why the system is dishonest. There are a myriad of misrepresentations and nondisclosure of material information about what we call a dollar. No amount of regulation or oversight committees will cure dishonesty. The only remedy is honesty.

To illustrate what in my view is the most egregious example of this dishonesty, I give an example of silver, although the same

²²⁴ [The prepared statement of Dr. Parks can be found on page 887.]

principle applies with gold. Now it was and remains inconvenient for people to carry around silver dollars because they are heavy and bulky. So what people did—let’s have the first exhibit up there—is that they deposited their silver dollars typically in a bank and received in exchange a promissory note, a.k.a. a banknote or a note that bore the inscription that so many dollars had been deposited and the note was payable to the bearer on demand.

Here is an example of a United States note. And notice that this is not a dollar. At the top of the bill are the words, “United States Note.” I don’t know if you can see it from where you are sitting but under the image it says, “will pay to the bearer on demand one dollar.” Well, what is a dollar?

Next slide [image of a silver dollar]. That is a dollar, as put into law by Alexander Hamilton in the Coinage Act of 1792. But then the promise to pay a dollar—let’s have the next slide—was defaulted. Here is the punchline. The broken promissory note, the dishonored promissory note is now represented as being a dollar. This is a gross misrepresentation and is dishonest. This piece of paper is not even a valid note. The signatures of the Treasurer of the United States and the Secretary of the Treasury are gratuitous and deceptive.

In other words, what we use for money are just dishonored promissory notes that are misrepresented to be dollars. It means that all of the securities in our capital markets at home and abroad are denominated in dishonored promissory notes. This has immense implications for trade, jobs, pensions, military preparedness, and almost everything else that is important.

People have the notion that the Congress can make the dollar anything the Congress wants it to be and back it with specie or not or whatever. This is demonstrably false. The highest law in our country is the Constitution and all of our laws have to be in conformity with it. The word “dollar” is mentioned twice in the Constitution but it is not defined in the Constitution. It is mentioned in connection with the Slave Tax, which is no more, but it is also mentioned very importantly in the Seventh Amendment, which guarantees everyone a right to a trial by jury for any dispute \$20 or more.

If it were true that the Congress could redefine the dollar, that would mean that the Congress could redefine the Seventh Amendment, which is ridiculous. And so the question comes up, what is the objective meaning of the dollar? And in fact, for the Seventh Amendment to have objective meaning, the dollar has to have an objective meaning. And what they are talking about in the Constitution itself—next slide—is the Spanish Milled Dollar, sometimes

called the piece of eight. The Spaniards had built mints all over the colonies and the Spanish Milled Dollar was ubiquitous. When independence was declared, the colonies adopted the Articles of Confederation, which gave the Congress the power to issue money called “continentals.” Here is an example of a continental \$30 bill.

Next slide. I don't know if you can read it from where you are sitting, but notice it “entitles the bearer to receive 30 Spanish Milled Dollars, or the Value thereof in Gold or Silver.” The value of a coin is its specie content.

After independence was achieved and the Constitution was adopted, the United States did not want to rely on Spanish mints for its coins. The United States wanted its own mints to mint its own coins, including dollars. To that end, Alexander Hamilton, then Secretary of the Treasury, wrote the Coinage Act of 1792, wherein he tells us exactly what a dollar is. And what a dollar is, is 371.25 grains of silver. Where did Hamilton get that crazy number? That was the silver content of the Spanish Milled Dollar. They couldn't just introduce some arbitrary coin because everybody had contracts in terms of dollars. So the Constitution requires that the dollar be a weight of silver. Now some might claim that if Hamilton defined the dollar this way, perhaps it can be defined another way. And that is not true either. Hamilton's definition of a dollar was not arbitrary. All he did was write into law what was already a fact.

Here is another way of looking at this issue. Go to the next slide, please. Suppose we have a sign that says “cat” and we hang it on a dog. Does the dog become a cat? And suppose the Congress passes a law that says all the dogs with cat signs are now cats—go to the next slide—now are all of these dogs cats? And the answer is no. Conceptually, this is no different than taking a piece of paper, printing the word “dollar” on it, adding seals and signatures, and calling it a dollar. And this is precisely what has happened to our money.

Clearly, there is no easy remedy. How could such an immense fraud be perpetrated? There are several reasons but one of the most important ones, which H.R. 1098 will go a long way to correcting, is that we are coerced into using fraudulent money by the legal tender statutes. By getting rid of legal tender, H.R. 1098 is necessary and may be sufficient to help pave the way to an honest monetary system.

I am going to stop now and give you a chance to address any questions or issues that may come to mind. Thank you so much.

Chairman PAUL. I thank you. I would like to go next to Dr. White.

Dr. Lawrence White is professor of economics at George Mason University, where he specializes in the theory and history of banking and money. Dr. White has written extensively on monetary systems with over 40 articles published in academic journals, including the *American Economic Review* and the *Journal of Monetary Economics*. He has also authored three books on monetary matters, including “*Competition and Currency: Essays on Free Banking and Money*.” He received his Ph.D. in economics from UCLA and his undergraduate degree in economics from Harvard.

Dr. White, you may proceed.

**STATEMENT OF LAWRENCE H. WHITE, PH.D.²²⁵
PROFESSOR OF ECONOMICS
GEORGE MASON UNIVERSITY**

Mr. WHITE. Thank you, Mr. Chairman. Thanks for the opportunity to discuss my views on H.R. 1098, the Free Competition and Currency Act of 2011. I am going to have to be very sweeping given the limited time, but I will be happy to answer any questions you might have about historical or other details.

The idea of competition in currency, or you might call it competition among currencies, is fairly straightforward. We know as a rule that open competition gives us better products, higher quality at lower cost. For example, we have faster and more reliable package delivery thanks to the competition of FedEx and United Parcel Service with the U.S. Postal Service. The main point I want to emphasize today is that competition in currency isn’t any exception to this general rule. More competition promotes better currency.

Let me give you some examples. Throughout history, currency has been better provided by freely competing private enterprises than by government monopoly or by legally protected private monopoly. The United States had competing gold and silver mints at one time during our gold and silver rushes and they produced very trustworthy coins. These private mints ended only when they were suppressed by Civil War legislation, part of which H.R. 1098 aims to repeal. Redeemable private tokens and redeemable bank-issued paper currency notes have also been popular forms of money in the 60-plus parts of the world where they have been allowed.

1098 would lift legal barriers to currency competition. It wouldn’t immediately remove the U.S. Treasury or the Federal Reserve System from issuing currency. But—and then this is the second point

²²⁵ [The prepared statement of Dr. White can be found on page 973.]

I want to emphasize—competition would give the Fed better incentives to provide the kind of money that people want. Sound money, stable, valued money, trustworthy money. It would give the Fed better incentives to avoid creating inflation, in other words, because its customers could begin to go elsewhere. The U.S. dollar already faces competition, and I would say useful competition, in the international arena. People have a choice in international trade. Between the dollar and the euro, the Swiss franc and they can invest in gold and silver. So there are many monetary standards in the world. 1098 would open a door to similar kinds of competition within the domestic arena between Federal Reserve Notes and other currencies. It won't make the Federal Reserve Note go away, as Dr. Paul said, if people want to use Federal Reserve Notes. New forms of currency won't gain a foothold in the market any faster than the public has reason to prefer them to Federal Reserve Notes. So the Fed can retain its business as long as it provides a high-quality product. But if the Fed slips up in quality control, meaning if double digit inflation should unfortunately return to the United States, then the American public would find it very useful to have trustworthy alternatives to Federal Reserve Notes that are depreciating in their pockets.

So this Act offers three concrete reforms. And let me talk about them briefly. Section 2 of the Act removes legal tender status from Treasury coins and Federal Reserve Notes. Legal tender has a more narrow scope than is often realized. It relates to the discharge of debts. So the phrase on Federal Reserve Notes, "legal tender for all debts" means that under current law a creditor is barred from refusing payment in Federal Reserve Notes. But it is perfectly feasible to have debt contracts without legal tender, and, in fact, there is already an important class of contracts that are today exempt from legal tender provisions.

Under Title 31, Section 5118(d)(2), the obligations created by gold clause bonds are not discharged by delivery of legal tender today. That section says that the bond issuer has a contractual obligation to pay in gold. That is what the contract says, and that will be enforced. So removing legal tender status from U.S. Treasury coins and Federal Reserve Notes more generally would simply broaden the freedom to denominate debt contracts in whatever people want, not just dollars, not just gold. But they might want silver. They might want to say the debt is only discharged by checks or wire transfers of dollars, or it could be silver coins or it could be units of foreign currency, claims

denominated in consumer index bundles or wholesale commodity bundles or it could be Bitcoins.

Section 3 of the Act rules out Federal or State taxes on precious metal coins, whether minted by a foreign government or by a private firm. That would allow a more level playing field for competition of private coins with the U.S. Treasury coins without the special tax disadvantages which now handicap private coins. Sales taxes on acquisition, capital gains taxes on holding them, right. Federal Reserve Notes are not subject to those taxes.

Section 4 of the Act repeals Title 18, Section 486. That section bans privately produced coins of gold, silver or other metals and it repeals Section 489 which bans disks that are merely similar to official coins. Section 486 is the relic of the Civil War that I mentioned. It was part of an effort to boost the acceptance of the wartime paper greenbacks by banning competition from the private gold coins that were being produced. Repealing that would again allow producers to make and consumers the option to use privately minted silver and gold coins if they like.

I think the question we should ask, in the words of Seth Lipsky in a recent Wall Street Journal article, is whether it makes any sense to “suppress private money that is sound in order to protect government-issued money that is unsound.”

I have mentioned that Section 489 would also be repealed. That I think is a section that is redundant at best and far too sweeping at worst. It outlaws making or possessing “any token, disk or device in the likeness or similitude as to design, color, or the inscription thereon of any of the coins of the United States.” It is redundant at best because there is already another section that outlaws counterfeiting and we are not talking about repealing the laws against counterfeiting. But this section is simply about similitude. And if you took it literally, it would outlaw all silver medallions because after all they are the same color as silver dollars and quarters and dimes. So it is too sweeping because it can be used to suppress private coinage, what we might say victimless private coinage that doesn’t involve counterfeiting and doesn’t involve any other fraudulent intent.

So to conclude, competition in currency is a very practical idea. It is an idea that offers sizable benefits to the public when the quality of the dominant currency becomes doubtful. Now we all hope that Federal Reserve Notes retain their value. But for those who are skeptical, they should have another alternative. U.S. citizens would benefit from H.R. 1098’s removal of current legal restrictions and

obstacles against currencies that could provide useful competition with Federal Reserve Notes and Treasury coins.

Thank you.

Chairman PAUL. Thank you. I will start off with the questions. The first question will be for both of you.

What do you think the arguments will be by the establishment? How will they come back and describe what we are trying to do? And why is it—I think it is well known that governments have always wanted to cling to a monopoly power over the currency, and it must be related to that. But could you give me an idea of what you think they will be saying or trying to describe what is going to happen? And if they claim that this would be terribly chaotic, what are some of the answers that we might give to those questions that they raise?

Mr. WHITE. I suspect that the argument might be made that you are encouraging people to abandon the U.S. dollar and, thereby, you are undermining the U.S. economy. Right? But the answer is that the fate of the dollar or the purchasing power of the dollar is in the Federal Reserve's hands. And all we are doing is giving people the option to make the transition to a more stable system if the Federal Reserve Note should begin to deteriorate in value, in reliability.

If we look at the experience around the world with paper money, we know that high inflation is not impossible, and we have had double digit inflation in the United States. And where people are free, they start—in a country with very high inflation—in Latin America we see this many times—they prefer to start moving their savings into a more stable currency. And then they start posting prices in the more stable currency so that they don't have to repost them every day. And then they start accepting payment in the more stable currency. Having that freedom makes the public a lot better off. So giving people an additional option doesn't undermine the stability of the current monetary system. That is under the control of the people who issue the current money.

Chairman PAUL. Dr. Parks?

Mr. PARKS. What I suspect they are going to do is to ignore this altogether, not raise any objections at all, just leave it alone. However, should any objections come forth, I think the best response is that the irredeemable paper-ticket money is going away, and, in fact, the history of the world is that these paper moneys always go away. Why should this one be any different?

Second, the irredeemable paper-ticket dollar has lost something like 98 percent of its purchasing power since the Federal Reserve was

formed. Why does anybody think that the last 2 percent is sacrosanct?

Third, there is a whole bunch of—how shall I say—trial balloons being put forth by the media talking about currency depreciation and why it is acceptable. So there was a time roughly about a year ago when Jeffrey Garten—Jeffrey Garten had a minor role in the Nixon Administration, was an Under Secretary of, I think Commerce, in the Clinton Administration, went on to be Dean of the Management School at Yale University, wrote five books, sometimes a publisher of articles in *Business Week*, member of the Council on Foreign Relations—published an article in the *Financial Times*, something to the effect of, we have to get ready for a weaker dollar. And he says in the *Financial Times*, the United States is going to have to camouflage a slow motion default. “Camouflage.” In other words, not really explain to the people what they are doing. But there is no question at all that the obligations of this government, of all the local and State governments and all the other debts, these obligations are not going to be met. People’s pensions are going to be lost.

Then this was followed up just recently by a professor from Harvard, Professor Rogoff, who published a piece saying that once every 75 years or so we have to have extra inflation, maybe 6, 7 percent, in order to get rid of this debt. And this was legitimized further by Floyd Norris, senior writer from *The New York Times*, a very senior guy. He wrote an article, “Sometimes inflation is not evil.”

So what they are really doing is setting us up for the depreciation of the dollar. And we know from history that once this gets started, once this gets out of the can, there is no way to put it back in the can.

Other things about this competition and money. It is true that you can make contracts in gold. However, in regular life, if you should have a contractual dispute with somebody and it gets settled in the courts, that judgment is going to come down in the irredeemable paper-ticket money. And it is also noteworthy that the people in the financial sector have gotten the International Monetary Fund—in 1978—to add a provision to the IMF Articles of Agreement—it is like their bylaws—to prohibit member countries from linking currencies to gold and only to gold. These folks have really knocked themselves out to get gold out of the monetary structure and I think part of the response should be that the reason they did that is so that they could garner unearned profits.

I have good evidence to show that. I think I am past my time. I don’t know if you want to see some of that evidence.

I am asking you a question. Should I put it up?

Chairman PAUL. Yes.

Mr. PARKS. Thank you. Put up slide number 67, please. I am sorry, 56. Do you have that? 63. It is important. So if you go back to 1980, the money supply in this country, defined by the Federal Reserve at that time, was M3, was something on the order of \$2 trillion. And the market capitalization of the stock market was roughly \$1 trillion. The financial sector portion of that was roughly 5 percent, roughly \$50 billion. You shift ahead to 2007. Now all created flat out of nothing, with no work, now the money supply is something on the order of \$13 trillion. The stock market capitalization is approaching \$20 trillion and now the value of the financial sector firms is something like \$4 trillion. It went from \$50 billion to \$4 trillion. Forget about the bonuses. Think stock options. These folks have garnered just an incredible amount of money. They don't even know what to do with it. That would not have been possible if we had an honest monetary structure. And the way they got away from an honest monetary structure is they got gold out of the system. And the legal tender laws helped do that. So really you have to get rid of legal tender.

Chairman PAUL. Thank you. I want to move on. I want to yield time to the vice chairman of the committee, the gentleman from North Carolina, Walter Jones.

Mr. JONES. Mr. Chairman, thank you very much. Dr. Parks and Dr. White, thank you very much for your testimony today. I am going to take a little different approach. I am not an expert in financial matters of this magnitude, but I have learned a lot from my good friend Ron Paul, and being part of the Liberty Caucus has at least exposed me to some individuals like yourself who could help me become more interested in the issue of monetary policy.

I am one who is very much concerned, as most Americans are, that we are headed down the road of no return. And when I listened to both of your testimonies—and I listened very carefully—it brings me to a question that the average working American, which I am a part of that group, by the way, when do we know that we get to a monetary point of no return? When that collapse comes, is that something in your opinion that you see happening sooner rather than later? And what should the average person—what will make the average person realize that we are in a collapse as it relates to strength of the dollar?

Mr. WHITE. I think we are getting mixed messages right now. If we look at the exchange value of the U.S. dollar, it has declined precipitously the last couple of years. If we look at the price of gold, of

course, that is shooting through the roof. And those are telling us that people don't want to hold their wealth in dollars. They want to move it into something they think is safer. On the other hand, if you look at the inflation indexed bonds or if you look at long-term bonds, those are not signaling the expectation of high inflation. But I am not sure how much we can trust those signals anymore because the Federal Reserve now has a policy of buying 30-year bonds to drive their prices up and drive their yields down. So that signal may be jammed a little bit.

But when we see all those signals indicating that high inflation is coming, then we know we have a big problem on our hands. And of course we don't just have a monetary problem. We also have a fiscal problem. We have a problem of an unsustainable debt going forward. And the two issues are of course related. As Dr. Parks mentioned, there has been talk about how we need inflation in order to relieve our national debt in real terms. But that is nothing more than a default, sort of behind a very thin veil in the form of the value of the dollars being paid back is reduced by half instead of the debt is explicitly cut in half. But it is the same thing. So when that becomes sort of respectable talk, then we have to be very worried.

I am not sure if I can identify exactly a tipping point. But when we see inflation get into double digits, then we will know we are in big trouble.

Mr. PARKS. I would say that collapse can come at any moment. And the amount of leverage in the system is beyond belief. Put up slide number 71, please. This is a slide showing the amount of derivative bets the banks have made all over the planet. It is something north of \$600 trillion. This data comes from the Bank for International Settlements, which is sort of like an umbrella organization for all the central banks—it has sovereignty by the way. But one of the things it does, they calculate all these derivative bets.

Slide 71. There you go.

So after the last tie to gold was broken, which was in 1971, as you can see from this chart, basically the only derivative bets you had were things like commodities, corn, soybeans or whatever. But after the last tie to gold was broken you start to have volatility in interest rates, big volatility, and big volatility in foreign exchange rates, and people who are in business and people who trade between countries need to hedge that. Banks have made an incredible number of bets on this. According to the Bank for International Settlements, the amount at risk that can be lost is something like \$30 to \$40 trillion and this is worldwide. In this country, according to the Office of the

Comptroller of the Currency, the amount of derivative bets is something on the order of \$200 trillion, and of that, one bank, JPMorgan Chase has something like \$80 trillion worth of derivative bets.

These bets, by the way, you have counterparty risk and that is what happened with AIG. That is why they really had to bail out AIG. AIG owed money to a bunch of banks. If you let AIG go down, then those banks' balance sheets become impaired.

But also on this business of inflation, they have changed the methodology of how they compute the CPI multiple times since the Clinton years.

Put up slide 27, please. There is a guy who is a scholar for us. His name is John Williams. He is in retirement now. He used to be an establishment economist with clients like Boeing and IBM. And what he does is he calculates the CPI using the consistent methodology from the 1980s—that is that top blue line—versus what the Bureau of Labor Statistics tells us today. And as you can see, on a consistent methodology basis, inflation is already and has been running 10, 11 percent for like 25 years. The understatement of the CPI, there are innovations such as the hedonic pricing, geometric weighting, substitution. Who knows what these people are talking about? They really lull people into thinking it is not as bad as it is.

I have prepared an analysis. Go to chart number 29, please. These are my health care premiums for Oxford while I had Oxford, and I compare the year-on-year increases with the medical component of the CPI. Next slide, please. With the medical component of the CPI and my insurance premiums—this is everybody in the whole country—they are going up 15 percent a year. But the medical component of the CPI is going up 4 percent a year. So they mislead people on that. And of course people who are seniors, who get Social Security and those benefits are keyed to the CPI. Disabled veterans, people who have cost-of-living escalations and union contracts and of course holders of Treasury inflation protection bonds, these people are all being cheated. But the tipping point comes, you don't know how it is because of the leverage. It is the leverage that always brings you down. And the leverage is beyond belief. As I said, it could happen while I am talking. You don't know when it is going to be.

Mr. JONES. Thank you, Mr. Chairman.

Chairman PAUL. I have a couple of follow-up questions that I would like to ask. I will start with Dr. White.

We have had this system of money since 1971 where there is no connection to gold and the dollar has been used as a reserve currency,

to a slightly less degree than it was even a year ago, but it is still the major reserve currency and most of the countries hold dollars. And they pyramid down and inflate their own currencies from this. Have there been many times in history that it has been this significant, this big, this worldwide with the fiat currencies? I know we have had fiat currencies for as long as we can date. People have debased their currency in different manners. But has it ever been this big? Is this a special phenomenon? Or is this something that you can go back in history and say, it was sort of like this 200 years ago or 300 years ago and we worked our way out of it? How do you put this in perspective in history?

Mr. WHITE. As far as the international monetary system goes, the international monetary system was never a fiat system. It was the international silver standard and the international gold standard. And of course there is no potential for runaway inflation when you have a metallic currency. It is only mined to—1, 2 percent of the stock is produced each year. The stock of gold just doesn't grow that fast. And in fact, that makes it possible to have an international monetary system. It is not controlled by any one country. And so countries can join, knowing that it is safe from political devaluation from the interest of any one country undermining the system.

Countries that have adopted the dollar or who fix their own exchange rate to the dollar do so when they think the dollar is the most popular currency in world markets. But as you have mentioned, as the dollar becomes a little shakier, they start to shy away. China, most importantly, has moved from basing their currency entirely on the dollar to now a basket of currencies. So we are starting to see other countries starting to back away from the dollar.

In that sense, I think the move to create the European monetary system provides some real competition to the dollar as an international reserve currency. And we can only hope that that will give the Fed a signal that there is somebody they don't want to inflate faster than. Of course, it seems to be a race to the bottom right now.

Chairman PAUL. If we were successful and had something like we are proposing and we had a competing currency, what would happen with the concept of fractional-reserve banking? Would more laws have to be written? Or would they follow the same pattern that we have today? How do you think that would work?

Mr. WHITE. That is a very good question. If private gold and silver coins begin to be popular, people are going to want to have bank services denominated in gold units or silver units, whatever it is that they find attractive. I am not sure we really have a sort of legal

barrier against the Fed controlling that parallel banking system the way they control the current banking system. So it might be necessary to construct some barriers and say, here are the rules for this parallel banking system. It doesn't have deposit insurance. It doesn't have control by the Federal Reserve System as to reserve ratios or investment portfolios. So we would need to think about that if we got to the point where there was a big demand for those services.

Chairman PAUL. I will follow up on that and ask both of you what your opinion is. Of fractional-reserve banking, you know in free market circles, there is a disagreement to a large degree on— I know Rothbard was very adamant, his position of no fractional-reserve banking. What is your opinion about what would be proper? And Larry, you can answer as well, as to whether we should have rules on what the banks declare.

Mr. WHITE. I think the basic should be freedom of contract. And as long as people make informed fractional-reserve contracts with a banker, I have no problem with that. Historically, that seems to have been what was more popular. If you have a fractional reserve then you don't need to pay storage fees to the vault keeper who is keeping your gold and you may even get interest on your account balance. So it is an attractive deal. It doesn't have to be based on hoodwinking the customers. Customers brought their money to fractional-reserve banks because they got a better deal.

The other thing worth noting is that you can't really have circulating paper currency, which is more convenient than carrying around coins for many purposes, unless you have fractional reserve banking. Because if it is a warehouse receipt, the warehouse needs to know who to charge the storage fees to. But if it is an anonymous circulating note, like we are accustomed to, how do they know who to charge the storage fees to? So I don't know of any historical examples of circulating warehouse receipts. But there are plenty of examples of pay to the bearer on demand in gold or silver circulating banknotes.

Chairman PAUL. Do you have an opinion on fractional-reserve banking?

Mr. PARKS. First question, put up slide number 73. This has to do with the size, the amount of fiat money out there. This is an analysis that is put together by McKinsey Global. And in 1980, the amount of financial securities was roughly—I don't know, it looks around \$18 trillion. By the end of 2009, it was close to \$200 trillion. Last year, it hit something like \$212 trillion. I don't know if you can

see on that chart, but at the very top it is in red, and that is gold. So all the rest is—it is irredeemable paper-ticket money,

U.S. and foreign money, or securities denominated in irredeemable paper-ticket money.

The nice thing about this bill is that it leaves everything in place. It leaves the dollar in place, leaves the Federal Reserve in place, and it really facilitates a transition. And for everyday purposes, it really doesn't make any difference to people whether we use an irredeemable paper-ticket, token, or whatever. They go to work, they get paid, they buy stuff, who cares? Where it becomes important is for future payment for people's pensions, for people's annuities, for people's savings. There they want to know in the future that they are going to have what they have. So in that way, this bill is very important.

For future transactions, people will want gold and we have precedent in this country where this kind of thing was instituted. And that was after the Civil War. You recall the Civil War was financed with greenbacks at one point. The greenbacks were discounted roughly 50 percent against gold. And the way people looked to protect themselves afterwards is they put a gold clause in their contracts. And when they got paid later on they got the same amount of gold they were expecting. When the United States issued Liberty Bonds during the first World War, they had a gold clause in the bonds.

As for fractional-reserve lending, I agree with Dr. White. But I want to add something to that. And that is, it is fractional-reserve lending that got us into trouble from the get-go. And the reason is, the banks have engaged in fraud in their basic banking relationships right from the beginning. And so, for example, banks told people that they were depositors. They are not depositors. They are unsecured creditors. And second, banks told people they could get their money back on demand. In fact and in law, when these people put money into a bank it is not their money anymore. It is the bank's money to do with as the bank wishes. If banks want to do fractional-reserve lending, they need to do what I call full disclosure. They have to tell people right out, we are going to lend this money to somebody else or whatever, that you may not be able to get it back. Some people may want to take that gamble. But my guess is they won't. Ordinary people put money in the bank for security, for safety. They don't want to have it in the mattress. It might be stolen or lost or whatever. They are not interested in making interest on their savings. They just want it to be safe. Those people are not going to be involved in fractional-reserve lending.

As to Murray Rothbard's point of view, Murray was talking all-ways about a gold backed dollar. That is a mistake. Again, you have to go back to what a dollar is. A dollar is the weight of silver. There is no such thing as a gold-backed piece of silver. The trouble with what Murray did is, he didn't go back further than the Coinage Act of 1792 where Hamilton defined the dollar as 371.25 grains of silver. The notion was that if Hamilton could define the dollar one way, we could define it another way. That is not true.

But again, the beauty of this H.R. 1098 bill is that we don't really have to address those issues. I think what will happen is that for long-term transactions, people will start using the gold clause. And over time, there will be a transition. During that period, all the irredeemable paper-ticket money will go away. The Federal Reserve will go away. Again, there is no possibility, in my view, as a practical matter, of having some kind of discontinuity in our monetary system, getting rid of the Fed. But this in fact is really important and we need to bring people up to curve as to why it is.

Chairman PAUL. Congressman Jones?

Mr. JONES. Mr. Chairman, thank you. I want to go a little bit off of your expertise, but I think you will have some very helpful comments. I have said two of the worst votes I ever made since I have been in Congress were the vote to go into Iraq and the repeal of Glass-Steagall. I realize this doesn't deal exactly with monetary issues, but we do have banks. You have made reference to banks many times in your comments about monetary policy.

Do you feel that when Glass-Steagall was repealed by the Congress, it helped the banking world or it created opportunities for greed and for mistakes?

Mr. PARKS. Greed is part of the human condition. Glass-Steagall did not do anything to change that. There is a fellow, his last name was Warburg, he was the son of Paul Warburg, what was his name? One of Franklin Roosevelt's advisors. He wrote a book in the 1930s called, "The Money Muddle," which really led to this business with Glass-Steagall, and what they were complaining about in those days was using bank money to speculate in the securities market. Bank money, it was understood, was money that the bank created out of nothing as opposed to regular money, gold and silver, and so the purpose of Glass-Steagall was really to keep the banks from overleveraging, and when Glass-Steagall was passed, now the banks could overleverage in a big way.

I have charts that I can put up for you that show what happens to the banks. Let me just get those out. Start with chart number 67, please. We will go right through them.

If you go before the last tie to gold was broken, and look at bank revenues, they are tiny. What are banks doing? They are processing payments, they are handling the check clearing system. But after the last tie to gold was broken, look what happened to bank revenues, it went up to something like \$800 plus billion. This is just for passing paper around.

Go to the next slide. Look at bank net income after the last tie to gold was broken. It went up to something like, I don't know, \$130 billion at its peak. This is after paying compensation to employees.

Go to slide 70, please. Look what happened to bank employee compensation. So the whole notion of all this business of allowing the banks to leverage up, this was enormously beneficial to employees, to the banks themselves. Over the period after the last tie to gold was broken, banks paid out over a trillion dollars in dividends, a trillion dollars in dividends, and just a couple of years ago, it turns out that while bank balance sheets said they had to get, I don't know, \$2 trillion from the Federal Reserve, all this money that they paid out in bonuses and what-not, it was not real profits, and the only reason they were able to do that is because they were able to leverage up, and the only reason they were able to leverage up is because we have irredeemable paper ticket electronic money as legal tender. If you had gold and silver money, you would be back on that curve before the last tie to gold was broken, and it is the banks that really have corrupted the system, but again it is probably counterproductive to point fingers. Really what we want to do is have a transition, and again the whole system is going to collapse no matter what. It is urgent that we pass this bill in order to facilitate a transition to an honest monetary structure.

Mr. JONES. I understand. Dr. White, could you comment on Glass-Steagall as well?

Mr. WHITE. I would say the repeal of Glass-Steagall had very little to do with the financial crisis. There would be absolutely no objection to repealing Glass-Steagall; that is, letting commercial banks align or merge with investment banks and insurance companies, if it weren't for deposit insurance and if it weren't for the too-big-to-fail doctrine.

If those had not been in place, then if somebody wants to form a financial supermarket, okay, we will see if that will fly. It is no skin off our nose. But when we begin to guarantee the liabilities of

investment banks which are highly leveraged, which are not like commercial banks, which are not even part of the payment system, that is really an invitation to trouble, and when the Federal Reserve Bank of New York intervened in the Bear Stearns failure and took up the bad assets so that JPMorgan Chase would buy the rest, it is not the first sort of too-big-to-fail action, but it is the one that sort of sticks in my craw. That was really bad policy.

Mr. JONES. Right.

Mr. WHITE. And I don't think it had that much to do with the repeal of Glass-Steagall. But if we treat investment banks like they are entitled to too-big-to-fail protection, then we are really asking for trouble, and that is really what needs to be undone.

Mr. JONES. Thank you, sir.

Mr. PARKS. Can I add to that, please? If you have gold and silver as money, gold as money, this too-big-to-fail stuff doesn't even come up. The only reason you have this is because of the irredeemable paper ticket money. You could never have this kind of leverage with gold, and in fact the money-center banks, they have leveraged their balance sheets something like 30 to 1, impossible if you had an honest monetary system. So really one feeds into the other, and this whole business with too-big-to-fail, the lender of last resort, Federal Deposit Insurance—Federal Deposit Insurance is not insurance; it is just a subsidy to the banks, and the reason it came about is that after the banks failed in 1933—they were failing before 1933—people were not putting their money back into the banks, and so they passed that legislation to induce people to put their money back into the banks.

As far as the lender of last resort comes about, again, that is the result of bank leverage, and the only reason you have so much leverage with the banks is because they misrepresented depositors. So if I were to borrow money from you, say I want you to lend me \$10,000, what is the first thing that goes through your mind? I would think, what is the collateral? How am I going to get the money back? What are you going to do with the money? But if you loaned it to a bank and they say, well, this is a deposit, now you don't do the counterparty surveillance, so it is really a function of what constitutes the money, and I think you have to go back and realize that what we call our money today, our dollar, this is just a dishonored promissory note. And in fact one of the quotes I have for you, and I will stop right here, is after Franklin Roosevelt closed the banks on March 5th, 1933, a lot of people were caught short, and there was a question of whether they should print script, and here is a quote from William Woodin, Roosevelt's Secretary of the Treasury, he says the Federal

Reserve Act lets us print all we need, and it won't frighten the people. Get this line now. It will look like—it won't look like stage money, it will be money that looks like real money. This is the Secretary of the Treasury telling you that this stuff is really, in effect, stage money, but it looks like real money. This is not real money that we have, folks. This is just a piece of paper gussied up with seals and what-not. It is dishonest, and we need to fix the dishonesty.

Mr. JONES. Thank you, sir.

Chairman PAUL. Thank you. I have one more question for Dr. White. If we moved in to a period of time where we had competing currency, we have one group of people thinking a dollar equals a Federal Reserve note and let's say we or somebody decides that a dollar equals 371 grains of silver, and we use an old silver dollar, that could be competing, but the definitions are obviously completely different. How do you think it would be resolved when it comes to paying your taxes? Because they won't allow—I think this is part of the reason that we allowed the resistance because some people have tried this, paying salaries with old silver dollars, and, oh, that is a dollar, I don't have to pay any taxes on this. But it is a real problem because if they think that anybody—we want to get rid of some of the inhibitions to a competing currency, but if the people who use silver dollars had no taxes to pay, it would be a tremendous advantage. I think we could win that argument. But what do you think the IRS and the tax people are going to say about this? And do you have an idea how that could be resolved?

Mr. WHITE. I am sure the IRS would like the taxes to be paid in the equivalent of what they would be if all the transactions had been done in Federal Reserve notes. It would be an interesting exercise to look at around the world and see if there are other countries that have faced this problem of having taxes denominated in multiple currencies. I really don't know that much about it myself, but it seems like not a very important problem. On tax day, you need to have some exchange rate between the different currencies people might be allowed to pay in or you would require them to convert their own books into whatever the official currency for tax purposes is, but 364 days of the year that shouldn't bother them. It is pretty easy with software these days to convert one column of figures into another column of figures.

Chairman PAUL. It seems like in the computer age we could probably work that out rather well. If I made one dollar of profit and silver was \$40, maybe it could be worked out, but of course the more

ideal thing would be not to have the income tax, and we wouldn't have to worry about problems like that.

Okay, Walter is gone.

I think that we will conclude. The Chair notes that some members may have additional questions for this panel that they may wish to submit in writing. Without objection, the hearing record will remain open for 30 days for members to submit written questions to these witnesses and to place their responses in the record.

This hearing is now adjourned.

[Whereupon, at 3:35 p.m., the hearing was adjourned.]

STATEMENTS

STATEMENT FOR THE RECORD
HON. RON PAUL
REPRESENTATIVE, 14TH DISTRICT OF TX
CHAIRMAN, SUBCOMMITTEE ON
DOMESTIC MONETARY POLICY & TECHNOLOGY
U.S. HOUSE OF REPRESENTATIVES

I. The Problem

John Maynard Keynes once stated that “There is no subtler, no surer means of overturning the existing basis of society than to debauch the currency. The process engages all the hidden forces of economic law on the side of destruction, and does it in a manner which not one man in a million is able to diagnose.” Such a situation is exactly what faces this country today, as the Federal Reserve seems hell-bent on destroying what little purchasing power remains of the U.S. Dollar.

Money is what allows civilization to flourish. Without money, consumers must barter their goods, hoping to exchange their products for those produced by others, and relying on a double coincidence of wants. Money enables man to rise above barter and makes exchange less burdensome. Once money comes into existence, businessmen can calculate profit and loss, homemakers can compare prices among different grocery stores, and individuals can begin to save and invest.

Money as a medium of exchange should always satisfy certain properties. It should be durable, not wearing out easily; it should be portable, easily carried; it should be divisible into units usable for everyday transactions; it should be recognizable and uniform, so that one unit of money has the same properties as every other unit; it should be scarce, in the economic sense, so that the extant supply

does not satisfy the wants of everyone demanding it; it should be reproducible, so that enough units of money can be created to satisfy the needs of exchange; and most importantly, it should be stable, so that the value of its purchasing power does not fluctuate wildly.

Unfortunately, monetary developments over the past century have eroded the stability of the monetary unit. The roots of this instability date back to the mid-19th century, when the government sought to establish a monopoly on the issuance of money. Until that time, gold and silver from numerous countries and private mints circulated as money. At this country's founding, there was no government-controlled national currency. While the Constitution established the Congressional power of minting coins, it was not until 1792 that the US Mint was formally established. In the meantime, Americans made do with foreign gold and silver coins such as the silver Spanish milled dollar, which was understood at the time of the Constitution's drafting to be the basis of our dollar system. Even after the Mint's operations got underway, foreign coins continued to circulate within the United States and did so for many decades. Since the dollar was variously defined as a specific weight of silver (or gold) it was relatively easy to determine the value of non-U.S. currency in dollars. Perhaps more importantly, the Coinage Act of 1792 ensured that the purchasing power of United States currency would remain stable, as debasement of the currency was punishable by death.

As with most monetary malfeasance throughout history, the United States government's drive to monopolize the issuance of money came about during a time of war. In order to fund its military operations during the 1860s, the federal government for the first time in its history issued paper currency which was unbacked by any commodity and was to be accepted at face value as a legal tender. These "greenbacks" quickly declined in value against gold-backed notes, and the government undertook numerous measures to eliminate competition and ensure that individuals would have to accept greenbacks. While some measures, such as banning futures trading in gold, were quickly repealed, other laws that banned the private minting of coinage remain in force today.

Since that time, the government slowly but surely tightened its grip over the issuance of money in this country. Resumption of gold redemption led to gradual acceptance of the federal government's paper currency, and then to Federal Reserve Notes. Once paper currency drove gold out of everyday use, the government was able to ban private ownership of gold in the 1930s. Eventually the gold window for foreign governments was closed in 1971, thus severing

once and for all any link between the dollar and gold. For the past 40 years we have lived in a world in which the issuance of money is completely at the discretion of governments and central banks, and we are reaping the consequences. The fiat money standard has led from one financial crisis to another, as each attempt to inflate out of the previous bubble only sows the seeds for the next crash. Real wages remain stagnant or decrease, while price increases resulting from inflation of the money supply force American households to go ever deeper into debt in order to maintain a constant standard of living.

Economics teaches that monopolies produce fewer goods and sell them at a greater price than in a competitive market. This leads to inefficiency, deadweight losses, and over time complacency on the part of the monopolist. Most mainstream economists fail to extend the theory of monopoly to the market for money. Government monopolization of the issuance of money fails to produce the sound money the market demands. The poor-quality money that is issued continues to lose its value, and the American people must work longer and harder for money that continues to decline in purchasing power. Meanwhile, government agencies and the banking system benefit from the first use of that money, being able to spend it and lend it before it circulates through the rest of the economy and before prices increase in reaction to this inflation.

The only way to counteract this problem is to break the government monopoly on the issuance of money. The Constitution does not grant the federal government this monopoly, a fact which was not in dispute for nearly a century after this country's founding. The federal government has become complacent, forgetting the need for sound money, and the only way to break this complacency is to break the monopoly. HR 1098, the Free Competition in Currency Act, intends to do just that.

II. The Solution

Over millennia of human history, gold and silver have been the two metals that have most often satisfied the market's demand for money and gained the trust of billions of people. Gold and silver are difficult to counterfeit, a property which ensures they will always be accepted in commerce. It is precisely for this reason that gold and silver are anathema to governments. A supply of gold and silver that is limited in supply by nature cannot be inflated, and thus serves as a check on the growth of government. Without the ability to inflate the

currency, governments find themselves constrained in their actions, unable to fund either the welfare state or the warfare state.

On the desk in my office I have a sign that says: "Don't steal – the government hates competition." Indeed, any power a government arrogates to itself, it is loathe to give back to the people. The history of this nation is filled with examples of increasing and unconstitutional centralization of power by the federal government. Militias, letters of marque and reprisal, and declarations of war have gone by the wayside; the postal monopoly drove out private competition; and a market-driven system of competing currencies was suppressed by the creation of a government-supported banking cartel that monopolizes the issuance of currency. In order to return to sound money, it is necessary to undo the legal obstacles that forbid other currencies from competing against the dollar.

The first step consists of eliminating legal tender laws. Article I, Section 10 of the Constitution forbids the States from making anything but gold and silver a legal tender in payment of debts. States are not required to enact legal tender laws, but should they choose to, the only acceptable legal tender is gold and silver, the two precious metals that individuals throughout history and across cultures have used as currency. There is nothing in the Constitution that grants Congress the power to enact legal tender laws. Congress has the power to coin money, regulate the value thereof, and of foreign coin, but not to declare a legal tender. Yet, there is a section of US Code, 31 USC 5103, that purports to establish US coins and currency, including Federal Reserve notes, as legal tender.

Historically, legal tender laws have been used by governments to force their citizens to accept debased and devalued currency. Gresham's Law describes this phenomenon, which can be summed up in one phrase: bad money drives out good money. An emperor, a king, or a dictator might mint coins with half an ounce of gold and force merchants, under pain of death, to accept them as though they contained one ounce of gold. Each ounce of the king's gold could now be minted into two coins instead of one, so the king now had twice as much "money" to spend on building castles and raising armies. As these legally overvalued coins circulated, the coins containing the full ounce of gold would be pulled out of circulation and hoarded. This same phenomenon occurred in the United States in the mid-1960s when the US government began to mint subsidiary coinage out of copper and nickel rather than silver. The copper and nickel coins were legally overvalued, the silver coins undervalued in relation, and silver coins vanished from circulation.

These actions also give rise to the most pernicious effects of inflation. Once the public realized that the king debased his currency by 50%, prices would eventually double, as it would now take two coins to purchase what used to require only one. The king who debased his currency spent his new money immediately, before prices rose, and thus gained the benefit of that new money. Most of the merchants and peasants who received the devalued currency felt the full effects of inflation, the rise in prices and the lowered standard of living, before they received any of the new currency. By the time they received the new currency, they had long since had to suffer doubled prices, and the new currency they received would give them no benefit. In the absence of legal tender laws, Gresham's Law no longer holds. If people are free to reject debased currency, and instead demand sound money, sound money will gradually return to use in society.

The second step to legalizing currency competition is to eliminate laws that prohibit the operation of private mints. One private enterprise which attempted to popularize the use of precious metal coins was Liberty Services, the creators of the Liberty Dollar. The government felt threatened by the Liberty Dollar, as Liberty Services had all their precious metal coins seized by the FBI and Secret Service in November of 2007.

The sections of US Code which Liberty Services is accused of violating are categorized as anti-counterfeiting statutes, when in fact their purpose was to shut down private mints that had been operating in California. California was awash in gold in the aftermath of the 1849 gold rush, yet had no US Mint to mint coinage. Even establishment of a US Assay Office failed to provide enough coinage, as the only coins they produced were too large to be used in everyday transactions. Foreign coins filled the void, but even still there was insufficient coinage, and these coins circulated at a value higher than their inherent metal value. The public clamored for smaller denominations of coins, and private mints stepped into the breach to fulfill this demand. The private mints were eventually accused of circulating debased coinage, and with the supposed aim of providing government-sanctioned regulation and a government guarantee of purity, federal laws were enacted which banned private mints from producing their own coins for circulation as currency.

The final step to reestablishing competition in currency is to eliminate capital gains and sales taxes on gold and silver coins. Under current federal law, coins are considered collectibles, and are liable for capital gains taxes. Coins held for less than one year are

taxed at the short-term capital gains rate, which is the normal income tax rate, while coins held for more than a year are taxed at the collectibles rate of 28 percent. These taxes on coins actually tax monetary debasement. The purchasing power of gold remains relatively constant, but as the nominal dollar value of gold increases due to the weakening of the dollar by the Federal Reserve, the federal government considers this to be an increase in wealth, and taxes accordingly. Thus, the more the dollar is debased, the more capital gains taxes must be paid on holdings of gold and other precious metals.

Just as pernicious are the sales and use taxes which are assessed on gold and silver at the state level in many states. Imagine having to pay sales tax at the bank every time you change a \$10 bill for a roll of quarters to do laundry. Inflation is a pernicious tax on the value of money, but even the official numbers, which are massaged downwards, are only on the order of 3-4% per year. Sales taxes in many states can take away 8% or more on every single transaction in which consumers wish to convert their Federal Reserve Notes into gold or silver coins. Americans should not be penalized through punitive taxation merely for desiring to hold or use one type of currency, nor should they be penalized for exchanging Federal Reserve Notes for US Mint-produced coins.

I hope that this hearing will start a vigorous discussion of currency competition, sound money, and how to return to a sound dollar. HR 1098 is certainly not a panacea, as there remain significant structural problems in our banking and monetary system that still need to be addressed. But allowing for competing currencies will enable Americans to choose a currency that suits their needs, rather than the needs of the government. The prospect of Americans turning away from the dollar towards alternate currencies will provide the necessary impetus to the US government to regain control of the dollar and halt its downward spiral. Restoring soundness to the dollar will remove the government's ability and incentive to inflate the currency, and keep us from launching unconstitutional wars that burden our economy to excess. With a sound currency, everyone is better off, not just those who control the monetary system.

WITNESS TESTIMONY

**WRITTEN TESTIMONY OF
LAWRENCE M. PARKS, Ph.D.,^{226,227}
EXECUTIVE DIRECTOR
FOUNDATION FOR THE ADVANCEMENT OF
MONETARY EDUCATION**

Thank you for the opportunity to testify in support of H.R. 1098, *The Free Competition in Currency Act of 2011*. I am honored to have been invited.

I know it must sound like hyperbole, but I believe that H.R. 1098 is perhaps the most important piece of legislation to ever come before the Congress, because H.R. 1098 is necessary to make a transition from the certain catastrophic collapse of our unauthorized (by the *Constitution*), dishonest and unstable legal tender irredeemable paper-ticket-electronic monetary system.

While I suspect that this committee will be most interested in how this bill will affect jobs, debt, economic growth, the capital markets, pensions, and a host of other important and timely topics, I will focus in my opening statement on where we are headed and on the dishonesty of our present system by highlighting some of the many misrepresentations about our money. There are three takeaway points. Our current monetary system is:

- (1) Not in conformity with the Constitution;
- (2) Dishonest; and,

²²⁶ [Dr. Parks submitted a slightly modified version of his testimony for inclusion in this work that corrected typographical and stylistic errors.]

²²⁷ [Dr. Parks answered additional questions for the record that can be found in Appendix B.]

(3) Unstable and in the process of blowing up, perhaps while I am testifying here today.

One can be certain of a complete collapse because there is no longer any market-based self-correcting mechanism providing negative feedback against increasing the money supply, increasing debt, and increasing leverage. Any system without a self-correcting mechanism is unstable and blows up.

Where We are Headed

With no exceptions, the history of legal tender irredeemable paper-ticket-electronic money is that its purchasing power always approaches its cost of production: ZERO! Here are some scenes that illustrate this point:

Exhibit 1: Sweeping Hungarian money into the sewer circa 1946

Exhibit 2: Burning German money for heat circa 1923

They are
not playing
with blocks

Exhibit 3: Children playing with blocks of German money circa 1923

A lesson in
high finance

Exhibit 4: Children playing with blocks of German money circa 1923

A cheaper way
to heat food

Exhibit 5: Burning German money to heat food circa 1923

Money not worth the paper it is printed on

Exhibit 6: Weighing paper money for value rather than nominal value, Germany circa 1923

Buying lunch in Zimbabwe today.

Exhibit 7: Using depreciated paper money in Zimbabwe to buy lunch circa 2008

*Exhibit 8: \$100 Trillion Zimbabwe bill, 2008***Collapse of the Monetary System**

With gold-as-money, and without the banking system creating money out of nothing, the amount of financial leverage would be *de minimis* with no possibility of collapse. Because legal tender irredeemable paper-ticket-electronic money can be created without limit, there is no market-based self-correcting mechanism to limit financial leverage. Especially at a time when those who engage in leverage do not bear the full risk of loss, but are able pass the risk on to the public through the banking system, whose balance sheet and liabilities are *de facto* guaranteed by the public, financial collapse is a certainty.

Exhibit 9: Sweeping Hungarian money into the sewer circa 1946

This is a scene from Hungary after World War II. That stuff that is being swept down into the sewer is the Hungarian money of the day. Those folks standing about watching are ordinary people who might

have been saving the legal tender irredeemable paper-ticket money for later needs.

“A lifetime’s worth of savings – literally down the sewer!”

While there have been many currency collapses during the 20th century, the reason why most countries eventually recovered after a time was that they had an alternate currency: the dollar. Once the dollar is rejected, all those countries that consider dollars as part of their reserves will also experience collapses.

What we define as civilization is the intricate web of understandings that we have about one another and the mutual promises we have made. For example, if I promise to meet you at two o’clock and don’t show up, that hurts the relationship. Aside from the mutual promises and understandings we have with family members, the most important promises in society are promises to pay: to pay pensions, salaries, suppliers, annuities, etc.

When money collapses, all promises of future payment are broken, and the enormous intricate web of promises both at home and abroad breaks down. The risks to society cannot be overestimated. A breakdown in national and international currencies is certain. The challenge is to mitigate the damage and lay the groundwork to put into train a monetary system that will not break down and that serves the needs of productive enterprise.

Most important, action must be taken to protect the middle class. As the British are fond of saying, it’s the middle class that protects us from the Barbarians.

In 1997, Mr. Greenspan, when he was the Chairman of the Board of Governors of the Federal Reserve, gave a remarkable speech in Belgium where he addressed the issue of leverage and the risk to the financial system.²²⁸ He said:

“Central bank provision of a mechanism for converting highly illiquid portfolios²²⁹ into liquid ones²³⁰ in extraordinary circumstances has led to a greater degree of leverage in banking than market forces alone would support.²³¹

Mr. Greenspan was confirming that the “mechanism” or safety net/subsidy/wealth transfer for banks, has led to more leverage than

²²⁸ Remarks by Chairman Alan Greenspan At the Catholic University Leuven, Leuven, Belgium January 14, 1997

²²⁹ “Highly illiquid portfolios” are portfolios that cannot be sold except at a substantial discount to par.

²³⁰ The most “liquid” portfolio consists of cash that the Federal Reserve creates out of nothing.

²³¹ Private investors would pay less for these assets than would the Fed. In fact, depending upon how “illiquid” these portfolios were, private investors might pay nothing.

would otherwise occur. For banks, this is great. They can enter into more profitable and riskier bets than they would otherwise because they know that if they lose, i.e., if their bets become “illiquid”—worthless and cannot be sold—the Federal Reserve will “convert” those bets into cash.

And where does the Federal Reserve get the cash? It literally “creates” it out of nothing, thereby diluting the purchasing power of savings and expected pensions of ordinary working people and seniors. In other words, if the banks win their bets they keep their winnings, and if they lose, the Fed—read that ordinary taxpayers—absorb the losses. Fantastic!

“Traditionally this has been accomplished by making discount or Lombard facilities available, so that individual depositories could turn illiquid assets into liquid resources and not exacerbate unsettled market conditions by the forced selling of such assets or the calling of loans.”

What this means is that rather than cause “individual depositories” (banks) to sell “illiquid assets” (loans) which are not good—at a presumed loss—or force borrowers into bankruptcy, the Federal Reserve may buy these loans from the banks, presumably at a discount. Again, if things work out, the banks keep the profits. If the loans cannot be repaid, the Federal Reserve (really taxpayers) makes up the loss.

Is it fair to taxpayers that banks keep the winnings if their bets are successful but that taxpayers make them good if they experience catastrophic losses? Isn’t this just blatant wealth transfer? When the Federal Reserve and the Treasury used the “Exchange Stabilization Fund” to bail out Mexico in 1995, the money supplied to Mexico was quickly transferred to the Wall Street firms and banks that had purchased Mexican securities.

Ignoring the fact that every so often the Mexican peso melts, to garner extra yield, U.S. financial institutions bought Mexican securities. When it appeared certain that Mexican debt would default, rather than allow these financial institutions to book a loss, our government—read that ordinary taxpayers—lent money to Mexico so that it could repay U.S. banks and Wall Street firms. Another version of this story was played out by the International Monetary Fund, in part financed by U.S. taxpayers, to bail out banks in South Korea, Indonesia, Malaysia, the Philippines, and elsewhere.

“More broadly, open market operations, in situations like that which followed the crash of stock markets around the world in 1987, satisfy increased needs for liquidity for the system as a whole that

otherwise could feed cumulative, self-reinforcing, contractions across many financial markets.”

In this and other speeches, Mr. Greenspan addresses systemic risk. Much more needs to be said about this, but, in sum, the system is perilously close to imploding or blowing up.

Why should ordinary citizens be at risk that our monetary system will implode so that banks and other financial players may reap unearned profits by taking on ever-greater risks?

“Of course, this same leverage and risk-taking also greatly increase the possibility of bank failures. Without leverage, losses from risk-taking would be absorbed by a bank’s owners, virtually eliminating the chance that the bank would be unable to meet its obligations in the case of a ‘failure.’”

In other words, without the safety net/subsidy from taxpayers, banks would make bets and take chances while putting their own capital at risk instead of taxpayers’ money. This is as it should be, it seems to me. Most important, Mr. Greenspan confirmed that without leverage the possibility that depositors would not get their money back in case of a “failure” would be virtually eliminated. Ordinary working people and seniors would not be at risk.

What an incredible acknowledgment! In other words, we can conclude that if the banks had not been induced by the safety net/subsidy to increase leverage, the banking system would not have collapsed in the 1930’s and we would not have experienced the Great Depression. Many think that the Great Depression was a “market failure.” Mr. Greenspan has written extremely eloquently that the Great Depression was in fact caused by the Federal Reserve feeding too much credit into the banking system, i.e., enabling the banking system to increase leverage too much.²³²

This raises other important questions: Why should our government empower and induce banks to increase leverage when we know that can lead, and has led, to a catastrophic monetary collapse? Why should ordinary working people and seniors and the rest of us be put at risk of a monetary implosion and the total collapse of our economy?

“Some failures can be of a bank’s own making, resulting, for example, from poor credit judgments. For the most part, these failures are a normal and important part of the market process and provide discipline and information to other participants regarding the

²³² See Greenspan, Alan; “Gold and Economic Freedom,” in Rand, Ayn; *Capitalism the Unknown Ideal*; Signet Books, 1967, pp96-101.

level of business risks. However, because of the important roles that banks and other financial intermediaries play in our financial systems, such failures could have large ripple effects that spread throughout business and financial markets at great cost.”

The point of this is that it is leading up to the need to suspend normal business rules for banks by not letting them fail on account of “ripple effects.”

Why Legal Tender Irredeemable Paper-ticket-Electronic Money is Dishonest

I wish to focus first on explaining why our monetary system is dishonest. Most importantly, there are myriad misrepresentations and nondisclosure of material information about what we now call a dollar. No amount of regulation or oversight committees will cure dishonesty. The only remedy is honesty.

There was a time after the Revolution when our money, as provided for by the *Constitution*, was gold and silver. There was no legal tender for private transactions. However, the bank notes of the first Bank of the United States were legal tender for payments to the government, e.g., tariff dues.

To illustrate what in my view is the most egregious example of dishonesty, I give an example with silver, although the same principle applies to gold.

It was, and remains, inconvenient to carry around silver dollars, because they are heavy and bulky. So, people deposited their silver dollars, typically in a bank, and received in exchange a promissory note, a.k.a. a banknote or a note, that bore the inscription that so many dollars were deposited and that the note was payable on demand by the bearer in silver.

Exhibit 10: United States One Dollar Note

Notice that this is not a dollar. At the top of the bill are the words “United States Note.” Under Washington’s image, it says “will

pay to the bearer on demand one dollar.” As put into law by Alexander Hamilton in the *Coinage Act of 1792*, this is a dollar:

Exhibit 11: U.S. Silver Dollar

Then, the promise to pay a dollar was defaulted, and the broken promise, the dishonored promissory note, is now represented as being a dollar!

Exhibit 12: One dollar Federal Reserve Note

This is a gross misrepresentation and is dishonest. This piece of paper is not even a valid note. The signatures of the Treasurer of the United States and the Secretary of the Treasury are gratuitous and deceptive.

In other words, what we use for money are just dishonored promissory notes that have been misrepresented to be dollars. All of the securities in our capital markets, at home and abroad, are denominated in dishonored promissory notes. This has immense

implications for trade, jobs, pensions, military preparedness and almost everything that is important.

People have the notion that the Congress can make the dollar anything the Congress wants it to be and “back” it or not with specie or whatever. This is demonstrably false. The highest law of our country is the *Constitution*, and all laws must be in conformity with it. The word “dollar” is mentioned twice in the *Constitution*, but it is not defined in the *Constitution*.

The word “dollar” appears in connection with the Slave Tax, which is no more. Much more importantly, it is mentioned in the 7th Amendment:

"In Suits at common law, where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved, and no fact tried by a jury, shall be otherwise re-examined in any Court of the United States, than according to the rules of the common law."²³³

If it were true that Congress could redefine the word “dollar,” that would mean that the Congress could redefine the 7th Amendment, which is ridiculous. Further, for the 7th Amendment to have objective meaning, the word “dollar” must have objective meaning. What is the objective meaning of the word “dollar” as used in the *Constitution*?

The word “dollar” in the *Constitution* refers to the Spanish Milled Dollar, a.k.a. a piece of eight.

²³³ 7th Amendment to the Constitution.

1753 PERU 8 REALES
PILLAR TYPE

Exhibit 13: A Spanish Milled Dollar, a.k.a. a piece of eight or a real

The Spaniards had built mints all over the colonies, and the Spanish Milled Dollar was ubiquitous. In some colonies it was made the unit of account. When independence was declared, the colonies adopted *Articles of Confederation* which gave Congress the power to issue paper money, called “continentals.” Here is an example of a continental \$30 bill. Notice that it “entitles the Bearer to receive Thirty Spanish milled Dollars or the Value thereof in Gold or Silver.”

Exhibit 14: A \$30 bill, issued by the Continental Congress for Thirty Spanish milled Dollars

After independence was achieved, and the *Constitution* was adopted, the U.S. did not want to rely on Spanish mints to mint its coins. The U.S. wanted its own mints to mint its own coins, including dollars. To that end, Alexander Hamilton, then Secretary of the Treasury, wrote the *Coinage Act of 1792* wherein he tells us exactly what a dollar is:

“Dollars or Units—each to be of the value of a Spanish milled dollar as the same is now current, and to contain three hundred and seventy-one grains and four sixteenths parts of a grain of pure, or four hundred and sixteen grains of standard silver.”²³⁴

This definition of a dollar, 371.25 grains of fine silver, has never been changed, and cannot be changed. The *Constitution* requires that a dollar be a weight of silver. Some might claim that if Hamilton defined a dollar in this way, perhaps it can be defined in another way. That is not true. Hamilton’s definition of a dollar was not arbitrary. All he did was to write into law what was already a fact.

Here is another way of looking at this issue. Suppose we take a sign that says “cat,”

Exhibit 15: Sign that says “cat”

And hang it on a dog,

Exhibit 16: Photo of a dog

Does the dog become a cat?

²³⁴ *Coinage Act of 1792*

Exhibit 17: Dog with a sign reading “cat”

Suppose Congress passes a law that says that now all dogs with cat signs are cats?

Exhibit 18: Dog with “cat” sign + order of Congress

Are all dogs with cat signs now cats?

Conceptually, this is no different than taking a piece of paper, printing the word “dollar” on it, adding seals and signatures and calling it a dollar. This is precisely what has happened to our money. Clearly, there is no easy remedy.

How could such an immense fraud be perpetrated? There are several reasons, but one of the most important, which HR1098 will go a long way to correcting, is that we are coerced into using fraudulent money by the legal tender statutes. By getting rid of legal tender, HR1098 is necessary, and may be sufficient, to help pave the way to an honest monetary system.

Placing images of some of our most revered Founding Fathers on various bills gives bogus money the patina of legitimacy by implying that it had the imprimatur and endorsement of the Founders, when in fact they condemned paper money.

Jefferson, for example, wrote:

"Paper is poverty,... it is only the ghost of money, and not money itself."²³⁵

"But that its [paper money's] abuses also are inevitable and, by breaking up the measure of value, makes a lottery of all private property, cannot be denied."²³⁶

"The trifling economy of paper, as a cheaper medium, or its convenience for transmission, weighs nothing in opposition to the advantages of the precious metals... it is liable to be abused, has been, is, and forever will be abused, in every country in which it is permitted."²³⁷

"I now deny [the Federal Government's] power of making paper money or anything else a legal tender."²³⁸

Placing Jefferson's image appear on a legal tender paper \$2 irredeemable paper-ticket-dollar misrepresents Jefferson's clear condemnation of legal tender irredeemable paper-ticket-electronic money. It is dishonest.

Exhibit 19: A \$2 United States Note with Jefferson's image

George Washington was equally clear: in a letter he wrote to Jefferson on August 1, 1786:

"Other states are falling into very foolish and wicked plans of emitting paper money."²³⁹

In addition, he wrote:

"Paper money has had the effect in your state that it will ever have, to ruin commerce, oppress the honest, and open the door to every species of fraud and injustice."

²³⁵ Thomas Jefferson to Edward Carrington, 1788. ME 7:36

²³⁶ Thomas Jefferson to Josephus B. Stuart, 1817. ME 15:113

²³⁷ Thomas Jefferson to John W. Eppes, 1813. ME 13:430

²³⁸ Thomas Jefferson to John Taylor, 1798. ME 10:65

²³⁹ Letter to Jefferson on August 1, 1786

Washington, in his circular letter of June, 1783, to the governors of the several United States, wrote that "honesty will be found on every experiment to be the best and only true policy," being convinced that "arguments deduced from this topic could with pertinency and force be made use of against any attempt to procure a paper currency."

Notice that Washington is not writing from an economic point of view. He is condemning paper money as "wicked," i.e., evil. The perils of paper money were well known. This is very strong language. As with Jefferson, the monetary authorities again misrepresent Washington's heart-felt condemnation of paper money by putting his image on a legal tender irredeemable paper-ticket dollar. That is dishonest.

Exhibit 20: \$1 Federal Reserve Note

James Madison, the "Father of the *Constitution*," had an unequivocal view of paper money as well:

"Paper money is unjust; to creditors, if a legal tender; to debtors, if not legal tender, by increasing the difficulty of getting specie. It is unconstitutional, for it affects the rights of property as much as taking away equal value in land." [Emphasis added]

Notice, as with Washington, Madison condemned paper money on moral, not economic, grounds as "unjust." As the principal author of the *Constitution*, who better to opine on it as not permitting paper money than Madison. Again, as with Jefferson and Washington, the monetary authorities misrepresent Madison's strong condemnation of paper money by putting his image on the \$5,000 legal tender irredeemable paper-ticket-dollar. That is dishonest.

Exhibit 21: \$5,000 Federal Reserve Note

Alexander Hamilton, Secretary of the Treasury and presidential aspirant did not condemn paper money *per se*, but he could not have been clearer of what he referred to as “unfunded paper,” the kind we have now. In June, 1783, Alexander Hamilton, in resolutions for a new constitution of the United States of America, set forth explicitly:

"To emit an unfunded paper as the sign of value ought not to continue a formal part of the constitution, nor ever hereafter to be employed; being, in its nature, pregnant with abuses, and liable to be made the engine of imposition and fraud; holding out temptations equally pernicious to the integrity of government and to the morals of the people."

By putting Hamilton’s image on the \$10 legal tender irredeemable paper-ticket-dollar, his clear condemnation of unfunded paper money is also misrepresented. That is dishonest

Exhibit 22: \$10 Federal Reserve Note

Consider now the all-important issue of how to get people to accept legal tender irredeemable paper-ticket-electronic money in exchange for their goods and services? Misrepresentation may not be enough. There is a need for coercion, which is provided by the legal tender laws.

Fraud: Nondisclosure of Material Information and

Misrepresentations about Our Monetary System

Commodity money, e.g. gold or silver, is what it is. There is nothing to disclose or misrepresent. Gold or silver is what it purports to be. When gold or silver is minted into coins by the U.S. mint, one can rely on the integrity of the coins because the penalty for malfeasance, e.g., cheating on the weight or the specie content, is punishable by death. Policing the integrity of coins produced by the U.S. mint is done by the U.S. Secret Service. It is very diligent.

The Free Competition in Currency Act of 2011, by removing coercion for our monetary system, will signal folks who otherwise would not pay attention to reevaluate the merits of legal tender irredeemable paper-ticket-electronic money.

A full disclosure critical review will tend to reveal:

- (1) “Dollars” are not redeemable into anything, i.e., they are not valid “notes” that promise to pay something of value to the bearer;
- (2) “Dollars” have value because people believe that other people, both at home and abroad, will continue to accept them for their goods and services and save them for future needs;
- (3) In the U.S., people are forced by law [legal tender] to accept “dollars” for all debts public and private;
- (4) “Dollars” are created out of nothing by the U.S. banking system—mostly by commercial banks;
- (5) If, in the judgment of the Federal Reserve, there needs to be additional “liquidity” in the system, then the Federal Reserve, on its own authority and without any oversight from Congress, may create “dollars” without limit. Creating additional “dollars” out of nothing will dilute the purchasing power of “dollars” that have been saved or promised for future payment, such as pensions;
- (6) Creation of new “dollars” out of thin air has depreciated “dollar” purchasing power by more than 95% since 1950;
- (7) “Dollars” are in no way obligations of the U.S. Government (the signatures of the Secretary of the Treasury and the Treasurer are gratuitous);
- (8) “Dollars” are tokens, i.e., a paper tickets or electronic blips in a computer;
- (9) What we call a *dollar* today is not in conformity with the word

dollar used in the 7th Amendment to the *United States Constitution*.²⁴⁰ In other words, what we call a dollar is not authorized by the highest law in the land.

For day-to-day transactions, none of this matters. People get paid in legal tender irredeemable paper-ticket-electronic money, and they use that money to buy what they need for daily living. It is, however, *crucially* important for people who save or have securities that are denominated in legal tender irredeemable paper-ticket-electronic money.

A monetary system based on legal tender irredeemable paper-ticket-electronic money is inherently fraudulent. Frauds can be classified in three ways:

Frauds in the private sector are generally limited and most times are recognized in a short period.

- (1) Frauds which have an indirect government imprimatur, — e.g., Madoff, whose fraud continued for three decades largely because many believed that government regulations and Securities and Exchange Commission oversight would prevent such frauds — lull folks into a sense of security and can continue for longer periods.
- (2) Frauds that have the direct participation of government by virtue of enabling legislation, e.g., the fiat money fraud, can continue for very long periods because people want to believe in their institutions, and, because government is involved, they are coerced — that’s what legal tender is about — into participating.
- (3) Some misrepresentations about our monetary system are:
 - (4) Pieces of paper gussied up with seals and signatures that have the word “dollar” printed on them are not dollars, as the term is used in our *Constitution* and as defined in the *Coinage Act of 1792*;
 - (5) Federal Reserve Notes are neither in law nor in fact notes — because they have neither a payee nor a due date certain, which are part of the definition and legal requirement for a note to be valid;

²⁴⁰ *7th Amendment*: “In Suits at common law, where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved, and no fact tried by a jury, shall be otherwise re-examined in any Court of the United States, than according to the rules of the common law.”

- (6) Legal tender irredeemable paper-ticket-electronic money is not authorized by our *Constitution*. It is misleading to have the signatures of the Secretary of the Treasury and the Treasurer on the bills;
- (7) Founders such as Washington, Madison, Jefferson and many others condemned paper money on moral grounds. It is misleading to put their images on the legal tender irredeemable paper-ticket-electronic money as if they might have endorsed paper money.

All frauds are eventually found out and collapse.

Legal Tender

Historically, some commodities were made legal tender, e.g., tobacco in the American colonies. However, there is no need to make gold a legal tender because people readily accept gold-as-money, especially for large transactions. For small transactions, historically people have always accepted silver.

Fiat, irredeemable paper ticket-token or electronic-checkbook money is always made legal tender because otherwise people tend to reject fiat money for their savings or promises of future payment, e.g., annuities, rents, pensions. The biggest hurdle for irredeemable paper-ticket-electronic money to circulate is getting people to accept it in exchange for their goods and services and especially to save it. Legal tender is the coercion in our monetary system.

Legal tender morphed from a concept called “forced tender.” When Marco Polo visited China in the middle of the 13th century, he, as well as other observers, noticed that the Chinese Emperor had become fabulously wealthy by issuing paper money. Upon returning home and reporting this to the Europeans, they were incredulous. Why, they asked, would anyone accept a piece of paper, even if gussied up with seals and signatures, in exchange for their goods and services? The answer was that if one didn't accept the Emperor's paper money he would be killed. This was called forced tender.

In 1694, Bank of England (then a private bank) notes were made legal tender by the king. There is no death penalty for not accepting legal tender today. However, if one doesn't accept it, one is not entitled to be paid.²⁴¹

²⁴¹ Interestingly, after the French Revolution and the issuance of legal tender irredeemable paper-ticket money, called *Assignats*, eventually the penalty for non-acceptance was death pursuant to a special law called *The Law of the Maximum*.

Legal tender was widely used in Colonial America, but opposition didn't crystalize until during the Revolution when the American experience with legal tender was a disaster. The experience of Thomas Jefferson is emblematic. Here is what happened to Jefferson.

Jefferson was married to the daughter of one of the richest men in the colonies, John Wayles. Wayles died in 1773 leaving a huge estate with assets, consisting of slaves and plantations, valued at upwards of 20,000 pounds, and liabilities, consisting of monies owed to British financiers, of about 11,000 pounds. At the time, 100 pounds was a good year's wages for a skilled tradesman, so the net estate was a fortune. Wales had appointed Jefferson along with Jefferson's two brothers-in-law the co-executors of his will.²⁴²

In those days, and today as well, if an executor distributes the assets of an estate without settling out the liabilities, he becomes personally liable for the liabilities. However, in this instance, since the value of the assets was so much greater than the liabilities, and, besides, Jefferson's in-laws wanted their shares, Jefferson felt comfortable in selling the assets and distributing the proceeds.

At the time in Virginia, folks did not have enough cash for such a large transaction. The remedy was to use what we call today a seller's mortgage or a "purchase money" mortgage, or in the case of goods, vendor financing. In 1773, the procedure was for the buyer to issue a bond to the seller, and amortize the bond, which is what happened. Jefferson offered the estate's British creditors a portion of the bonds to settle their claims, but they wanted specie, i.e., gold or silver. So Jefferson would need to pay off the debts from the amortization of the bond.

But then in 1776 the Revolution started. Virginia issued paper money and made it legal tender. As with all paper money, its purchasing power approached its cost of production — near zero — and Jefferson's debtors paid off the bond with the then worthless money. But Jefferson was still personally liable for the 11,000 pounds to Wayles' creditors in England.

Jefferson was never able to work his way out of that debt and he died a *de facto* bankrupt. Along the way the Congress tried to help him out; it bought his books for \$15,000 which became the Library of Congress. After he died, his possessions were auctioned, but they didn't bring enough money to satisfy the debt.
